T&D SYSTEM OPERATIONS

OPERATING ORDER 5T-10

RATINGS FOR ALL TRANSMISSION CIRCUITS 60 KV OR HIGHER

Supersedes 5T-10 issued 1 March 2024

Effective Date: 16 April 2024

Review Year: 2028

Highlight Denotes Revision

- This SOO must be posted on bchydro.com.
- This SOO must be posted in the BCRC Extranet.
- This SOO requires email conveyance to reliability entities.

1.0 GENERAL

1.1 Intent and Scope

This operating order defines the operating limits of all transmission circuits. The continuous operating limit of a circuit is the minimum of either the maximum continuous rating of equipment at the substation (e.g. sectionalizing switches, bus, etc.), or the overhead or underground conductor ratings. A temporary overload capability may exist for some individual circuits. Ratings for all transmission circuits 60 kV and above are found in Appendix 1.

Note: All overhead line conductor emergency ratings are 30 minute ratings, unless otherwise specified.

When an outage of a Level III or IV circuit causes the remaining Level III or IV circuit to be radially connected to a generation source or IPP above 25 MW, that remaining circuit is automatically raised to Level II. Further information is found in:

- OO 1J-11 - Power System Operation – Authority and Responsibility
- OO 1T-53 - Implementation of BC Hydro Generation LOBs Commercial Management System by BC Hydro.

Any inquiries regarding the information provided within this document should be directed to tdso.compliance@bchydro.com.

1.2 Policy and Process

The review and update of 5T-10 is the responsibility of the T&D System Operations (TDSO) Director and the responsibility is delegated to the TDSO Principal Engineer. Operations Planning staff are to provide recommendation for approval by the TDSO Principal Engineer.

All ratings can be reviewed by Asset Investment Management, Asset Sustainment (AIM AS) which includes staff within the Lines Strategy and Standards or Stations/P&C Strategy and Standards departments. In addition to circuit conductor/clearance ratings, AIM-AS (Stations/P&C) will review for any protection changes/recommendations or equipment limitations and provide updated ratings, and/or drive PN changes, as necessary.

A Commissioning Notice to Energize (CNE) can be used to confirm ratings of new or updated circuits because it confirms that the technical specifications and operations requirements have been reviewed and accepted by a Professional of Record.

The Real Time Operations (RTO) System Control Manager (SCM) can temporarily de-rate the circuit rating prior to receiving new rating confirmation from AIM-AS or CNE, but not increase circuit ratings.

A Transmission Line Plant Alteration document (PA) without an associated CNE will **not** be used to verify ratings, only to confirm assets are in service (as built).

Subsequent to the revision of 5T-10, the following operating tools need to be updated:

- EMS alarms update: CPC and RTS SCADA teams are notified by distribution list when 5T-10 is updated. Analog alarm and warnings settings are updated accordingly.
- Other operating order update requirements: Ops Planner must confirm and remove ratings from other orders and cite the reference to 5T-10, and prepare for signing by the responsible BC Hydro manager.

1.3 Circuit Rating

The overall rating of a circuit is determined by taking the most restrictive rating between Protection (CT), Disconnect, and Conductor (cable or overhead) ratings associated to the same circuit. Where a circuit has taps, the distribution of the loading on the segments of the circuit, and the locations of the telemetry must be considered. During a contingency, for instance, the source end may reverse with the receiving end, and different line sections will be limiting. If taps exist for a circuit, and segment information is NOT provided, then the circuit limitation is based upon the minimum of all the segments, and tap loading does not have to be considered.

The emergency rating of a cable is dependent on variable factors, such as soil resistivity, load factor (assumed as 80%), duration of load, loading prior to emergency, etc., which can fluctuate widely in individual cases. The emergency rating of underground cables are intended as a guide only and must be applied with discretion.

Winter ratings apply during November to April and summer ratings apply during May to October. For overhead conductors, the summer ratings assume that the sun is shining on the conductor and the winter ratings do not. For cable ratings, different ground temperatures are assumed for summer versus winter.

Note: Bulk Electric System (BES) circuits in Appendix 1 are shown in **bold** font.

1.4 Conductor Temperature Limitations

Severe overloading of transmission conductors may cause permanent damage, through annealing of the steel and/or aluminum strands. A conductor that is nominally rated 590 A, if subjected to a current of 1200 A, will reach a temperature of 300°C. Within 12 minutes, the aluminum portion will lose 40% of its strength. This same conductor at 1000 A would reach 200°C and will lose 10% of its strength in 12 minutes. Overloads of these magnitudes must be reduced quickly to avoid permanently damaging the conductors.

Dependent upon the type of aluminum, significant loss of strength can begin at conductor temperatures as low as 60°C. However, most 'typical' conductors show no loss of strength until the 80°C – 90°C range is reached. For high steel content conductors, the limit may be higher, depending upon the amount of steel content. The conductor type and normal temperature are an indication of the temperature at which the limiting conductor can be operated continuously.

1.5 Clearance Limitations

Overhead sections of transmission circuits are required to meet minimum clearances for safety between conductor to ground and conductor to underbuilt circuits. Conductor sag and tension affect clearances, which are further influenced by factors such as conductor temperature, conductor creep, wind, and ice loading. For operating purposes, the conductor temperature at which the maximum allowable sag occurs will be used to determine the clearance limitation. This limitation is NOT to be exceeded without additional clearance monitoring procedures in place (see exceptions, Section 2.3).

1.6 Normal Rated Capacity

The rating of a transmission circuit is dependent upon ambient temperature that is normally defined to be 30°C ambient for summer and 0°C ambient for winter.

Overhead transmission circuit ratings may be adjusted by the actual ambient air temperature. The ambient air temperature must be picked as a maximum assumed to occur at any point in the circuit at the time. Ambient assumptions should be revisited should temperatures rise appreciably.

Pro-rating is acceptable for temperatures extending 10°C higher and lower than the Summer and Winter rating temperatures given in Appendix 1. This results in a valid pro-rated temperature range of -10°C to 40°C. For temperatures beyond this range, contact the appropriate Transmission Operation Manager. Note that both the normal and emergency values can be pro-rated by this calculation.

Do NOT pro-rate when a circuit rating section is composed of both cable and overhead components, with different components limiting at different times.

Example of pro-rating 5L75:

Pro-rating to 15°C ambient temperature:

$$2870 \text{ A} + [(3700 \text{ A} - 2870 \text{ A}) \times (30^\circ\text{C} - 15^\circ\text{C}) \div (30^\circ\text{C} - 10^\circ\text{C})] = 3492 \text{ A}$$

Pro-rating to 40°C ambient temperature

$$2870 \text{ A} + [(3700 \text{ A} - 2870 \text{ A}) \times (30^\circ\text{C} - 40^\circ\text{C}) \div (30^\circ\text{C} - 10^\circ\text{C})] = 2455 \text{ A}$$

Pro-rating to 15°C ambient temperature:

$$3370 \text{ A} + [(4072 \text{ A} - 3370 \text{ A}) \times (30^\circ\text{C} - 15^\circ\text{C}) \div (30^\circ\text{C} - 10^\circ\text{C})] = 3896 \text{ A}$$

Pro-rating to 40°C ambient temperature:

$$3370 \text{ A} + [(4072 \text{ A} - 3370 \text{ A}) \times (30^\circ\text{C} - 40^\circ\text{C}) \div (30^\circ\text{C} - 10^\circ\text{C})] = 3019 \text{ A}$$

2.0 TRANSMISSION CIRCUIT OVERLOAD

2.1 Procedure

Transmission circuits shall be operated at or below their continuous rating. Clearance limits must not be violated. Emergency ratings are used only in contingency basis and would be identified by an Operating Plan for planned outages.

Operations Planning and AIM-AS groups are responsible for tracking the overload hours of circuits.

2.2 Action on Overload/Emergency Condition

If a circuit becomes seriously overloaded, (e.g. due to tripping of a parallel circuit or loss of generation), the overload must be reduced as promptly as possible by such actions as:

- Restoring the parallel circuit
 - Sectionalizing the system
 - Increasing appropriate generation
 - Shedding appropriate load

Should the overload exceed a circuit's 'Emergency' rating, the circuit loading MUST be reduced within five minutes to the emergency rating. If the emergency rating is not provided, reduce loading to the 'Normal' rating. As soon as practical, reduce the circuit loading to the normal rating at the existing ambient.

Where emergency ratings are provided, the circuit must not be operated at this temperature in excess of the total amount of time specified on a yearly basis. Using an emergency rating weakens the conductor due to annealing and should be limited so that the line does not prematurely fail or permanently alter design clearances. The values shown are representatives of emergency use that will not unduly shorten line life nor change its design characteristics.

2.3 Exception to Overload Rules

Under certain planned conditions, it may be necessary to load some circuits beyond the value listed and accept the reduced ground clearance and/or strength loss that will result. However, this must be done only after consultation with the appropriate Transmission Operations Manager and after various monitoring procedures are put in place.

2.4 Cable Emergency Rating

The emergency rating is dependent on variable factors such as soil resistivity, load factor, duration of load, loading prior to emergency, etc. which can fluctuate widely in individual cases. The values given are intended as a guide only and must be applied with discretion. When the loading on any of the cable circuits exceeds the Normal ratings, the SCM must be notified, so that the appropriate manager can investigate and advise on the validity of the emergency rating for each particular case. Duration of overload loading is not to exceed a total of 100 hours in any twelve consecutive months.

3.0 CIRCUIT RATING TABLES

Conductors shown in the rating table in Appendix 1 are the LIMITING conductors. Other conductors in this circuit may have equal or greater rating than the one shown.

Abbreviations and Definitions Used in Circuit Rating Tables:

DS	Disconnect Switch
CT	Current Transformer
IR	Impedance Relay
O/C	Over Current Relay
WT	Wave Trap
PN	Protection
CB	Circuit Breaker
SCOIP	Solid Core Oil Impregnated Paper
LPOF	Low Pressure Oil Filled
SCOF	Self-Contained Oil Filled

Single Breaker Closed CT Rating: Line is being fed by a single circuit breaker from the station end.

* Ending verification from asset manager

4.0 REVISION HISTORY

Revised By	Revision Date	Summary of Revision
CM	17 February 2022	Appendix 1 – updated ratings for 1L157, 5L42, 5L71 and 5L72.
AH	03 March 2022	Appendix 1 – added 5L6.
CM	10 March 2022	Appendix 1 – updated ratings for 1L31, 1L214, 1L218, 1L375, 2L12, 2L48, 5L79 and 5L96. Removed 60L9.
AH	17 March 2022	Appendix 1 – removed line sections and updated ratings for 60L20; added ratings for 60L90; corrected rating in 2L48.
CM	25 March 2022	Appendix 1 – updated and added ratings for 1L251.
AH	12 May 2022	Appendix 1 – updated ratings for 1L201, 1L202, 1L358, 2L103, 2L128, 2L50, 5L1, 5L2, 5L7, 5L11, 5L12, 5L13, 5L41, 5L44, 5L45, 5L75, 5L77 and 5L87.
AH	20 May 2022	Appendix 1 – updated ratings for 2L50, 2L97 and added rating for 1L210 tap to BKP, Changed TAP to Tap throughout the rating section of 5T-10.
AH	05 July 2022	Appendix 1 – updated ratings for 2L154; updated comment section for 2L90 and 2L103 to refer to App 2 for Ambient Temperature Adjusted ratings. Appendix 2 – Added new Ambient Temperature Adjusted ratings for 2L103.
AH	02 August 2022	Appendix 1 – updated ratings of 2L64.
AH	13 September 2022	Appendix 1 – updated ratings for 60L392, 1L14, 2L86, 5L92.
AH	16 October 2022	Appendix 1 – updated ratings for 60L351, 1L120, 1L121, 2L58, 2L62, 2L76, 2L79, and 2L264..
AH	11 January 2023	Section 1.3 – Note section removed shaded grey comment and Appendix 1 – updated ratings for 60L91, 1L366, 2L56, and 2L142.
AH	27 April 2023	Appendix 1 – updated ratings for 60L5, 60L20, 60L21, 60L31, 60L61, 60L62, 60L71, 60L75, 60L92, 60L101, 60L102, 60L271, 1L31, 1L209, 1L366, 1L377, 2L100; and added 2L107 rating row; and removed 2L1 overall rating row and 2L5 rating row; and deleted N/A from the rating tables and left blank for consistency.
AH	24 May 2023	Appendix 1 – updated ratings for 60L20, 60L21, 60L271, 1L143, 2L96; 3L2, 5L5 and 5L6.
AH	17 August 2023	Appendix 1 – updated ratings for 60L5, 60L20, 60L29, 60L295, 60L301, 1L48, 1L139, 1L251, and added new 2L379 rating rows.
AH	01 March 2024	Appendix 1 – updated ratings for 60L7, 60L8, 60L74, 60L336, 60L351, 60L392, 1L102, 1L109, 1L117, 1L120, 1L122, 1L143, 1L205, 1L218, 1L219, 1L385, 2L2, 2L4, 2L9, 2L13, 2L32, 2L51, 2L54, 2L123, 2L253, 2L263, 2L264, 2L277, 2L289 and 5L94.
BB	16 April 2024	Appendix 1 – updated ratings for 60L338, 1L220, 1L249, 1L251, 1L274, 1L275, 1L348, 1L359, 1L364, 2L277 and editing of many of the notes in the “Limitations” column for accuracy. Added line ratings for 1L351; transfer of ownership to BCH.
