TABLE OF CONTENTS

ACKNOWLEDGEMENTS

This Building Envelope Thermal Bridging Guide was prepared by Morrison Hershfield Limited in collaboration with many stakeholders and industry partners. We would like to thank the organizations and individuals that made this undertaking possible.

The Project Co-Sponsors

BC Hydro Power Smart
BC Housing
CMHC
Canadian Wood Council
Fortis BC
FPInnovations
Manitoba Hydro
National Resources Canada
Transition énergétique Quebec

Industry Advisors

The following organizations were included as industry advisors for the completion of the guide.

Architectural Institute of British Columbia (AIBC)
Building and Safety Standards Branch, BC
City of North Vancouver
Engineers and Geoscientists British Columbia (EGBC)
Fenestration Association of BC (FEN-BC)
Urban Development Institute (UDI)

We wish to also gratefully thank the following individuals for their active participation in steering this guide to completion.

Bojan Andjelkovic, BC Hydro
Curt Hepting, EnerSys Analytics Inc
Dan Bradly, FortisBC
Denisa Ionescu, BC Housing
Gordon Monk, BC Hydro
Jieying Wang, FPInnovations
Jim Kobialko, FortisBC
Jonathan Meads, Concert Properties
Oscar Ceron, BC Hydro
Peggy Lepper, Canadian Wood Council
Remi Charron, BC Housing
Robert Jonkman, Canadian Wood Council
Tim Ryce, City of North Vancouver

Industry Partners

We wish to extend a special thanks to the manufacturers and industry partners that helped extend the scope of the thermal performance catalogue. Thanks to the support and contributions of the following industry partners: ACS Composite Systems, Armadillo NV, BV Glazing, Canadian Sheet Steel Building Institute (CSSBI), Dow Corning Corporation, EIFS Council of Canada, EJOT Construction Fastening Systems Inc. (EJOT), Fero, Hohmann & Barnard, JK Thermal, Owens Corning Canada, Schöck Bauteile GmbH, Tnemec and the manufacturers of proprietary cladding attachments (American Fiber Cement Corporation, Cascadia Windows, CL Talon, ECO Cladding, Engineered Assemblies, ETG, Knight Wall, Mayne Coatings, Northern Facades, Nvelope, SOPREMA, Technoform, U-Kon Systems. These industry partners provided the funding to evaluate many variations of solutions that mitigate the impact of thermal bridging.

Preparation of the Guide

We acknowledge the team at Morrison Hershfield Ltd. for their dedication, insight, and collaborated effort in preparing this guide. MH's team included the following individuals:

Alex Blue, Barilelo Nghana, Christian Cianfrone, David Fookes, Eileen Holt, Fabio Almeida, Ivan Lee, Jameson Vong, Julien Schwartz, Katie Hay, Mark Lawton, Matthew Doiron, Felipe Merino Gordo, Michael van der Laan, Neil Norris, Nick Adamson, Patrick Roppel, Radu Postole, and Ruth McClung.

We acknowledge the team at Open Technologies for their work developing the online version of the BETB, available at thermalenvelope.ca. Open's team included the following individuals: Ryan McCuaig, Christian Cianfrone, Daniel Eden, and Andrew Shopland.

What's New in Version 1.6

BETB Version 1.6 is the fourth and final major expansion of the BETB catalog and part of a larger project to transform the BETB Guide into a Canada-wide resource.

This project includes an easy-to-use, web-based database to support the industry in fully recognizing the impact of thermal bridging in energy codes and in practice. When completed, the expanded BETB database and web-application will be applicable to all Canadian climates, current construction practices, energy codes, and construction types. The database will also include details and systems that are needed to meet future requirements for net-zero buildings.

This version adds 26 new details and 95 new scenarios of generic details and assemblies. A summary of the additional details follows. The discussion of performance categories for thermal bridging details has also been expanded to include categories for point transmittances.

New assemblies have been added to the database, including precast-concrete, wood-framed, low sloped roofing systems, and insulated concrete form (ICF) foundations. Details have been added for mitigating thermal bridges at interface details, including the window to wall transition, intermediate floors, roof penetrations, and base of wall details at foundations. Additional insulation scenarios have been added to walls and roofs from previous versions of the BETB guide providing solutions for all Canadian climates zones and low TEDI/ net-zero buildings.

DISCLAIMER

This publication is provided to inform the practice of applying the Building Envelope Thermal Analysis (BETA) methodology for determining the effective thermal performance of building envelope assembly and interface details, as well as to guide BETA's application in overall building design. The greatest care has been taken to confirm the accuracy of the information contained herein. However, the authors, co-sponsors, industry advisors, industry partners and other contributors assume no liability for any damage, injury, loss or expense that may be incurred or suffered as result of the use of this publication, building envelope design methodology or energy modelling practices. The views expressed herein do not necessarily represent those of any individual contributor. Nothing in this publication is an endorsement of any proprietary building envelope system or particular assembly product.

In addition to using this publication, readers are encouraged to consult applicable up-to-date technical publications on building envelope science, practices and products. Retain consultants with appropriate architectural and/ or engineering qualifications and speak with appropriate municipal and other authorities with respect to issues of envelope design, assembly fabrication and construction practices. It is also advisable to seek specific information on the use of envelope-related products and consult the instructions of envelope assembly manufacturers. Always review and comply with the specific requirements of the applicable building codes for any construction project.

1. OVERVIEW

In British Columbia, a large percentage of electricity and natural gas is consumed in commercial, institutional, and residential buildings. Improved energy conservation in buildings has long been recognized as an important approach to reduce energy consumption and greenhouse gas emissions in BC. Government and utilities have a mandate to encourage energy conversation in buildings and BC jurisdictions have been adopting increasingly more stringent building energy efficiency standards. Space conditioning, primarily heating, is one of the largest components of energy use in commercial, institutional, and residential buildings in BC. Building envelope thermal performance is a critical consideration for reducing space heating loads and will be an increasingly important factor as authorities strive for lower energy consumption in buildings.

It has become more and more evident that the thermal performance of the building envelope can be greatly affected by thermal bridging. Thermal bridges are localized areas of high heat flow through walls, roofs and other insulated building envelope components. Thermal bridging is caused by highly conductive elements that penetrate the thermal insulation and/or misaligned planes of thermal insulation. These paths allow heat flow to bypass the insulating layer, and reduce the effectiveness of the insulation.

Figure 1: Thermal Bridging due to a Shelf Angle that supports Brick Veneer

Research and monitoring of buildings is increasingly showing the importance of reducing thermal bridging in new construction and mitigating the impact in existing buildings. The impact can be significant to whole building energy use, the risk of condensation on cold surfaces, and occupant comfort. The traditional approach of building codes to reducing space heating loads in buildings was to introduce progressively higher levels of thermal insulation and more stringent glazing performance requirements. This was a logical approach in the past because standard practice was to largely overlook thermally bridging. The effects of thermal bridging were assumed to be negligible if the cross-sectional areas of these conductive components were small, relative to the rest of the building envelope or they were purposely ignored due to the difficulty in assessing the impact. However, the additional heat flow due to major thermal bridges, including ones with small cross sectional areas such as shelf angles or flashing around windows, can add up to be a significant portion of the heat flow through opaque envelope assemblies. For example, the contribution of details that are typically disregarded can result in the underestimation of 20% to 70% of the total heat flow through walls. If major thermal bridges are not addressed then adding insulation to the assemblies may not provide significant benefits in reducing the overall heat flow because heat will flow through the path of least resistance. The cost of adding extra insulation, not just additional materials but also potentially reduced useable floor space, is not justified if no substantial energy savings are realized in practice.

Energy standards and codes in BC jurisdictions (BCBC, VBBL, ASHRAE 90.1and NECB) do not currently effectively address, or explicitly allow designers to ignore, major thermal bridges such as slab edges, shelf angles, parapets, window perimeters, etc. These codes and standards have steadily increased their insulation requirements but the development and implementation of procedures to effectively address thermal bridging in these codes has been slow. Some reasons for the slow response include: absence of data, the complexity of some prevailing procedures to account for thermal bridging, and a lack of clear information demonstrating that thermal bridging needs to be more thoroughly addressed. Moreover, reaching agreement for how to implement

significant changes to codes and standards can be challenging for committees comprised of a wide range of interests, backgrounds and perspectives.

With this context in mind, the original guide explored how the building industry in BC can realistically meet the challenges of reducing energy use in buildings, in part by effectively accounting for the impact of thermal bridging. The goal of the co-sponsors of the BETB guide is to help transform the BC construction sector to realize more energy efficient buildings. To help meet this goal, the primary objective of of the original BETB guide was to address the obstacles currently confronting our industry, with regard to thermal bridging, by:

1. Providing a catalogue of the thermal performance of common envelope assemblies and interface details directly relevant to construction in BC.
2. Providing information that makes it easier for industry to comprehensively consider thermal bridging in building codes and bylaws, design, and whole building energy simulations.
3. Examining the costs associated with improving the thermal performance of opaque building envelope assemblies and interface details, and forecasting the energy impact for several building types and BC climates.
4. Evaluating the cost effectiveness of improving the building envelope through more thermally efficient assemblies, interface details, and increasing insulation levels.

Scope

It is important to recognize that this guide is deliberately narrow in scope. The focus is on the thermal performance of the opaque building envelope. A wide range of opaque assemblies were evaluated in preparation of this guide; however, the thermal performance of the opaque building envelope is only one of many considerations for reducing energy use in buildings and its relative impact changes as other building energy uses are reduced. Refer to the orginal version of the BETB Guide released in 2014 for the energy savings and cost benefit analysis (Part 2) and sections related to market transmformation (Part 3: Signficance, Insights and Next Steps).

Audience

The target audiences for this guide are broad: committees for energy standards, policy and government, utilities, architects, mechanical designers, building envelope consultants, energy modellers, developers and contractors, manufacturers and trade organizations. Not all the information contained in the guide will be of direct interest to all these industry stakeholders.

2. GLOSSARY OF TERMS

Term	Symbol	Units Imperial	Units SI	Description
Conductivity	K	$\frac{\text{(BTU in)}}{\text{(hr ft}^2\ ^o\text{F)}}$	$\frac{\text{W}}{\text{(m K)}}$	The ability of a material to transmit heat in terms of energy per unit area per unit thickness for each degree of temperature difference.
Equivalent Conductivity	K_{eq}	$\frac{\text{(BTU in)}}{\text{(hr ft}^2\ ^o\text{F)}}$	$\frac{\text{W}}{\text{(m K)}}$	The averaged or equivalent thermal conductivity of a component consisting of several building materials, effectively treating the component as a homogeneous material that provides the same thermal characteristics.
Heat Flow	Q	BTU/hr	W	The amount of energy per unit time that passes through an assembly under a specific temperature drive of ΔT.
Thermal Transmission Coefficient	U	$\frac{\text{(BTU)}}{\text{(hr ft}^2\ ^o\text{F)}}$	$\frac{\text{W}}{\text{(m}^2\text{ K)}}$	Heat flow per unit time through a unit area of an assembly per temperature degree difference. The convention is to include the impact of air films
Thermal Resistance of a Material	R	$\frac{\text{(hr ft}^2\ ^o\text{F)}}{\text{(BTU)}}$	$\frac{\text{(m}^2\text{ K)}}{\text{W}}$	A measure of a material's resistance to heat flow.
Effective Thermal Resistance	R_{eff}	$\frac{\text{(hr ft}^2\ ^o\text{F)}}{\text{(BTU)}}$	$\frac{\text{(m}^2\text{ K)}}{\text{W}}$	A measure of an assembly's resistance to heat flow, including the effects of thermal bridging. The inverse of the assembly U-value.
Clear field Assembly Thermal Transmittance	U_0	$\frac{\text{(BTU)}}{\text{(hr ft}^2\ ^o\text{F)}}$	$\frac{\text{W}}{\text{(m}^2\text{ K)}}$	Heat flow coefficient for an assembly with uniformly distributed thermal bridges, which are not practical to account for on an individual basis for U-value calculations. Examples of thermal bridging included in U_o are brick ties, girts supporting cladding, and structural studs.
Linear Heat Transmittance Coefficient	Ψ	$\frac{\text{(BTU)}}{\text{(hr ft }^o\text{F)}}$	$\frac{\text{W}}{\text{(m K)}}$	Heat flow coefficient representing the added heat flow associated with linear thermal bridges that are not included in the clear field U_o. Linear thermal bridges typically occur at interface details. Examples are shelf angles, slab edges, balconies, corner framing, parapets, and window interfaces.
Point Heat Transmittance Coefficient	χ	$\frac{\text{(BTU)}}{\text{(hr }^o\text{F)}}$	$\frac{\text{W}}{\text{(K)}}$	Heat flow coefficient representing the added heat flow associated with a point thermal bridge that is not included in the clear field U_o. Point thermal bridges are countable points and are considered feasible to account for on an individual basis for U-value calculations. An example is a structural beam penetration through insulation.
Length of a Linear Transmittance	L	ft	m	The length of a linear thermal bridge, i.e. height of a corner or width of a slab.

Term	Description
Air Films	An approximation of the combined radiative and conductive-convective heat exchange at air boundary surfaces.
Area of Influence	The area that heat flow through an assembly is affected by a thermal bridge by lateral heat flows.
Area Weighted Method	The method by which an average U-value is determined by summing the Area multiplied by U-Value of each component and then dividing by total Area. This method assumes parallel heat flow paths.
At-Grade Interface Detail	An interface detail at the transition between the above-grade wall assembly intersections with either an at-grade floor slab or below grade assemblies.
Building Elevation	A view of a building seen from one side, a flat representation of one façade. Elevations drawings typically show views of the exterior of a building by orientation (North, East, South or West).
Building Envelope	The elements of a building that separate the conditioned space from unconditioned space of a building. This includes walls, roofs, windows and doors.
Clear Field Assembly	Wall, floor and roof assemblies of a building. (see definition of U_0 above).
Corner Interface Detail	Where walls meet at a corner of the building. Interface details can have additional heat flow than compared to the clear field assembly because of additional framing and related to the geometry (increased exterior surface area).
Curtain Wall	A non-load bearing building façade that sits outboard of the main building structure made up of metal framing, vision glass and spandrel sections. The curtain wall only carries its own dead-load and lateral loads (wind).
Dynamic Thermal Response	The time variant heat flows through the building envelope that result in delayed heat gain or loss depending on the amount of energy that is stored within the building envelope. The amount of energy that is stored within the building envelope at any given time is related to the mass of all the combined components of the building envelope (thermal mass).
Eyebrow	An architectural feature where the floor slab projects beyond the walls. Eyebrows often provide overhead protection from rain for fenestration and are similar in construction to a balcony.
Fenestration	All areas (including the frames) in the building envelope that let in light, including windows, plastic panels, clerestories, skylights, doors that are more than one-half glass, and glass block walls.
Firestop	A fire protection system made of various components used to seal openings and joints in fire-resistance rated wall and floor assemblies.
Floor Space Ratio	Ratio of gross floor area of a building to the area of land on which it is built.
Glazing	See definition of fenestration. Examples of glazing are windows, window-wall, and curtain-wall.
Glazing Interface Detail	Linear thermal bridges that occur at the intersection of glazing and opaque assemblies.

Term	Description
Insulating Glass Unit (IGU)	Double or triple glass planes separated by air or other gas filled space. The space between the panes is glass is created by a physical spacer that is also adhered to the glass. Sealant is provided at the perimeter of the unit as a gas and moisture barrier.
Interface Details	Thermal bridging related to the details at the intersection of building envelope assemblies and/or structural components. Interface details interrupt the uniformity of a clear field assembly and the additional heat loss associated with interface details is accounted for by linear and point thermal transmittances.
Lateral Heat Flow	Heat flow in multiple directions through an assembly as a result of conductive components bypassing the thermal insulation in multiple dimensions.
Linear Thermal Bridge	An interface detail that can be defined by a linear length along a plane of the building envelope.
MURB	Multi-unit residential building.
Opaque Assembly	All areas in the building envelope, except fenestration and building services openings such as vents and grilles.
Parallel Path	The assumption that the heat flow paths through an assembly are perpendicular to the plane of the assembly and there is no lateral heat flow.
Parapet	An interface detail that joins the walls to the roof.
Point Thermal Bridge	Points of heat loss that are considered feasible to account for on an individual basis for U-value calculations. An example is a structural beam penetration through insulation.
Poured-in-Place Concrete Wall	An architectural exposed concrete wall that is formed at the location of installation and is part of the building structural support.
Precast Concrete Wall	An architectural concrete cladding that is formed off site and shipped to the location of installation.
Plane of Heat Transfer	The theoretical projected area between the interior and exterior environment where the net heat flow through the building envelope is calculated.
Plug Loads	Any system that draws electrical power through the building but is not explicitly used to operate the building. This includes appliances, computers and other items that are dependent on the occupants use.
Setpoint Temperature	The desired operating temperature that a heating system works to maintain, ie: the interior space temperature set by a thermostat.
Shelf Angle	A structural support that transfers the dead load of brick veneer to the building structure at the floor slab.
Floor Slab	A concrete floor that partially or fully penetrates the building envelope at the exterior.
Slab Bypass	A portion of window-wall that covers the floor slab edge to give the appearance of uninterrupted glazing across the entire façade of a building.
Spandrel Section	An opaque section of curtain wall or window wall with insulation between the system framing.

Term	Description
Stick Built Curtain Wall	A site installed and glazed curtain-wall system that is assembled by running long pieces of framing between floors vertically and between vertical members horizontally.
Structural Beam	A steel beam that penetrates through the building envelope to support an exterior element, such as a canopy.
Quantity Takeoff	A quantity measurement that determines the areas and lengths needed for U-value calculations. The quantities are determined using architectural drawings.
Thermal Break	A non-conductive material that interrupts a conductive heat flow path. For example, aluminum framing for glazing in cold climates typically utilizes a low conductivity material to join an exterior and interior portion of the metal framing.
Thermal Bridge	Part of the building envelope where otherwise uniform thermal resistance is changed by full or partial penetration of the thermal insulation by materials with lower thermal conductivities and/or when the interior and exterior areas of the envelope are different, such as what occurs at parapets and corners.
Thermal Modeling	The process by which the thermal performance of assemblies is determined through computer simulations utilizing heat transfer models. Assemblies can be modeled two- or three- dimensions (2D and 3D).
Thermal Performance	A broad term to describe performance indicators related to the heat transfer through an assembly. The performance indicators include thermal transmittances, effective R-values, and metrics to evaluate condensation resistance related to surface temperatures.
Thermal Zone	A grouping of the interior building spaces that experience similar heating and cooling requirements.
Total Energy Use	The amount of annual energy use of a building, including space heating/cooling, ventilation, lighting, plug loads, domestic hot water, pumps, fans etc.
Unitized Curtain Wall	A curtain-wall system that is assembled in modules that is glazed before arriving at site.
Vision Section	The section of curtain-wall or window-wall that contains transparent or translucent elements.
Window to Wall Ratio/ Glazing Ratio	The percentage of glazing to the wall area of a building.
Window-wall	A factory built modular façade system installed from floor to ceiling that is supported by the floor slab. This could include a vision and a spandrel section.
Whole Building Energy Use	The amount of energy a building uses, typically on a yearly basis. This includes, but is not limited to, energy for space and ventilation heating and cooling, domestic hot water heating, lighting, miscellaneous electrical loads and auxiliary HVAC equipment such as pumps and fans.

3. METHODOLOGY FOR DETERMINING THERMAL PERFORMANCE OF BUILDING ENVELOPE ASSEMBLIES

The performance data prepared for this guide was determined by following the same methodology as 1365-RP and using the same 3D thermal modeling package that was extensively calibrated and validated as part of that work. Detailed information on the background of the methodology can be found in the final report for 1365-RP. What follows is an outline of the important points of that methodology.

In determining the thermal performance of the building envelope that includes thermal bridging, a basic distinction must be made between two types of opaque building components, clear field assemblies and interface details, examples of which are shown in Figures 2 and 3 respectively.

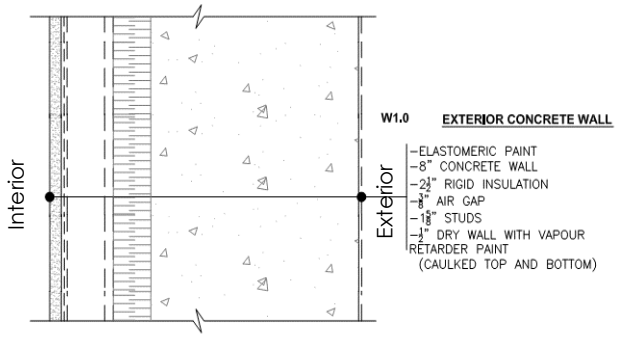

Figure 2: An example of a clear field assembly drawing

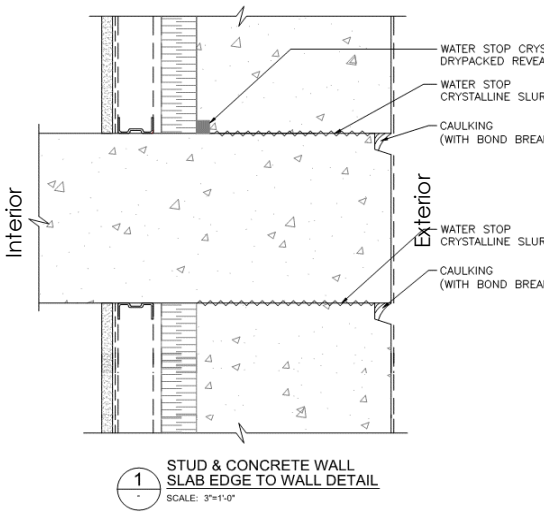

Figure 3: An example of an envelope interface detail drawing

Clear field assemblies are wall, roof or floor assemblies that include all the components that make up a wall, including structural framing. These are typically found in the architectural drawings in the wall/roof/floor schedules. Clear field assemblies can contain thermal bridges from uniformly distributed secondary structural components which are needed for the wall to resist loads, but do not include thermal bridges related to intersections to the primary structure or between assemblies. Examples of components included in clear field assemblies are brick ties, girts that support cladding and/or studs.

Interface details are changes in construction or geometry that interrupt the uniformity of the clear field. These are typically found in the detail sections in architectural drawings. These include slab edges, opaque to glazing or wall transitions, parapets, corners and through wall penetrations.

Determining the impact of heat flows through the clear field and through interface details is necessary to accurately assess the thermal transmittance of building envelope assemblies.

A Note on Glazing

Glazing in buildings can have an incredibly large influence on building energy use, especially in designs that have high window to wall ratios. Glazing portions of the building envelope are often dealt with separately from the opaque elements because of the additional effects of solar heat gain. Thermal analysis and testing of glazing systems in North America typically follow standards by the National Fenestration Rating Council (Mitchell, et al., Rev 2013). Following this guide to determine the thermal performance of opaque elements and NFRC standards for glazing is compatible. While the thermal performance of glazing assemblies can affect the thermal resistance of adjacent wall or roof assemblies, the heat loss is accounted for through the **window to wall transition** thermal values described later in this guide.

3.1 DETERMINING THERMAL PERFORMANCE OF CLEAR FIELD ASSEMBLIES

The thermal performance of clear field assemblies can be determined through calculation, modeling or physical testing. Typically this takes the form of a U-value or effective R-value.

- The **ASHRAE Handbook of Fundamentals** (ASHRAE, 2013) provides several methods to determine clear field U-values using hand calculations. These hand calculations are meant for simple assemblies with only thermal bridges in one or two dimensions. These methods are described in more detail in the Handbook of Fundamentals.
- For assemblies where the 2D heat flow paths can influence each other and are more complex than appropriate for hand calculations, then 2D thermal modeling can be utilized to approximate the thermal performance of building envelope details. Software for this type of modeling (such as **THERM**, (Mitchell, et al., Rev 2013) is widely available and used in industry for two-dimensional thermal modeling. Approximations need to be made for components that are not continuous or occur in three dimensions, such as creating an equivalent thermal conductivity. These approximations can be sufficient in many cases for determining the expected thermal transmittance of opaque assemblies, but cannot be used to determine surface temperatures.
- For complex geometries and configurations where 2D heat flow assumptions are no longer valid, then 3D modeling or physical testing is often necessary for more accurate approximations of thermal performance. As stated previously, the clear field and detail values prepared for this guide were determined through 3D modeling.

It is typically only necessary to model or test a clear wall assembly if it is a new or unique design when information is not available. The construction industry has a wide variety of resources accessible to designers which contain thermal performance values for many types of clear field assemblies. Clear field assemblies analyzed for this guide are discussed in section 4.1 with additional information and thermal performance values provided in Appendices A and B. Other sources of information beyond this guide are discussed further in section 4.3.

3.2 DETERMINING THERMAL PERFORMANCE OF INTERFACE DETAILS – AREA WEIGHTED APPROACH

Area weighted calculations are commonly used to calculate U-values or effective R-values of the combined effect of assemblies and interface details. Typically, this is done by weighting the heat flow through the materials by the area they take up. While this can be applied easily to simple clear field assemblies, the question that arises when applied to interface details is **what is the area of a thermal bridge?**

Using only the physical area of a thermal bridge assumes that the heat flow paths through an interface detail are one-dimensional and parallel. Unfortunately, this is rarely true, and highly conductive building components create lateral heat flows to other components in three dimensions that are not accounted for in basic parallel flow assumptions. A steel shelf angle holding up a brick wall may seem small from the outside, but it is connected to many other components behind the brick and heat can easily flow around the insulation.

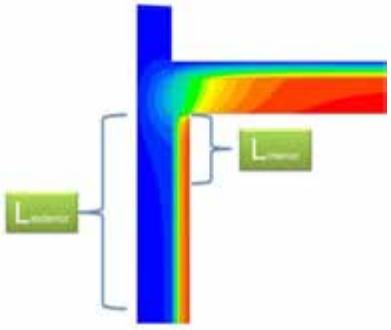

Figure 4: Areas of influence of a parapet detail differ from the interior and exterior of the wall

To improve simple parallel path assumptions, an area of influence of a thermal bridge has been utilized in the past. This requires finding out the distance where the heat flow through the assembly is no longer affected by the thermal bridge. The heat flow through this area is then used as a combined U-value for the wall and the thermal bridge. However, determining areas of influence of many common thermal bridges is incredibly difficult. Lateral heat flows caused by conductive elements allow heat to be transferred in multiple directions for large distances. This can create large differences in areas of influence depending on whether you are looking from inside or outside.

Using the area weighted approach can produce reasonable results when analyzing structures with low thermal conductive structural members, such as some wood-frame configurations. However, this approach can be complicated and difficult to use in practice for detailed analysis of the heat transfer through building envelopes constructed with moderate to highly conductive materials like concrete, steel and aluminum.

3.3 DETERMINING THERMAL PERFORMANCE OF INTERFACE DETAILS UTILIZING LINEAR TRANSMITTANCES

Linear and point transmittances can simplify things by ignoring the area of thermal bridges altogether. With this approach, the heat flow through the interface detail assembly is compared with and without the thermal bridge, and the difference in heat flow is related to the detail as heat flow per a linear length or as a point heat flow.

To illustrate how this works, let's apply this method to an exterior insulated steel stud wall with a cantilevered balcony slab that is a direct extension of the concrete structural floor slab, as shown in Figure 5:

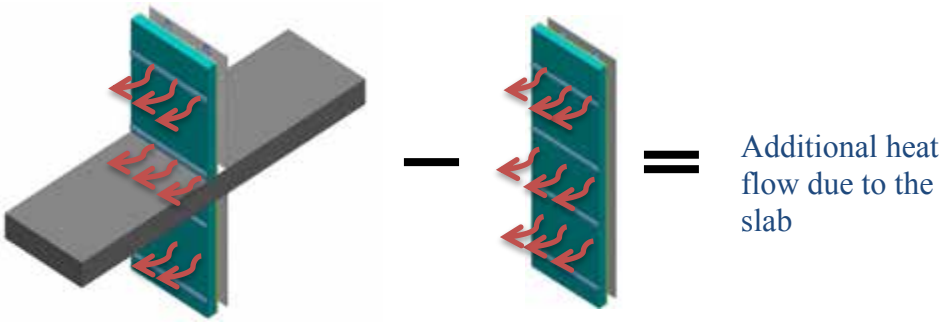

Figure 5: Determining linear transmittance for a slab

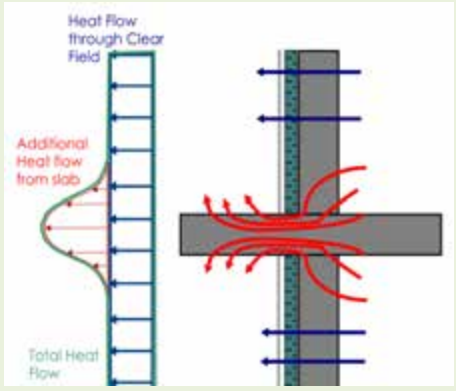
First, the heat flow through the interface detail assembly with the slab is determined. Next, the heat flow is determined through the assembly as if the slab was not there (you may recognize this as the clear field assembly). Since the clear field does not contain the slab, which is a large

thermal bridge, the amount of heat flow is less. The difference in overall heat flow between the two assemblies is the extra amount caused by the balcony/floor slab bypassing the thermal insulation. Dividing by the assembly width (linear length of the slab edge) creates the linear transmittance of the slab, which is a heat flow per linear length.

With linear transmittances, the extra heat flow prescribed to the floor slab is not dependent on the area of the thermal bridge, but only by the linear length (width) of the balcony slab. A point transmittance is similar in concept, but is a single point of additional heat flow, not dependent on area or length. Since the linear and point transmittances are separate from the clear field, they can be directly compared to assist in determining the most appropriate details for a building. Calculated linear and point transmittances along with the clear field transmittance can be used to determine the overall heat flow for any size of wall or roof that use those components.

As with the clear field assemblies, there are additional information sources that have thermal performance values for common linear and point transmittances, albeit they are not as widely available. The performance catalogue in this guide, discussed in section 4, consolidates several of the linear and point transmittance as determined using the method set forth in 1365-RP. However, there are other sources available which are detailed further in section 4.3.

Superimposing Heat Flows



Another way of looking at the basic concept of linear transmittance is by superimposing the heat flows from the full assembly, with an interface detail, and the clear field assembly, without the interface detail, over top of each other.

From this figure you can visualize the lateral heat flows to the path of least resistance through the interface detail assembly (i.e. through the slab). This results in a higher heat flow at the slab compared to if it was only the clear field. Far away enough from the slab and the heat flow reaches the same level as in the clear field. By subtracting the clear field from the total interface detail assembly leaves the additional heat flow from just the slab, from which we get the linear transmittance.

3.4 DETERMINING OVERALL THERMAL PERFORMANCE

The thermal performance values of each of the envelope components can be used to calculate an overall thermal transmittance (U-value) for building envelope assemblies that include thermal bridging. Summarizing the approach so far, the thermal transmittances used in the calculations comprise of three separate categories:

- **Clear field transmittance** is the heat flow from the wall, floor or roof assembly. This transmittance includes the effects of uniformly distributed thermal bridging components, like brick ties, structural framing like studs, and structural cladding attachments that would not be practical to account for on an individual basis. The clear field transmittance is a heat flow per area, and is represented by a U-value denoted as the clear field **(U_o)**.

- **Linear transmittance** is the additional heat flow caused by details that are linear. This includes slab edges, corners, parapets, and transitions between assemblies. The linear transmittance is a heat flow per length, and is represented by psi **(Ψ)**.

- **Point transmittance** is the heat flow caused by thermal bridges that occur only at single, infrequent locations. This includes building components such as structural beam penetrations and intersections between linear details. The point transmittance is a single additive amount of heat, represented by chi **(χ)**.

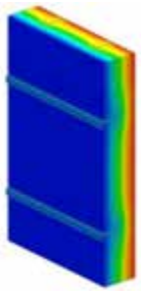


Figure 6: Example clear field assembly

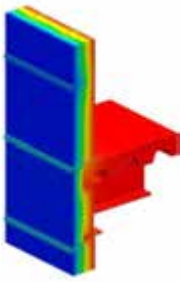

Figure 7: Example linear transmittance of a floor slab detail

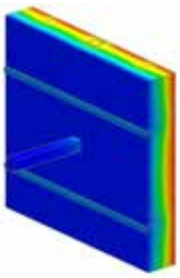

Figure 8: Example point transmittance of a beam penetration detail

The overall U-value for any building envelope section is a simple addition and multiplication process. In straightforward terms this amounts to:

$$\text{Total Heat flow per area through the overall assembly} = \frac{\text{Heat flow through linear transmittances} + \text{Heat flow through point transmittances}}{\text{Total Area of assembly}} + \text{Heat flow per area through clear field assembly}$$

Or, in mathematical terms:

$$U_T = \frac{\Sigma(\Psi \cdot L) + \Sigma(\chi)}{A_{Total}} + U_o$$

Where:

U_T = total effective assembly thermal transmittance (Btu/hr·ft^2·^{o}F or W/m^{2}K)

U_o = clear field thermal transmittance (Btu/hr·ft^2·^{o}F or W/m^{2}K)

A_{total} = the total opaque wall area (ft^2 or m^2)

Ψ = heat flow from linear thermal bridge (Btu/hr·ft ^{o}F or W/mK)

L = length of linear thermal bridge, i.e. slab width (ft or m)

χ = heat flow from point thermal bridge (Btu/hr· ^{o}F or W/K)

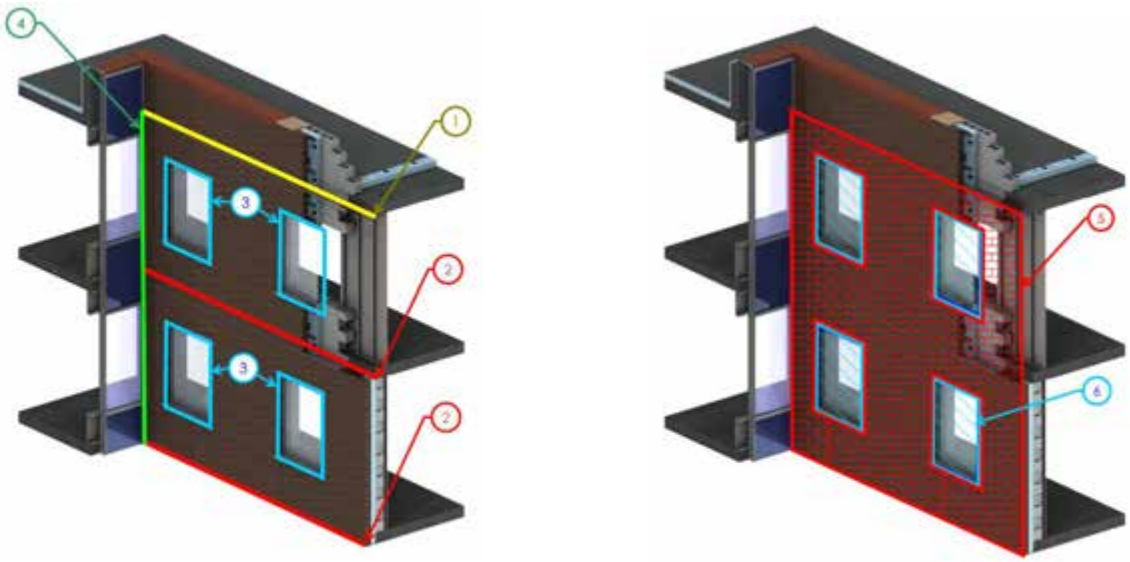
There are multiple types and quantities of linear and point transmittances, but they are all added to the clear field heat flow to get the overall heat flow of an area of the building envelope. The length for the linear transmittance depends on the detail. For example, the length used in the calculation for a floor slab bypassing the thermal insulation could be the width of the building perimeter, if this slab detail occurs around the whole façade of the building. Alternatively, a corner detail length could be the height of the building envelope. By finding the heat flows separately, each component can be evaluated to find their relative contribution to the overall heat flow.

The overall U-value for a building section can be found as long as the thermal performance values for the clear field, linear and point transmittances are known along with the quantities determined by architectural drawings. These transmittances can be calculated using the procedures put forth in 1365-RP; however, modeling every detail on a project would be impractical. As such, this guide provides an extensive catalogue of assemblies where the thermal performance values have already been calculated for designers. This catalogue is discussed in more detail in section 4.

3.4.1 FINDING LENGTH AND AREA TAKEOFFS

Determining the overall U-value of a building section using length and area takeoffs can be fairly straight forward i.e. slab lengths along the face of a building, or corner heights; however, there are some nuances when it comes to certain interface details. The following example shows the lengths and areas for a simple brick wall section.

Example: The overall opaque wall U-value is required for the brick wall section of a building that is adjacent to a curtain-wall system. From the analysis, the designer has determined that the brick wall section contains a parapet, slab, wall to window transition and corner detail. The designer finds the thermal performance values for the brick clear wall assembly and the linear transmittances for the interface details in a thermal performance catalogue. The length and area takeoffs are shown in Figure 9.



1. Parapet Length
2. Slab Lengths
3. Wall to Window Transition Lengths
4. Corner Length
5. Opaque Brick Wall Area
6. Glazing Area

Figure 9: Example building length and area takeoffs

The glazing area above shows the differences between the glazing and opaque wall areas; however, glazing is not included with the opaque wall U-value calculations.

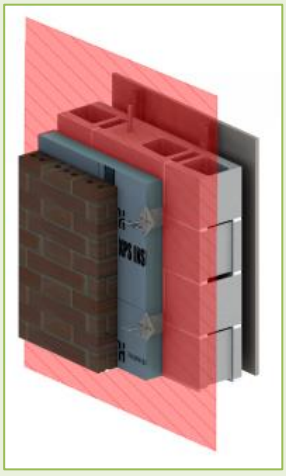
Once the thermal performance values of the clear wall and interface details are known, and the lengths and areas found, the overall U-value for the brick wall can be determined:

$$U_{overall} = \frac{\Psi_{parapet} \cdot L_{parapet} + \Psi_{slab} \cdot L_{slab} + \Psi_{transition} \cdot L_{transition} + \Psi_{corner} \cdot L_{corner}}{A_{Opaque\ Brick\ Wall\ Area}} + U_{brick\ clear\ wall}$$

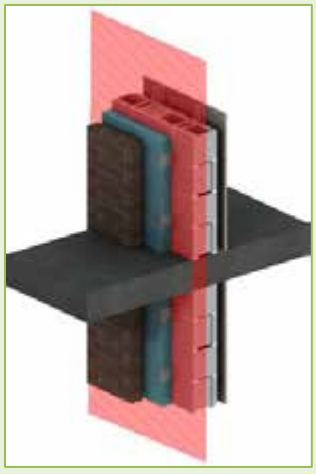
For some of the interface details, there are additional considerations as to where to assign the extra heat flow. In the above example, the brick wall was connected to a curtain-wall system with spandrel. The corner interface detail is connected to both assemblies, and in the above calculation, the heat flow through the corner was assigned entirely to the brick wall. Alternatively, it could have been assigned entirely to the brick wall or the curtain-wall or split evenly between the two. It is up to the designer to decide how they wish to divide up the building U-values. This matters mostly for energy models as the heat flow through each envelope section gets assigned to a particular building thermal zone. This same concept applies to a parapet as it acts as a corner between the roof and the walls. However, it may not matter if the heat flow through the parapet is assigned to the wall or to the roof as both are connected to the same interior thermal zone. For wall to glazing transitions, the additional heat flow is assigned to the wall and not the glazing, thereby NFRC standards can be utilized for determining the U-value of glazing separately (Mitchell, et al., Rev 2013). When there are slabs, the clear wall area includes the projected area of slab edges, including balcony slabs.

Length and Area Takeoffs and the Plane of Heat Transfer

The plane of heat transfer for the building envelope is a theoretical projected area between the interior and exterior conditions through which heat flows. In order for there to be a heat loss or heat gain through the building envelope, energy must pass through this plane of heat transfer. A building assembly may have some elaborate features that extend out past the building envelope; however, all that is important for thermal performance is where the heat flow passes the plane of heat transfer into or out of the building.



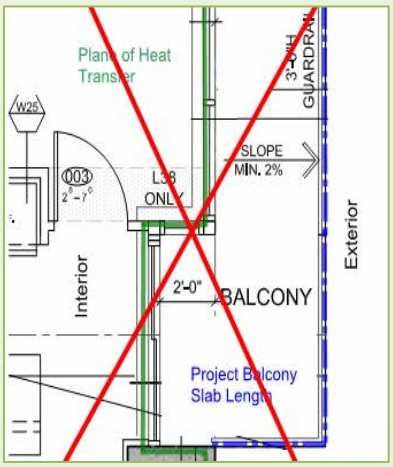
Plane of heat transfer through a wall



Plane of heat transfer through a projected balcony

For flat objects (i.e. walls) the plane of heat transfer is easy to visualize. With projections, such as balcony slabs, it may not be immediately intuitive where the plane is; however, since it is only important where the heat flows through the building envelope, the plane of heat transfer is the same as the flat wall. The areas of details that project out of the building envelope are not necessary for calculations. The heat flows as a result of these projections are accounted for in the linear transmittance of that detail. If there was a significant difference in heat flow as a result of the distance of the projection (i.e. a balcony that projected 1m from the wall compared to one that projects 3m from the wall) then there would be a different linear transmittance value. However, it should be noted that for the details in this guide, the projected distances of the balconies had minimal effect on the linear transmittance values for the projected slabs. When determining length takeoffs for projections for use in overall thermal performance calculations, only the lengths along the plane of heat transfer should be used. For example, for balcony slabs, use the length where the balcony intersects the wall and NOT the outside perimeter length of the balcony. Similarly for parapets, the length around the parapet is not needed.

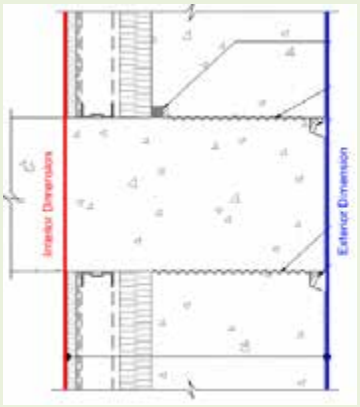
Correct Projected Balcony Slab Length for Calculations



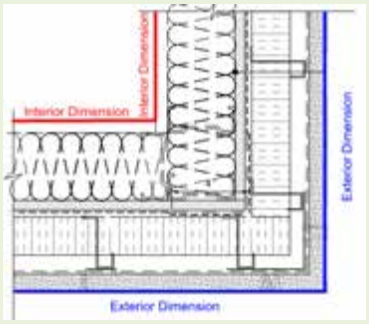
Incorrect Project Balcony Slab Length for Calculations

A Note on Length and Area Takeoffs for the Detail Oriented

The lengths for linear transmittances are usually easiest to find using building elevation drawings, which are exterior dimensions. Some further investigation for take offs may be required, such as looking at interior section views, when a detail is obstructed by other building features (i.e. the cladding). However, getting the takeoff lengths and areas from the exterior or the interior dimensions will result in slight differences on the overall U-value, depending on how the linear transmittances are reported. The way in which the linear transmittances are reported for this guide are such that if mixed interior and exterior dimensions are used, then the U-values will be slightly more conservative. This is typically not a concern as the differences from mixing interior and exterior dimensions are minor and there are already inherent discrepancies between architectural drawings and what is built on site. The following information is for those designers who want that extra level of precision.



Interior/Exterior Dimensions for a single plane assembly



Interior/Exterior Dimensions for a multi-plane assembly

The formulation of linear transmittance values is dependent on the area of the plane of heat transfer through the modeled assembly. In most cases, figuring out the plane of heat transfer is straight forward. For straight building objects, like a wall, heat transfer between the interior and the exterior is in a single plane, through the wall, so the interior and exterior dimensions will be the same. However, for an angled detail like an outside corner, the heat transfer is in more than one plane and the interior and exterior dimensions are different.

Remembering that the linear transmittance is an extra heat flow caused by an interference detail compared to the clear field heat flow, the calculation of Ψ is dependent on the area of the clear field used in the calculation. Due to conservation of energy, the heat flow in equals the heat flow out, and the overall amount is the same regardless of the dimension chosen. However, assigning the degree of that heat flow between the clear field and the detail is where the issue lies.

Example: *For the outside corner shown above, if the clear field area is assumed to be the interior dimensions, which are smaller, then the heat flow contribution from the clear field will be smaller and the rest is assigned to the corner. If the clear field is assumed to be the exterior dimensions, then the heat flow contribution through the clear field will be larger, with a smaller amount assigned to the corner. This results in a smaller or larger calculated linear transmittance depending on the dimension used, however, the resultant heat flow* ***should be identical*** *when the correct lengths are used in U-value calculations.*

If a linear transmittance for a multi-plane assembly was determined using interior dimensions, and the takeoff lengths for the detail use exterior dimensions, then the heat flow through that detail will be slightly overestimated for outside corners and parapets since the exterior dimensions are typically larger than the interior dimensions. This overestimation is the same magnitude as using exterior dimensions for any U-value calculation and is equal to the clear field U-value multiplied by the difference in area between the interior and exterior dimensions.

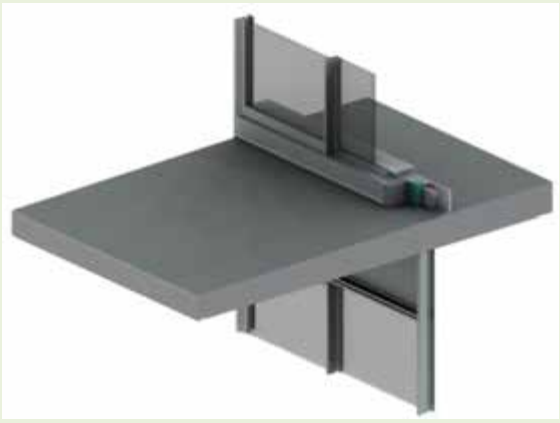
To be most precise, the locations for the takeoffs in multi-plane assemblies should match with how the linear transmittance is reported. Alternatively, the difference between the interior and exterior dimensions on either side of the corner is actually just the wall thickness. The heat flow through a section of clear wall the size of the wall thickness could be subtracted from the overall heat flow in order to remove the overestimation. However, it should be noted that multi-plane assemblies are typically parapets and corners and this may only be a consideration in smaller buildings (less than four storeys) if the parapet or corner details have a high linear transmittance.

ISO 14683 (CEN, 2007) reports multiple linear transmittances for interface details based on different dimensioning systems. While this is thorough, the intent of the methodology in ASHRAE 1365-RP (Morrison Hershfield Ltd, 2011) was to simplify calculations; therefore only one transmittance value, reported from interior dimensions, is given per insulation level per interface detail in this guide. Differences in exterior and interior dimensions with linear transmittances are further discussed in (Janssens, et al., 2007).

Dealing with Floor to Ceiling Glazing

An issue that arises when determining lengths and areas for heat loss calculations is glazing that spans floor to ceiling. In the methodology presented in the guide, glazing and opaque envelope areas are accounted for separately when calculating heat loss, with additional heat loss from interface details added to the opaque areas. Thus, a situation arises when there is floor to ceiling glazing from slab to slab and there is no discernible opaque clear wall area.

In calculating the linear transmittance of a detail, the value is based on an additive amount of heat flow from the detail to the clear field assembly associated with that detail. For example, the linear transmittance of a balcony going through an interior insulated concrete wall is the difference in heat loss between the same sized assembly with and without the balcony there. In the calculations for the overall U-value, we prescribe an area to the total assembly, and a portion of that assembly is interrupted by details. We calculate the total U-value by adding the heat loss associated with thermal bridging at interface details to the clear field heat loss. However, with floor to ceiling glazing, the slab is flanked by glazing assemblies, which presents a situation where there is not an obvious clear wall thermal transmittance.



Assembly without an opaque clear field

The linear transmittances for the details in section 8.0 Balcones and Doors in Appendix A and B were calculated by subtracting out the glazing heat flow above and below the slab. There are many possible wall assemblies that can be adjacent to the balcony sliding door and balcony slab.

Using the linear transmittance values directly and including the areas of the slabs between the floor to ceiling glazing as clear field area may result in a more conservative overall U-value since the clear field area is being over accounted for. The results for the balcony details presented in Appendix B are presented in a few alternative formats than for the other interface details. The reason for this deviation is to allow the data to be applied broadly to many variations and to make the information easy and flexible to use. Balconies can be factored into U-value calculations using the following approaches.

1) U-value Approach

U-values of the opaque area of balconies are presented in the thermal performance data sheets in Appendix B. These U-values can be treated as its own wall assembly, or averaged into the adjacent assembly using an area weighted calculation. If using area weighted calculations, then the total projected area of the slabs need to be determined separately from the area of the adjacent walls.

2) Linear Transmittance without Area

Linear transmittances are provided in section 8.0 of Appendix B for balconies where it has been assumed there is no clear field. These values are essential a delta U that can be added to any adjacent wall assembly. However, in the calculations the clear wall heat loss should not include the area of the slabs. In the U-value equation given in section 1.25, the clear field U_o term should be corrected by multiplying it by the following factor, $A_{adjacent\ wall} / A_{total}$, where the area of the adjacent wall is the total area minus the area over the slab edge at the floor the floor glazing.

In each assembly where choosing one of these approaches in necessary, it has been indicated in the thermal performance results sheets in Appendix B.

4. SUMMARY OF THE THERMAL PERFORMANCE CATALOGUE

4.1 CATALOGUE BREAKDOWN

The catalogue prepared for this guide contains extensive thermal performance information on numerous common details, along with details intended to mitigate thermal bridging, including some emerging technologies and products. This data was calculated using the methodology from 1365-RP (including air films), as summarized in Section 1.2. The catalogue also contains thermal performance information from ASHRAE 1365-RP, along with other details previously analyzed by Morrison Hershfield Ltd. The catalogue is broken into two main sections:

- **Appendix A** contains an overview of the assemblies and interface details. This includes isometric drawings, dimensions and material properties.
- **Appendix B** contains the thermal performance information. This includes clear field, linear and point transmittance values, where applicable, along with overall U-values for the modeled assembly sizes and temperature indices.

The catalogue has been organized first by construction type as follows:

1. Window-wall
2. Conventional Curtain-wall
3. Unitized Curtain-wall
4. High Performance Curtain-wall
5. Steel-Framed Construction
6. Metal Buildings
7. Concrete Construction
8. Woof-Frame and Timber Construction
9. Doors and Balconies
10. Roofs

Within each construction type category the assemblies have been organized by transmittance type. Table 1 summarizes the types of transmittances that are featured in the catalogue. A more detailed discussion on the catalogue information is given at the beginning of Appendices A and B.

Table 4: Transmittance Type Sub-Categories

Detail Type	Detail Sub-Category
Clear Field Assemblies	wall, roof, spandrel section, cladding attachment method, insulation strategy
At-grade Transitions	exposed, exterior insulated, wood
Floor and Balcony Slab Transitions	exposed, under-insulated, shelf angle, manufactured thermal break, exterior insulated, wood
Glazing Transitions	un-insulated, misaligned insulation, efficiently aligned
Interior Wall Intersections	exposed, exterior insulated
Corners	interior insulated, exterior insulated
Parapets	exposed, under-insulated, manufactured thermal break, exterior insulated, wood
Roofs	penetrations, transitions
Structural Beams	through beam, manufactured thermal break

Many projects have architectural packages that can contain an overwhelming number of details (150+), and accounting for every interface detail can be time consuming and impractical. An intent of providing a catalogue is that by becoming familiar with the assemblies and interface details included here, designers will be able to estimate when interface details will have an impact on the building envelope and when similar details can be grouped together. As with any estimating process, good judgment will always be required.

4.2 THERMAL PERFORMANCE CATEGORIES

Previous work has been done (Janssens et al. 2007, BETB Guide V1 2014) to categorize thermal transmittances to help designers compare details and set expectations for details that have not been explicitly modeled. Previous versions of the BETB Guide categorized thermal bridges as “efficient” based on what was considered good for industry practice circa 2010. These categories were revisited in light of what level of thermal bridging mitigation is required to meet low TEDI and net-zero ready standards as outlined in the Low TEDI Guide (Morrison Hershfield Ltd., 2018).

Establishing expectations and categories for thermal transmittances has several uses:

1. Not every common interface detail has been evaluated with publically readily available data. Ranges help with estimating the order of magnitude of transmittance values for interface details that are not directly covered by the BETB catalogue, without the need for further evaluation.
2. Some project specific interface details will still require further evaluation. The ranges for transmittances help set expectations for evaluating other interface details.
3. Ratings can establish default assumptions and/or set prescriptive requirements for the inclusion of interface details in codes and energy standards.
4. Similarly, ratings can establish values for the baseline buildings of the performance compliance paths in energy standards and/or performance rating programs (for example LEED).

5. Ranges for interface details can help set thermal performance targets for the building envelope early in design. When included with a preliminary energy model (before details are even chosen) the ranges can show what can be expected from the building envelope based on a given construction type.

4.2.1 PERFORMANCE CATEGORIES FOR LINEAR TRANSMITTANCES

All the linear transmittances in the BETB catalogue have been assigned a category, from poor to thermal bridge free, based on the thermal transmittance ranges outlined in Table 2.

Table 2: Performance Categories and Default Linear Transmittances

Performance Category	Linear Transmittance		Description and Examples	
	Btu hr ft F	**W** m K		
Thermal Bridge Free	<0.006	<0.01		**Fully exterior insulated and fully aligned thermal insulation between components** Examples: exterior insulated walls at intermediate floors.
				**Well aligned glazing without conductive bypasses and minimal thermal bridging in clear wall** Examples: wall insulation is aligned with the glazing thermal break and insulation is provided around the perimeter of the window framing. Flashing does not bypass the thermal break. Low conductive window frames and/or insulation outboard of the window frame.
Efficient	0.058	0.1		**Fully insulated with only small conductive bypasses** Examples: split insulated wall at intermediate floor, exterior insulated walls at intermediate floors with additional cladding attachment at floor.
				**Well aligned glazing without conductive bypasses** Examples: wall insulation is aligned with the glazing thermal break. Flashing does not bypass the thermal break.
Mitigated	0.12	0.2		**Thermally broken connections with good aliment of adjacent thermal insulation** Examples: large structural thermal breaks where the thickness of the thermal break is similar in size as the thermal insulation.
				**Well aligned glazing with minimal conductive bypasses** Examples: the glazing thermal break is within the wall insulation, but there is thermal bridging related to conductive window frames, flashing partially bypasses the exterior insulation, and un-insulated window perimeters.

Performance Category	Linear Transmittance		Description and Examples	
	Btu hr ft F	**W** m K		
Moderate	0.17	0.3		**Thermally broken and intermittent structural connections** Examples: structural thermal breaks where the insulation and break do not have similar thickness or thermal resistance, and stand-off shelf angles.
				**Misaligned glazing and minor conductive bypasses** Examples: wall insulation is not alligned with the window thermal break and the exterior insulation is completely bypassed by flashing or a metal closure.
Regular - Poor	>0.17	>0.3		**Un-insulated, continuous structural connections, and major conductive bypasses** Examples: un-insulated balconies, exposed concrete floor slabs, and shelf angles attached directly to the edge of the floor.
				**Un-insulated and conductive bypasses** Examples: metal closures connected to structural framing. Un-insulated concrete opening (wall insulation does not extend into the window opening).

4.2.2 PERFORMANCE CATEGORIES FOR POINT TRANSMITTANCES

The impact of point thermal bridges depends on the spacing between, or density (number of components per area) of, the component that bypasses the thermal insulation. Point transmittances can be utilized for components that do not have a large cross-sectional area but are closely spaced together, such as fasteners, or for components that have a large cross section area but are not spaced far apart, such as beams. The impact each thermal bridge has on the overall thermal transmittance depends on the point transmittance multiplied by the density of the component.

Recognizing that many closely spaced components with low point transmittances can have the same impact as a large beam with a higher point transmittance leads to different expectations for the thermal quality of point transmittances, based on the component density. Performance categories for point transmittances can be divided into two based on the component density as:

Class 1 – Closely Spaced Point Thermal Bridges

Class 2 – Dispersed Point Thermal Bridges

The component density, examples, and performance for each category follow below.

PERFORMANCE CATEGORIES FOR CLOSELY SPACED POINT THERMAL BRIDGES – CLASS 1

Fasteners through continuous insulation and brackets, ties, and clips for cladding attachment systems where the density of the structural element is greater than 2 per square meter (0.185 per ft^2) are in this category.

For example, a bracket that is part of a cladding attachment system that is spaced at 406 mm (16") o.c. horizontally and 609 mm (24") o.c. vertically has a density of 4 brackets per m^2 [1 bracket/(0.406*0.609)]. Fasteners for mechanically attached conventional roof assemblies have fastener densities in the order of magnitude of 3 to 7 fasteners/m^2 (0.25 to 0.65 fasteners/ft^2).

Thermal transmittance ranges for closely spaced point transmittances are outlined in Table 3.

Table 3: Performance Categories and Default Point Transmittances for Closely Spaced Point Thermal Bridges

Performance Category	Point Transmittance		Description and Examples	
	Btu / hr F	W / K		
Thermal Bridge Free	<0.004	<0.0025		**Fasteners that are exterior insulated** Example: fastners that do not penetrate all the insulation layers in a convential low slope roof assemblies.
Efficient	0.026	0.015		**Brick ties or brackets with thermal bridging mitigation and moderate conductivity, fasteners that penetrate the entire insulation** Examples: fully mechanically attached conventional low slope roof assemblies, stainless steel brick ties and brackets, thermally broken steel components
Mitigated	0.09	0.05		**Thermally broken aluminum components and concrete penetrations** Examples: aluminum brackets and support with thermal breaks, concrete embedment with insualted perimeter

Performance Category	Point Transmittance		Description and Examples	
	Btu hr F	**W** K		
Regular - Poor	>0.09	>0.05		**Unmitigated metal penetrations** Examples: steel knife edges

PERFORMANCE CATEGORIES FOR DISPERSED POINT THERMAL BRIDGES – CLASS 2

Beams, anchors, columns, and other structural elements that have a density less than 2 per square meter (0.185 per ft^2) are in this category. For example, a beam that is located at ever floor at every floor with 3 m (10') floor height and 0.9 (3') horizontal spacing has a density less than 1 beam per m^2.

Thermal transmittance ranges for dispersed point transmittances are outlined in Table 4.

Table 4: Performance Categories and Default Point Transmittances for Dispersed Point Thermal Bridges

Performance Category	Point Transmittance		Description and Examples	
	Btu hr F	**W** K		
Efficient	0.17	0.01		**Thermal break thickness is similar to the insulation thickness and the supporting structure is not steel** Examples: manufactured thermal break for a beam penetration at a concrete intermediate floor or a roof anchor on a concrete deck
Mitigated	0.43	0.25		**Thermal break thickness is similar to the insulation thickness and the supporting structure is steel** Examples: manufactured thermal break for a beam penetration at a steel intermediate floor

Performance Category	Point Transmittance		Description and Examples	
	Btu / hr F	**W** / K		
Moderate	0.86	0.5		**Thermally isolated penetrations with pads equal or greater than 50 mm (2”) and stainless-steel bolts, Insulation wrap around penetration that extends outward more than 762 mm (2.5 feet)** Examples: pad for beam penetration with stainless steel bolt connection, insulation extending down a concrete column of an insulated floor
Regular - Poor	>0.86	>0.5		**Minimal thermal isolation and uninterrupted large penetrations** Examples: thin pads or beam penetrations with steel bolted connections

4.3 OTHER SOURCES OF INFORMATION

While the catalogue provided with this guide is extensive, there are additional sources to find thermal performance data for clear field assemblies and linear and point transmittances. Here are a few examples:

- Appendix A of **ASHRAE 90.1 “Energy Standard for Buildings Except Low-Rise Residential”** (ASHRAE, 2010) contains several tables of thermal performance values for a variety of clear field constructions, including walls, roofs and floors for concrete, steel framed and wood framed constructions. The values for many of the exterior insulated structures assume continuous insulation and do not account for cladding attachments which interrupt the exterior insulation.

- **Manufacturers of proprietary systems**, such as structural cladding attachments or curtain-wall systems, often have thermal performance data of their products. Upon request they can provide designers with the information. However, be aware that different manufacturers may calculate thermal performance using various procedures, sometimes making it difficult to compare different systems appropriately. If the manufacturer does not provide a full report on their thermal performance values, it may be prudent to request further information.

- In the absence of more specific information, **ISO 14683:2007 "Thermal Bridges in Building Construction"** (CEN, 2007) provides generic linear transmittances for simplified constructions. This standard outlines the methods of calculating linear transmission used in the European standards and provides an Annex with default Ψ values for many of the common interface details. The default values are based on very basic geometric shapes representing building components, as shown in Figures 10 and 11, resulting in conservative transmittance values. For example, complex heat flow paths created by misaligned glazing thermal breaks or flashing are not captured by these values. This standard also provides multiple linear transmittances based on different dimensioning procedures. See the breakout box "A Note on Linear Length and Area Takeoffs for the Detail Oriented" in section 3.4.1 for more information.

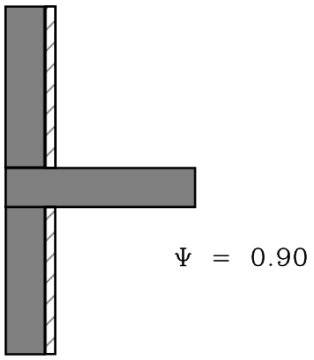


Figure 10: A reproduction of a simplified concrete wall assembly with interior insulation at through wall slab from ISO 14683:2007

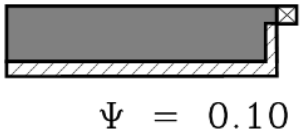

Figure 11: A reproduction of a simplified concrete wall assembly at a window jamb from ISO 14683:2007

5. EXAMPLE UTILIZATION OF THE CATALOGUE

In order to demonstrate how to utilize the catalogue in calculating overall U-values for a building, the following is a step-by-step example for a common Vancouver residential high-rise building.

Figure 0.1: Example High-Rise MURB with 60% glazing

Example: *A designer wishes to find the overall U-value for each construction type for a High-Rise Multi-unit Residential Building with 60% glazing.*

The building (illustrated in Figure 1.11) is concrete construction, with an R-11 (RSI-1.94) interior insulated concrete wall between window-wall sections. The window-wall sections include a glazed section (U-0.4, USI-2.3) and spandrel section with R-8.4 (RSI-1.48) insulated backpan. The roof contains an R-20 (RSI-3.52) insulated deck that has several beam penetrations and curbs to support an architectural feature. There are balconies, exposed concrete slab edges and window-wall bypasses. All details are typical and assumed to be contained within an architectural drawing package.

Step 1: Determine How to Divide Up the Building

In calculating building envelope U-values, first it should be known how the U-values will be used. U-values can be calculated for different areas depending on how the U-value will be utilized or level of detail required. For example, the building envelope performance could be divided by zone to find specific zone heating loads, by construction type for whole building energy analysis or kept as one value for the whole building for preliminary design. The methodology to find the different U-values are the same and it is up to the judgment of the designer on what they require.

In this example, the designer chooses to divide the building by construction type.

Step 2: Determine Clear Field Assemblies

The construction types can be determined through the clear field assemblies, which can be found from wall/roof/floor schedules, as shown in Figure 13, but also by sorting through the elevations and detail drawings. There may be multiple clear field assemblies for a single construction type (i.e. several steel stud assemblies), but if they are similar enough in thermal transmittance, with good judgment they can be combined and considered one assembly.

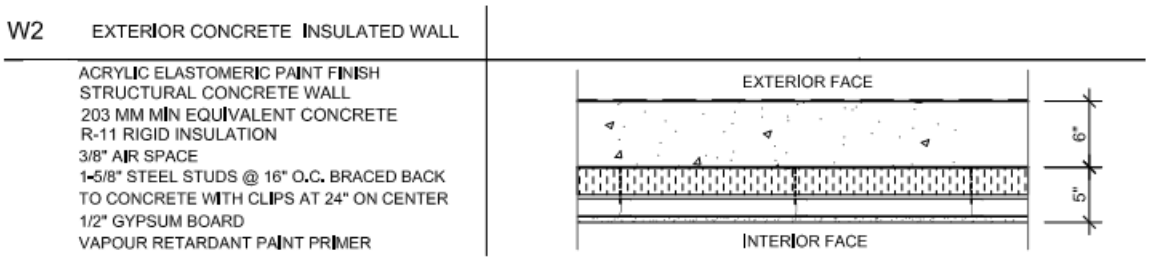

Figure 13: Example concrete clear field wall assembly

For this example, from the architectural drawings, the designer finds there are three distinct construction types in the wall and roof schedules: Concrete Wall, Concrete Roof and Window-wall Spandrel.

Step 3: Determine Linear and Point Details

After determining the clear field assemblies, the types of linear and point details need to be found. In architectural drawings, these can be found through elevations, plans and detail drawings, as shown in Figures 14 and 15.

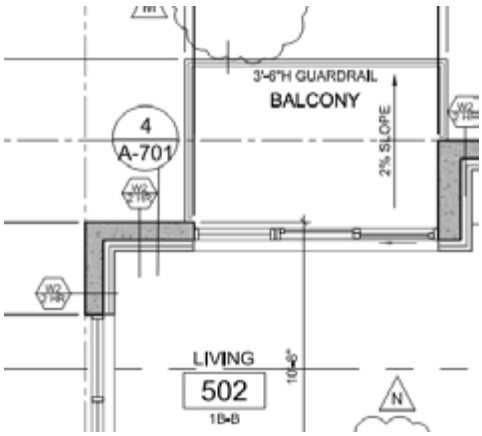

Figure 14: Exposed Floor Slab in Plan 4/A701

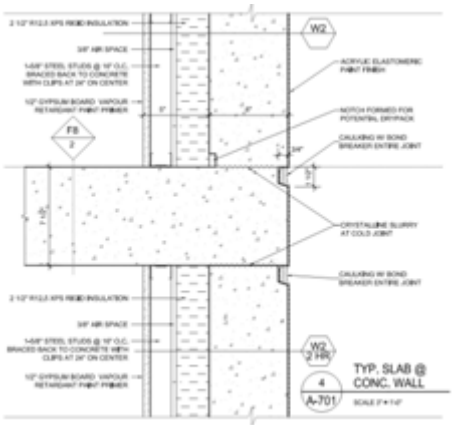

Figure 15: Exposed Floor Slab detail 4/A701

When dividing by construction type, the interface details can also be divided in the same way and can be assigned to specific clear field assemblies. For each clear field assembly there will be a set of linear and/or point details associated with it. For transitions between different clear field assemblies (such as a parapet transition between wall and roof) it is up to the designer to choose which assembly to assign the heat loss to.

For this example, an isometric floor plan is given in Figure 16. From the architectural drawings, the designer determines there are several standard details and assigns them to the concrete wall, the window-wall spandrel or the roof. In this case, the designer assigns the parapets to the walls.

In the drawings, the designer finds there are only balcony slabs at the spandrel sections. The transmittance types are summarized in Table 3. For the simplicity of this example, other miscellaneous details have been omitted.

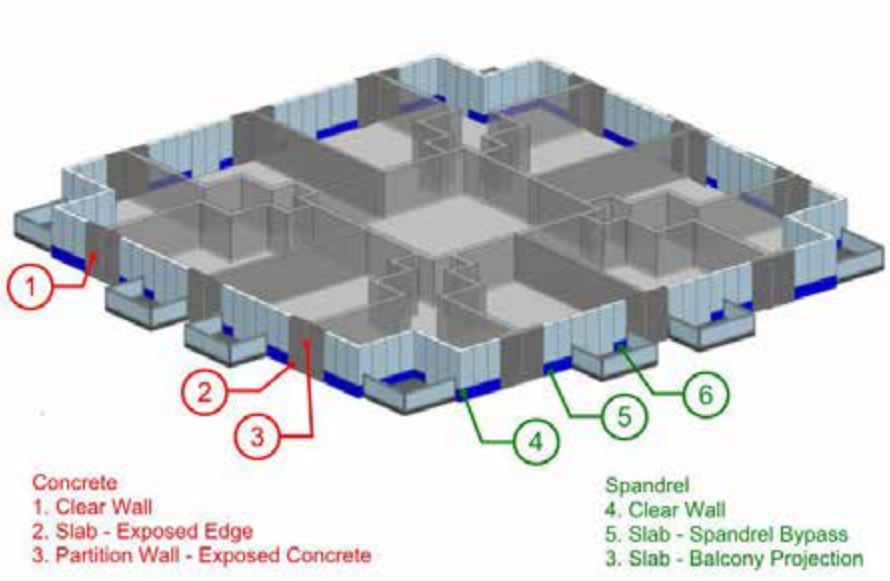

Figure 16: Example building typical floor plan

Table 3: Summary of Steps 1-3 for example building

Step 1-2	Step 3
Transmittance Type	
Concrete Wall	Clear Field – Concrete Wall
	Parapet – Exposed Concrete
	Slab - Exposed Concrete Edge
	Slab - At Grade Transition
	Partition Wall - Exposed Concrete
Window-wall Spandrel	Clear Field – Spandrel
	Parapet – Partially insulated by Spandrel
	Slab – Spandrel Bypass
	Slab – Spandrel with Balcony projection
	Slab - At Grade Transition
Roof	Clear Field – Roof
	Curb – Uninsulated
	Point Penetrations – Structural Beams

Step 4: Determine Area and Length Takeoffs

With the types of transmittances (clear field, linear and point) found, the area, lengths and number of instances should be determined. Information on takeoffs is given in section 3.4.1. Areas for the clear field can typically be easiest to determine from elevation drawings. Lengths for slabs, parapets and other horizontal linear details can be found through plans, while lengths for vertical linear details (such as corners) can be found in the elevations. An example takeoff for slab edges is shown in Figure 17.

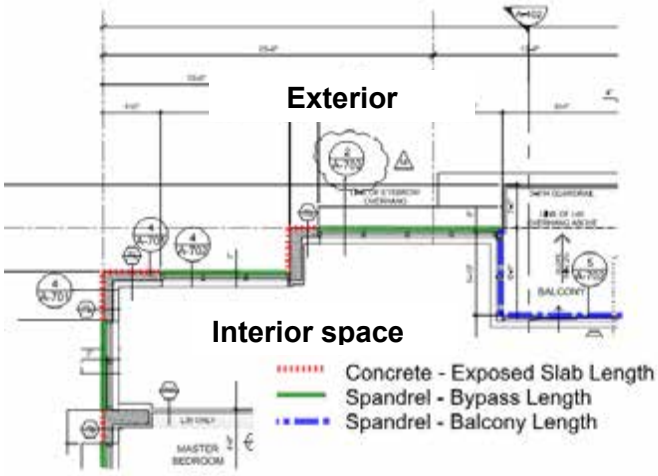

Figure 17: Example slab length takeoff

Using the floor plans and elevations, the designer determines the appropriate takeoffs for each detail they determined in Table 3. Using the elevations, the areas of the clear fields (including areas over the slab edges) are found. The slab edge lengths for a single floor are calculated, and then are multiplied by the amount of similar floors in the building. Each of the partition walls are found to extend the height of the building. The parapet lengths and curb lengths and number of beam penetrations are found using the roof plan and the at-grade transitions are found using the ground floor plan. Takeoff areas and lengths for this example are given in Table 4.

Step 5: Determine Clear Field, Linear and Point Transmittances

Thermal performance data for clear field, linear and point details can be found in the catalogue provided with this guide, or through other sources (outlined in section 4.3). The project specific interface details can be matched up with the catalogue details in Appendix A and the thermal values are given in Appendix B. If a specific project detail cannot be found in the catalogue, judgment will be required to estimate the thermal performance by comparing similar details or by using the ranges in section 4.2. If that cannot be done with certainty, then further modeling may be necessary.

For this example, the designer matches as many clear field assemblies and interface details to the catalogue as they can. The designer first reviews the database summary at thermalenvelope.ca, then narrows down to the specific details. The designer finds the following:

- *For the concrete wall clear field and interface details, the designer finds appropriate matching details in Appendix A.6 – Mass Walls and the thermal values for those details in Appendix B.6, except for the at-grade transition.*
- *The designer finds an appropriate linear transmittance for the concrete at-grade transition in ISO 14863.*

- *For the spandrel wall clear field and interface details, the designer finds appropriate matching details in Appendix A.1 – Window-wall and Appendix A.8 – Balconies and Doors, along with the thermal data in Appendix B.1 and B.8, except for the at-grade transition.*
- *The designer estimates the at-grade transition by comparing their project detail to a similar conventional curtain-wall Detail 2.5.1.*
- *The designer finds matching roof details in Appendix A.9 – Roofs along with the matching thermal data in Appendix B.9.*
- *The designer decides not enough information is available to estimate the roof penetrations and decides to have that detail modeled.*

Detail references and transmittances for this example are given in Table 4.

Step 6 (Optional): Calculate Individual Transmittance Heat Flow

While not necessary to calculate the overall U-value, it may be advantageous for designers to calculate the individual heat flows associated with specific details to help make better design decisions and identify details that should be targeted. Recognizing components of the U-value equation given in section 3.4, the individual heat flows can be calculated using the following:

- Clear Field Heat Flow = $U_o \cdot A$
- Linear Transmittance Heat Flow = $\Psi \cdot L$
- Point Transmittance Heat Flow = $\chi \cdot$number of occurrences

For this example, the designer calculates the heat flow through the individual details to see which interface details have the largest impact on thermal performance. From that analysis the designer is able to determine which details should be a priority to improve. Individual heat flows for this example are given in Table 4.

Step 7: Calculate Overall U-Value

With all the transmittance values and takeoff areas/lengths known, the overall Wall/Roof U-values can be calculated using the equation given in section 3.4.

$$U_T = \frac{\Sigma(\Psi \cdot L) + \Sigma(\chi)}{A_{Total}} + U_o$$

If the individual heat flows have already been determined in Step 6, then all of the heat flows can be summed together and divided by the total opaque area (in this case, the clear field area) to get the overall U-value that includes the effects of thermal bridging at interface details.

The designer calculates the overall U-values for each construction type, along with an overall Opaque Wall U-value and Opaque Roof U-value separately. The summary of all steps for the example building is given in Table 4 and 5 for the walls and roof respectively.

Table 4: Summary of Calculation Steps 1-7 for Example Building Opaque Wall

Step 1-2	Step 3	Step 4	Step 5		Step 6-7	
Transmittance Type		**Quantity**	**Detail Ref.**	**Transmittance**	**Heat Flow (W/K)**	**% of Total Heat Flow**
Concrete Wall	Clear Field	2987 m^2	6.2.2	0.42 W/m^2K	1254	16%
	Parapet	27 m	6.5.3	0.78 W/mK	21	<1%
	Exposed Floor Slab	1090 m	6.2.5	1.00 W/mK	1085	14%
	At Grade Transition	27 m	ISO-14863	0.75 W/mK	20	<1%
	Partition Wall	1315 m	6.2.2	0.67 W/mK	876	11%
Overall Concrete Wall U-value, BTU / hr ft^2 °F (W/m^2K)					**0.192 (1.09)**	
Overall Concrete Wall R-value, hr ft^2 °F/ BTU (m^2K/W)					**5.2 (0.92)**	
Window-wall Spandrel	Clear Field	1792 m^2	1.1.1	1.07 W/m^2K	1917	24%
	Parapet	82 m	1.3.2	0.72 W/mK	59	<1%
	Slab Bypass	1635 m	1.2.1	0.58 W/mK	945	12%
	Balcony Slab	1635 m	8.1.9	1.11 W/mK	1815	23%
	At Grade Transition	82 m	2.5.1 (est.)	0.86 W/mK	70	<1%
Overall Spandrel Wall U-value, BTU / hr ft^2 °F (W/m^2K)					**0.472 (2.68)**	
Overall Spandrel Wall R-value, hr ft^2 °F/ BTU (m^2K/W)					**2.11 (0.37)**	
Total (W/K)					**8063**	**100%**
Overall Opaque Wall U-value, BTU / hr ft^2 °F (W/m^2K)					**0.297 (1.68)**	
Overall Opaque Wall R-value, hr ft^2 °F/ BTU (m^2K/W)					**3.4 (0.59)**	

Table 5: Summary of Calculation Steps 1-7 for Example Building Opaque Roof

Transmittance Type		Quantity	Detail Ref.	Transmittance	Heat Flow (W/K)	% of Total Heat Flow
Roof	Clear Field	743 m^2	9.2.2	0.27 W/m^2K	200	82%
	Curbs	20 m	9.2.2	0.93 W/m K	19	8%
	Beam Penetrations	#20	Modelled	1.2 W/K	24	10%
Overall Roof U-value, BTU / hr ft^2 °F (W/m^2K)					**0.058 (0.33)**	
Overall Roof R-value, hr ft^2 °F/ BTU (m^2K/W)					**17.3 (3.05)**	

Even though it takes up less area of opaque wall than the concrete, the designer can see that the largest amount of heat flow is associated with the spandrel section clear field, but the heat flow through the window-wall bypass and the balconies is also significant.

6. INPUTTING THERMAL VALUES INTO ENERGY MODELS

Determining overall building performance, including the combined interaction between envelope, mechanical and electrical systems, is often termed "whole building energy analysis" and is often assessed using computer simulation and is used for multiple purposes, including:

- Design decision making through parametric analysis, by considering the energy and cost impact of design decisions to reduce energy or meet code
- Demonstrating compliance with energy codes
- Comparing a proposed building to a reference building for green building rating systems (LEED, Green Globes, etc.)
- Estimating energy use in new or existing buildings
- Estimating the impact of operational improvements or capital investments in existing buildings
- Heat loss calculations for mechanical system sizing

One of the main drivers for creating this guide was to provide more accurate thermal values and a methodology for designers to assist in creating more precise energy models.

Currently, there are few energy modeling programs that allow linear transmittance values to be input directly into energy simulations. While this feature is being considered for development for common building energy simulation software, at the moment this ability is not widely available. Thermal transmittances are either directly inputted as wall, roof or floor U-values or determined by using construction layers to build up the building envelope assemblies. For either case, the overall U-value that includes the effects of linear and points transmittances must first be determined without the assistance of the energy modeling software to ensure that the correct thermal transmittances will be processed by the model.

It is important to emphasize that air leakage and dynamic thermal responses are accounted for by separate functions in typical whole building energy models. Thermal bridging is accounted for only in the thermal transmittances that are processed by the energy model. See Appendix C for an explanation of how energy models take into account thermal mass separately from thermal transmittances.

Many modeling programs use construction layers to build up the building envelope assemblies based on material properties. To account for thermal bridging, all the material properties should be left as is, while only the insulating layer R-value should be de-rated such that the correct overall U-value determined from calculation is matched and output by the software. This method allows for the functions that account for thermal mass to be approximated by the software.

Example: *a section of concrete wall with R-15 exterior insulation contains a balcony slab and is calculated to have an overall U-value of U-0.16. The energy modeling program being used requires construction layers as the inputs. The layers are input with default values for the air films, cladding, airspaces, concrete and interior finishes and the simulation output shows a U-value of U-0.05. The exterior insulation R-value is edited and decreased from R-15 such that in the simulation output, the U-value for the overall wall assembly matches U-0.16.*

One final note on model inputs, the clear field U-values given in the thermal performance catalogue in this guide are based on the ASHRAE 1365-RP methodology, which include air films. Many energy modeling programs calculate air films separately. The air films for the modeled details in this guide are listed with the material properties in each of the details in Appendix A. The thermal resistance of these air films may need to be subtracted out before entering R- or U-values into an energy modeling program.

APPENDIX A – CATALOGUE MATERIAL DATA SHEETS

CATALOGUE INDEX

Introduction

Introduction

Appendix A contains the catalogue of material data information sheets for all the details available for this guide. The purpose is to provide this information such that designers will be able to easily reference their project details to a modeled detail within the catalogue or to be able to make estimations based on the information provided. The catalogue is divided into 10 sections, based on construction type:

Catalogue Index	
1.	**Window Wall**
2.	**Conventional Curtain Wall**
3.	**Unitized Curtain Wall**
4.	**High Performance Curtain Wall**
5.	**Steel-Framed Construction**
6.	**Metal Buildings**
7.	**Concrete and Mass Masonry Construction**
8.	**Wood-Frame and Timber Construction**
9.	**Balconies and Doors**
10.	**Roofs**

Within each section contains a variety of clear field and interface details. The catalogue contains details modeled by Morrison Hershfield Ltd. for this guide, along with previous modeling, including ASHRAE 1365-RP and other proprietary systems.

Each material data sheet is meant to be standalone and contains all the information needed for that particular detail. For instance, Detail 5.2.5 is a balcony slab detail for a steel stud assembly. That data sheet contains the material information for both the slab detail, and the clear field steel stud assembly above and below it. The clear field steel stud assembly material data sheet 5.1.14 is not additionally required to analyze the slab detail.

It should be noted that, as they are standalone, there are not necessarily a matching clear field data sheet for every detail. Additionally, some assemblies shown in the data sheets contain more than one interface detail, so while they are arranged by major detail type (slab, then parapet etc), there may be other interface details contained within it. The thermal results information in each results data sheet in Appendix B is given for all interface details contained within a single assembly detail.

Air Films and Contact Resistances

In thermal modeling, beyond the assembly material properties, assemblies are also affected by air films and contact resistances. From ASHRAE 1365-RP, the modeling was extensively calibrated with air films and contact resistances and is shown below in Tables A.1 and A.2. More information on assumptions and other modeling parameters can be found in Section 5 of ASHRAE 1365-RP.

Table A.1. Air film resistances

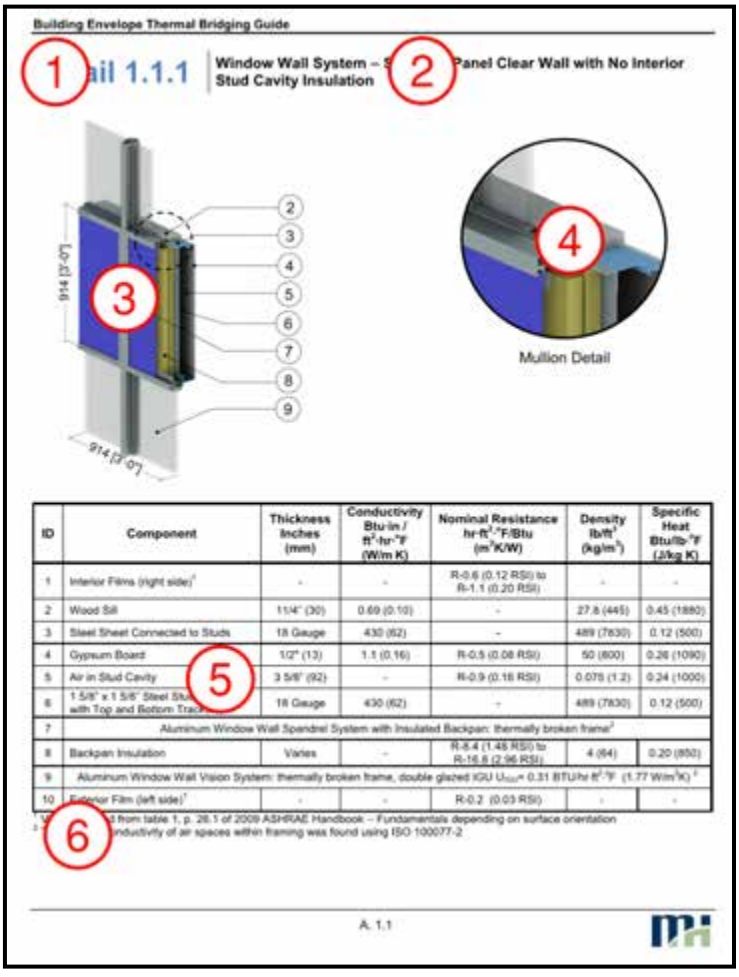
Location	Description of Condition	Heat Transfer Coefficient Btu/h·ft²·°F (W/m² K)
Exterior wall surface with generic cladding	Heat transfer coefficient to account for vented air space and cladding; surface is not directly exposed to wind	1.5 (8.3)
Exterior brick veneer and Precast Concrete surface	Surface exposed to 15 mph (24 km/h) wind	6.0 (34)
Exterior roof surface	Horizontal roof surface exposed to 15 mph (24 km/h) wind	6.0 (34)
Interior wall surface	Vertical surface exposed to indoor air and surfaces	1.5 (8.3)
Interior ceiling surface	Horizontal surface exposed to indoor air and surfaces with upward heat flow	1.6 (9.3)
Interior floor surface	Horizontal surface exposed to indoor air and surface with downward heat flow	1.1 (6.1)

Table A.2. Contact resistances

Location	Contact Resistance hr·ft²·°F /Btu (m² °C/W)
Steel flanges at sheathing interfaces	0.17 (0.030)
Insulation interfaces	0.057 (0.010)
Steel to concrete interfaces	0.057 (0.010)
Steel to steel interfaces	0.011 (0.0020)

Material Data Sheets

Each material data sheet contains several pieces of information. An example material data sheet is shown below with a description for each section following.



1) Detail Name

Each detail is named based on position within the catalogue index. The first number **1.**x.x indicates the construction type according to the main index (ie 1 is Window-Wall, 5 is Steel-Framed, 8 is Wood-Framed and Timber, etc). The second number x.**1.**x indicates detail group (ie. 1 is clear field values, 2 may be all slabs and 3 may be all parapets). The last number x.x.**1.** is simply the order in which the detail appears within that grouping (ie slab detail 1, slab detail 2 etc).

2) Detail Description

Each material data sheet has a basic description that denotes the construction system or type, along with additional detail identifiers such as limited dimension information, transmittance type and insulation locations

3) Detail Image

An isometric image of each detail is provided that includes cut away sections to view interior portions of the assembly. The images include dimensional information on the modeled assembly, along with ID numbers of key components. Each image is shown from the exterior side.

4) Close Up Image

Some material data sheets also contain close up images for further information on key components in an assembly. These callouts are usually from the same angle as the full assembly, however when an interior feature cannot be seen from that angle, the close up image may indicate it is from an interior view.

5) Material Information

For each component ID number given in the Detail Image, the material data sheets contain a description, thickness, thermal conductivity, nominal resistance (if applicable), material density and specific heat. For full systems that may contain multiple parts, such as window wall, a general description is given. Material properties were taken from standard tabulated values (typically measured at 24^{o}C or 75^{o}F).

6) Additional References

References for the conductivity of air spaces and other information are provided underneath the material tables.

7) PDF Version

With the PDF version of the catalogue, each entry in the catalogue index is linked to each construction section. Within each section, there is an additional index for the details, which are also linked directly to each detail data sheet. To return to the index, simply click on the Building Envelope Thermal Bridging Guide header.

1.0 Window Wall

Detail 1.1.1

Window Wall System – Spandrel Panel Clear Wall with No Interior Stud Cavity Insulation

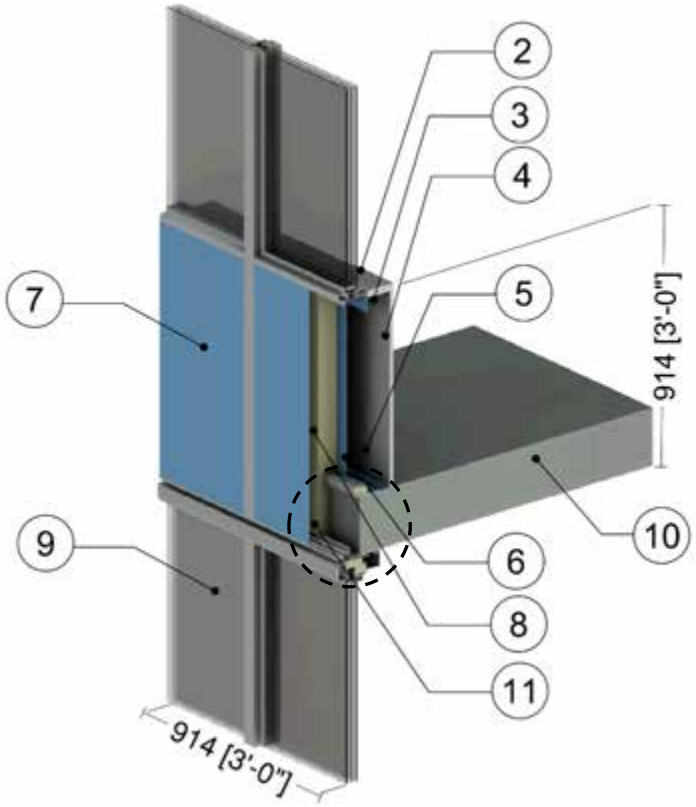
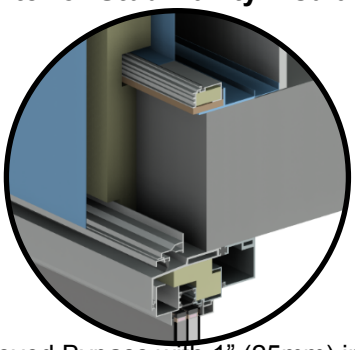
[3] For a window to wall ratio of 40%
AIM = Architectural Insulation Module

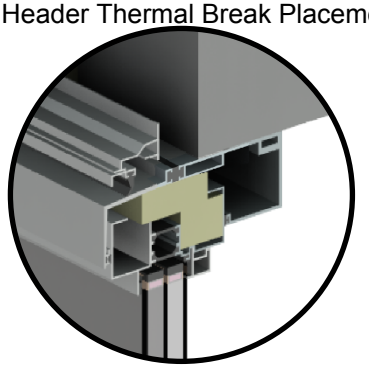
Detail 1.2.4

Window Wall System – Triple Glazed Insulated Frame at Slab Intersection with Improved Spandrel Bypass & No Interior Stud Cavity Insulation





A. Improved Bypass with 1" (25mm) insulation behind horizontal mullion, *Standard* Deflection Header Thermal Break Placement



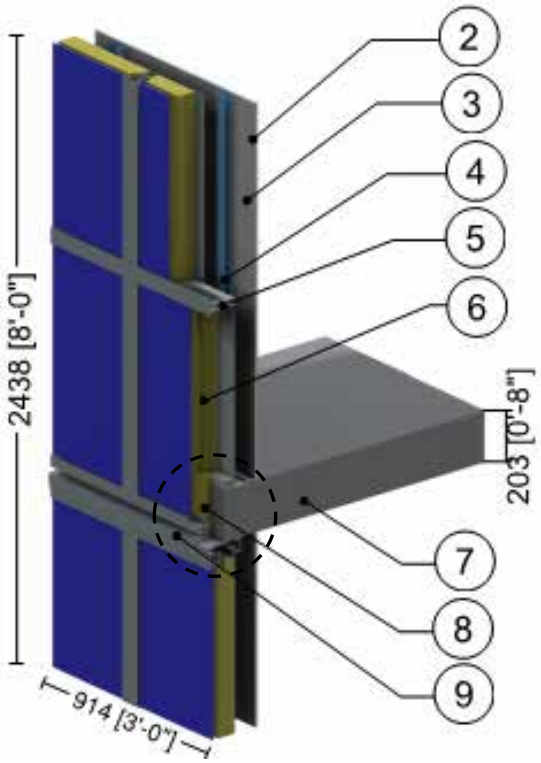
B. Improved Bypass with 1" (25mm) insulation behind horizontal mullion, and Deflection Header Thermal Break in line with Bypass Insulation

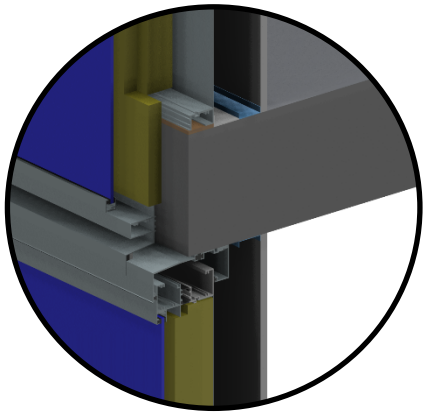
ID	Component	Thickness Inches (mm)	Conductivity Btu·in / ft²·hr·°F (W/m K)	Nominal Resistance hr·ft²·°F/Btu (m²K/W)	Density lb/ft³ (kg/m³)	Specific Heat Btu/lb·°F (J/kg K)
1	Interior Films[1]	-	-	R-0.6 to R-1.1 (0.12 to 0.20 RSI)	-	-
2	Wood Sill	1 1/4" (30)	0.69 (0.10)	-	27.8 (445)	0.45 (1880)
3	Steel Sheet Connected to Studs	18 Gauge	430 (62)	-	489 (7830)	0.12 (500)
4	Gypsum Board	1/2" (13)	1.1 (0.16)	R-0.5 (0.08 RSI)	50 (800)	0.26 (1090)
5	Air in Stud Cavity	3 5/8" (92)	-	R-0.9 (0.16 RSI)	0.075 (1.2)	0.24 (1000)
6	3 5/8" x 1 5/8" Steel Studs (16"o.c.) with Top and Bottom Tracks	18 Gauge	430 (62)	-	489 (7830)	0.12 (500)
7	Aluminum Window Wall Spandrel System with Insulated Backpan: thermally broken frame with insulation within mullions, additional bypass insulation and two deflection header thermal break scenarios, A) Standard, B) Inline with Slab Insulation[2]					
8	Backpan Insulation	3" (76)	0.24 (0.034)	R-12.6 (2.22 RSI)	4 (64)	0.20 (850)
9	Aluminum Window Wall Vision System: thermally broken frame[2], triple glazed IGU U_{COG}= 0.14 BTU/hr·ft²·°F (0.81 W/m²K)					
10	Concrete Slab	8" (203)	12.5 (1.8)	-	140 (2250)	0.20 (850)
11	Bypass Insulation	2" (51)	0.24 (0.034)	R-8.4 (1.48 RSI)	4 (64)	0.20 (850)
12	Exterior Film[1]	-	-	R-0.2 (0.03 RSI)	-	-

[1] Value selected from table 1, p. 26.1 of 2009 ASHRAE Handbook – Fundamentals depending on surface orientation
[2] The thermal conductivity of air spaces within framing was found using ISO 100077-2

Detail 1.2.5

Window Wall System – Full Height Spandrel at Slab Intersection with Spandrel Bypass & No Interior Stud Cavity Insulation





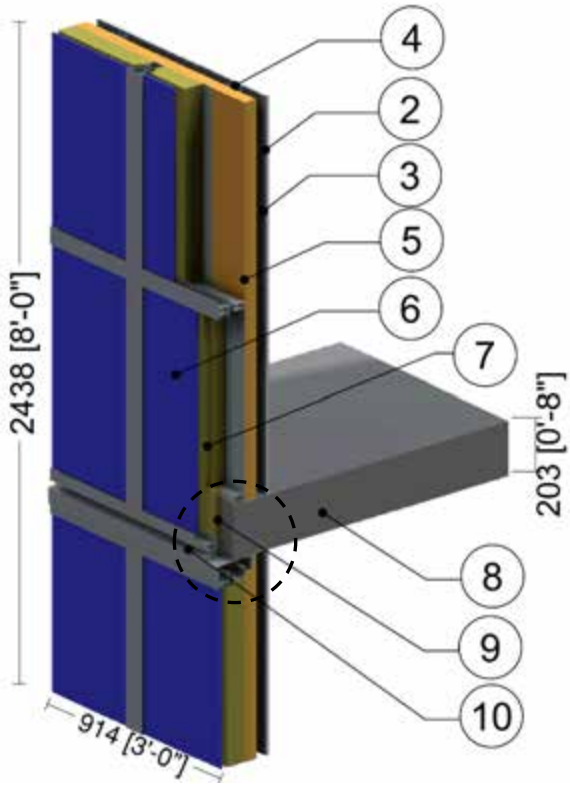
Bypass Detail with Deflection Header and 1/2" (12mm) Air Gap Behind Horizontal Mullion

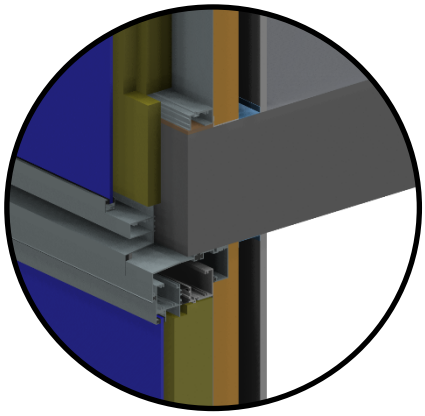
ID	Component	Thickness Inches (mm)	Conductivity Btu·in / ft²·hr·°F (W/m K)	Nominal Resistance hr·ft²·°F/Btu (m²K/W)	Density lb/ft³ (kg/m³)	Specific Heat Btu/lb·°F (J/kg K)
1	Interior Films[1]	-	-	R-0.6 to R-1.1 (0.12 to 0.20 RSI)	-	-
2	Gypsum Board	1/2" (13)	1.1 (0.16)	R-0.5 (0.08 RSI)	50 (800)	0.26 (1090)
3	Air in Stud Cavity	3 5/8" (92)	-	R-0.9 (0.16 RSI)	0.075 (1.2)	0.24 (1000)
4	3 5/8" x 1 5/8" Steel Studs (16"o.c.) with Top and Bottom Tracks	18 Gauge	430 (62)	-	489 (7830)	0.12 (500)
5	Full Height Aluminum Window Wall Spandrel System with Insulated Backpan: thermally broken frame, no insulation in mullions [2]					
6	Backpan Insulation	Varies	0.24 (0.034)	R-8.4 to R-16.8 (1.48 to 2.96 RSI)	4 (64)	0.20 (850)
7	Concrete Slab	8" (203)	12.5 (1.8)	-	140 (2250)	0.20 (850)
8	Bypass Insulation	1" (25)	0.20 (0.029)	R-5 (0.88 RSI)	1.8 (28)	0.29 (1220)
9	Aluminum Flashing	14 Gauge	1109 (160)	-	171 (2739)	0.21 (900)
10	Exterior Film[1]	-	-	R-0.2 (0.03 RSI)	-	-

[1] Value selected from table 1, p. 26.1 of 2009 ASHRAE Handbook – Fundamentals depending on surface orientation
[2] The thermal conductivity of air spaces within framing was found using ISO 100077-2

Detail 1.2.6

Window Wall System – Full Height Spandrel at Slab Intersection with Spandrel Bypass & Interior Spray Foam Insulation





Bypass Detail with Deflection Header and 1/2" (12mm) Air Gap Behind Horizontal Mullion

ID	Component	Thickness Inches (mm)	Conductivity Btu·in / ft²·hr·°F (W/m K)	Nominal Resistance hr·ft²·°F/Btu (m²K/W)	Density lb/ft³ (kg/m³)	Specific Heat Btu/lb·°F (J/kg K)
1	Interior Films[1]	-	-	R-0.6 to R-1.1 (0.12 to 0.20 RSI)	-	-
2	Gypsum Board	1/2" (13)	1.1 (0.16)	R-0.5 (0.08 RSI)	50 (800)	0.26 (1090)
3	Air in Stud Cavity	1 5/8" (41)	-	R-0.9 (0.16 RSI)	0.075 (1.2)	0.24 (1000)

9	Aluminum Window Wall Vision System: thermally broken frame[2], no insulation in mullions, double glazed IGU U_{COG}= 0.32 BTU/hr·ft²·°F (1.82 W/m²K)					
10	Backpan insulation	Varies	0.24 (0.034)	R-8.4 to R-16.8 (1.48 to 2.96 RSI)	4 (64)	0.20 (850)
11	Aluminum Flashing	14 Gauge	1109 (160)	-	171 (2739)	0.21 (900)
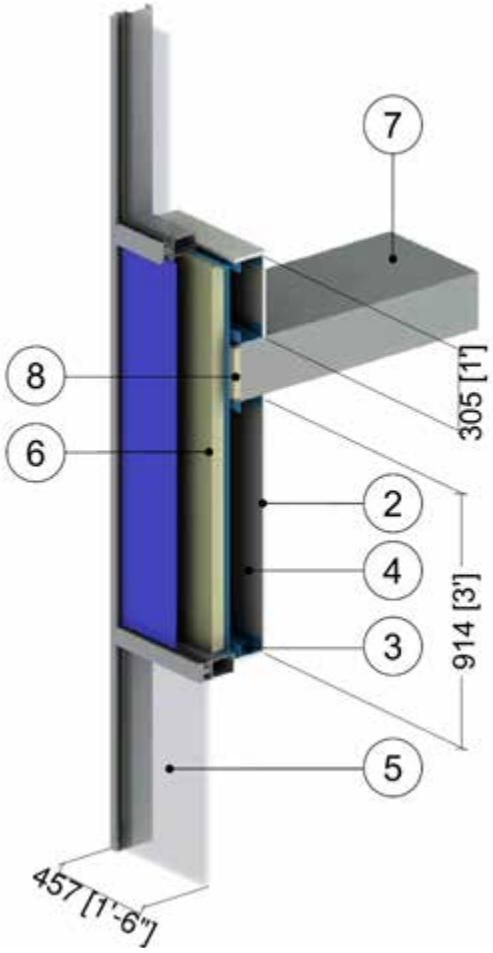
12	Exterior Film[1]	-	-	R-0.2 (0.03 RSI)	-	-

[1] Value selected from table 1, p. 26.1 of 2009 ASHRAE Handbook – Fundamentals depending on surface orientation
[2] The thermal conductivity of air spaces within framing was found using ISO 100077-2

2.0 Conventional Curtain Wall

Detail 2.1.1

Conventional Curtain Wall System with Insulated Spandrel Panel and 3 5/8″ x 1 5/8″ Steel Stud (16″ o.c.) – Intermediate Floor Intersection & No Interior Insulation in Stud Cavity

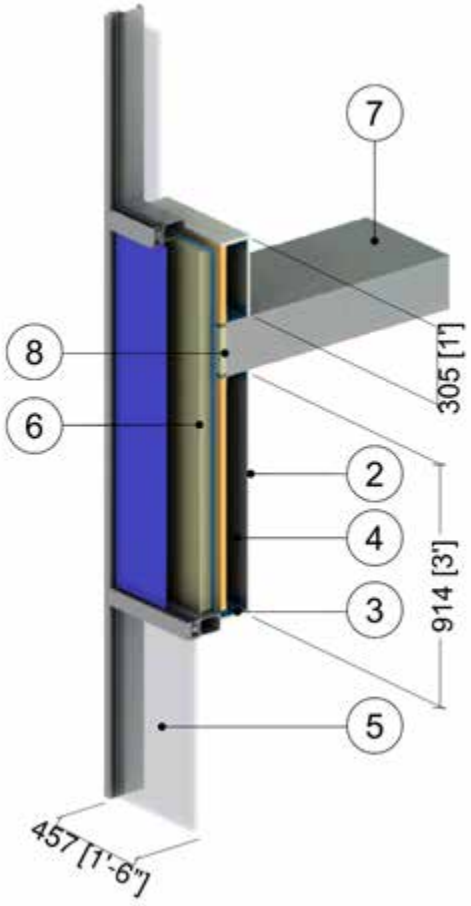


ID	Component	Thickness Inches (mm)	Conductivity Btu·in / ft²·hr·°F (W/m K)	Nominal Resistance hr·ft²·°F/Btu (m²K/W)	Density lb/ft³ (kg/m³)	Specific Heat Btu/lb·°F (J/kg K)
1	Interior Film[1]	-	-	R-0.6 to R-0.9 (0.11 to 0.16 RSI)	-	-
2	Gypsum Board	1/2" (13)	1.1 (0.16)	R-0.5 (0.08 RSI)	50 (800)	0.26 (1090)
3	3 5/8" x 1 5/8" Steel Studs with Top and Bottom Tracks	18 Gauge	430 (62)	-	489 (7830)	0.12 (500)
4	Air in Stud Cavity	4 5/8" (118)	-	R-0.9 (0.16 RSI)	0.075 (1.2)	0.24 (1000)
5	Conventional curtain wall system with insulated back pan (Pressure plates with minimal thermal break)[2]					
6	Backpan Insulation	Varies	-	R-8.4 to R-16.8 (1.48 to 2.96 RSI)	1.8 (28)	0.29 (1220)
7	Concrete Slab	8" (203)	12.5 (1.8)	-	140 (2250)	0.20 (850)
8	Firestop Insulation	1" (25)	0.24 (0.034)	R-4.2 (0.74 RSI)	4 (64)	0.20 (850)
9	Exterior Film[1]	-	-	R-0.2 (0.03 RSI)	-	-

[1] Value selected from table 1, p. 26.1 of 2009 ASHRAE Handbook – Fundamentals depending on surface orientation & surface emissivity. Window values supplemented by ISO 1007-2, Annex B.
[2] The thermal conductivity of air spaces within curtain wall framing was found using ISO 10077-2.

Detail 2.1.2

Conventional Curtain Wall System with Insulated Spandrel Panel and 3 5/8″ x 1 5/8″ Steel Stud (16″ o.c.) – Intermediate Floor Intersection & Spray Foam Insulation in Stud Cavity

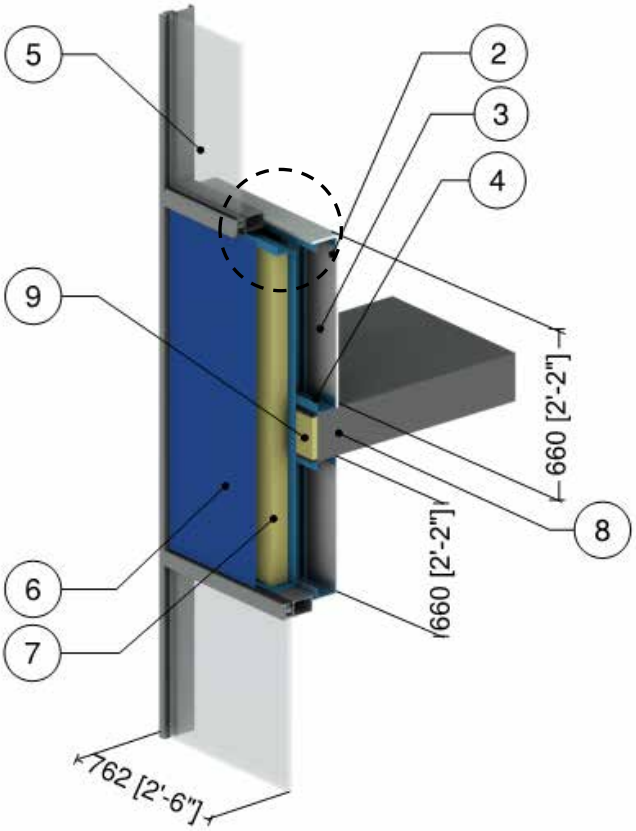


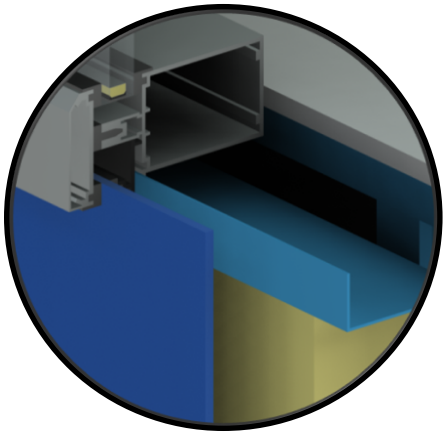
ID	Component	Thickness Inches (mm)	Conductivity Btu·in / ft²·hr·°F (W/m K)	Nominal Resistance hr·ft²·°F/Btu (m²K/W)	Density lb/ft³ (kg/m³)	Specific Heat Btu/lb·°F (J/kg K)
1	Interior Film[1]	-	-	R-0.6 to R-0.9 (0.11 to 0.16 RSI)	-	-
2	Gypsum Board	1/2" (13)	1.1 (0.16)	R-0.5 (0.08 RSI)	50 (800)	0.26 (1090)
3	3 5/8" x 1 5/8" Steel Studs with Top and Bottom Tracks	18 Gauge	430 (62)	-	489 (7830)	0.12 (500)
4	Air in Stud Cavity	2 5/8" (67)	-	R-0.9 (0.16 RSI)	0.075 (1.2)	0.24 (1000)
5	Conventional curtain wall system with insulated back pan (Pressure plates with minimal thermal break)[2]					
6	Backpan Insulation	Varies	-	R-8.4 to R-16.8 (1.48 to 2.96 RSI)	1.8 (28)	0.29 (1220)
7	Concrete Slab	8" (203)	12.5 (1.8)	-	140 (2250)	0.20 (850)
8	Firestop Insulation	1" (25)	0.24 (0.034)	R-4.2 (0.74 RSI)	4 (64)	0.20 (850)
9	Spray Foam Insulation	2" (51)	0.17 (0.024)	R-12.0 (2.11 RSI)	2.4 (39)	0.35 (1470)
10	Exterior Film[1]	-	-	R-0.2 (0.03 RSI)	-	-

[1] Value selected from table 1, p. 26.1 of 2009 ASHRAE Handbook – Fundamentals depending on surface orientation & surface emissivity. Window values supplemented by ISO 1007-2, Annex B.
[2] The thermal conductivity of air spaces within curtain wall framing was found using ISO 10077-2.

Detail 2.1.3

Conventional Curtain Wall System with Vertical and Horizontal Pressure Plates and 5' x 5' Spandrel Section – Insulated Metal Backpan and Intermediate Floor Intersection





Aluminum Spacer

ID	Component	Thickness Inches (mm)	Conductivity Btu·in / ft²·hr·°F (W/m K)	Nominal Resistance hr·ft²·°F/Btu (m²K/W)	Density lb/ft³ (kg/m³)	Specific Heat Btu/lb·°F (J/kg K)
1	Interior Films[1]	-	-	R-0.6 to R-1.1 (0.12 to 0.20 RSI)	-	-
2	Gypsum Board	1/2" (13)	1.1 (0.16)	R-0.5 (0.08 RSI)	50 (800)	0.26 (1090)

APPENDIX B – CATALOGUE THERMAL DATA SHEETS

CATALOGUE INDEX

Introduction

Introduction

Appendix B contains the catalogue of thermal performance data sheets for all the details available for this guide. The thermal performance information includes U-values, transmittance values and condensation indices. Appendix B consists of a catalogue with full thermal information for each detail.

Each thermal data sheet, along with its matching material data sheet, is meant to be standalone. For instance, Detail 5.2.5 is a balcony slab detail for a steel stud assembly. That data sheet contains the material information for both the slab detail, and the clear field steel stud assembly above and below it. The clear field steel stud assembly material data sheet 5.1.14 is not additionally required to analyze the slab detail. Additionally, some assemblies contain more than one interface detail, so while they are arranged by major detail type (slab, then parapet etc.), there may be other interface details contained within it. Each thermal data sheet contains the thermal performance values for all interface details contained within that assembly detail. Note that some clear field assemblies do not have their own individual thermal data sheet and may be included within other thermal data sheets. For instance, there is no separate clear field data sheet for an interior insulated concrete wall, however there is clear field data available for that wall within the slab interface detail 7.2.2.

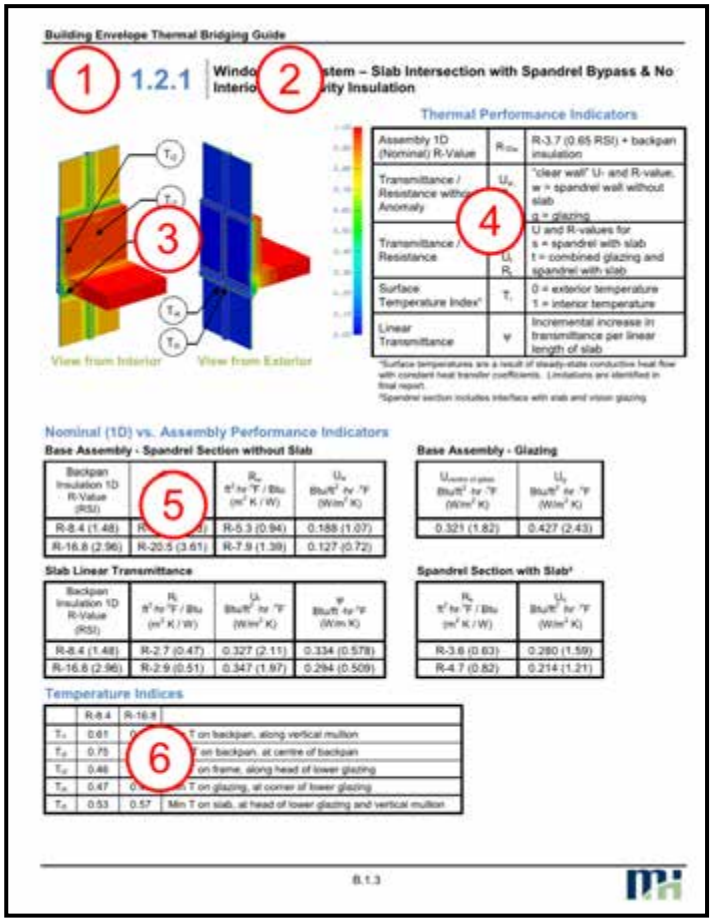
Modelling Assumptions

- Exterior surfaces and air spaces include convection, conduction and radiation heat exchange.
- The models were evaluated at non-dimensionalized temperatures, where 0 is the exterior temperature and 1 is the interior. This was done to allow the results to be applicable to any temperature difference. See condensation indices below for more information.
- The model was analyzed at steady state, so thermal mass is not taken into account within assembly U-values.
- Air leakage was not taken into account. It was assumed materials were well fit together
- Contact resistances between materials were used

Additional modeling parameters and assumptions can be found in Section 5 of ASHRAE 1365-RP.

Thermal Data Sheets

Each thermal data sheet contains several pieces of information. An example thermal data sheet is shown below with a description for each section following.



1) Detail Name

Each detail is named based on position within the catalogue index. The first number **1.**x.x indicates the construction type according to the main index (ie 1 is Window-Wall, 5 is Steel Framed, 8 is Wood Framed etc). The second number x.**1.**x indicates detail group (ie. 1 is clear field values, 2 may be all slabs and 3 may be all parapets). The last number x.x.**1.** is simply the order in which the detail appears within that grouping (ie slab detail 1, slab detail 2 etc).

2) Detail Description

A basic description is included that denotes the construction system or type, along with additional detail identifiers such as limited dimension information, transmittance type and insulation locations

3) Thermal Image

An isometric thermal image from the interior and from the exterior is provided, along with a non-dimensionalized temperature scale and key locations for temperature indices, see condensation indices below. While temperatures could be read off these images, they are meant to give a general look at where the areas of high heat flow are.

4) Thermal Performance Legend

A thermal performance legend is provided denoting terms and subscripts for the thermal values that follow.

5) Thermal Values

The thermal data sheets contain several types of thermal performance indicators. If one or more assemblies are present on a detail, there will typically be multiple tables present, one for each assembly and one for the averaged values for all the assemblies combined. For clear field thermal data sheets, they typically have all the information contained within one table, however for curtain wall and window wall assembly clear field thermal data sheets; they also include the glazing data. In these instances, the spandrel clear field value and glazing values are in two separate tables, along with a combined assembly that is an average of the glazing and spandrel combined.

For interface detail thermal data sheets, each type of interface detail present in a single assembly has their own table, along with a separate table for the clear field values. There may be multiple ways the clear field values are presented. If there is only one clear field assembly, all values for the detail are given in a single table and the clear field values are presented as U_o and R_o. If there are multiple clear field assemblies or multiple interface transmittances in a single detail, the clear field values for each clear field assembly will be presented in a “Base Assembly” table. This is usually the case when there are glazing assemblies involved.

The thermal values provided in these tables are as follows:

- Insulation 1D R-value is the value of insulation if it is varied within the model. This is typically the exterior insulation or backpan insulation amount.
- R_{1D} is the combined thermal resistance of all the materials in a clear field assembly. This is the value of the assembly if there were absolutely no thermal bridging.
- R_o and U_o is the clear field thermal resistance and transmittance when there is only one base clear field assembly.
- R_x and U_x is the thermal resistance and transmittance for base assembly "X" when there are multiple clear field assemblies. Be aware of the subscripts given in the Thermal Performance legend. The subscript may not always represent a clear field assembly value.
- $U_{center\ of\ glass}$ and U_g are the thermal transmittances through the 1D center of glass and the overall glazing assembly respectively.
- R and U are modelled assembly thermal resistance and transmittance that include the effects of interface details for the specific size of the modeled assembly. There may be additional subscripts if the assembly contains multiple interface details, please be aware of the subscript labels given in the Thermal Performance Legend. This is important for details with glazing, such as window wall and curtain wall. The thermal values for the combined assembly with spandrel and glazing may be wanted, however as glazing can be dealt with separately, most designers will only want the information on the spandrel, therefore the spandrel only values with the slab are given separately.
- Ψ is the linear transmittance value. There may be additional subscripts if there are multiple interface details within one assembly
- X is the point transmittance value. There may be additional subscripts if there are multiple interface details within one assembly
- T_{ix} is the condensation indice for location x

6) Condensation Indices

The thermal data sheets also provide surface temperatures of assembly components that could be exposed to interior air to help locate potential areas of risk for condensation. In order to be applicable for any climate (varying indoor and outdoor temperatures), the temperatures are non-dimensionalized into a temperature index, T_i, as shown below

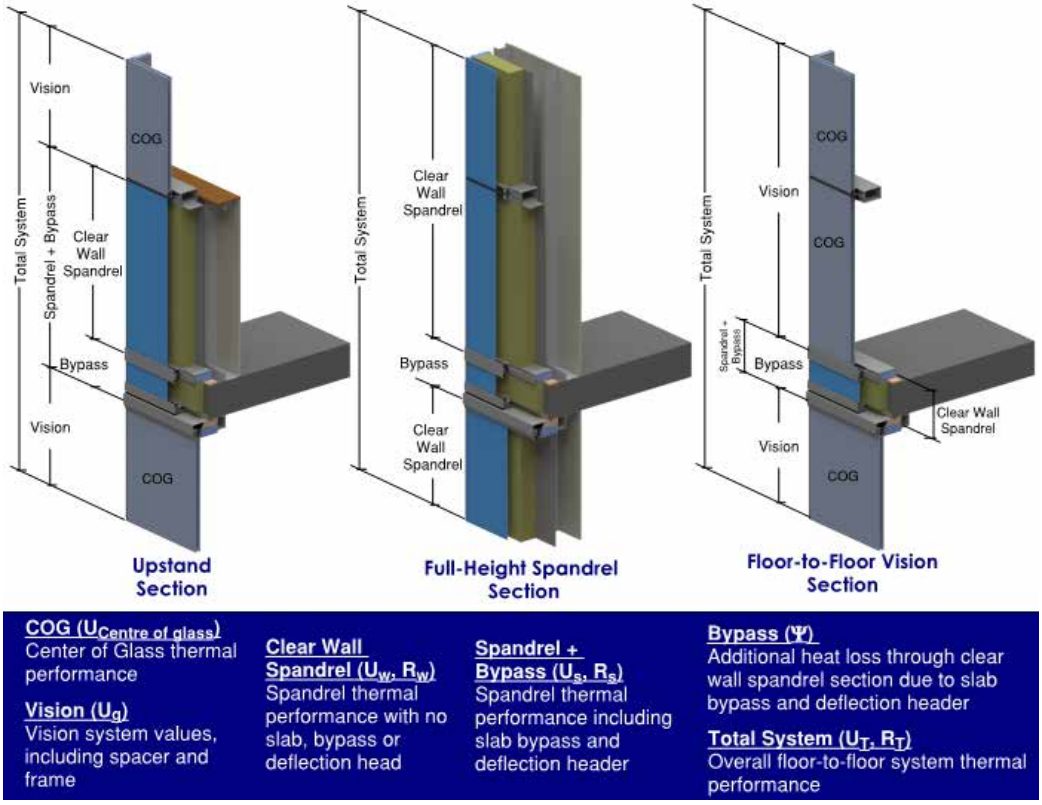
$$T_i = \frac{T_{surface} - T_{outside}}{T_{inside} - T_{outside}}$$

The index is the ratio of the surface temperature relative to the interior and exterior temperatures. The temperature index has a value between 0 and 1, where 0 is the exterior temperature and 1 is the interior temperature. If T_i is known, the above equation can be rearranged for $T_{surface}$. Note that these not meant as absolute temperatures and are only given as guidance on potential regions of condensation. There are many factors that can affect the formation of condensation that are not included in the modeling. For more discussion, see section 5.3 of ASHRAE 1365-RP.

7) Window-Wall Systems

Window-wall systems integrate vision glazing, opaque spandrels, and intermediate floor bypasses into their systems, making it difficult to differentiate the thermal performance of these sections. Below is a figure to help clarify how different sections are identified in the thermal bridging details.

For the floor-to-floor vision section scenario the bypass linear transmittance Ψ is compared to a spandrel clear wall section of the same dimension but with regular mullions in place of the deflection header and without the impact of the slab.



8) At-Ground Transitions

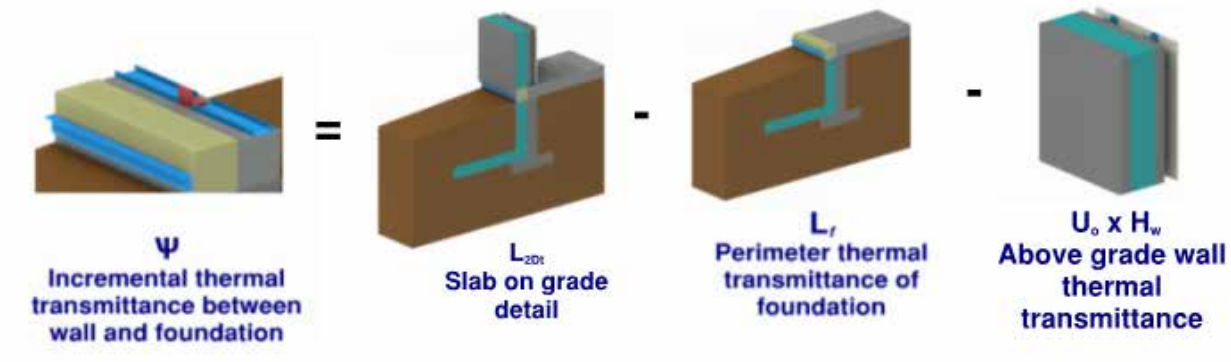
Some details contain at-grade transitions. The Ψ-value can be used like any other linear transmittance and it represents the incremental heat flow between the wall and foundation assembly. While heat flow through the wall assembly is based on heat flow per area (U-value), heat flow at foundation assemblies (slab on grade or below grade) is calculated by L-value based on ISO 10211: 2007. The L-value is simply the overall heat flow of the slab on grade per unit length of the slab perimeter. It is based on the assumption that the overall steady state heat flow though slab on grade is dominated by the perimeter, similar to F-factors referenced in ASHRAE 90.1.

Wall and floor junctions with slab on grade are still characterized by linear transmittance Ψ. The linear transmittance at wall to floor junctions are calculated by subtracting the L-value of the overall assembly by the L-value of the slab and thermal transmittance of the clear wall per unit width as shown by the equation below:

$$\Psi = L_{2Dt} - L_{2Df} - U_{ow} * H_w$$

Where:

Ψ = Linear transmittance of wall/ slab on grade transition
L_{2Dt} = Heat flow of overall assembly per unit length of slab perimeter
L_{2Dt} = Heat flow of slab edge per unit length of slab perimeter
U_{ow} = U-value of the clear wall
H_w = Height of the clear wall in the overall modelled assembly



9) PDF Version

With the PDF version of the catalogue, each entry in the catalogue index is linked to each construction section. Within each section, there is an additional index for the details, which are also linked directly to each detail thermal sheet. To return to the index, simply click on the Building Envelope Thermal Bridging Guide header.

Nominal (1D) vs. Assembly Performance Indicators

Base Assembly – Roof

Roof Insulation 1D R-Value (RSI)	R_{1D} ft²·hr·°F / Btu (m² K / W)	R_o ft²·hr·°F / Btu (m² K / W)	U_o Btu/ft² ·hr ·°F (W/m² K)
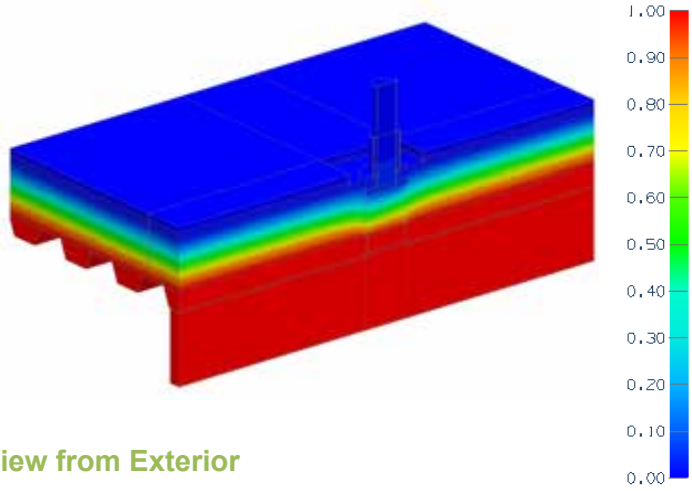
R-40 (7.04)	R-42.7 (7.53)	R-42.7 (7.53)	0.023 (0.133)

Roof Anchor Point Transmittance

R ft²·hr·°F / Btu (m² K / W)	U Btu/ft² ·hr ·°F (W/m² K)	χ Btu/hr·°F (W/K)
R-26.0 (4.57)	0.039 (0.219)	0.640 (0.34)

Detail 10.3.2

Exterior Insulated Conventional Flat Roof – Armatherm Thermal Break under Roof Anchor



View from Exterior

Thermal Performance Indicators

Assembly 1D (Nominal) R-Value	R_{1D}	R-2.7 (0.48 RSI) + insulation
Transmittance / Resistance without Anomaly	U_o, R_o	"clear field" U- and R-value, without roof anchor
Surface Temperature Index[1]	T_i	0 = exterior temperature 1 = interior temperature
Point Transmittance	χ	Incremental increase in transmittance for anchor

[1]Surface temperatures are a result of steady-state conductive heat flow with constant heat transfer coefficients. Limitations are identified in final report

Scenarios

Scenario	Roof Anchor Arrangement
A	1/2" Armatherm FRR thermal break under roof anchor
B	6" Armatherm 500 thermal break under roof anchor

Nominal (1D) vs. Assembly Performance Indicators

Base Assembly – Roof

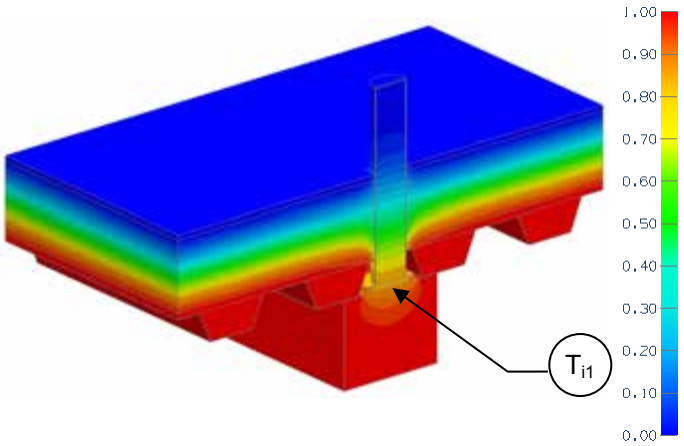
Roof Insulation 1D R-Value (RSI)	R_{1D} ft²·hr·°F / Btu (m² K / W)	R_o ft²·hr·°F / Btu (m² K / W)	U_o Btu/ft² ·hr ·°F (W/m² K)
R-40 (7.04)	R-42.7 (7.53)	R-42.7 (7.53)	0.023 (0.133)

Roof Anchor Point Transmittance

Scenario	R ft²·hr·°F / Btu (m² K / W)	U Btu/ft² ·hr ·°F (W/m² K)	χ Btu/hr·°F (W/K)
A	R-27.6 (4.86)	0.036 (0.206)	0.542 (0.29)
B	R-37.5 (6.60)	0.027 (0.151)	0.130 (0.07)

Detail 10.3.3

Exterior Insulated Conventional Low-Sloped Roof – Roof Anchor



Thermal Performance Indicators

Assembly 1D (Nominal) R-Value	R_{1D}	R-2.28 (0.40 RSI) + insulation
Transmittance / Resistance without Anomaly	U_o, R_o	"clear field" U- and R-value, without connectors or joint
Transmittance / Resistance	U, R	U- and R-values for the overall assembly
Point Transmittance	χ	Incremental increase in transmittance per connector

Scenarios

Scenario	Roof Anchor
A	Without fill insulation
B	With fill insulation

Nominal (1D) vs. Assembly Performance Indicators

Base Assembly – Roof

Roof Insulation 1D R-Value (RSI)	R_{1D} ft²·hr·°F / Btu (m² K / W)	R_o ft²·hr·°F / Btu (m² K / W)	U_o Btu/ft² ·hr ·°F (W/m² K)
R-34.3 (6.03)	R-36.5 (6.44)	R-36.6 (6.45)	0.027 (0.155)

Roof Anchor Point Transmittance

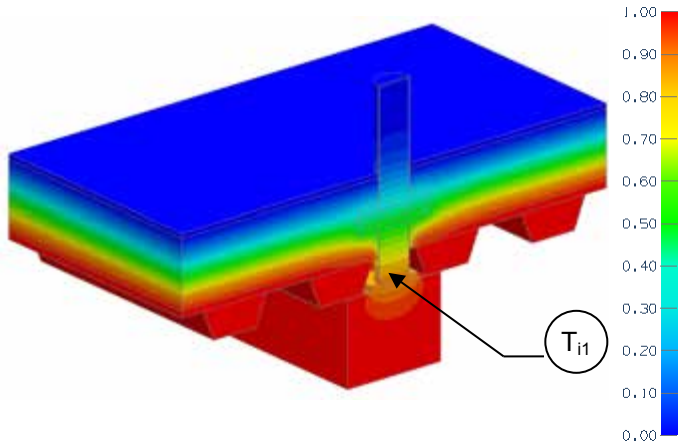
Scenario	R ft²·hr·°F / Btu (m² K / W)	U Btu/ft² ·hr ·°F (W/m² K)	χ Btu/hr·°F (W/K)
A	R-25.1 (4.41)	0.040 (0.227)	0.202 (0.106)
B	R-26.7 (4.70)	0.037 (0.213)	0.163 (0.086)

Temperature Indices

	A	B	
Ti_1	0.80	0.84	Min T on beam, at anchor

Detail 10.3.4

Exterior Insulated Conventional Low-Sloped Roof – Thermal Break in Roof Anchor



Thermal Performance Indicators

Assembly 1D (Nominal) R-Value	R_{1D}	R-2.28 (0.40 RSI) + insulation
Transmittance / Resistance without Anomaly	U_o, R_o	"clear field" U- and R-value, without connectors or joint
Transmittance / Resistance	U, R	U- and R-values for the overall assembly
Point Transmittance	χ	Incremental increase in transmittance for connector

Scenarios

Scenario	Roof Anchor
A	Without fill insulation
B	With fill insulation above thermal break

Nominal (1D) vs. Assembly Performance Indicators

Base Assembly – Roof

Roof Insulation 1D R-Value (RSI)	R_{1D} $ft^2 \cdot hr \cdot {}^oF$ / Btu (m^2 K / W)	R_o $ft^2 \cdot hr \cdot {}^oF$ / Btu (m^2 K / W)	U_o Btu/$ft^2 \cdot hr \cdot {}^oF$ (W/m^2 K)
R-34.3 (6.03)	R-36.5 (6.44)	R-36.7 (6.47)	0.027 (0.155)

Roof Anchor Point Transmittance

Scenario	R $ft^2 \cdot hr \cdot {}^oF$ / Btu (m^2 K / W)	U Btu/$ft^2 \cdot hr \cdot {}^oF$ (W/m^2 K)	χ Btu/$hr \cdot {}^oF$ (W/K)
A	R-25.8 (4.55)	0.039 (0.220)	0.184 (0.097)
B	R-26.2 (4.61)	0.038 (0.217)	0.175 (0.093)

Temperature Indices

	A	B	
Ti_1	0.82	0.83	Min T on beam, at anchor
