2013 Resource Options Report Update  
Firm Energy Cost Adjustments

**Integrated Resource Plan Appendix 3A-34  
2013 Resource Options Report Update Appendix 12**

## **Firm Energy Cost Adjustments**

In the 2013 Resource Options Report (**ROR**) Update, the estimated costs of resources were shown in two ways: first, the total energy base UEC at the point of interconnection and, second, the adjusted firm energy UEC at the point of delivery (being the Lower Mainland which is the largest load centre).

The base unit energy costs (**UECs**) for each resource option at the point of interconnection (**POI**) reflect:

- Overall costs to the point of interconnect for total energy, i.e., both firm and non-firm energy;
- Costs within plant gate;
- Access road costs; and
- Transmission interconnection costs.

The adjusted firm energy UEC facilitates high level resource comparisons reflecting the total cost of the resource in meeting system needs. This process is similar to the approach taken in bid evaluation during acquisition call processes. The adjustments applied to each resource option are as follows<sup>1</sup>:

- **Soft Cost Adder:** A 5 per cent cost adder, calculated off the UEC at POI and chosen based on BC Hydro's experience was included to reflect cost expenditures such as environmental assessment, First Nations and stakeholder engagement costs, etc.
- **Freshet Firm Energy Adjustment:** Additional energy in the freshet period (May through July) has limited value to the BC Hydro system. This is a result of high freshet inflows into BC Hydro reservoirs which limit the capability of the system to absorb additional energy combined with depressed prices in the Pacific North West electricity markets during that time. The amount of firm energy from a resource option during the freshet was thus limited to 25 per cent of the total firm energy for the year. Any excess energy was deemed to be non-firm.
- **3 x 12 Time of Delivery Price Adjustment:** A firm energy price (at POI) was calculated for each resource option such that the total revenue of the resource option using the firm price for the firm energy and a non-firm price for the non-firm energy would equal the annual leveled resource option cost<sup>2</sup>. The non-firm energy was valued at the market price from BC Hydro's 2013 Market Scenario 1. In valuing the energy, a time of delivery factor applicable to the time of energy delivery was used. The time of delivery was determined based on the monthly energy profile of

---

<sup>1</sup> A 2 per cent annual inflationary factor was used in instances where it was necessary to inflate constant dollar values to \$F2013.

<sup>2</sup> Equal to the UEC at the POI multiplied by the resource options' total energy.

## **Integrated Resource Plan Appendix 3A-34 2013 Resource Options Report Update Appendix 12**

each resource option<sup>3</sup>. The time of delivery factor accounts for the value of electricity delivered to BC Hydro at different time periods in a month and at different months in the year. The time of delivery factors used are the same factors used in the Clean Power Call<sup>4</sup>.

- **Cost of Incremental Firm Transmission (CIFT):** The CIFT provides a general indication of the long-term unit cost of bulk transmission system reinforcements from one transmission region to the next. CIFT is expressed as a region-to-region bulk transmission capacity cost. A CIFT for energy delivery to the Lower Mainland load centre was calculated for each resource option. The CIFT adjustment was based on the BC Transmission Corporation (**BCTC**) report titled: *Bulk Transmission System Cost of Incremental Firm Transmission for BC Hydro's 2008 LTAP Base Plan and Contingency Resource Plans CRP1 and CRP2* (January 15, 2009)<sup>5</sup>.
- **Line Losses Adjustment:** A calculation was carried out to determine the losses associated with delivering energy of each resource option to the Lower Mainland. Losses were calculated based on a BCTC report titled: *Peak Load Incremental Losses for the Bulk Transmission System* (January 2010).
- **Greenhouse Gas (GHG) Offset Costs:** Offset costs were calculated for coal, cogeneration (**cogen**) and combined cycle gas turbine (**CCGT**) resource options and added to the UEC. GHG offset cost was assumed to be \$30/tonne (\$2012) of CO<sub>2</sub> equivalents.
- **Capacity Credit:** A capacity credit was applied to resource options capable of delivering an hourly firm product. This credit of \$50/kW-year (\$2013 based on REV6 UCC) was applied to wood-based biomass, biogas, municipal solid waste (**MSW**), CCGT, coal, cogen, large hydro and geothermal resources.
- **Wind Integration Cost:** Due to the intermittent and variable nature of wind energy output, a \$10/MWh adjustment was added to the wind resource UECs to account for the incremental cost of integrating wind projects into the BC Hydro system.

Table 1 and Figure 1 summarize UECs that have been adjusted as described above. Additional details of resource options with adjusted firm UECs under \$200/MWh are presented in Table 2.

---

<sup>3</sup> Within month profile was assumed to be flat except in instances where more detailed data was available.

<sup>4</sup> Please refer to Table 5-3: Time of Delivery Factors of the “Clean Power Call Request for Proposals - Report on the RFP Process” available at [http://www.bchydro.com/etc/medialib/internet/documents/planning\\_regulatory/acquiring\\_power/2010q3/cpc\\_rfp\\_process\\_report.Par.0001.File.CPC\\_RFP\\_Process\\_Report\\_August\\_3\\_2010.pdf](http://www.bchydro.com/etc/medialib/internet/documents/planning_regulatory/acquiring_power/2010q3/cpc_rfp_process_report.Par.0001.File.CPC_RFP_Process_Report_August_3_2010.pdf)

<sup>5</sup> BC Hydro is in the process of reviewing/updating the CIFT adjustments. Preliminary sensitivity tests with different CIFT values have shown no material impact on the relative ranking of resource options based on adjusted firm energy costs.

**Integrated Resource Plan Appendix 3A-34  
2013 Resource Options Report Update Appendix 12**

It should be noted that these cost adjusters do not reflect risks and uncertainties related to the level of study upon which resource option information is based, resource technology, earliest in-service date, and resource costs. They also do not reflect the cost of network upgrades required to interconnect the resource options to the bulk transmission system.

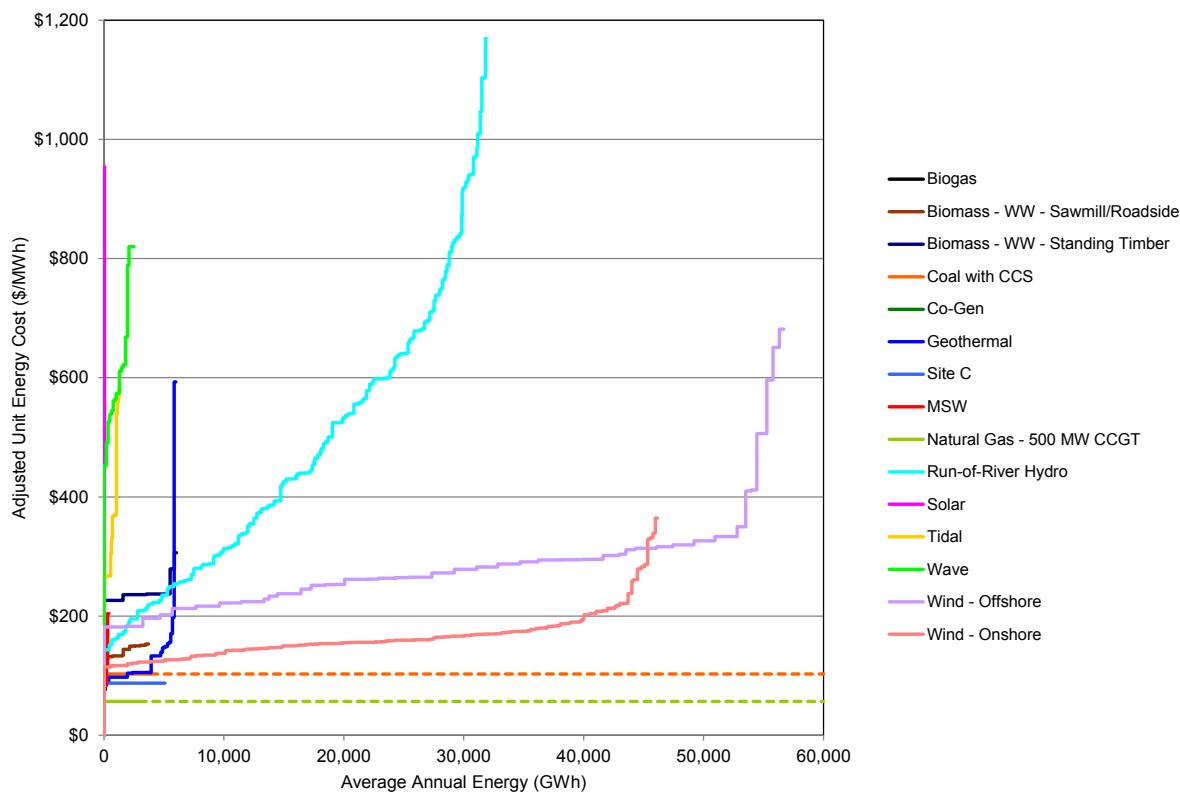

**Table 1: Summary of Supply-Side Energy Resource Options Potential – UECs at POI and Adjusted Firm UECs**

Energy Resource	Total Annual Energy (GWh/yr)	Total Dependable Generation Capacity (MW)	UEC at POI @ 7% Real Discount Rate (\$F2013/MWh)	Adjusted Firm UEC @ 7% Real Discount Rate (\$F2013/MWh)
Biomass – Wood Based	9,772	1,226	122 – 276	132 – 306
Biomass – Biogas	134	16	59 – 154	56 – 156
Biomass – MSW	425	50	85 – 184	83 – 204
Wind – Onshore	46,165	4,271	90 – 309	115 – 365
Wind – Offshore	56,700	3,819	166 – 605	182 – 681
Geothermal	5,992	780	91 – 573	90 – 593
Run-of-River	31,880	1,149	97 – 493	143 – 1,170
Site C	5,100	1,100	83	88
CCGT and Cogeneration	4,770	774	58 – 92	57 – 86
Coal-fired generation with CCS	3,896	556	88	103
Wave	2,506	259	440 – 772	453 – 820
Tidal	1,426	247	253 – 556	264 – 581
Solar	57	12	266 – 746	341 – 954

Note: The Site C values presented in this table are based on information provided in the Site C Environmental Impact Statement (**EIS**) submission filed in January 2013, and the UEC is calculated assuming a 5 per cent real discount rate.
