BC Hydro is affected by numerous drivers having a direct impact on the strategy we employ to meet our objective. These drivers affect the type of investments we make, how we prioritize investments and adapt to future trends.

Technology Strategy

BC HYDRO SERVICE PLAN OBJECTIVES

- Safety above all
- Set the standard for reliable and responsive service
- Help keep electricity bills affordable for our customers
- Help make renewable, clean power British Columbia's leading energy source

GOVERNMENT DIRECTION, REGULATION, AND COMPLIANCE

- BCUC regulation and rates forecast
- Mandatory Reliability Standards (MRS) and NERC CIP (Critical Infrastructure Protection) regulations requirements are increasing

BC HYDRO BUSINESS UNIT OUTCOMES

- Integrated Planning – optimize investments
- Capital Infrastructure Project Delivery – reduce delivery, safety and environment risk
- Operations – improve work management, productivity and maintain reliability
- Safety – improve safety outcomes, reduce risk
- Business Support Services – improve productivity and service
- Enterprise – Agile delivery, adapt to flexible work conditions

UTILITY INDUSTRY DIRECTION

- Security and compliance continues to be a rapidly increasing and growing market, ever changing and demanding
- Increased expectations for digital solutions to improve safety, productivity, and management visibility
- Increasing OT/IT convergence provides opportunities for knowledge and resource sharing
- A growing need to control distributed and customer side sources of energy as well as demand side management and load control
- Increasing electrification of transportation and management of charging infrastructure
- Climate change adaptation and mitigation

TECHNOLOGY ASSET HEALTH

- Existing systems are on ageing platforms that cannot be supported or are incompatible with newer operating systems
- Built in product obsolescence leads to regular upgrades to retain product support

TECHNOLOGY MARKET DIRECTION

- Subscription licensing is a major trend within the software industry changing our cost profile away from capital investment and towards operating costs
- Commoditization of technology services can result in lower costs, for example data network transport costs
- Everything as a service or cloud services are becoming the norm, changing our cost profile away from capital investment and towards increased operating costs

TECHNOLOGY TRENDS

- Cloud services are growing rapidly offering scalability, disaster recovery, and mobility enablement
- Mobility offers productivity benefits for field workers and a flexible COVID-19 response.
- Internet of things, Edge computing and Digital twin offers opportunities in asset monitoring and performance management
- Artificial intelligence and robotic process automation offer efficiency gains through replacement of manual processes
- Augmented and virtual reality for training, virtual mentoring, inspections and maintenance support
- Robotics and drones for inspections and progress reporting
- Blockchain for secure transaction processing

Technology strategy

Digital value streams for electric utilities

Digital technologies are used to enable new and improved capabilities and drive value across all functions of the utility.

PLANNING & DESIGN

High performance computing, cloud solutions, and advanced analytic and drafting tools enable more comprehensive and timely energy and system planning, load forecasting, resource management, engineering and design.

ASSET MANAGEMENT

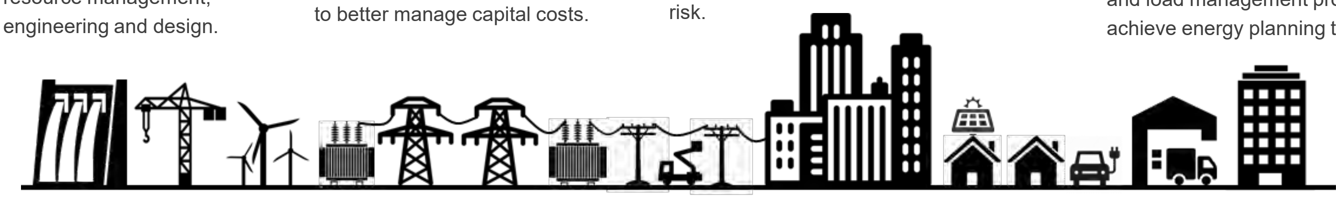
Real-time asset health information enables condition-based maintenance and just-in-time replacement to reduce asset sustainment costs. Asset health also provides for optimized investment planning to better manage capital costs.

MOBILE WORKFORCE

A fully mobile workforce seamlessly completes their field work. Job information is available, inspections are captured, drawings updated, and problems and progress automatically reported. Safety training and support is available on demand. Value is achieved through productivity, efficiency and reduced safety risk.

CUSTOMER ENGAGEMENT

Multi-channel technologies and relationship management tools improve quality and timeliness of customer interactions. Self-service reduces our costs and improves customer experience. Systems to support demand side management and load management programs help achieve energy planning targets.



WORK MANAGEMENT

Productivity, efficiency and risk reduction can be achieved through mobile applications, digital workflows to manage information and record keeping, use of drones to capture progress images, access to real-time data and business intelligence and analytics. Scheduling tools and optimization algorithms make managing work, during both normal and emergency situations, more efficient.

GRID INTELLIGENCE & CONTROL

Smart devices on the grid help optimize power delivery and resilience, and give operators and field service crews visibility into outages, faults, power quality issues, and the status of energized equipment. Digital systems manage distributed energy resources, automate connect and disconnect functions, power distribution and power quality.

SAFETY & SECURITY

Sensors, imaging and internet of things technologies provide visibility to facilities that are remote and/or unmanned. Monitoring and surveillance technologies improve identification and response to safety and security situations. Mobile field tools aid in worker and crew safety. Improved protection of digital information, systems and equipment reduces cyber security risk.

BUSINESS OPERATIONS

All business functions benefit from improvements to work processes, access to analytics, decision making, information management, and knowledge retention tools. Opportunities also exist to improve hiring, development and retention of valuable employees through specialized tools.

BC Hydro
Power smart

Our Strategy

- Principles
- Critical success factors

BC Hydro
Power smart

Technology Strategy

Our Strategy

We will adopt a business mindset, ensuring we work within our constraints to achieve the best outcomes for BC Hydro while maintaining the security and integrity of our information and systems at all times. We will adapt our solutions and processes to exploit short term opportunities and deliver outcomes early and often. We will develop technology roadmaps to ensure alignment on business solutions, leverage new technologies and prepare for technology obsolescence.

Business mindset

Optimize our investment

- ✓ Use a prioritization and selection methodology to achieve optimal outcomes
- ✓ Develop a plan that works within the constraints of costs and resources
- ✓ Use structured decision making in choosing investment alternatives
- ✓ Leverage existing systems
- ✓ Use a risk based approach to sustainment

Value fast

Deliver outcomes early and often

- ✓ Adapt delivery processes to deliver early and often
- ✓ Use a flexible architecture to support early value
- ✓ Leverage our existing systems
- ✓ Use off-the-shelf products
- ✓ Use cloud services

Forward thinking

Leverage technology

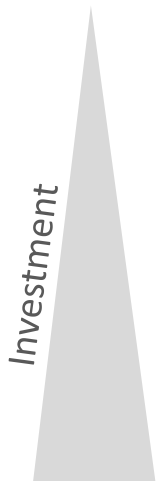
- ✓ Develop roadmaps for foundation technologies
- ✓ Ensure alignment of short-term business solutions
- ✓ Plan for future obsolescence

BC Hydro
Power smart

Technology Strategy

Principles – Business mindset

- **Justify and prioritize investments.** Investment proposals are selected into the portfolio based on relative value to the organization. Compliance, security, sustainment and risk mitigation solutions receive higher priority followed by those required to enhance business capability. Business cases must identify value and articulate specific benefits. Value (both cashable and non-cashable) from the investment must support the total cost of the investment.



Initiative / Investment	Description
Enhance our Capability	Discretionary activities that provide new or improved business capabilities
Manage our Risk and Sustain Productivity	Critical activities needed to ensure reliable and safe operations and to maintain the current level of productivity for our users
Compliance & Security	Mandatory activities needed to meet government/BCUC/NERC/WECC requirements

- **Work within our constraints.** Investment decisions are subject to the application of constraints due to funding, resource capacity, available skill sets, and ability of the organization to sustain and absorb change. Choices between investment options are decided through structured decision making.

- **Track the outcomes of investments**. Sponsors of technology-enabled initiatives are required to track benefits throughout implementation and into sustainment.

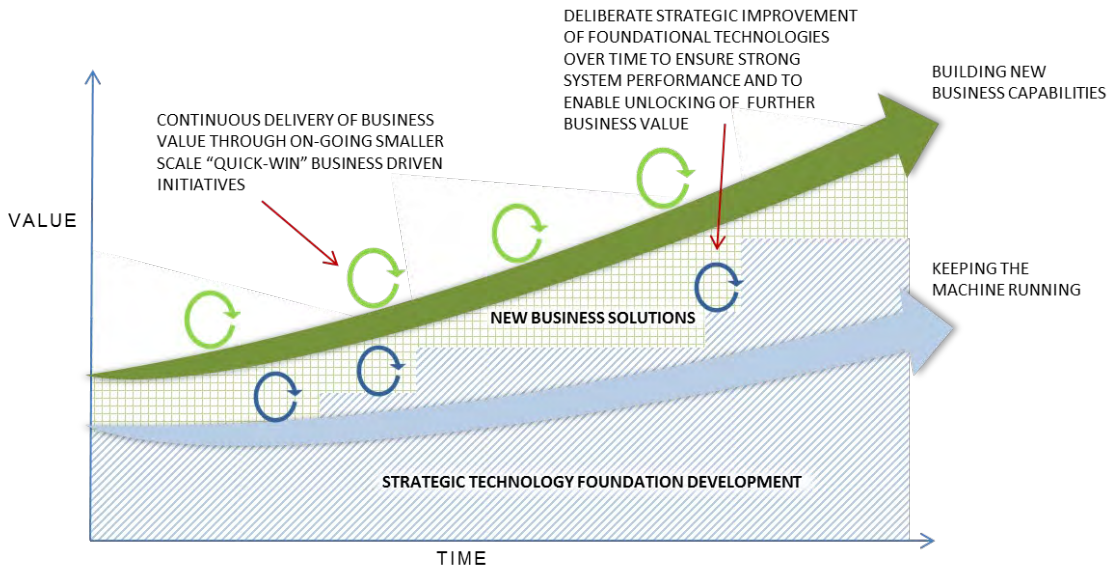
BC Hydro
Power smart

Technology Strategy

Principles – Value fast

- **Deliver value early and often.** Our approach is to exploit opportunities to deliver value early from interim solutions, even at a cost – provided the value exceeds the cost over the life of the interim solution. We will use "two-speed" or "agile" delivery methods, where appropriate, to expedite implementation of solutions.

- **Ensure architectural flexibility.** We will make investments that advance our delivery of value while still maintaining flexibility in our systems architecture. This allows for incremental and early value delivery, while implementing efficient and sustainable long-term foundation investments.



The diagram shows how we strive to deliver value early and often through incremental improvements (in green) while continuing to invest in our technology foundation for long term strategic business enablement (in blue)

BC Hydro Power smart

Technology Strategy

Principles – Forward thinking

- **Build for the future.** Technology roadmaps describe how we can invest in our foundation and leverage new technologies to enable our strategic objectives. The roadmaps sequence initiatives, identify decision points, and provide unconstrained scheduling of milestones to enable business outcomes. Given the dynamic nature of technology and technology industry changes as well as changes to BC Hydro's environment, our roadmaps will be updated regularly. The following summaries describe current guidance for each foundation area however all initiative proposals require individual investment justification.

NETWORK CONNECTIVITY	Sustain existing wide area, field area and local area networks, as well as extend network bandwidth and coverage to our more remote sites. Continue to refresh our network equipment based on end-of-life cadence, meet current and future capacity requirements, and take advantage of software alternatives as they become available. Continue to invest in wireless networks for our facilities and vehicles to enable workforce mobility, asset management, and increased safety and security.
ENTERPRISE APPLICATIONS	Continue to upgrade our enterprise applications based on a cadence to maintain product support. As upgrades are scheduled, take advantage of opportunities to modernize current platforms as per industry direction to remain current and reduce risk of obsolescence. Implement new customer contact centre systems to replace those that are not meeting requirements of availability and reliability, as well as modernizing the stack to extend and enhance current functionality for our customers. For Enterprise Resource Planning (ERP), we have adopted a "Core ERP" approach in which SAP is our single system of record for enterprise data but the systems our users engage with may be "bolt-ons" or cloud service products. Complete SAP Supply Chain and initiate Enterprise Asset Management and Work Management allowing for improved work planning and scheduling as well as the decommissioning of Passport. Migrate SAP to the S4/HANA© platform to maintain currency and support. Use Robotic Process Automation (RPA) to replace manual, repetitive processes on a case-by-case basis.
CLOUD & DATA CENTRE	BC Hydro's approach to cloud is to adopt services on a case-by-case basis. Use cloud services as needed for compute power, specific business functionality, disaster response environment, collaboration and productivity. Continue to refresh our data centre servers, storage and other equipment based on end-of-life cadence. As equipment is replaced, leverage opportunities to consolidate racks as well as review cloud options. Leverage major product upgrades in line with the direction our product vendors as they move to cloud platforms.

Technology Strategy

Principles – Forward thinking

MOBILITY SERVICES	Extend and improve our mobile services and mobile workforce capabilities. Continue to refresh our user's mobile phones and devices based on recommended refresh cadence, break/fix and device management requirements. Complete replacement of our existing mobile application management platform to better support device management, performance and required functionality. To facilitate future development of field worker applications, implement a suite of container services, application program interfaces (APIs) and a mobile work management platform. Strive to extend our device management capability to a broader range of devices.
GIS	Our approach is to use the ESRI platform for new applications requiring GIS (Geographic Information System), upgrade the current version of Smallworld and defer future direction decisions on our Smallworld GIS applications until the next major product replacement or upgrade. This will likely be the replacement of our Distribution Analysis & Design (DAD) and Spatial Asset Management (SAM) tools. Continue to focus on integrating GIS with our CAD (Computer Aided Design) tools, mobile application and ERP capabilities in order to support designers, field workers, asset management and work management. Extend our use of GIS in application development to provide geographic location search to access information, provide operational and emergency situational awareness. Continue to upgrade our GIS platforms based on a cadence to maintain product support.
PERSONAL WORKSPACE	Continue to refresh personal computing devices based on recommended refresh cadence, productivity, break/fix and device management. Upgrade our desktop environment to Windows 10 to improve performance and functionality, implement Microsoft's Office 365 suite of tools to support improved collaboration and productivity, and migrate to Microsoft Exchange Online to optimize storage capacity, ensure product support and align with product vendor direction. Upgrade our information collaboration (SharePoint) platform and make SharePoint online available for collaboration in the future. We expect to maintain an "on premise" presence for security and business continuity.

BC Hydro
Power smart

Technology Strategy

Principles – Forward thinking

CYBER SECURITY	BC Hydro uses a risk-based approach to cyber security and information protection. New investments are made based on compliance requirements, emerging threats and retaining our risk posture. Comply with NERC (North American Electric Reliability Corporation) CIP (Critical Infrastructure Protection) standards. Respond to audit reports, assess risk and ensure security of grid and facilities. Sustain and maintain our information management systems, corporate monitoring tools, firewalls and other protection equipment based on end-of-life cadence, and risk mitigation. Leverage upgrades to modernize our architecture and optimize network segmentation through software as it becomes operationally mature. Apply information technology (IT) cybersecurity best practices to our operational technology (OT) environments and develop an information protection program to improve security of our systems of record, information sharing and records management platforms.
BUSINESS INTELLIGENCE & ANALYTICS	BC Hydro's direction is to adopt a self-service model for analytics in which users are given access to data and can use their own tools and analysts to meet their needs. In support of this approach, work to broaden access to our smart meter data, implement SAP on S4/HANA© for improved performance and easier data access, and implement a virtual data warehouse to improve ability to share both enterprise and business specific data across business functional areas. In addition, implement a telematics solution for fleet data analytics, fleet asset management and fleet operations, as well as a platform for asset investment planning and asset performance management to enable business outcomes such as enhanced condition based maintenance and predictive maintenance. Continue to leverage the Province of BC and TELUS Strategic Innovation Fund to explore implementation of an enterprise data collection platform (internet-of-things) to support business outcomes related to worker and public and dam safety.
ENERGY MANAGEMENT	BC Hydro's grid modernization work identified opportunities for improving operations, security, safety and visibility to the grid with many of these improvements involving the deployment of digital technologies. Our approach is to take advantage of these opportunities on a case-by-case basis depending on their ability to meet our strategic objectives, the priorities of our organization, the maturity of the technologies and business constraints. Continue to upgrade our Energy Management System and Outage Management System (PowerOn) to maintain product support, and work to extend the use of our smart meter data to support outage management objectives. Implement an integrated Advanced Distribution Management System to improve performance, meet business outcomes and align with product vendor direction.

BC Hydro Power smart

Technology Strategy

Critical success factors

Delivery of the strategy demands that we address some non-technical factors that will be critical to success:

1. **Early engagement with our business leaders on strategic direction.** Technology must be recognized as necessary to achieving the goals of the organization. Technology leaders must be invited to work closely with business leaders during their planning to understand the strategic objectives and advise on opportunities for technology enablement.

2. **Streamline our delivery processes to be fit for purpose.** We have a robust IT delivery process (ITDSP) which has served us well in providing strong guidance and oversight of our project delivery function. This process does not scale adequately for our lower risk project activity nor provide the agility needed for user facing capability development. We are developing alternative delivery models (both variants to ITDSP as well as 2-speed or agile models) to meet the needs of modern technology deployment.

3. **Resource availability and reduction in capacity bottlenecks.** Project initiation decisions must consider not only capital investment availability. Equal emphasis is required for the availability of operating funds to support the non-capital project costs and on-going sustainment costs, and availability of resources to deliver and support pre-project and project delivery activities.

4. **Portfolio management prioritization and selection processes.** Capital investment prioritization and selection must be based on a common value framework for the organization and an integrated selection process that allows for trade-offs in non-sustainment investments. Investment decisions are subject to the application of constraints due to funding, resource capacity, available skill sets, sustainment capabilities, and ability of the organization to absorb change.

5. **Funding**. The current funding model based on capital investment for technology does not support future subscription and cloud services investments that typically require operating funds. A new funding model is required to ensure the success of future technology investment and operations.

6. **Governance, risk and compliance.** Continued central governance of systems architecture and project delivery is required to optimize resources and ensure compliance with security, privacy, delivery and architecture standards and policies.

BC Hydro
Power smart

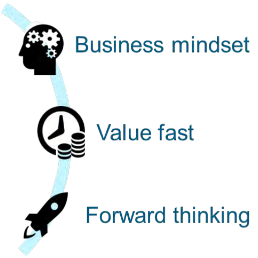
5-Year Plan

- Developing the plan
- Future business outcomes
- Prioritization and constraints
- Investment summary
- Measuring our success
- Conclusion

BC Hydro
Power smart

New in Fiscal Year 2021

5-Year Plan



This year's 5-Year Plan has been refreshed to reflect the priorities and initiatives expected over the next five years under the current capital investment plan.

After the application of prioritization and constraints, our investments over the next five years are driven primarily by compliance, security and sustainment. With the completion of the Supply Chain Applications project, we are now planning for a future initiative to meet BC Hydro's work management objective. Pre-initiation work on Enterprise Asset and Work Management will provide us with the information we need on costs, benefits and approach to proceed with an investment designed to achieve our productivity and cost efficiency objectives.

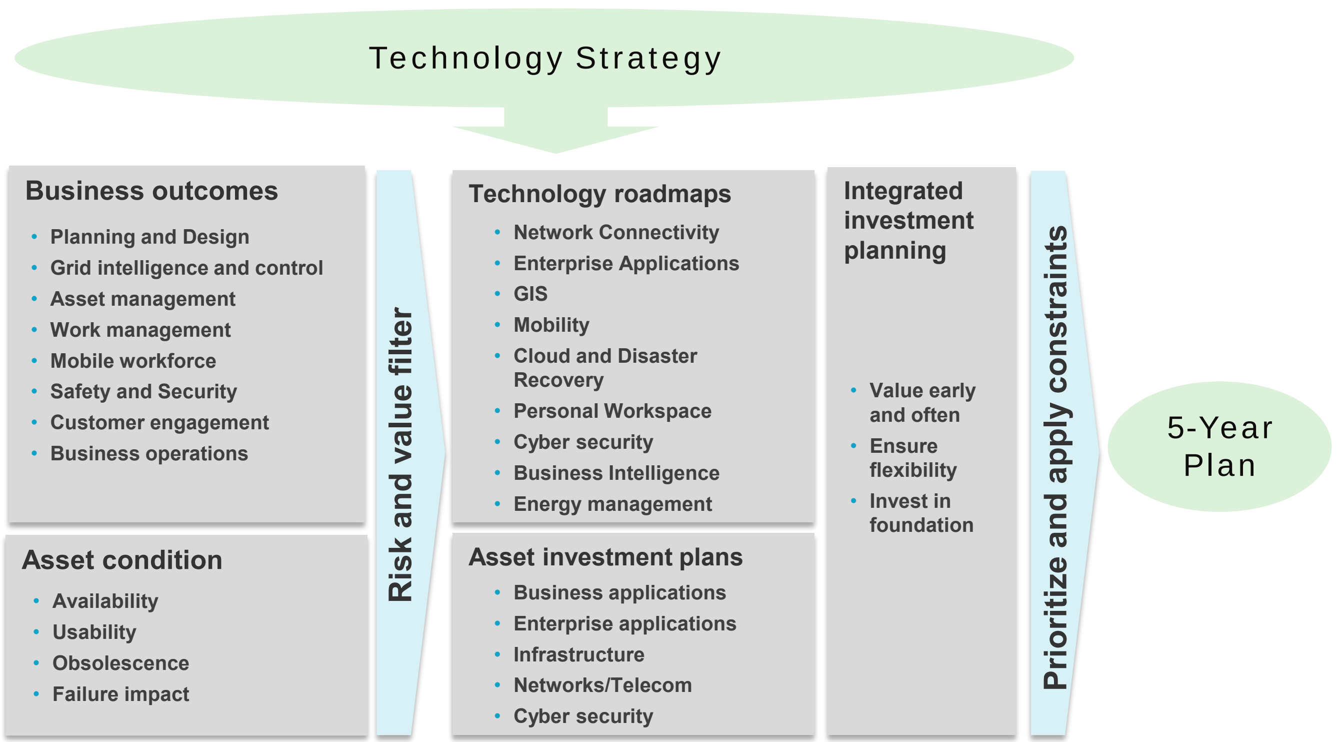
Pre-initiation work is also underway for migrating our core SAP system to S4/HANA. SAP HANA is SAP's in-memory database which provides technical capabilities to run transactions much faster and simpler access to the data. SAP S/4 HANA is a new version of SAP application that runs on SAP HANA database leveraging the power of in-memory computing. This version of SAP has a dramatically simplified data model, faster processing, advanced real-time data analytics capabilities and a modern user experience. It also provides options for robotic process automation, machine learning and artificial intelligence capabilities.

All compliance and security related initiatives are included in the capital plan including incremental investment that may be required as an outcome of the compliance technology roadmap work. Any major compliance or cybersecurity initiative resulting from the compliance technology roadmap work is not included.

5-Year Plan

Developing the plan

Fundamentally, the objective of the Technology group is to enable business outcomes and sustain the availability and security of our existing assets.



BC Hydro Power smart

5-Year Plan

Developing the plan

In developing this Plan, the Technology group facilitated over twenty workshops with business group leaders to identify desired business outcomes for the next five to ten years. Over two hundred outcomes were articulated, with approximately half of those dependent on a technical solution. These outcomes were assessed for value based on executive and senior management's best judgement on their contribution to meeting our strategic objectives. This information is reviewed and confirmed annually and is used to inform our technology roadmap development and investment planning.

The condition, health and longevity of our assets are also assessed annually by our Technology team. Our Business Partner Services team also use their best judgement in how well the business and enterprise applications are meeting the needs of BC Hydro. This information, together with the impact of lost availability, is used to inform our technology asset investment plans.

Integrated investment planning activities bring together the technology roadmap view, the asset investment view, and alignment with business expectations. The result is our aspiration for technology investment. Application of selection and prioritization criteria, as well as funding and resource constraints, leads to the development of the five year plan.

This 5-Year Plan shows the investments currently anticipated based on BC Hydro's capital plan for the next five years. With the application of prioritization and constraints, our investments over the next five years will be driven primarily by compliance, security and sustainment. This year, we begin planning for opportunities to improve business capabilities in priority areas. These plans allow us to initiate investment as resources become available. Priority investments are those that provide opportunities for improving compliance outcomes, making it easier to get work done and achieving operational efficiencies.

5-Year Plan

Future business outcomes

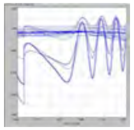
Our Technology team reviewed and aggregated the business outcomes for commonalities and determined the underlying technology investment needed. This is a summary of the aggregated business outcomes.

VALUE STREAMS

BUSINESS OUTCOMES

PLANNING & DESIGN

- Enhanced load forecasting and energy planning
- Enhanced engineering design



GRID INTELLIGENCE & CONTROL

- Distribution grid management
- Demand response management
- Digital substations
- Distributed energy resource management
- Resilient tele-communications networks

ASSET MANAGEMENT

- Integrated and optimized investment planning
- Asset performance management
- Asset intelligence for operations
- End-to-end asset management

WORK MANAGEMENT

- Operations work planning and scheduling
- Optimized planned outage management
- Real-time monitoring and management of work

MOBILE WORKFORCE

- Ability to complete job on site
- Safety practices integrated into work process on site
- Work site awareness
- Real-time visibility to grid status on site
- Ability to collect quality information from the field

SAFETY AND SECURITY

- Resilient and secure IT and OT systems
- Real-time situation awareness during emergencies
- Physical grid security
- Automated facility security
- Enhanced dam safety systems

CUSTOMER ENGAGEMENT

- Customer inclusion in conservation and electrification programs
- Improved outage and restoration information
- Customer work booking
- Optimized customer service interactions

BUSINESS OPERATIONS

- Optimized supply chain function
- Optimized back office processes
- Enhanced data access and business intelligence
- Improved information, records management, search
- Improved employee experience, productivity and collaboration
- Workforce planning and development

5-Year Plan

Prioritization and Constraints

There are many opportunities for utilizing technology to unlock value in BC Hydro but it is not possible to achieve all outcomes all at once. Therefore, it is necessary to **prioritize** the outcomes and focus on those which we consider most important to the organization. In general, mandatory initiatives needed to address *compliance and security* are the highest priority and critical initiatives that address *risk management and sustainment of productivity* are next.

Initiative / Investment	Description
Enhance our Capability	Discretionary activities that provide new or improved business capabilities
Manage our Risk and Sustain Productivity	Critical activities needed to ensure reliable and safe operations and to maintain the current level of productivity for our users
Compliance & Security	Mandatory activities needed to meet government/BCUC/NERC/WECC requirements

Initiatives that *enhance our capability* are considered discretionary and are third in priority ranking. It should be noted, however, that these initiatives may provide significant benefits and help us in achieving our strategic objectives.

Once prioritized, it is necessary to apply our **constraints** in order to develop a plan that can be delivered with confidence. We apply a number of critical constraints including,

- The Technology team capacity
- Capital and operating funding
- Business capacity for change
- Availability of BC Hydro and contractor support resources
- Technical dependencies
- Technology maturity

5-Year Plan

Investment summary

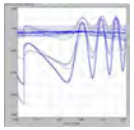
Under the current constraints, work will continue to complete projects underway and a limited number of new business value initiatives will be undertaken. The bolded outcomes are those that are wholly or partially addressed by major planned initiatives.

VALUE STREAMS

BUSINESS OUTCOMES

PLANNING & DESIGN

- Enhanced load forecasting and energy planning
- **Enhanced engineering design**



GRID INTELLIGENCE & CONTROL

- **Distribution grid management**
- Demand response management
- Digital substations
- Distributed energy resource management
- Resilient tele-communications networks

ASSET MANAGEMENT

- Integrated and optimized investment planning
- Asset performance management
- Asset intelligence for operations
- **IT and OT system asset management**

WORK MANAGEMENT

- **Operations work planning and scheduling**
- Optimized planned outage management
- Real-time monitoring and management of work

MOBILE WORKFORCE

- **Ability to complete job on site**
- **Safety practices integrated into work process on site**
- Work site awareness
- Real-time visibility to grid status on site
- **Ability to collect quality information from the field**

SAFETY AND SECURITY

- **IT and OT system security and resilience**
- Real-time situation awareness during emergencies
- **Physical grid security**
- Automated facility security
- **Enhanced dam safety systems**

- **Customer inclusion in conservation and electrification programs**
- Improved outage and restoration information
- **Customer work booking**
- **Optimized customer service interactions**

BUSINESS OPERATIONS

- **Optimized supply chain function**
- Optimized back office processes
- Enhanced data access and business intelligence
- **Improved information, records management, search**
- **Improved employee experience, productivity and collaboration**
- Workforce planning and development

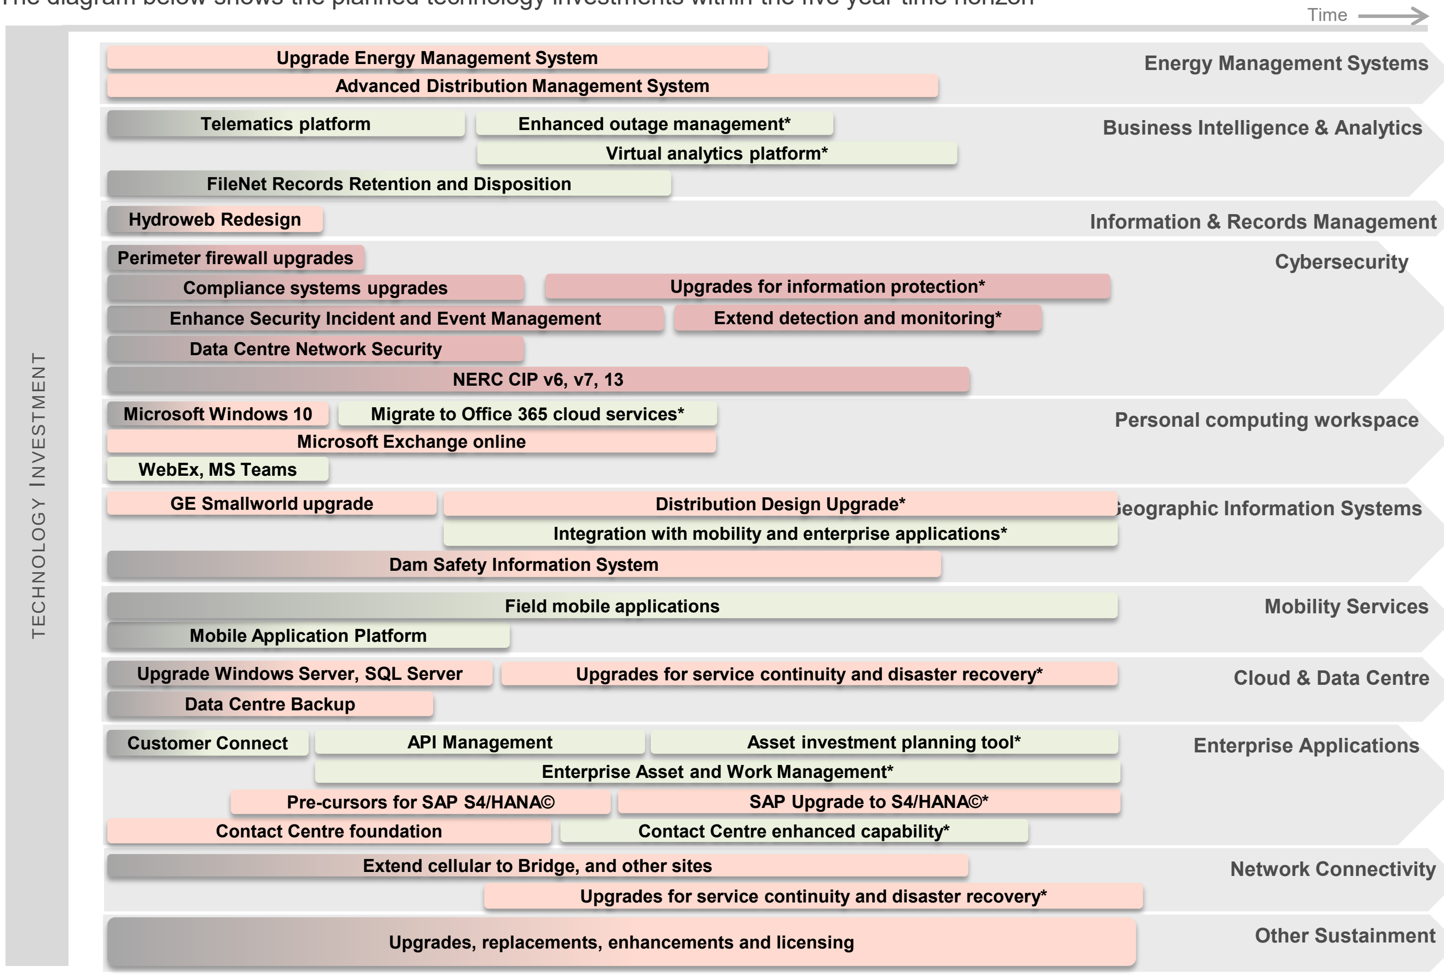
5-Year Plan

	Investment Initiatives	Business outcome
Security and Compliance	NERC CIP v6, v7, NERC CIP-013 Compliance System Upgrades Compliance Technology Roadmap	IT and OT system security and resilience Physical grid security
	Firewall Upgrades Enhance Security Incident and Event Management (SIEM) Extend Detection and Monitoring	IT and OT system security and resilience Physical grid security
Risk and Productivity Sustainment	**Upgrades:** Energy Management System (EMS), Windows 10, Exchange Online, Windows Server and SQL Server, Enterprise Mobile Application Management, GE Smallworld GIS, Contact Centre Foundation, PowerOn 4.3, Energy Analytics System GreenPlum Hardware Upgrade, SAP Technical Upgrades, API Management, WISKI Upgrade (water) **Replacement**: Surrey Campus Network, CIDC Network, FVO/SIO Network, Regional Site Infrastructure, Corporate Telephony, Data Centre Infrastructure (servers, storage, network devices), Personal Devices (PCs, Phones, Tablets), SAP Customer Management, Learning System, Advanced Distribution Management System Studies: Distribution Design Replacement and Passport Decommission Study, SAP S4/HANA Migration Study Product licensing and enhancements to ensure vendor support	IT and OT system security and resilience IT and OT systems asset management
	Extended Cellular to Dam Facilities Dam Safety Information System	Enhance dam safety systems
Enhance Business Capability	Customer Connect Web Enablement Enable Voluntary Time-based Rates	Optimized customer services interactions Customer inclusion in conservation and electrification programs
	WebEx, Microsoft Teams Enterprise Hydro Web (Intranet) Redesign FileNet Records Retention and Disposition	Improved employee experience, productivity and collaboration Improved information, records management, search
	Field mobile applications Mobility Application Platform	Ability to complete job on site Ability to collect quality information from the field Safety practices integrated into work processes on site
	Studies: Enterprise Asset and Work Management Study, Lines Asset Hierarchy Study, Contractor Lifecycle Study	Operations planning and work scheduling
	Telematics Platform	Asset intelligence for operations

5-Year Investment Plan

Investment Summary

The diagram below shows the planned technology investments within the five year time horizon



26

*Those initiatives with an asterisk are not included in the F21 current capital portfolio.

5-Year Plan

Measuring our success

The Technology group has a variety of ways to track and measure the success of our capital investments. These range from the immediate and quantifiable, such as operational and delivery metrics, to the completely qualitative business satisfaction survey. We recently introduced a benefits tracking process for business capability driven initiatives. In this process both quantitative and qualitative assessments are made over a period of time following deployment of a solution.

- **Operational Metrics** – Technology uses a number of metrics to evaluate and track the performance of our systems, services, and vendors.

- **Delivery Metrics** – Technology uses a number of metrics to assess and track the performance of our delivery which include measures on cost, schedule, and quality.

- **Business satisfaction** – Technology conducts an annual satisfaction survey to solicit feedback from across the business of the level of satisfaction with Technology delivery and services.

- **Project Benefits** – Benefits from initiatives undertaken as part of implementing technology solutions will be tracked to assess how well they deliver on the expectations set out in their respective business cases.

Technology Strategy and 5-Year Plan

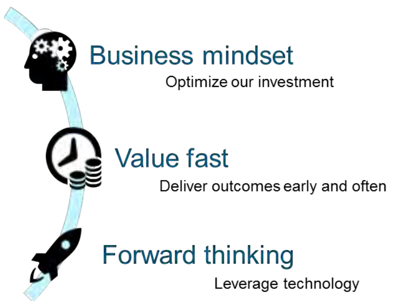
Conclusion

Our strategy describes BC Hydro's landscape and the drivers that influence our future business and technology decisions; our overall objective is to help BC Hydro achieve its service plan goals through the use of technology. We identify eight value streams across BC Hydro through which technology can unlock significant benefits. Our approach is to operate with a *business mindset*, to deliver *value fast*, and to be *forward thinking* in all we do.

BC Hydro's 5-Year Technology Investment Plan identifies expected business outcomes from across planning, delivery, operations and business support functions. The outcomes are assessed based on their ability to help achieve our service plan objectives. Following prioritization and the application of constraints, the Plan describes the outcomes we expect to achieve in the next five years and the corresponding investments in technology.

We must also sustain and maintain our existing systems. Investments for sustainment include refreshes for infrastructure, personal devices, network, telephony and cyber security assets, as well as upgrades and replacement of business and enterprise applications.

The plan reflects corporate planning activities and uses input from BC Hydro's executive and senior managers as well as the Technology subject matter experts. BC Hydro uses an annual planning cycle to maintain currency of plans and adapt to changes. We expect to update this plan annually.



BC Hydro
Power smart

BC Hydro Fiscal 2023 to Fiscal 2025
Revenue Requirements Application

Appendix P

Project Write-off Costs

Table of Contents

List of Tables

1 Introduction

In its Decision on the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (**F20-F21 RRA**) , the BCUC acknowledged that some project write-offs are reasonable and to be expected in a utility's normal course of business.[1] The BCUC suggested that a regulatory account could be considered as a mechanism to capture BC Hydro's actual project write-off costs for future recovery, provided that:

> …in future RRAs BC Hydro also lists all of the projects and costs that have been written-off and captured in the regulatory account along with a description of each project, the rationale for incurring the costs and the rationale for the decision to not continue with the project. In the Panel's view, this would provide the BCUC and interveners with an opportunity to review the reasonableness of these costs.1

In response to Directive 33 of the BCUC's Decision on the F20-F21 RRA, BC Hydro applied for approval to establish a Project Write-off Costs Regulatory Account,[2] which was approved by BCUC Order No. G-337-20 dated December 17, 2020. The purpose of the account is to defer, on an ongoing basis starting in fiscal 2020, actual project write-off costs in each fiscal year where BC Hydro believes future recovery from ratepayers is appropriate. BC Hydro then provides the details in respect of completed fiscal years in its RRAs for review by the BCUC.

In its Decision on the Previous Application, the BCUC approved a recovery mechanism for the account, and accepted that the $9.3 million of actual project write-off costs incurred in fiscal 2020 should be recovered from ratepayers.

In accordance with the suggested process from the Decision on the F20-F21 RRA, this Appendix lists the projects and costs that have been written-off and captured in the regulatory account in fiscal 2021, a description of the projects, as well as the

1 BCUC Decision and Order No. G-246-20, BC Hydro F20-F21 RRA (October 2, 2020), page 107.
2 Refer to: https://www.bcuc.com/ApplicationView.aspx?ApplicationId=833.

rationale for incurring the costs and the rationale for not continuing with the projects or reducing the scope of the projects.

2 Information Considered for Project Write-Off

Project write-offs continue to be determined with reference to the accounting rules BC Hydro is required to follow. BC Hydro uses International Financial Reporting Standards guidance in reviewing capital projects for any asset impairment. Specifically, International Accounting Standards 36 – *Impairment of Assets* – provides the following guidance:

> An entity shall assess at the end of each reporting period whether there is any indication that an asset may be impaired. If any such indication exists, the entity shall estimate the recoverable amount of the asset.

Active capital projects are not yet assets in service, but from an accounting perspective are still assets on the balance sheet classified as work in progress. BC Hydro reviews capital projects each month based on the standard noted above for any internal or external information to determine if an impairment exists and if so, the amount of the project that needs to be written off. If a project or any part of the project is to be written off, a justification is prepared by the project team and presented to the appropriate level of management for approval, depending on the amount of the write-off.

Projects are similarly reviewed throughout the project lifecycle. Specifically, at the end of each phase of the project lifecycle, BC Hydro determines whether a project should proceed to the next phase of the project lifecycle, be cancelled or be reduced in scope. If a project is cancelled or reduced in scope, the expenditures on that project are reviewed against the standard noted above to determine any impairment and resulting write-off.

Pursuant to the processes outlined above, and consistent with the Previous Application, key reasons why an impairment may occur and a write-off may be required include the following:

1. **Cost**: Detailed design work may indicate that the costs of the original leading alternative are higher than originally planned, which may result in another alternative being more cost-effective. If it is determined that another alternative will be pursued as a result, some or all of the costs incurred in respect of the original leading alternative may hold no future value (i.e., are impaired) and may be required to be written off;
2. **Technical Issue**: Detailed engineering work may indicate that the original leading alternative has technical issues that were not previously known. Examples are challenges associated with retro-fitting new equipment with existing equipment of a different vintage, or the identification of damage or poor condition of assets that were not being replaced once a sealed asset is opened. Another example of a technical issue is where information developed may reveal a new alternative that is determined to be superior to the original leading alternative. If these examples result in changes to the leading alternative or the pursuit of another alternative, some or all of the costs incurred to that point may be impaired and may be required to be written off;
3. **Business Driver**: Business factors, such as the load forecast, could push the need for a project that is currently underway to a future period. In this instance, depending on factors such as the length of time before the project may be needed in the future and the likelihood of future need, some or all of the costs incurred to that point may be impaired and may be required to be written off; and
4. **Customer's Need**: A project to interconnect a customer may be cancelled or the scope changed because the customer has changed its request. A customer could also cancel a load request that had a reinforcement project to existing

BC Hydro assets to support the new load. In this instance, some or all of the costs incurred to that point may be impaired and may be required to be written off.

3 Project Write-Offs in Fiscal 2021

BC Hydro's actual project write-offs in fiscal 2021 were $9.6 million. BC Hydro is not seeking recovery of $2.3 million of this amount as BC Hydro does not believe it would be reasonable for ratepayers to pay for the costs in these instances. Accordingly, BC Hydro has deferred $7.3 million ($9.6 million minus $2.3 million) to the Project Write-off Costs Regulatory Account in fiscal 2021 and proposes to recover this amount from ratepayers over the Test Period in accordance with the approved recovery mechanism for the account.

Table P-1 provides the itemized project write-offs deferred to the Project Write-off Costs Regulatory Account in fiscal 2021.

Table P-1 Project Write-Off Amounts deferred in Fiscal 2021

Project Name	Amount Deferred ($ million)	Project Description	Rationale for Write-off
Chilliwack Facility Project	2.1	This project was to construct a new building to accommodate the combined operational needs of the current Chilliwack (a leased facility) and Atchelitz (adjacent to the substation) field offices.	Technical Issue. During the early Definition Phase in the project, BC Hydro had identified a suitable property, reached a conditional agreement on the property acquisition with the property owner, and proceeded with the building design in parallel with the property owner seeking final approval from the Agricultural Land Commission (ALC). The property acquisition was ultimately unsuccessful due to the property owner deciding not to accept the conditions of development required by the ALC. Subsequently, BC Hydro conducted multiple attempts to locate a suitable site; however, all were unsuccessful. $2.1 million of costs associated with the building design and property site project management could not be utilized in the future and were written-off.
Jordan River (JOR) Fire Risk Reduction	1.6	This project was to address the deficiencies in the existing fire protection piping, increase the reliability of the fire protection water supply and to implement general fire risk reduction measures in high risk areas at the JOR Powerhouse. The scope of the project included the replacement and expansion of the fire protection piping throughout the powerhouse, the replacement of the cladding on the west side of the powerhouse, and the upgrade of the fire protection supply water pressure reducing system.	Technical Issue and Cost. Upon installation, BC Hydro made multiple attempts to commission the Fire Protection supply water pressure reducing system. The new valves were installed according to specifications but did not perform as expected in the new piping configuration. Outage availability at the facility is low and rather than continue to troubleshoot the new valves and new piping design, it was decided to advance an alternate design as a lower risk approach to resolving the technical challenges. As a result of the design change, costs incurred related to the abandoned design and installation of $1.6 million were written-off.

Project Name	Amount Deferred ($ million)	Project Description	Rationale for Write-off
Lake Buntzen 1 - Coquitlam Tunnel Gates Refurbishment	1.3	This project was to address the safety and environmental risks by improving the reliability of the Coquitlam tunnel gates for control of water conveyance from the Coquitlam Reservoir to Buntzen Lake Reservoir.	Technical Issue. Due to the complexity of the project (modifying an existing underground tunnel) and lack of BC Hydro personnel with experience in this area, BC Hydro used a multi-stage public procurement process which is a common approach for complex projects. The process included stages for prequalification, request for proposal and the selection of two engineering consulting firms with relevant experience to develop detailed design and construction proposals. This approach was selected to ensure innovation in design and methodology in a competitive bidding environment. BC Hydro provided engineering support to both consulting firms during the development of the preliminary designs. One of the two designs was ultimately rejected due to higher cost and a construction methodology that had higher safety and quality risks. As a result, costs of $1.3 million associated with the preliminary design not selected and BC Hydro's support leading to the completion of that design, were written-off as they are not directly attributable to the project and the assets being constructed. Although the approach to engage two engineering firms resulted in a project cost write-off, BC Hydro derived important benefits from working with two proponents by receiving an optimal design option that addresses the constructability and safety risks at the lowest cost, with expected cost savings for the overall project. Notably, the winning bid was approximately $10.9 million less than the competitor's bid and had a safer construction methodology.

Project Name	Amount Deferred ($ million)	Project Description	Rationale for Write-off
Jordan River (JOR) Generating Station Upgrade Governor & PRV Controls	0.8	The JOR Generation Station has a 150 MW generator with an electro-hydraulic governor, and a Pressure Regulating Valve (PRV) that is connected to the servo motors/wicket gate via a mechanical linkage. This project started in 2016 and was to address the JOR Generating Station governor controls that were operating beyond their expected life. Failure of the governor and PVR controls could lead to damage to the penstock.	Technical Issue. During the Identification Feasibility Design Stage of the project, BC Hydro engaged a firm specializing in governor design to study the existing system. Full replacement of the governor and PRV controls was selected as the leading alternative. The Feasibility stage design was based on a system installed in a facility in California but, due to issues with the facility owner, a visit to the installation was not possible before the leading alternative was finalized. During Preliminary Design, it was discovered that the replacement design would require extensive and expensive changes to work at the JOR Generating Station. The team reviewed the proposed design changes and, given the high design risk and cost risk due to these changes, the team selected retrofitting the existing equipment as the leading alternative. As a result, costs of $0.8 million incurred related to the original leading alternative were written-off as they are not directly attributable to the project and the assets being refurbished.
Asset Investment Planning Tool Project	0.5	The project was to support and implement process and technology changes to enable a consistent, transparent and more objective approach to asset investment planning and management across BC Hydro.	Cost and Technical Issue. BC Hydro cancelled the Asset Investment Planning (AIP) Tool project due to increased expected total project cost and to align the project with the implementation of an Enterprise Asset Management (EAM) software platform. In its Decision on the Previous Application, the BCUC requested that BC Hydro "explain the prudency of its project expenditures given BC Hydro's explanation that the project is not cost-effective because its EAM software needs to be implemented first." BC Hydro provides the following explanation. The objective of the AIP Tool project, approved in June 2018, was to implement process and technology changes to enable a consistent and more objective approach to asset investment planning across the company. At that time, BC Hydro identified incremental improvements to our capital planning process, that did not require integration with the asset information systems, and were not dependent on the implementation of EAM software. During the Definition (design) phase of the project, the design specifications were further evaluated and the vendor and pricing information was updated to align with the new understanding of the requirements of the project. This pricing was

Project Name	Amount Deferred ($ million)	Project Description	Rationale for Write-off
			considerably higher than the Definition phase estimate and the project was put on hold in June 2019 to allow time to reassess the business case. In reassessing the business case, BC Hydro determined that the full benefits of an AIP Tool project could be achieved only if an EAM software platform was first implemented that allowed asset health information, asset life-cycle management and financial information to be integrated for asset investment planning purposes. Implementation of an AIP Tool prior to an EAM platform would result in a standalone AIP tool without detailed asset information which would be reliant on manual data integration from multiple IT systems. Considering the higher pricing estimates and with a better understanding of the available tool capabilities, BC Hydro determined that the incremental benefits without integration could not be justified. This information on pricing and capabilities could only be understood as BC Hydro worked through design specifications with the vendor and was not known at the time that the project was approved in June 2018. BC Hydro is initiating the Stations Work Management project in fiscal year 2022. This project will form the foundation for the EAM platform and is expected to be completed in fiscal year 2025. In September 2020, the project team presented these findings to the project steering committee and project sponsor. Since the capital planning process was already considered robust and achieving the potential of asset investment planning would require prior implementation of an EAM software platform, the steering committee and project sponsor endorsed the recommendation to cancel the project. The project was cancelled in October 2020. As a result of the project cancellation, $0.5 million of costs incurred were written-off. BC Hydro may initiate a new project after the implementation of the EAM Software Platform to realize the full benefits of an AIP Tool. Any such project would go through the standard Technology portfolio selection process. Additional information related to this project is included in Chapter 6, section 6.1.3.4.

Project Name	Amount Deferred ($ million)	Project Description	Rationale for Write-off
Bridge River 1 Slope Drainage Improvements	0.5	The project was to design and implement mitigation measures to reduce the risk of debris flows at the Bridge River 1 Facility and to reduce the associated risk of loss of life to acceptable levels.	Technical issue. Work associated with the project, such as characterization of the Bridge River 1 slope materials and inspection of the slope drainage system was carried out starting in 2012. The original project recommendation was to proceed with creating a channel through the existing spoil pile in the School Creek hill slope as a means of reducing but not eliminating the landslide risk. However, in 2014, the project was made aware of the potential for the downslope school site to be developed for permanent occupation requiring the project to refine its approach to the drainage design. BC Hydro then advanced a strategy to acquire and limit the use of the school site property to eliminate the risk of loss of life. However, after lengthy negotiations, BC Hydro was unable to agree to terms that would result in BC Hydro acquiring and/or limiting the use of the school site property. It was concluded in 2020 that the solution to be advanced would be the full removal of the spoil pile plus drainage improvements. The originally selected channelization alternative was no longer considered viable. Upon review of the project costs, it was determined that costs of $0.5 million associated with the channelization alternative could not be used for the new leading alternative and were written-off as they are not directly attributable to the revised project scope and the assets being constructed.
Project Write-Offs equal or less than $200K	0.5	Various minor expenditures on projects (each less than $200,000) across the capital portfolios.	A total of thirteen projects with minor expenditures where it was determined to be appropriate to cancel the project or proceed with a reduced scope.
Total Write-Off Amounts	7.3

Mr. Patrick Wruck
Commission Secretary and Manager
Regulatory Support
British Columbia Utilities Commission
Suite 410, 900 Howe Street
Vancouver, BC V6Z 2N3

Dear Mr. Wruck:

RE: British Columbia Utilities Commission (BCUC or Commission)
British Columbia Hydro and Power Authority (BC Hydro)
Annual Reporting of Reliability Indices
Annual Response to Directive 26 of BCUC Decision on F2005/F2006 Revenue Requirements Application (F05/F06 RRA)

BC Hydro writes to provide an annual reporting of reliability indices, as required by Directive 26 of BCUC Order No. G-96-04 on BC Hydro's F2005 to F2006 Revenue Requirements Application.[1]

Directive 26 states that BC Hydro is expected to present reliability indices (SAIFI, SAIDI, CAIDI, ASAI, SARI, MAIFI, generation forced outages, availability, and generation outage rates), both combined and disaggregated (where applicable), on an annual basis with comparisons to Canadian Electricity Association (**CEA**) averages.

In this filing, BC Hydro is providing reliability indices for distribution, transmission and generation performance through fiscal 2021. As in previous years, BC Hydro reliability statistics are provided on a fiscal year basis and compared with the CEA calendar year data.

1 BC Hydro submitted its initial distribution and generation reliability indices compliance filing in September 2005, and subsequently reported the available reliability indices in May 2006 as part of the F2007/F2008 RRA. Starting in May 2007, BC Hydro began filing annual reports with the Commission on these reliability indices. Transmission system reliability indices for the years prior to fiscal 2012 were provided separately by the British Columbia Transmission Corporation (**BCTC**) in its Transmission System Capital Plan filings. BC Hydro provided the transmission system reliability indices starting in fiscal 2012, subsequent to the integration of BC Hydro and BCTC in fiscal 2011.

Distribution and Transmission Update

The most recent annual CEA reports for distribution and transmission are the 2019 Annual Service Continuity data on Distribution System Performance in Electrical Utilities and the Bulk Electricity System. CEA data on distribution and transmission performance for the 2020 calendar year are not yet available. The comparative reliability indices, both combined and disaggregated, for BC Hydro's distribution and transmission systems, are presented in Attachment 1, in tabular and graphical form through to fiscal 2021.

Generation Performance Update

The most recent annual CEA report on generation performance is the 2019 Generation Equipment Status Annual Report. CEA data on generation performance for the 2020 calendar year are not yet available.

The comparative reliability indices, both combined and disaggregated, for BC Hydro's generation system are presented in Attachment 2, in tabular and graphical form for the 10-year period ending fiscal 2021.

To reflect BC Hydro's investment strategies and operating practices of prioritizing Key Generating Facilities (large MW capacity units) over Available Generating Facilities (small MW capacity units), weighted averages of the reliability indices are also included in Attachment 2. CEA weighted averages for these indices were not available at the time of submission and will be provided for comparison starting next year. BC Hydro will continue to include this additional information in future reports.

Reliability Indices Performance Highlights

BC Hydro highlights the following with regard to its reliability indices performance through fiscal 2021:

- BC Hydro's SAIFI results (blue line) continue to perform better than the CEA community average (red line);
- On average, BC Hydro's SAIDI performance is better than the CEA average SAIDI;
- On average, BC Hydro's CAIDI performance is within 15 minutes of the CEA average CAIDI, except during years of notable storm events;
- BC Hydro's Transmission SAIDI and DPUI (Delivery Point Unavailability Index) performance are higher than previous years due to more outages and longer duration outages to our Transmission Voltage Customers;
- For generation, all aggregate reliability measures included improved slightly in fiscal 2021 compared to fiscal 2020;

- The aggregate measures (all plants) for forced outage factor and availability factor were negatively impacted by our smallest facilities with the main contributor being the forced extension of a planned outage at Aberfeldie due to leaks found in the penstock, which were subsequently repaired;
- On average, BC Hydro's aggregate availability factor is lower than the CEA average by 5 per cent to 7 per cent as BC Hydro spends more time than the CEA average on planned outages; and
- The 60-Month Rolling Forced Outage Factor for Key Facilities, which is included as one of BC Hydro's Service Plan metrics, was 1.21 per cent at the end of fiscal 2021, which meets the Service Plan target of less than or equal to 1.8 per cent.

For further information, please contact Chris Sandve at 604-974-4641 or by email at bchydroregulatorygroup@bchydro.com.

Yours sincerely,

Chris Sandve
Chief Regulatory Officer

Annual Response to Directive 26 of BCUC Decision

F2021 Annual Reporting of Reliability Indices

Attachment 1

Distribution and Transmission Reliability Indices

This section includes the following distribution and transmission indices:

SAIFI	a measure of the number of sustained interruptions (longer than one minute) an average distribution customer will experience in a year
T-SAIFI-MI	a measure of transmission interruptions of less than one minute in duration that a delivery point experiences in a year
T-SAIFI-SI	a measure of transmission interruptions of one minute or more that a delivery point experiences in a year
T-SAIDI	a measure of the average total interruption duration, in hours that a delivery point experiences in a year
SAIDI	a measure of the amount of time, in hours, an average distribution customer is without power in a year
CAIDI	a measure of the average interruption, in hours, per interrupted distribution customer in a year
%ASAI	a measure of the percentage of time service is available in the year
CEMI-4	percentage of customers experiencing four or more outages in a year
MAIFI	a measure of the frequency of momentary (less than one minute) interruptions per distribution customer served in a year
DPUI	a measure of overall bulk electricity system performance in terms of a composite index of unreliability expressed in system minutes in a year. It takes into account all forced and planned outages except interruptions attributed to generators
SARI	a measure of the average restoration time, in hours, for each transmission delivery point in a year

As noted in Provision 9x of the F2011 Revenue Requirements Application Negotiated Settlement Agreement, BC Hydro is also reporting its CEMI-4 reliability metric, and SAIFI, SAIDI, CAIDI, ASAI, and CEMI-4 metrics normalized using the IEEE 2.5 Beta method. CEMI-4 is not benchmarked externally as utilities are at varying stages in their development of this metric.

Table 1 Reliability Indices – BC Hydro Overall and CEA Overall (All-Event Indices, Not Normalized)

Year	BC Hydro Overall				CEA Overall

Definitions

Availability Factor = Operating Time + Available-But-Not-Operating Time / In Commercial Service Time Note 5
Forced Outage Count = Average Number of Forced Outages / Unit / Year (including Starting Failures)(Internal)
Forced Outage Factor = Forced Outage Time (including Starting Failures)(Internal) / In Commercial Service Time Note 5
Failure Rate = Forced Outage Count (excluding Starting Failures)(Internal) / Operating Time X In Commercial Service Time Note 5

Notes

1. Outages with causes that were external to Generation, such as Transmission System forced outages, are excluded from this measure.
2. Data excludes ALU Unit 1 and SHU Unit 1, which have been forced out of service for an extended period.
3. Data excludes ALU Unit 1, SHU Unit 1 and ELK Units 1 and 2 which have been forced out of service for an extended period.
4. Data excludes ALU Unit 1, SHU Unit 1, ELK Units 1 and 2 and SPN Unit 1,2 and 3 which have been forced out of service for an extended period.
5. In Commercial Service Time represents the number of hours in the measurement period that the unit(s) were considered part of the active fleet.
6. Average reliability indices are weighted by unit maximum capacity rating.

BC Hydro Fiscal 2023 to Fiscal 2025
Revenue Requirements Application

Appendix R

Regulatory Accounts

Table of Contents

List of Tables

This appendix provides the following information regarding BC Hydro's regulatory accounts:

- The types of regulatory accounts and amortization periods;
- The application of interest to regulatory accounts; and
- A description of each regulatory account that existed and was approved by the BCUC prior to this application.

1 Types of Regulatory Accounts and Amortization Periods

The four types of regulatory accounts currently used by BC Hydro are consistent with the BCUC Regulatory Account Filing Checklist.[1] The four types of accounts are described below, including a discussion of the relevant considerations when determining the appropriate recovery mechanisms to ensure that the balances in the accounts are recovered over the appropriate time period. The alignment of the four account types to the BCUC Regulatory Account Filing Checklist is shown in the table below.

BC Hydro Account Type	BCUC Account Type
Variance accounts	Forecast variance account
Benefits matching accounts	Benefit matching account
Non-cash Provisions accounts	Other
IFRS Transition accounts	Retroactive expense accounts/Other

[1] https://www.bcuc.com/Documents/Guidelines/2017/05-03-2017_RegulatoryAccountFilingChecklist.pdf. Specifically, when requesting approval for a new regulatory account, the BCUC Regulatory Account Filing Checklist requires that regulated entities classify the regulatory account as either: (a) forecast variance account; (b) rate smoothing account; (c) benefit matching account; (d) retroactive expense account; or (e) other and to identify if the regulatory account is a cash or non-cash account.

1.1 Variance Accounts

Regulatory accounts may be used to capture variances between forecast costs or revenues and actual costs or revenues. For BC Hydro, this includes variances between forecast and actual costs due to non-controllable factors such as water inflow levels, interest rates, discount rates, and market prices of energy, which are difficult to forecast. These types of variances are captured in BC Hydro's cash and non-cash variance accounts, which are discussed below.

BC Hydro believes that it should generally assume financial responsibility for controllable risks and create variance accounts for non-controllable risks. In the Fiscal 2005 to Fiscal 2006 Revenue Requirements Application (**RRA**), BC Hydro proposed the following criteria to assess whether a risk is controllable or non-controllable:[2]

1. BC Hydro's ability to directly or indirectly influence the cost category;
2. The volatility of the cost category;
3. The predictability of the cost category;
4. The materiality of the cost category to the revenue requirement; and
5. The frequency of major exceptions within the cost category.

In its Decision on the Fiscal 2005 to Fiscal 2006 RRA, the BCUC accepted BC Hydro's proposed criteria but concluded that risk/reward considerations were also a relevant consideration.[3]

BC Hydro is not proposing any changes in this application to the criteria used to assess whether a risk is controllable or non-controllable.

[2] BC Hydro Fiscal 2005 - Fiscal 2006 RRA Argument, page 70.
[3] BC Hydro Fiscal 2005 to Fiscal 2006 RRA Decision, pages 29 to 30.

BC Hydro's Cost of Energy Variance Accounts (i.e., Heritage Deferral Account, Non-Heritage Deferral Account, Load Variance Regulatory Account, Biomass Energy Program Regulatory Account, Low Carbon Fuel Credits Variance Regulatory Account and Trade Income Deferral Account) are examples of variance accounts that defer, for recovery or refund in a future period, differences between forecast and actual costs or revenues. The balances in these accounts are currently recovered through the DARR, which is discussed further in Chapter 7, section 7.3.3.3.

BC Hydro also has cash variance accounts that capture the difference between forecast and actual costs for non-energy related costs that BC Hydro considers to be non-controllable. Examples include the Storm Restoration Costs and the Total Finance Charges regulatory accounts. Amounts transferred to cash variance accounts in a test period are generally recovered over the next test period. This approach is appropriate as these accounts represent amounts already incurred, rather than amounts providing long-term benefits for ratepayers.

Lastly, BC Hydro has non-cash variance accounts that capture the differences between forecast and actual non-controllable costs which are non-cash in nature, for recovery from or refund to ratepayers in a future period. BC Hydro currently has four non-cash variance accounts: The Foreign Exchange Gains and Losses, the Non-Current Pension Costs, the PEB Current Pension Costs, and the Debt Management regulatory accounts. The recovery period for these variance accounts match the underlying attribute. For example, the Foreign Exchange Gains and Losses Regulatory Account is amortized on a straight-line pool basis over the weighted average life of the related debt and the Non-Current Pension Costs Regulatory Account is amortized over the expected average remaining service life of employees.

1.2 Benefit Matching Accounts

Regulatory accounts are often used to reflect timing differences between when a utility spends money to provide a service or acquire an asset, and when that expenditure provides benefits to ratepayers. The benefit of a particular service or asset may accrue to ratepayers over a long period of time. Regulatory accounts can be used to match the benefit with the cost, thereby supporting intergenerational equity between current and future ratepayers. The amortization period for this type of account will vary depending on the period of time that the benefit of a particular service or asset accrues to ratepayers. The use of this type of regulatory account means that BC Hydro's current customers are not required to pay for the full cost of an asset or service that will provide benefits to customers in the future.

The DSM Regulatory Account is an example of this type of account. Through DSM measures, BC Hydro spends money in current years to reduce the amount of electricity that customers would otherwise use in current and future periods. This results in lower energy costs and delayed or reduced infrastructure costs. The benefits of reduced costs from these DSM measures accrue to future customers. Therefore, the costs of DSM measures are matched to the benefits realized by future customers. DSM costs are deferred and amortized over 15 years, which reflects the average measure life of DSM measures.

The Site C Regulatory Account is another example of this type of regulatory account. This account defers costs attributable to the project that are not eligible for capitalization related to the Site C Project to future years. The Site C Project has a long development period before it will be placed into service and provide benefits to customers. If these costs had been expensed as incurred, it would have created unfair rate impacts on current ratepayers, prior to the benefits of the project being provided.

1.3 Non-Cash Provisions

Non-cash provisions are regulatory accounts set up in response to loss provision liabilities required under IFRS accounting rules. These provisions are not recovered in rates until actual cash expenditures are made against the provision. At that time, the provision is drawn down by the amount of the expenditure and a corresponding amount is transferred to the matching regulatory account. This amount is then amortized into rates based on the approved amortization method. The provision regulatory accounts remain in place until the loss provision liability is no longer required under IFRS. These accounts are regulatory assets which, subject to BCUC approval, preserve BC Hydro's ability to collect, in rates, any actual amounts paid in respect of these provisions. BC Hydro currently has two non-cash provision regulatory accounts: The First Nations Provisions and the Environmental Provisions regulatory accounts.

1.4 IFRS Transition Accounts

A change in the accounting standards applicable to BC Hydro may create non-controllable financial impacts, requiring a regulatory account to protect customers from sudden and significant rate increases.

In fiscal 2013, BC Hydro transitioned to the Prescribed Standards directed by the Government of B.C.'s Treasury Board. The Prescribed Standards were based on the principles of IFRS, combined with regulatory accounting in accordance with Financial Accounting Standards Board Accounting Standards Codification 980, *Regulated Operations* with one modification. This change impacted the method of accounting for capital overheads. It also required BC Hydro to recognize, on its balance sheet, all unamortized actuarial gains and losses on its pension and other post-employment benefit plans. To recover the financial impact of these changes from customers over a reasonable time period, BC Hydro proposed the establishment of the IFRS Transition regulatory accounts. If BC Hydro had recognized the impact of the transition to IFRS in its rates at the time of the transition, the rate impact for customers in the year of transition, would have been significant.

The approved recovery periods for the IFRS Transition Accounts are 20 years for the IFRS Pension Regulatory Account and 40 years for the IFRS Property, Plant and Equipment Regulatory Account. These recovery periods mean that the accounts recover the transition costs of pension and capital assets over the same period of time as if the IFRS rules had not come into place as part of the Prescribed Standards.

1.5 Summary of Recovery Mechanisms

Table R-1 below provides a summary of the rationale to determine the appropriate recovery mechanisms for BC Hydro's regulatory accounts.

Table R-1 Summary of Rationale for Regulatory Account Recovery Mechanisms

Type of Regulatory Account	Rationale for Recovery Mechanism
Variance Accounts:	
Cost of Energy Variance Accounts	BC Hydro is proposing to continue the use of The Deferral Account Rate Rider mechanism which minimizes intergenerational inequity by being responsive to the changing net balance in the cost of energy variance accounts, while maintaining rate stability for customers to the extent practicable. BC Hydro is proposing to increase the Deferral Account Rate Rider from 0 per cent to (2.0) per cent on April 1, 2023, (1.0) per cent on April 1, 2024 and (0.5) per cent on April 1, 2025 to refund the forecast fiscal 2022, fiscal 2023 and fiscal 2024 net closing balances, in the Cost of Energy Variance Accounts over fiscal 2023, fiscal 2024 and fiscal 2025, respectively.
Other Cash Variance Accounts	To minimize intergenerational inequity, cash variance accounts should be recovered in the subsequent test period.
Non-Cash Variance Accounts	Non-cash variances should be recovered over the remaining period of the associated asset or liability (e.g., expected average remaining service life of employees or remaining term of debt issuances).
Benefit Matching Accounts	To achieve intergenerational equity, the recovery period should match the future benefit period of the expenditure.
Non-Cash Provisions	Since non-cash provisions are not recovered in rates, no recovery mechanism is required. The provision is drawn down when actual expenditures are incurred, at which time the amounts are transferred to the corresponding regulatory account and recovered via the approval mechanism for those accounts.
IFRS Transition Accounts	To smooth the impact of changes in accounting standards, the balances in these accounts should be recovered on the same basis as they would have been recovered under the previous accounting rules.

BC Hydro has BCUC-approved or has requested recovery mechanisms to collect, in rates, the balances of all of its regulatory accounts except the portion of the Customer Crisis Fund Regulatory Account described in Chapter 7 section 7.3.3. and the portion of the Mining Customer Payment Plan Regulatory Account balance attributable to the MCPP impairment losses as described in Chapter 7, section 7.3.3.6.

2 Application of Interest to Regulatory Accounts

This section explains that it is generally appropriate for regulatory account balances to attract interest at BC Hydro's weighted average cost of debt in recognition that BC Hydro incurs carrying costs.

2.1 Rationale for Application of Interest Charge to Regulatory Account Balances

BC Hydro applies the principle of matching costs with benefits to determine whether interest should be applied to a regulatory account balance. This reflects the fact that the carrying costs of maintaining the account balances may have a real financial cost in any particular period that should be recovered in rates. For cash variance regulatory accounts that arise from a direct cash outlay by BC Hydro, the related interest costs are generally included as part of the regulatory accounts. BC Hydro incurs financing charges to carry amounts that were paid in cash but not recovered in rates in the same test period. For some accounts, the interest cost may be immediately expensed from the regulatory account to rates, rather than being deferred and amortized for recovery in future rates. For interest applicable accounts, interest is applied to the account balance regardless of whether the account represents an amount owing to or from ratepayers. In other words, ratepayers receive an interest benefit in accounts containing an amount owing to them.

Variance regulatory accounts such as energy deferral accounts also attract interest because BC Hydro does not forecast variances in the accounts and therefore must fund the variances. In the case of lower than forecast revenues, BC Hydro incurs debt which results in finance charges.

Interest applied to regulatory accounts does not have the effect of increasing or decreasing BC Hydro's allowed net income, as the interest added to regulatory accounts is intended to offset the unbudgeted incremental interest costs that BC Hydro has incurred.

Based on these criteria, and in accordance with BCUC Orders, BC Hydro applies interest to all regulatory accounts, with the exception of the following accounts:

(a) Non-cash regulatory accounts (such as provisions);

(b) The Total Finance Charges Regulatory Account (since interest costs are part of total finance charges); and

(c) Regulatory accounts that capture timing differences (such as Pre-1996 Contributions).

In addition, interest is not charged to the DSM Regulatory Account, similar to the treatment for capital projects, as DSM expenditures generally go into service in the year of expenditure and BC Hydro does not apply interest on capital projects after they enter service. Table R-2 below indicates which deferral and regulatory accounts have interest applied to balances in accordance with BCUC orders.

Table R-2 Application of Interest to Regulatory Accounts

	Regulatory Account	Interest Applied to Balance
Cost of Energy Variance Accounts		
1	Heritage Deferral Account	Yes
2	Non Heritage Deferral Account	Yes
3	Trade Income Deferral Account	Yes
4	Load Variance Account	Yes
5	Biomass Energy Program Account	Yes
6	Low Carbon Fuel Credits Variance Regulatory Account	Yes

	Regulatory Account	Interest Applied to Balance
Other Cash Variance Accounts		
7	Storm Restoration Costs Regulatory Account	Yes
8	Amortization of Capital Additions Regulatory Account	Yes
9	Total Finance Charges Regulatory Account	No
10	Remediation Regulatory Account	Yes
11	Real Property Sales Regulatory Account	Yes
12	Dismantling Cost Regulatory Account	Yes
13	Customer Crisis Fund Regulatory Account	Yes
14	Mining Customer Payment Plan Regulatory Account	Yes
15	Project Write-off Costs Regulatory Account	Yes
16	Electric Vehicle Costs Regulatory Account	Yes
17	MRS Costs Regulatory Account	Yes
18	Fiscal 2022 Depreciation Study Impact	Yes
Non-Cash Variance Accounts		
19	Foreign Exchange Gains and Losses Regulatory Account	No
20	Non-Current Pension Costs Regulatory Account	No

22	Debt Management Regulatory Account	No
Benefit Matching Accounts		
23	DSM Regulatory Account	No
24	First Nations Costs Regulatory Account	Yes
25	Site C Regulatory Account	Yes
26	Pre-1996 Contributions in Aid of Construction Regulatory Account	No
27	SMI Regulatory Account	Yes
28	Load Attraction Costs Regulatory Account	Yes
Non-Cash Provisions		
29	First Nations Provisions Regulatory Account	No
30	Environmental Provisions Regulatory Account	No

	Regulatory Account	Interest Applied to Balance
IFRS Transition Accounts		
31	IFRS Property, Plant and Equipment Regulatory Account	No
32	IFRS Pension Regulatory Account	No

The table above no longer includes the Rock Bay Regulatory Account as the BCUC approved the closure of the account effective, March 31, 2021. At March 31, 2021, the account held a credit balance of $0.15 million related to interest. BC Hydro transferred the balance to the Total Finances Charges Regulatory Account, and it will be refunded to ratepayers in the Test Period.

2.2 Interest Rate Applied to Regulatory Accounts

By Order No. G-77-12A to BC Hydro's Fiscal 2012 to Fiscal 2014 Amended RRA, the BCUC approved that the interest rate applicable to BC Hydro's regulatory account balances in a given year is the weighted average cost of debt in that year. The weighted average cost of debt that is forecast to be applied to the regulatory account balances is 3.01 per cent for fiscal 2023, 2.98 per cent for fiscal 2024 and 3.11 per cent for fiscal 2025.

3 Previously Approved Regulatory Accounts

Consistent with prior applications, provided below is an overview of the history and recovery periods of all BC Hydro's currently approved regulatory accounts. The descriptions reflect approvals prior to the requests for changes in this application.

3.1 Cost of Energy Variance Accounts

BC Hydro has six Cost of Energy Variance Accounts that capture the differences between forecast and actual revenues and costs for recovery or refund to ratepayers in future periods: the Heritage Deferral Account, the Non Heritage Deferral Account, the Load Variance Regulatory Account, the Biomass Energy Program Variance Regulatory Account, the Trade Income Deferral Account and the Low Carbon Fuel Credits Regulatory Account.

The Heritage Deferral Account and Trade Income Deferral Account were created pursuant to Heritage Special Direction No. HC2 and BCUC Order No. G-96-04. Special Direction No. HC2 was repealed in March 2014 and the Heritage Deferral Account and the Trade Income Deferral Account were continued on an ongoing basis through Direction No. 7 and BCUC Order No. G-48-14.

By Order No. G-96-04, the BCUC also approved the establishment of the Non-Heritage Deferral Account and approved the specific cost components eligible for deferral to the Heritage Deferral Account and to the Non-Heritage Deferral Account. Through subsequent Orders, the scope of the Non-Heritage Deferral Account has been expanded.[4] Notably, by Order No. G-16-09, the BCUC authorized BC Hydro to defer to the Non-Heritage Deferral Account, the variances between forecast and actual cost of energy arising from differences in forecast and actual domestic customer load in fiscal 2009 and fiscal 2010. This was continued through the Fiscal 2011 Negotiated Settlement Agreement and by Order No. G-77-12A to the

[4] BCUC Order No. G-16-11 approved the deferral of variances between forecast and actual transmission service revenue and non-capital emergency transmission maintenance expenditures over $1 million to the Non-Heritage Deferral Account.
BCUC Order No. G-68-17 approved the deferral of variances between forecast and actual Northwest Transmission Line Supplemental Charge revenues to the Non-Heritage Deferral Account.
BCUC Order No. G-130-18 approved the deferral of the fiscal 2019 Lease revenues arising from the Waneta 2017 Transaction and the revenue associated with capital expenditures made by Teck with respect to Teck's two-third interest in Waneta during the Lease Term to the Non-Heritage Deferral Account. The Order also approved that the variance between forecast and actual water rentals in a given year arising from the Waneta 2017 transaction be excluded from the water rental variances that are currently deferred to the Non-Heritage Deferral Account during the Lease Term.

Fiscal 2012 to Fiscal 2014 RRA. Direction No. 7 required the BCUC to allow these variances to be deferred to the Non-Heritage Deferral Account on an ongoing basis. Direction No. 7 also required the BCUC to allow BC Hydro to defer costs associated with the decommissioning of portions of Burrard Thermal not required for transmission support services, to the Non-Heritage Deferral Account.

In its Decision on the Fiscal 2020 to Fiscal 2021 RRA, the BCUC directed the following:

- The creations of two additional Cost of Energy Regulatory Accounts:
  - Load Variance Regulatory Account, to capture variances between forecast and actual domestic customer load (referred to as the Domestic Revenue Variance, which was previously captured in the Non-Heritage Deferral Account);[5] and
  - Biomass Energy Program Variance Regulatory Account, to capture all variances between forecast and actual amounts related to the Biomass Energy Program.[6]
- Deferral of any variances related to the accounting for EPAs determined to be leases under IFRS 16, which are not eligible for deferral treatment under existing BCUC orders, to the Non-Heritage Deferral Account.[7]

The new regulatory accounts allow for the separation of certain components of BC Hydro's existing Cost of Energy Variance Accounts for enhanced transparency.

5 BCUC Decision and Order No. G-247-20, BC Hydro Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (October 2, 2020), Directive 15.

6 BCUC Decision and Order No. G-247-20, BC Hydro Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (October 2, 2020), Directive 38.

7 BCUC Decision and Order No. G 247-20, BC Hydro Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (October 2, 2020), Directive 44.

Order No. G-127-21 approved the 2020 Transfer Pricing Agreement (**2020 TPA**) as filed by BC Hydro. The adoption of the 2020 TPA resulted in a change in the presentation of transactions relative to the terms used in BCUC Order No. G-96-04.[8] The terms from Order No. G-96-04, “Market Electricity Purchases”, “Surplus Sales” and “Net Purchases (Sales) From Powerex” were replaced by “System Exports” and “System Imports” under the 2020 TPA and variances on these items are deferred to the Non-Heritage Deferral Account.

By Order No. G-248-21, the BCUC approved the establishment of the Low Carbon Fuel Credits Regulatory Account to capture, on an ongoing basis, the difference between forecast and actual miscellaneous revenue from low carbon fuel credits, and apply interest on the balance of the account based on BC Hydro’s current weighted average cost of debt. As the low carbon fuel credit revenues recognized by BC Hydro are a result of transfers to Powerex based on a transfer pricing agreement, low carbon fuel credit variances experienced by BC Hydro are offset by variances in Trade Income. Trade Income variances are deferred to the Trade Income Deferral Account. BC Hydro has proposed in this application to classify the Low Carbon Fuel Credits Regulatory Account as a Cost of Energy variance account and recover the Low Carbon Fuel Credits Regulatory Account balance using the DARR mechanism.

The purpose of the six Cost of Energy Variance Accounts is to defer the differences between forecast and actual revenues and energy costs for recovery or refund to ratepayers in future periods. These differences are non-controllable and can be

[8] In accordance with BCUC Order No. G-96-04, Directive 11, BC Hydro deferred variances between forecast and actual Market Electricity Purchases and Surplus Sales to the Heritage Deferral Account, and in accordance with BCUC Order No. G-96-04, Directive 12, BC Hydro deferred variances between forecast and actual Net Purchases (Sales) from/to Powerex to the Non-Heritage Deferral Account. The scope of variances covered by these existing orders is equivalent to the variances between forecast and actual System Exports and System Imports.

positive or negative. The variances captured by the Cost of Energy Variance Accounts can be summarized as follows:

- The Heritage Deferral Account captures variances between the forecast and actual cost of Heritage Energy as described in Chapter 4, sections 4.5. and Domestic Transmission - Export costs as described in Chapter 4, section 4.7.2. In addition, the Heritage Deferral Account captures variances between forecast and actual costs and revenues for items approved by BCUC Order No. G-96-04, which includes Skagit Valley Treaty revenues;
- The Non-Heritage Deferral Account captures variances between the forecast and actual cost of Non-Heritage Energy which includes IPPs and Long-Term Commitments as described in Chapter 4, section 4.6.1, Non-Integrated Areas in Chapter 4, section 4.6.2, Gas and Other transportation costs in Chapter 4, section 4.6.3, System Exports which consists of sales of electricity to Powerex by BC Hydro, and System Imports which consists of purchases of electricity by BC Hydro from Powerex and thermal generation run for Powerex as described in Chapter 4, section 4.7.1. In addition, the Non-Heritage Deferral Account captures variances between forecast and actual costs for items approved by BCUC Order No. G-96-04 and subsequent Orders as noted above;
- The Load Variance Regulatory Account captures variances between forecast and actual domestic customer load;
- The Biomass Energy Program Variance Regulatory Account captures all variances between forecast and actual amounts related to the Biomass Energy Program;
- The Trade Income Deferral Account captures variances between the forecast and actual Trade Income as described in Chapter 8, section 8.10; and

- The Low Carbon Fuel Credits Regulatory Account captures the difference between forecast and actual miscellaneous revenue from low carbon fuel credits.

In its Decision on the Previous Application, Directive 14,[9] the BCUC approved the recovery of the balances in the Cost of Energy Variance Accounts using the DARR based on the DARR table mechanism and the forecast net balance of the Cost of Energy Variance Accounts at the end of the preceding fiscal year, for fiscal 2022 only.

BC Hydro is not requesting any changes to the scope of the existing Cost of Energy Variance Accounts in this application but is requesting the continued use of the DARR recovery mechanism in this application in Chapter 7.

3.2 Storm Restoration Costs Regulatory Account

By Order No. G-16-09 to the Fiscal 2009 to Fiscal 2010 RRA, the BCUC approved the ongoing deferral of the difference between actual storm related restoration costs and the average of the actual storm restoration costs for the five most recent normal weather years. Fiscal 2017 through fiscal 2021 comprise the five most recent normal weather years and result in an average annual storm restoration cost of $19.2 million. BC Hydro has included this amount for storm restoration costs in its fiscal 2023 to fiscal 2025 operating cost plan.

In many recent years, BC Hydro has experienced more extreme weather resulting in volatile storm-related expenditures, which has caused the storm expenditures to vary as shown in Table R-3 below.

9 BCUC Decision and Order No. G-187-21, BC Hydro Fiscal 2022 Revenue Requirements Application (June 17, 2021), Directive 14.

Table R-3 Storm Restoration Costs Fiscal 2017 to Fiscal 2021 Actual

	($ million)	F2017 Actual	F018 Actual	F2019 Actual	F2020 Actual	F2021 Actual	F2017-F2021 Average
		1	2	3	4	5	6
1	Storm Restoration Costs	25.3	22.9	25.6	10.1	12.1	19.2

By Order No. G-47-18, the BCUC approved that interest continue to be applied to the balance of this regulatory account and that the forecast account balance at the end of a test period be recovered over the next test period. Interest is applied to the account based on BC Hydro's weighted average cost of debt and forecast interest is recovered from the account each year. By Order No. G-215-20, the BCUC approved BC Hydro's request to expand the scope of the Storm Restoration Costs Regulatory Account to include the deferral of revenue impacts related to BC Hydro's actual amounts for bill credits and waivers of charges for evacuation relief.

BC Hydro is not requesting any changes to this account in this application.

3.3 Amortization of Capital Additions Regulatory account

By Order No. G-16-09, the BCUC directed BC Hydro to defer to a regulatory account any differences between forecast and actual amortization of capital additions. In its Decision, the BCUC stated that:

> "the most effective solution to ensuring that amortization charges collected in revenue requirements for the test period appropriately reflect the capital assets that are actually utilized for the benefit of ratepayers during the same test period is to establish a new regulatory account."[10]

The Amortization of Capital Additions Regulatory Account was continued in the Fiscal 2011 Revenue Requirement Application Negotiated Settlement Agreement,

[10] Fiscal 2009 to Fiscal 2010 Revenue Requirement Application Decision, page 191.

the Fiscal 2012 to Fiscal 2014 Amended RRA and the Fiscal 2015 to Fiscal 2016 Revenue Requirements Rate Application. By Order No. G-47-18, the BCUC approved this regulatory account to continue on an ongoing basis, that interest continue to be applied to the balance of this regulatory account, and that the forecast account balance at the end of a test period be recovered over the next test period. Interest is applied to the account based on BC Hydro's weighted average cost of debt and forecast interest is recovered from the account each year.

BC Hydro is not requesting any change to this regulatory account in this application.

3.4 Fiscal 2022 Depreciation Study Impact Regulatory Account

In its decision on the Previous Application, Directive 15,[11] the BCUC directed BC Hydro to establish a new regulatory account to capture the variances arising in fiscal 2022 as a result of any changes to the depreciation expense determined in the depreciation study. Interest charges are applied to this account based on BC Hydro's weighted average cost of debt. As directed by the BCUC, BC Hydro is requesting a recovery mechanism for the account in Chapter 7 of this application.

3.5 Total Finance Charges Regulatory Account

By Order No. G-16-09 to the Fiscal 2009 to Fiscal 2010 RRA, the BCUC directed BC Hydro to defer to a regulatory account any differences between forecast and actual finance charges for fiscal 2009 and fiscal 2010. The Total Finance Charges Regulatory Account was continued by BCUC decisions on the Fiscal 2011 Revenue Requirement Application Negotiated Settlement Agreement, the Fiscal 2012 to Fiscal 2014 Amended RRA and the Fiscal 2015 to Fiscal 2016 Revenue Requirements Rate Application. By Order No. G-47-18, the BCUC approved the continuation of this regulatory account on an ongoing basis, and that

[11] BCUC Decision and Order No. G-187-21, BC Hydro Fiscal 2022 Revenue Requirements Application (June 17, 2021), Directive 15.

the forecast account balance at the end of a test period be recovered over the next test period.

BC Hydro is not requesting any changes to this account in this application.

3.6 Remediation Regulatory Account

Starting in fiscal 2013 and in following years, BC Hydro began to incur expenditures related to asbestos remediation at its facilities. By Order No. G-7-13, the BCUC approved the establishment of the Asbestos Remediation Regulatory Account for unplanned asbestos remediation costs in fiscal 2013 and fiscal 2014. In accordance with Direction No. 7, BCUC Order No. G-48-14 authorized BC Hydro to continue to defer variances between forecast and actual asbestos remediation costs, to the account, on an ongoing basis.

By Order No. G-47-18, the BCUC approved an expansion of the account scope to include costs incurred related to the compliance with polychlorinated biphenyl regulations. To reflect this change, the BCUC also approved that the name of the account be changed to the Remediation Regulatory Account.

By Order No. G-47-18, the BCUC approved, starting in fiscal 2017, and on an ongoing basis, that actual expenditures related to compliance with polychlorinated biphenyl regulations and asbestos remediation be deferred to this account each year, and forecast expenditures related to compliance polychlorinated biphenyl regulations and asbestos remediation be amortized from this account each year. Order No. G-47-18 also approved that interest continue to be applied to the balances in the account and that the forecast account balance at the end of a test period be recovered over the next test period. Interest is applied to the account based on BC Hydro’s weighted average cost of debt and forecast interest is recovered from the account each year.

It continues to be appropriate to defer variances related to asbestos remediation to the Remediation Regulatory Account. The rationale for deferring these variances is the same as the rationale accepted by the BCUC for the deferral of variances related to compliance with polychlorinated biphenyl regulations. In its Decision to the Fiscal 2017 to Fiscal 2019 RRA, the BCUC stated that:

> *"Although the treatment of PCB is not prescribed by Direction No. 7, as it is for asbestos costs, the Panel concurs with BC Hydro that PCB costs are similar in nature to asbestos costs in that they involve long-term estimates, the actual expenditures are susceptible to variances in amount and timing and differences from forecast due to the timing and scope of work undertaken. Furthermore, the Panel finds the consistent treatment of asbestos and PCB costs is reasonable."*[12]

BC Hydro is not requesting any changes to this account in this application.

3.7 Real Property Sales Account

By Order No. G-48-14, the Real Property Sales Regulatory Account was established to defer the variances between BC Hydro's actual and forecast real property gain/loss from real estate sales, with interest to be applied to the account based on BC Hydro's weighted average cost of debt.

The timing of completion of real estate transactions is difficult to forecast accurately. Since fiscal 2015, BC Hydro has been preparing surplus properties for sale. Activities have included market value appraisals and estimates, investigation and remediation of environmental contamination, working with municipalities on subdivision requirements, and consultation with First Nations.

The 2013 10 Year Rates Plan included a target of $50 million of net gains from real property sales from fiscal 2015 to fiscal 2019. Consistent with this target, BC Hydro included $10 million in forecast net gains from real property sales in each fiscal year

[12] BCUC Order No. G-47-18, Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, page 65.

in both the Fiscal 2015 to Fiscal 2016 Revenue Requirements Rate Application and the Fiscal 2017 to Fiscal 2019 RRA.

BC Hydro increased its net gains target from $50 million to $100 million and extended the timeframe to achieve this target to the end of fiscal 2024. However, in Directive 41[13] of its Decision on BC Hydro's Fiscal 2020 to Fiscal 2021 RRA, Order No. G-246-20, the BCUC disallowed BC Hydro's forecast of $10 million net gains in each of fiscal 2020 and fiscal 2021 and instead approved forecast net gains of $0 in that test period from the sale of surplus real property. The future recovery of this account is addressed in Chapter 7 of the Application.

BC Hydro is not requesting any changes to this account in this application.

3.8 Dismantling Cost Variance Account

The Dismantling Cost Regulatory Account was established by BCUC Order No. G-47-18 and captures variances between forecast and actual dismantling costs.

In its Decision on the Fiscal 2017 to Fiscal 2019 RRA, the BCUC approved the use of this account for the fiscal 2017 to fiscal 2019 test period. In its Decision on the Fiscal 2020 to Fiscal 20021 RRA, the BCUC approved the use of this account for the fiscal 2020 to fiscal 2021 test period. In its Decision, the BCUC stated:

> "The Panel accepts that dismantling costs are largely driven by the capital plan and are impacted by capital project schedules. Given this and the magnitude of the variances in the last test period, the Panel agrees that variances between forecast and actual dismantling costs should be provided deferral treatment similar to the treatment of variances between forecast and actual amortization of capital asset additions."

[13] Directive 41; BCUC Decision and Order No. G-246-20, BC Hydro Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (October 2, 2020), page 127.

In its Decision on the Previous Application, Directive 16,[14] the BCUC approved the use of this account for fiscal 2022. In response to BCUC Order No. G-246-20, Directive 40,[15] on the Fiscal 2020 to Fiscal 2021 RRA, BC Hydro is requesting the continued use of this account for fiscal 2023 to fiscal 2025 and proposing to adopt net salvage rates using a transition approach, beginning in the next test period, in Chapter 7 and Chapter 8 of this application.

3.9 Customer Crisis Fund Regulatory Account

By Order No. G-166-17, the BCUC approved the establishment of the Customer Crisis Fund (**CCF**) Regulatory Account.

By Order No. G-5-17 to the 2015 Rate Design Application, the BCUC directed BC Hydro to file a proposal for the establishment of a crisis intervention fund pilot program (**CCF Pilot Program**) for residential customers who have arrears with BC Hydro and are unable to pay their electricity bills. By Order No. G-166-17, the BCUC approved the CCF Pilot Program on a three-year basis.

The costs related to the CCF Pilot Program were driven by program participation and thus varied from forecast. In addition, there were variations in the timing of revenues and costs over the duration of the CCF Pilot Program.

Accordingly, in its application to establish the CCF Pilot Program, BC Hydro proposed that the net difference between the revenues collected under the CCF Rate Rider and the incremental costs related to the CCF Pilot Program in each fiscal year be transferred to the CCF Regulatory Account. Any remaining balance in the CCF Regulatory Account at the end of the CCF Pilot Program would be to the account of residential ratepayers.

---

[14] BCUC Decision and Order No. G-187-21, BC Hydro Fiscal 2022 Revenue Requirements Application (June 17, 2021) Directive 16.

[15] Directive 40; BCUC Decision and Order No. G-246-20, BC Hydro Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (October 2, 2020).

By Decision and accompanying Order No. G-144-21 dated May 7, 2021, the BCUC found that continuation of the CCF Pilot Program could not be justified and ordered BC Hydro to terminate the CCF Pilot Program effective May 31, 2021. By Order No. G-162-21 dated May 27, 2021, the BCUC approved BC Hydro's application to rescind the CCF Rate Rider, effective June 1, 2021. By Order No. G-179-21A dated June 7, 2021, the BCUC granted approval allowing BC Hydro to amend its Electric Tariff to remove language that enables on-bill credits for the CCF Pilot Program grants and removing all references to the COVID-19 Relief Fund for Residential Customers, effective September 1, 2021.

In accordance with section 3 of Order in Council No. 365, issued on June 21, 2021, BCUC Order No. G-203-21 authorized BC Hydro to defer to the CCF Regulatory Account: (a) amounts incurred by BC Hydro in administering the program and, (b) grants provided to residential customers under the program. The total amount deferred must not exceed $5 million.

In response to the Government of B.C.'s Direction to the British Columbia Utilities Commission Respecting COVID-19 Relief (Order in Council No. 159 issued on April 2, 2020), the BCUC approved, by Order No. G-79-20, BC Hydro's application to amend BC Hydro's Electric Tariff in order to implement BC Hydro's COVID Relief Fund for Residential Customers and allow BC Hydro to defer to the CCF Regulatory Account: (i) in addition to the amounts BC Hydro already defers as approved by Order No. G-166-17, those amounts credited to customers under the COVID Relief Fund for Residential Customers; (ii) BC Hydro's costs to administer the COVID Relief Fund for Residential Customers; and (iii) in relation to the balance in the CCF Regulatory Account, interest determined in a fiscal year at a rate equal to BC Hydro's weighted average cost of debt in that fiscal year. The COVID Relief Fund for Residential Customers was a temporary program available until June 30, 2020, for the purpose of providing grants (bill credits) to qualifying customers who lost their employment or became unable to work as a result of the COVID pandemic.

BC Hydro is proposing the recovery of the portion of the CCF Regulatory Account associated with the COVID Relief Fund for Residential Customers balance, as explained in more detail in Chapter 7.

3.10 Mining Customer Payment Plan Regulatory Account

In accordance with section 3(2) of Order in Council No. 123, issued on February 29, 2016, BCUC Order No. G-34-16 authorized BC Hydro to establish the Mining Customer Payment Plan Regulatory Account to defer to future fiscal years amounts equal to the sum of the following related to mining customers participating in the Mining Customer Payment Plan Program:

(i) The account balances of mining customers, if those account balances are impaired;

(ii) Any other amounts that are payable to BC Hydro by mining customers before the closing date and that are impaired; and

(iii) Any taxes paid by BC Hydro on behalf of mining customers on the account balances referred to in subparagraph (i) and amounts referred to in subparagraph (ii).

This Order arose from the Government of B.C.'s decision to allow companies operating metal and coal mines in B.C. to temporarily defer a portion of their electricity payments during periods of low commodity prices.

BCUC Order No. G-34-16 also directed BC Hydro to reduce the Mining Customer Payment Plan Regulatory Account by an amount collected from an applicable mining customer, and to include in the account, interest determined in a fiscal year at the rate of BC Hydro's weighted average cost of debt in that fiscal year. This program closed on March 14, 2021 with no balance in the regulatory account.

In accordance with Order in Council No. 319, BC Hydro announced new COVID-19 relief measures, three new Industrial Customer Payment Plan tariff supplements (TS 97, TS 98, TS 99) that allowed certain industrial customers to temporarily defer payment of a portion of their bills, with repayment plus interest once the programs closed. If any portion of amounts due became uncollectable, that amount would be in scope of the Mining Customer Payment Plan Regulatory Account. The ability to defer payment of bills under these three tariff supplements closed during fiscal 2021. $0.1 million of the deferred amounts owing from customers was deemed impaired under current accounting criteria and as such, that amount was transferred to the regulatory account as of March 31, 2021. However, BC Hydro still expects to fully collect all amounts owing from customers, including the amounts deemed impaired, so a recovery from general ratepayers is not proposed.

In addition, in response to the Government of B.C.’s Direction to the British Columbia Utilities Commission Respecting COVID-19 Relief (Order in Council No. 159 issued on April 2, 2020), the BCUC, by Order No. G-79-20 approved BC Hydro’s application to waive charges for eligible commercial customers during the period from the date that is the later of April 1, 2020 and the date on which an eligible commercial customer ceased operating until June 30, 2020 and defer the waived charges and BC Hydro’s cost of administering this relief for eligible commercial and industrial customers to the Mining Customer Payment Plan Regulatory Account and apply interest at BC Hydro’s weighted average cost of debt.

BC Hydro is proposing to recover the entire balance of the account from ratepayers except for the $0.1 million described above that BC Hydro expects to collect from the participating customer.

3.11 Project Write-off Costs Regulatory Account

In response to Directive 33[16] of the BCUC's Decision on the Fiscal 2020 to Fiscal 2021 RRA, BC Hydro made a separate application for approval to establish a new Project Write-off Costs Regulatory Account to capture the portion of actual project write-off costs in each fiscal year for which BC Hydro believes future recovery from ratepayers is appropriate.[17] BC Hydro's request to establish the Project Write-off Costs Regulatory Account was approved by BCUC Order No. G-337-20 dated December 17, 2020.

In its Decision on the Fiscal 2020 to Fiscal 2021 RRA, the BCUC accepted that some project write-offs are reasonable and to be expected in a utility's normal course of business,[18] but disallowed the recovery of any forecast amounts for project write-offs in the test period revenue requirements as proposed by BC Hydro. However, the BCUC stated that it was willing to consider a regulatory account to capture write-off costs, as follows:

> "The Panel, however, is willing to consider a mechanism, such as the establishment of a regulatory account, to capture BC Hydro's actual project write-off costs for future recovery, provided that in future RRAs BC Hydro also lists all of the projects and costs that have been written-off and captured in the regulatory account along with a description of each project, the rationale for incurring the costs and the rationale for the decision to not continue with the project. In the Panel's view, this would provide the BCUC and interveners with an opportunity to review the reasonableness of these costs. The Panel acknowledges that this would cause a delay between when the write-offs were incurred and when they are recovered. However, if the regulatory account balance is to be cleared over each test period, this would result in minimal intergenerational equity issues and balances the need for BC Hydro to recover these

[16] BCUC Decision and Order No. G-246-20, BC Hydro Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (October 2, 2020), Directive 33.

[17] Refer to: https://www.bcuc.com/ApplicationView.aspx?ApplicationId=833.

[18] BCUC Decision and Order No. G-247-20, BC Hydro Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (October 2, 2020), page 107.

> costs from ratepayers and the BCUC's ability to examine these costs prior to their recovery."[19]

Consistent with the BCUC's recommendation, in the Previous Application, BC Hydro requested BCUC approval to recover amounts deferred to the Project Write-off Costs Regulatory Account in respect of completed fiscal years over the next test period, starting in fiscal 2022 and on an ongoing basis, subject to BCUC review and approval of the recovery of these amounts; apply interest to the balance of the account based on BC Hydro's current weighted average cost of debt; and, recover actual interest charged to the account for amounts related to any completed fiscal years over the next test period. In its Decision on the Previous Application, Directive 16,[20] the BCUC approved BC Hydro's request.

BC Hydro is not requesting any changes to this account in this application.

3.12 Electric Vehicle Costs Regulatory Account

In its Decision on the Fiscal 2020 to Fiscal 2021 RRA, the BCUC denied BC Hydro recovery of electric vehicle charging station costs as the BCUC noted that BC Hydro had not demonstrated, subsequent to the amendment to the *Greenhouse Gas Reduction (Clean Energy) Regulation* (**GGRR**), that the electric vehicle charging stations are prescribed undertakings and encouraged BC Hydro to apply for recovery of its prescribed undertaking costs, stating:

> "The Panel encourages BC Hydro to apply to the BCUC if it wishes to have any of its prior, current or future EV capital expenditures considered as possible prescribed undertakings under the GGRR."

[19] BCUC Decision and Order No. G-247-20, BC Hydro Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (October 2, 2020), pages 107 to 108.

[20] BCUC Decision and Order No. G-187-21, BC Hydro Fiscal 2022 Revenue Requirements Application (June 17, 2021), Directive 16.

Under section 18 of the *Clean Energy Act*, the BCUC must set rates that allow BC Hydro to collect sufficient revenue to recover costs incurred for implementing prescribed undertakings.

Therefore, in the Previous Application, BC Hydro requested BCUC approval to establish an Electric Vehicle Costs Regulatory Account to defer any actual operating costs, amortization, and cost of energy amounts related to electric vehicle charging stations that meet the definition of a prescribed undertaking under the GGRR for fiscal 2020 and fiscal 2021; apply interest to the balance of the account based on BC Hydro's current weighted average cost of debt and recover the forecast interest charged to the account each year from the account each year; and, starting in fiscal 2022, recover the forecast balance at the end of a test period over the next test period, until such time that the actual amounts deferred to the account for fiscal 2020 and fiscal 2021 are recovered in rates. In its Decision on the Previous Application, Directive 24,[21] the BCUC approved the establishment of the Electric Vehicle Costs Regulatory Account to defer any actual operating costs, depreciation, and cost of energy amounts related to BC Hydro's EV charging stations that meet the definition of a prescribed undertaking under the GGRR for fiscal 2020 and fiscal 2021 and approved BC Hydro's request to apply interest to the balance of the account based on BC Hydro's current weighted average cost of debt.

The BCUC denied BC Hydro's request to, starting in fiscal 2022, recover the forecast account balance and forecast interest at the end of a test period over the next test period, and directed BC Hydro remove all fiscal 2022 costs related to its EV charging stations that meet the definition of a prescribed undertaking under the GGRR and defer these costs to the Electric Vehicle Costs Regulatory Account. The

[21] BCUC Decision and Order No. G-187-21, BC Hydro Fiscal 2022 Revenue Requirements Application (June 17, 2021) Directive 24.

BCUC also directed BC Hydro to apply for a recovery mechanism for the account in this application, which BC Hydro has done in Chapter 7.

3.13 Foreign Exchange Gains and Losses Regulatory Account

By Order No. G-47-02, the BCUC approved the deferral and amortization of foreign exchange gains and losses on the translation of foreign denominated long-term monetary items, using the straight-line pool method, from fiscal 2003 onwards. More specifically, deferred foreign currency translation gains and losses related to long-term debt is amortized over the weighted average remaining term to maturity of the foreign denominated long-term debt portfolio. Deferred foreign currency translation gains and losses related to sinking funds are amortized over the weighted average remaining term to maturity of the sinking fund portfolio.

BC Hydro is not requesting any changes to this account in this application.

3.14 Non-Current Pension Costs Regulatory Account

By Order No. G-16-09 to the Fiscal 2009 to Fiscal 2010 RRA, the BCUC approved the establishment of a regulatory account to defer the difference between forecast and actual non-current pension costs in fiscal 2010. The Fiscal 2011 RRA Negotiated Settlement Agreement extended this regulatory account for fiscal 2011 and directed that the closing fiscal 2011 balance be amortized over a five-year period, beginning in fiscal 2012.

BCUC Order No. G-77-12A extended the account for fiscal 2012 to fiscal 2014 and expanded the scope of the account to include the difference between forecast and actual non-current other post-employment benefit costs, beginning in fiscal 2012. In accordance with Direction No. 7, BCUC Order No. G-48-14 authorized BC Hydro to continue to defer to the account variances between forecast and actual non-current pension costs, on an ongoing basis.

By Order No. G-47-18, the BCUC approved that the portion of the forecast account balance at the start of a test period related to the variances transferred to the account during the previous test period be amortized over the expected average remaining service life (**EARSL**) of the active plan members at the start of the test period. EARSL is determined by BC Hydro's external actuary and is currently 13 years.

In accordance with BCUC Order No. G-47-18, the discount rate used to forecast post-employment benefit plan costs are based on the market discount rate in effect at the time the forecast was prepared.

Please refer to Chapter 5, section 5.12.4.1 for further information on Non-Current Service Costs.

BC Hydro is not requesting any changes to this account in this application.

3.15 PEB Current Pension Costs Regulatory Account

By Order No. G-47-18 to the Fiscal 2017 to Fiscal 2019 RRA, the BCUC approved the establishment of the Post-Employment Benefit (**PEB**) Current Pension Costs Regulatory Account to defer the annual variance between forecast and actual costs related to the operating cost portion of post-employment benefits current pension costs, on an ongoing basis. Order No. G-47-18 also approved that the forecast account balance at the end of a test period be recovered over the next test period.

In accordance with BCUC Order No. G-47-18, the discount rate used to forecast post-employment benefit plan costs are based on the market discount rate in effect at the time the forecast was prepared.

Please refer to Chapter 5, section 5.12.4.2, for further information on Current Service Costs.

BC Hydro is not requesting any changes to this account in this application.

3.16 Debt Management Regulatory Account

By Order No. G-42-16, the BCUC approved the establishment of the Debt Management Regulatory Account, to capture mark-to-market gains and losses of financial contracts that hedge future long-term debt. Hedging the interest rate on future long-term debt enables BC Hydro to mitigate interest rate risk on future long-term debt issuances.

Since fiscal 2017, BC Hydro has locked in interest rates on forecast future long-term debt issuances by entering into financial contracts that hedge the interest rate risk in order to create certainty of financing costs associated with future planned expenditures. In accordance with Order No. G-42-16, the gains and losses from financial contracts that hedge future long-term debt are recorded in the Debt Management Regulatory Account and amortized over the remaining term of the associated long-term debt issuances. These gains and losses are amortized in the test period following the test period in which the long-term debt associated with a particular hedge is issued.

BC Hydro is not requesting any changes to this account in this application.

3.17 DSM Regulatory Account

By Order No. G-55-95, the BCUC directed the deferral and recovery of costs associated with DSM activities. In accordance with Direction No. 7, BCUC Order No. G-48-14 authorized BC Hydro to continue to defer these costs to the DSM Regulatory Account and to amortize the balance of the account into rates over 15 years, on an ongoing basis.

The Direction to the BCUC Respecting the Authority's Thermo-Mechanical Pulp (**TMP**) Program (Order in Council No. 404, issued on July 14, 2015) specified that BC Hydro be allowed to defer costs incurred related to the TMP program, up to $100 million, to the DSM Regulatory Account.

The Direction to the BCUC Respecting Undertaking Costs (Order in Council No. 100, issued on March 1, 2017) specified that BC Hydro be allowed to defer low-carbon electrification expenditures, to the DSM Regulatory Account.

By Order No. G-246-20, the BCUC approved the deferral of low-carbon electrification expenditures to the DSM Regulatory Account, consistent with the Direction to the BCUC Respecting Undertaking Costs.

BC Hydro is not requesting any changes to this account in this application.

3.18 First Nations Costs Regulatory Account

By Order No. G-53-02, the BCUC approved the deferral of costs related to negotiations and settlements with First Nations and approved the amortization of actual negotiation costs and approved settlement costs, over a ten-year period. Settlement payments transferred to the First Nations Costs Regulatory Account from the First Nations Provisions Regulatory Account are not amortized or recovered in rates, pending BCUC approval to do so. In accordance with BCUC Order No. G-11-08, when a settlement is completed, BC Hydro must submit an application to the BCUC for approval to recover the settlement payment in rates. BCUC Order No. G-48-14 directed the amortization of specific amounts from the account for fiscal 2015 and fiscal 2016, and also directed that interest be applied on the account going forward.

Actual transfers to the account in fiscal 2015 and fiscal 2016 were different from the amounts on which the specific amortization in BCUC Order No. G-48-14 was based, which resulted in BC Hydro recording higher amortization than if the amortization had been calculated on actual transfers. This resulted in a credit amount which was refunded to ratepayers over the fiscal 2017 to fiscal 2019 period, consistent with BCUC Order No. G-47-18 to the Fiscal 2017 to Fiscal 2019 RRA.

By Order No. G-47-18 to the Fiscal 2017 to Fiscal 2019 RRA, the BCUC approved, starting in fiscal 2017, and on an ongoing basis that:

(i) Actual lump sum settlement payments be deferred to this account each year, and forecast lump sum settlement payments be amortized over a ten-year period, starting in the year of payment;

(ii) Actual annual settlement payments be deferred to this account each year, and forecast annual settlement payments be amortized in the year of payment;

(iii) Actual negotiation costs be deferred to this account each year, and actual negotiation costs be recovered from the account each year;

(iv) Interest continue to be applied to the balances in the account, consistent with the application of interest to other variance accounts, based on BC Hydro's weighted average cost of debt, and forecast interest charged to the account be amortized from the account each year;

(v) The forecast account balance at the end of a test period related to the difference between the amortization of the forecast annual and lump sum settlement payments and the calculation of amortization based on the actual annual and lump sum settlement payments during that test period be recovered over the next test period; and

(vi) The forecast account balance at the end of a test period related to the difference between the forecast interest recovered and the actual interest charged to the account during that test period be recovered over the next test period.

For items (i) and (ii) above, the year of payment refers to the year the payment is forecast to be made.

BC Hydro is not requesting any changes to this account in this application.

3.19 Site C Regulatory Account

By Order No. G-143-06, the BCUC approved the creation of a regulatory account related to Site C Project expenditures and approved deferral of project costs incurred in fiscal 2007 and fiscal 2008 to the account. The Fiscal 2009 to Fiscal 2010 RRA Decision and Fiscal 2011 RRA Negotiated Settlement Agreement extended the deferral of project costs to the Site C Regulatory Account to the end of fiscal 2011. By Order No. G-77-12A to the Fiscal 2012 to Fiscal 2014 Amended RRA, the BCUC authorized the deferral of all operating costs incurred related to the Site C Project in fiscal 2012 to fiscal 2014. By Order No. G-48-14, the BCUC authorized the deferral of all operating costs incurred in fiscal 2015 and fiscal 2016.

Following the final investment decision by the Government of B.C. to proceed with the Site C Project, BC Hydro commenced capitalization of costs related to the project starting in January 2015. While BC Hydro has commenced capitalization of costs, certain costs related to the project may not be eligible for capitalization under IFRS. For example, some legal costs are not eligible for capitalization under IFRS.

By Order No. G-47-18, the BCUC approved the deferral of any costs related to the Site C Project that are not able to be capitalized under the Prescribed Standards, to the Site C Regulatory Account.

In Directive 44[22] of its Decision on BC Hydro’s Fiscal 2020 to Fiscal 2021 RRA, the BCUC approved BC Hydro’s request to remove the reference to the “Prescribed Standards” from the scope of what may be deferred to the Site C Regulatory Account, as BC Hydro has fully adopted IFRS. This allowed BC Hydro to continue to

[22] Directive 44; BCUC Decision and Order No. G-246-20, BC Hydro Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (October 2, 2020).

defer to the Site C Regulatory Account any costs related to the Site C Project that are not able to be capitalized under IFRS.

Under IFRS, the amortization of the Debt Management Regulatory Account cannot be classified as finance charges and as such cannot be included in the calculation of BC Hydro's interest during construction that is applied to the Site C project. As these amounts cannot be capitalized under IFRS, they are deferred to the Site C Regulatory Account.

BC Hydro is requesting commencement of recovery of this account in Chapter 7.

3.20 Pre-1996 Contributions in Aid of Construction Regulatory Account

In fiscal 2006 BC Hydro retained Gannett Fleming to complete a depreciation study, which was filed as part of the Fiscal 2007 to Fiscal 2008 RRA. Gannett Fleming recommended that the amortization period for assets referred to as “Profile ID 99403 Distribution Pre-1996 Contributions in Aid” be increased from the then-approved period of 25 years to 45 years.

However, section 7(iv) of the Fiscal 2007 to Fiscal 2008 RRA Negotiated Settlement Agreement approved by BCUC Order No. G-143-06 committed BC Hydro to maintain the amortization period for these assets at 25 years. In its financial records BC Hydro changed the amortization period for these assets from 25 to 45 years to match the depreciation study, and implemented the Fiscal 2007 to Fiscal 2008 RRA Negotiated Settlement Agreement commitment by creating a regulatory account to capture the difference in the revenue requirement impacts of a 45-year amortization period and a 25-year amortization period. This regulatory account will be fully amortized at the end of fiscal 2040.

BC Hydro is not requesting any changes to this account in this application.

3.21 SMI Regulatory Account

By Order No. G-64-09, the BCUC approved the establishment of the Smart Metering and Infrastructure Program (**SMI**) Regulatory Account to defer the operating costs incurred by BC Hydro related to the Smart Metering and Infrastructure Program in fiscal 2009. By Order No. G-67-10, the BCUC approved the deferral of these costs for fiscal 2010. BCUC Order No. G-115-11 authorized BC Hydro to include its actual fiscal 2011 Smart Metering and Infrastructure Program operating costs up to $5.8 million in the SMI Regulatory Account. BCUC Order No. G-77-12A to the Fiscal 2012 to Fiscal 2014 Amended RRA approved the deferral of actual net operating costs, amortization on capital assets, finance charges, and return on equity related to the SMI program from fiscal 2012 to fiscal 2014, to the SMI Regulatory Account.

By Order No. G-166-13, and in accordance with section 3(2) of Direction No. 4, BC Hydro was directed to defer to the account:

- Program costs;
- Investigation costs and infrastructure costs that are not recovered from eligible customers at premises where a legacy meter or radio-off meter is installed; and
- Costs related to smart meters, which are incurred during the period January 1, 2013 to March 31, 2014.

By Order No. G-48-14 to the Fiscal 2015 to Fiscal 2016 Revenue Requirements Rate Application, the BCUC approved the amortization of specific amounts in fiscal 2015 and fiscal 2016 from the SMI Regulatory Account and also approved deferral of the net operating costs incurred in fiscal 2015 to fiscal 2016 related to the SMI Program, to the account. As the SMI Program is now complete and operationalized, no further additions are being made to this regulatory account.

By Order No. G-47-18 to BC Hydro's Fiscal 2017 to Fiscal 2019 RRA, the BCUC approved the recovery of the fiscal 2016 closing account balance over a period of 13 years, starting in fiscal 2017, which is the remaining period of the original 15-year amortization period proposed in the Regulatory Accounts Report filed in the Fiscal 2015 to Fiscal 2016 Revenue Requirements Rate Application. The 15-year amortization is based on the average life of SMI assets. BCUC Order No. G-47-18 also approved that interest continue to be applied to the balance of this regulatory account. Interest is applied to the account at BC Hydro's weighted average cost of debt and forecast interest is recovered from the account each year.

BC Hydro is not requesting any changes to this account in this application.

3.22 First Nations Provisions Regulatory Account

By Order No. G-56-06, the BCUC approved the establishment of a regulatory asset corresponding to the amount of a loss provision that BC Hydro recorded on its financial statements as required under the accounting standards related to two First Nations claims. By Order No. G-11-08, the BCUC amended the First Nations Provisions Regulatory Account to allow the balance of the regulatory account to reflect loss provisions as required under the accounting standards, related to any First Nations claim, and to allow the periodic adjustment of the balance of the regulatory account to reflect adjustments to the loss provisions required under the accounting standards.

BC Hydro's settlements with First Nations may include both lump sum payments and annual payments. When settlement payments are made, corresponding amounts are transferred from the First Nations Provisions Regulatory Account to the First Nations Costs Regulatory Account and recovered in rates through amortization of that regulatory account.

BC Hydro is not requesting any changes to this account in this application.

3.23 Environmental Provisions Regulatory Account

By Order No. G-88-10, the BCUC approved the establishment of the Environmental Provisions Regulatory Account in the amount of the loss provision liability recognized by BC Hydro in its financial statements, related to compliance with the polychlorinated biphenyl regulations and remediation of environmental contamination at Rock Bay. Order No. G-88-10 also approved periodic adjustments to the amounts in the regulatory account to match the changes required under the accounting standards in the loss provision liability. By Order No. G-7-13, the terms of the Environmental Provisions Regulatory Account were expanded to include the loss provision liability related to asbestos remediation at BC Hydro's facilities.

As BC Hydro makes actual expenditures related to compliance with the polychlorinated biphenyl regulations and the remediation of asbestos at its facilities, the balance in the Environmental Provisions Regulatory Account is reduced accordingly.

Actual costs of remediation activities at Rock Bay were deferred to the Rock Bay Remediation Regulatory Account as they were incurred, and the provision was reduced by an equal amount. Remediation of the Rock Bay property was completed in fiscal 2019, and the balance in the Environmental Provisions Regulatory Account related to Rock Bay has been reduced accordingly. In the Previous Application, BC Hydro requested BCUC approval to close the Rock Bay Remediation Regulatory Account at the end of fiscal 2022 as its balance will be fully amortized into rates at that time. In its Decision on the Previous Application, Directive 17,[23] the BCUC approved the closure of the Rock Bay Remediation Regulatory Account at the end of fiscal 2022, or a subsequent fiscal year, when the account balance is zero.

[23] BCUC Decision and Order No. G-187-21, BC Hydro Fiscal 2022 Revenue Requirements Application (June 17, 2021) Directive 17.

Actual costs related to asbestos remediation are deferred to the Remediation Regulatory Account as they are incurred, and the provision is reduced by an equal amount.

Actual costs related to compliance with polychlorinated biphenyl regulations were expensed as incurred until the end of fiscal 2016, and the Environmental Provisions Regulatory Account was reduced by an equal amount. By Order No. G-47-18 to the Fiscal 2017 to Fiscal 2019 RRA, BCUC approved that, starting in fiscal 2017, and on an ongoing basis, actual costs related to compliance with polychlorinated biphenyl regulations be deferred to the Remediation Regulatory Account as they are incurred and the provision be reduced by an equal amount. This is similar to the treatment of the costs associated with asbestos remediation.

BC Hydro is not requesting any changes to this account in this application.

3.24 IFRS Property, Plant and Equipment Regulatory Account

The IFRS Property, Plant and Equipment Regulatory Account enables the deferral of overhead costs that can no longer be capitalized under IFRS, as they are not directly attributable to the construction of an asset. Under Canadian Generally Accepted Accounting Principles (**CGAAP**), costs related to administration and general overhead were eligible for capitalization to Property, Plant, and Equipment.

BCUC Order No. G-77-12A to BC Hydro's Fiscal 2012 to Fiscal 2014 Amended RRA implemented BC Hydro's proposal that overhead costs that can no longer be capitalized be deferred and transitioned into operating expenditures over 10 years to avoid immediate and significant rate impacts. BCUC Order No. G-77-12A implemented this proposal and set the amortization period at 40 years, starting in fiscal 2013.

In the Fiscal 2012 to Fiscal 2014 Amended RRA, BC Hydro included a proposal to transition the overhead costs that could no longer be capitalized under IFRS into rates over a ten-year period. Under this proposal 100 per cent of ineligible overhead costs were charged to the IFRS Property, Plant and Equipment Regulatory Account in fiscal 2012. Starting in fiscal 2013, the percentage of the ineligible overhead costs to be charged to the regulatory account was reduced by 10 per cent each year. The additions of ineligible overhead costs to the account ceased in fiscal 2021.

In the Fiscal 2012 to Fiscal 2014 Amended RRA, BC Hydro also proposed to amortize the additions to the IFRS Property, Plant and Equipment Regulatory Account over 40 years. This amortization period was based on the composite life of BC Hydro's assets so that the overhead costs would be matched with the benefits of the underlying assets.

If BC Hydro had recognized the impact of the transition to IFRS in rates at the time of the transition, the rate impact for customers would have been immediate and significant. Amortizing these costs over a 40-year period allows these costs to be recovered over a similar period of time as was required under CGAAP, the accounting rules that BC Hydro followed prior to IFRS. Accordingly, a 40-year amortization period also results in approximately the same revenue requirement impact under IFRS as under the previous CGAAP rules. This means that ratepayers are not subject to higher rates as a result of changes in accounting standards. BC Hydro believes that the existing amortization period of 40 years continues to be appropriate.

BC Hydro is not requesting any changes to this account in this application.

3.25 IFRS Pension Regulatory Account

Upon the transition to IFRS in fiscal 2013, BC Hydro was required to recognize all unamortized actuarial gains and losses on the pension and other post-employment benefit plans, not previously recognized in its financial statements.

In the Fiscal 2012 to Fiscal 2014 Amended RRA, BC Hydro requested the establishment of the IFRS Pension Regulatory Account with an opening liability balance equal to the actual unamortized actuarial gains and losses on the pension and other post-employment benefit plans, which BC Hydro had to recognize in its financial statements at the time of conversion to IFRS. BCUC Order No. G-77-12A implemented this request and also set the amortization period at 20 years on a straight-line basis, starting in fiscal 2013.

Amortizing these costs over a 20-year period results in approximately the same revenue requirement impact under IFRS as under the previous CGAAP rules. This means that ratepayers are not subject to higher rates as a result of changes in accounting standards. BC Hydro believes that the existing amortization period of 20 years continues to be appropriate.

BC Hydro is not requesting any changes to this account in this application.

4 Summary of BC Hydro's Regulatory Accounts and Approach to Recovery

Table R-4 below provides a summary of the information contained in this appendix for each of BC Hydro's approved regulatory accounts discussed in this appendix. For clarity, the table excludes the two accounts requested that have not received BCUC approval.

Table R-4 Summary of BC Hydro's Regulatory Accounts

		Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate
1	Heritage Deferral Account	Captures variances related to BC Hydro's Heritage Cost of Energy as well as other items approved by the BCUC.	Net Forecast Cost of Energy Variance Account balance is recovered/ refunded based on DARR table mechanism as approved for fiscal 2022 and proposed going forward.	DARR table mechanism: • Minimizes intergenerational inequity by being responsive to the changing net balance in the Cost of Energy Variance Accounts; maintains rate stability for customers to the extent practicable; and • Is administratively simple and transparent.
2	Non-Heritage Deferral Account	Captures variances related to BC Hydro's Non-Heritage Cost of Energy (i.e., IPPs) as well as other items approved by the BCUC.	Net Forecast Cost of Energy Variance Account balance is recovered/ refunded based on DARR table mechanism as approved for fiscal 2022 and proposed going forward.	DARR table mechanism: • Minimizes intergenerational inequity by being responsive to the changing net balance in the Cost of Energy Variance Accounts; maintains rate stability for customers to the extent practicable; and • Is administratively simple and transparent.
3	Trade Income Deferral Account	Captures variances between forecast and actual Trade Income (i.e., Powerex).	Net Forecast Cost of Energy Variance Account balance is recovered/ refunded based on DARR table mechanism as approved for fiscal 2022 and proposed going forward.	DARR table mechanism: • Minimizes intergenerational inequity by being responsive to the changing net balance in the Cost of Energy Variance Accounts; maintains rate stability for customers to the extent practicable; and • Is administratively simple and transparent.

		Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate
4	Load Variance Regulatory Account	Capture variances between forecast and actual domestic customer load (referred to as the Domestic Revenue Variance).	Net Forecast Cost of Energy Variance Account balance is recovered/ refunded based on DARR table mechanism as approved for fiscal 2022 and proposed going forward.	DARR table mechanism: • Minimizes intergenerational inequity by being responsive to the changing net balance in the Cost of Energy Variance Accounts; maintains rate stability for customers to the extent practicable; and • Is administratively simple and transparent.
5	Biomass Energy Program Variance Regulatory Account	Capture all variances between forecast and actual amounts related to the Biomass Energy Program.	Net Forecast Cost of Energy Variance Account balance is recovered/ refunded based on DARR table mechanism as approved for fiscal 2022 and proposed going forward.	DARR table mechanism: • Minimizes intergenerational inequity by being responsive to the changing net balance in the Cost of Energy Variance Accounts; maintains rate stability for customers to the extent practicable; and • Is administratively simple and transparent.
6	Low Carbon Fuel Credits Regulatory Account	Capture variances between forecast and actual miscellaneous revenue from low carbon fuel credits.	Net Forecast Cost of Energy Variance Account balance is recovered/ refunded based on DARR table mechanism as approved for fiscal 2022 and proposed going forward.	DARR table mechanism: • Minimizes intergenerational inequity by being responsive to the changing net balance in the Cost of Energy Variance Accounts; maintains rate stability for customers to the extent practicable; and • Is administratively simple and transparent.

		Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate
7	Storm Restoration Costs	Captures variances between forecast and actual storm restoration costs and revenue impacts (variances) from the evacuation relief provided under the Evacuation relief tariff.	Next Test Period.	The expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.
8	Amortization of Capital Additions	Captures variances between forecast and actual amortization of capital additions.	Next Test Period.	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.
9	Total Finance Charges	Captures variances between forecast and actual finance charges	Next Test Period.	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.
10	Remediation	Captures variances between forecast and actual costs incurred related to compliance with Polychlorinated Biphenyl Regulations (**PCB**) and Asbestos remediation at BC Hydro facilities.	Next Test Period.	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.

		Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate
11	Real Property Sales	Captures variances between forecast and actual gain/loss on real estate sales.	Balance recovered from actual recognition of gains on sale. BC Hydro proposes to recover/refund the balance in the account, at the beginning of the next test period, over the next test period and continue to record only actual net gains	Smooths the recognition of gains and losses as sales will not occur uniformly over the 10 years since fiscal 2015.
12	Dismantling Cost	Captures variances between forecast and actual Dismantling Costs.	Next Test Period.	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.
13	Customer Crisis Fund	Captures the net difference between Customer Crisis Fund Rate Rider revenues and BC Hydro's incremental costs related to the Customer Crisis Fund pilot program and costs related to COVID-19 relief measures for residential customers. From June 2021, this account will capture administration costs of the program and grants provided to residential customers to a maximum of $5 million.	Next Test Period for COVID-19 relief measures costs only. No recovery/refund requested for Customer Crisis Fund balance	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.

		Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate
14	Mining Customer Payment Plan	Captures any amounts impaired related to mining customers participating in the Mining Customer Payment Plan Program and costs related to COVID-19 relief measures for commercial and industrial customers	Next Test Period for COVID-19 relief measures only. No recovery for Mining Customer Payments Plan deferral balance.	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.
15	Project Write-off Costs	Captures a portion of actual project write off costs in each fiscal year	Next Test Period	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.
16	Electric Vehicle Costs	Captures operating costs, amortization, and cost of energy amounts related to electric vehicle charging stations for fiscal 2020, fiscal 2021 and fiscal 2022	Next Test Period proposed	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.

		Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate
18	Fiscal 2022 Depreciation Study Impact[24]	Captures the variances arising in fiscal 2022 from the changes determined in the Depreciation Study	Next Test Period proposed	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.
19	Foreign Exchange Gains/Losses	Captures foreign exchange gains and losses on the translation of foreign denominated long-term monetary items.	Straight-line Pool Method	The recovery period matches the underlying attribute and should be recovered over a longer period of time (i.e., foreign denominated long-term monetary items).
20	Non-Current Pension Costs	Captures variances between forecast and actual non-current pension costs.	Over Average Remaining Service Life of Active Employee Group (**EARSL**) - currently 13 years	The recovery period matches the underlying attribute and should be recovered over a longer period of time (i.e., remaining life of employee group).
21	PEB Current Pension Costs	Captures operating cost variances between forecast and actual current pension costs.	Next Test Period.	These expenditures provide immediate, rather than long-term benefits (i.e., current pension costs).
22	Debt Management	Captures mark-to-market gains and losses on financial contracts that hedge future long-term debt.	Over remaining term of associated long-term debt issuances.	The recovery period matches the underlying attribute (i.e., long-term debt Issuance).

24 In its Decision on the Previous Application, Directive 15, the BCUC directed BC Hydro to establish a new regulatory account to capture the variances arising in fiscal 2022 as a result of any changes to the depreciation expense determined in the depreciation study

		Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate
23	DSM	Captures expenditures associated with Demand-Side Management activities. These expenditures result in future energy savings.	Over 15 years.	Matches the future benefit period for customers, which is the average measure life of DSM initiatives.
24	First Nations Costs	Captures First Nations annual and lump sum settlement payments and negotiation costs.	Over 10 years for lump sum settlement payments, annual settlement payments, which are amortized each year.	Lump sum settlements are amortized over a longer period of time to smooth the impact on rate.
25	Site C	Captures costs related to the Site C project prior to the final investment decision to proceed with the project, and costs that are not eligible for capitalization thereafter.	Over the weighted average life of the Site C assets of 84 years proposed.	Matches the benefits period of the Site C assets.
26	Pre-1996 Contributions in Aid of Construction	Captures the difference between the 25-year amortization period required for regulatory purposes and the 45-year amortization period required for financial reporting for this asset class.	Over 45 years (to fiscal 2040)	Matches the 45-year amortization period determined in a depreciation study filed in the Fiscal 2007-Fiscal 2008 RRA.

		Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate
27	SMI	Captured operating costs related to the SMI Program. The SMI Program is complete and no further additions are being made to this account.	Over 15 years (to fiscal 2029)	Matches the future benefit period for customers, which is the average life of the SMI assets.
29	First Nations Provisions	Regulatory provision established for BC Hydro's liability in respect of First Nations claims.	Amounts recovered in First Nations Costs Regulatory Account as settlement payments are made	Since non-cash provisions are not recovered in rates, no recovery mechanism is required. The provision is drawn down when actual expenditures are charged to the regulatory account and the amounts are recovered from the corresponding expenditure regulatory account (i.e., First Nations Costs Regulatory Account).
30	Environmental Provisions	Regulatory provision established for BC Hydro's liability in respect of compliance with Polychlorinated Biphenyl Regulations, and asbestos remediation at BC Hydro facilities.	Amounts recovered in Remediation Regulatory Account as expenditures are incurred	Since non-cash provisions are not recovered in rates, no recovery mechanism is required. The provision is drawn down when actual expenditures are charged to the regulatory account and the amounts are recovered from the corresponding expenditure regulatory account (i.e., Remediation Regulatory Account (PCB and Asbestos) and the Rock Bay Remediation Regulatory Account).

		Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate
31	IFRS Property, Plant and Equipment	Captures capital overhead costs that were eligible for capitalization under CGAAP but can no longer be capitalized under IFRS. The additions to the account were completed in fiscal 2021.	Rolling 40-year period (to fiscal 2061)	Recovered on the same basis as under the previous CGAAP accounting rules. Therefore, ratepayers are not impacted by higher rates as a result of changes in accounting standards.
32	IFRS Pension	Captures unamortized gains/losses on BC Hydro's pension plans that were required to be recognized in BC Hydro's financial statements upon transition to IFRS.	Over 20 years (to fiscal 2032)	Recovered on the same basis as under the previous CGAAP accounting rules. Therefore, ratepayers are not impacted by higher rates as a result of changes in accounting standards.

Debt Management Regulatory Account Annual Status Report

April 1, 2020 to March 31, 2021

Table of Contents

Appendices

Background

On March 30, 2016, the BCUC issued Order No. G-42-16 which authorized BC Hydro to establish a Debt Management Regulatory Account (**DMRA**) to capture mark-to-market gains and losses on financial contracts that hedge future long-term debt to mitigate interest rate risk related to future long-term debt that BC Hydro intends to issue. In compliance with Directive 4 of that Order, BC Hydro provides below its annual report on the DMRA.

Report as at March 31, 2021

During fiscal 2021, BC Hydro did not enter into any future debt hedges (**FDHs**) to mitigate interest rate risk on future long-term debt that BC Hydro intends to issue as we reached our hedging target as per our Liability Risk Management policy. The existing outstanding hedges consist of 10-year and 30-year interest rate swaps, with remaining contract maturity dates ranging from approximately three months to 3.25 years and forecast borrowing yields ranging from 3.15 per cent to 3.67 per cent.

Since the establishment of the DMRA and as at March 31, 2021, a total of $10.0 billion of FDHs have been placed, of which $3.2 billion remain outstanding. Based on BC Hydro's 2021/22 to 2023/24 Service Plan, at March 31, 2021, BC Hydro had hedged approximately 40 per cent of forecast long-term debt issuances for fiscal 2022 to fiscal 2025. The details of all FDHs are included in Appendix 1.

Lower (higher) long-term interest rates result in lower (higher) interest costs on the associated future long-term debt issues when issued. These lower (higher) interest costs on the associated debt issues provide an offset to the impact of the FDH losses (gains). This results in the net effect of locking in the interest rate and mitigating interest rate risk related to future long-term debt that BC Hydro intends to issue.

Any realized gains and losses will be amortized over the remaining term of the issued debt starting at the beginning of the test period following the test period during which the long-term debt associated with a particular hedge is issued. As a result, the effective interest rate on hedged debt is a combination of the gain or loss on the settled FDH and the yield of the underlying debt issuance.

At March 31, 2021, the DRMA had a balance of $449 million (after amortization). This balance included:

- $126 million of net unrealized losses on the $3.2 billion of outstanding FDHs;
- $298 million of net realized losses on the $6.8 billion of settled FDHs; and
- $25 million of amortization related to net realized gains on the $4.0 billion of FDHs settled during fiscal 2017 to fiscal 2019.

This was a net decrease of $504 million from the balance at March 31, 2020 of $953 million to the balance at March 31, 2021 of $449 million. The $504 million decrease was due to:

- $571 million related to increases in the unrealized mark-to-market value of the $3.2 billion of outstanding FDHs; partially offset by:
- $55 million related to decreases in the value of the $1.8 billion of FDHs that were settled during fiscal 2021; and
- $12 million related to the amortization of net realized gains on the $4.0 billion of FDHs settled during fiscal 2017 to fiscal 2019.

The increase in the value of the outstanding FDHs was due to a significant increase in long-term interest rates during fiscal 2021. The decrease in the value of the FDHs settled during fiscal 2021 was a result of a decrease in long-term interest rates at the time the FDHs were settled relative to the beginning of the fiscal year.

The net unrealized loss of $126 million relating to the $3.2 billion in outstanding FDHs remains sensitive to changes in long-term yields and will continue to change until the hedges are settled. A 100-basis point change in long-term yields would result in a change of approximately $400 million to $550 million in the value of the $3.2 billion in outstanding FDHs.

BC Hydro Fiscal 2021 Annual Report to the British Columbia Utilities Commission

Appendix B

Appendix 2

Glossary for Appendix 1

Name	BC Hydro reference for each individual FDH.
Execution Date	Date the FDH was entered into.
Transaction Type	Type of Future Debt Hedge **Bond Locks** – contracts with financial institutions that are based on the performance of Government of Canada Treasury Bonds. Under a Bond Lock, BC Hydro will effectively sell a particular Government of Canada Bond at the current interest rate and effectively repurchase it at a pre-defined future date at the then-prevailing market interest rate **Forward Swaps** – contracts with financial institutions whereby BC Hydro will pay the current interest rate on the Interest Rate Swap[1] and agree to receive the prevailing interest rate on the Interest Rate Swap at a pre-defined future date.
Forecast Debt Issuance and Contract Maturity Year	Fiscal year the FDH derivative contract is forecast to be unwound and cash settled (set at the inception of the hedge) and the related future debt is expected to be issued.
Contract Settlement Date	Date the FDH derivative was actually unwound and cash settled.
Hedge Term	The term of the future debt issue that is being hedged (i.e., either a 10-year debt issue or a 30-year debt issue).
Notional Amount	The dollar value of the FDH derivative. The notional amount of the derivative will be equal to the principal amount of the related future debt issue.
Forecast Borrowing Yield	The anticipated yield on a particular future debt issue on the day the FDH was executed. The forecast borrowing yield is subject to change based on the difference between the change in the yield on Government of B.C. Bonds vs. the change in the yield on the underlying FDHs (Bond lock or Forward Swap) since the inception of the hedges. The actual yield will only be known upon the cash settlement of the FDH and the issuance of the related future debt.
Actual Yield	The effective yield on the future debt issuance taking into account the gain or loss on the related FDH.
Fair Market Value	The mark to market value of the FDHs that are not yet cash settled.
Settlement Value	The amount of cash paid out by BC Hydro or received by BC Hydro upon the unwinding and cash settlement of the FDH. A loss on the FDH would involve a cash payment by BC Hydro and a gain on the FDH would involve a receipt of cash by BC Hydro.
Total DMRA Balance Before Amortization	The amount of gain or loss on FDHs recorded in the DMRA since inception. Comprised of mark to market gains and losses and settlement gains and losses.

[1] A Canadian Interest Rate Swap is an agreement between two counterparties that agree to exchange an interest payment based on the CDOR Canadian Dollar Offer Rate index.

Amortization	The amount removed from the DMRA and included in Net Income. The gains or losses in the DMRA will be amortized over the remaining term of the associated long-term debt issuances, commencing at the beginning of the test period subsequent to the test period in which the long-term debt to which the FDH is associated is issued. The combination of the amortization of the DMRA and the interest charges on the underlying debt result in the effective yield on the debt at its hedged rate.
DMRA Balance	The balance in the DMRA at the report date.

Attention: David Wong,
Executive Vice President, Finance, Technology, Supply Chain and CFO;

Ryan Layton,
Chief Accounting Officer;

Dear David and Ryan,

Pursuant to your request, we conducted a review and assessment of the regulated life estimates related to the BC Hydro assets as of March 31, 2020. Our report presents a description of the methods used in the estimation of depreciation and net salvage, the statistical analysis of service life and the summary of annual depreciation expense.

We gratefully acknowledge the assistance of BC Hydro personnel in the completion of the review.

Should you have any questions or concerns, please do not hesitate to contact me directly at 587.997.6489

Yours truly,

Concentric Advisors, ULC

Larry E. Kennedy
Senior Vice President

TABLE OF CONTENTS

SECTION 1

1 STUDY HIGHLIGHTS

Pursuant to BC Hydro's ("BC Hydro" or the "Company") request, Concentric Advisors, ULC ("Concentric") conducted a depreciation study related to the electric generation, electric transmission, electric distribution, and general plant accounts, as of March 31, 2020.

The purpose of this study was to:

- determine the average service lives and whole life annual accrual percentages related to the return of original cost and cost of removal for ratemaking objectives based on assets in-service at March 31, 2020.
- review the impact of dismantling costs in compliance with the directives 39 and 40 contained in the British Columbia Utilities Commission (BCUC) Decision and Order G-246-20 dated October 2, 2020.

The depreciation study considered three key topics:

- Determination if the current average service life estimates are providing an appropriate return of investment over the useful life of the assets, and provides recommendation for accounts where it is considered that the current average service life estimates require adjustment;
- Review of the current BC Hydro method of collecting Costs of Removal (Dismantling) and consider alternatives for the collection of Dismantling costs in a way that neither current or future ratepayers are overburdened.
- Review and determination of any asset groups that would benefit from the use of a Life Span (Economic Life) approach.

The consideration of the above topics included preparation of detailed historic retirement and cost of removal patterns, in depth discussion with internal BC Hydro subject matter experts and management staff, and a review of Canadian peer electric generation, transmission and distribution utilities.

Based on the above review of the three key topics, Concentric recommends the average service lives and positive salvage rates set forth herein applied specifically to assets in service, as of March 31, 2020, as summarized in Tables 1, 2, and 3 in Section 5 of this report by account detail. Supporting data and calculations are provided as well.

Additionally, Concentric recommends that the estimated future cost of removal requirements be recovered through implementation of the "Traditional Method" of net salvage recovery. Our review and recommendations are discussed in detail in the document entitled "BC HYDRO – Report on Applicability of Inclusion of Net Salvage in the Depreciation Rate Calculations".

This study results in average service life and positive salvage rate proposals that show an estimated average decrease to depreciation expense over a 10-year period, fiscal 2022 to fiscal 2031, of $5.2 million, which excludes the location specific assets subject to the Life Span (Economic Life) approach. This estimated decrease is calculated on the application of the proposed average service lives when applied to the depreciable plant study balances as at March 31, 2021. In addition, the results of the recommended life changes to the location specific assets subject to the Life Span (Economic Life) approach is estimated to be an average $2.3 million increase over the 10-year period, fiscal 2022 to fiscal 2031.

Additionally, in order to provide the impact of the inclusion of dismantlement costs into the depreciation rate calculations, BC Hydro has estimated that the implementation of the estimated future net salvage requirements would result in an additional of $87.8 million, $92.2 million, and $97.5 million of annual net salvage amortization in fiscal years 2023, 2024, and 2025 respectively. However, Concentric notes that this additional annual accrual amount would be offset resulting from the reduction of approximately $53.3 million, $46.3 million, and $44.8 million related to fiscal years 2023, 2024, and 2025, respectively, of current revenue requirement resulting from the current policy of expensing net salvage amounts in the year of occurrence. However, given the potential impact on customer rates, Concentric recommends deferring implementation of the recommended approach for the recovery of the estimated Costs of Removal into depreciation calculation until the next Rate Application in 2026.

1.1 BASIS OF STUDY

1.1.1 Scope

Concentric has been retained by BC Hydro to develop reasonable and appropriate average service life and net salvage percentage estimates for use in the estimated depreciation calculations for the purpose of determining the annual regulated revenue requirement. The review included the analysis based on plant in service as of March 31, 2020 and resulting impacts of the results of this study were applied specifically to plant in service as of March 31, 2020. This report sets forth the findings of our independent review. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates.

The results of this study will be implemented on an individual asset level within the BC Hydro accounting system on a remaining life basis. This is a continuation of the longstanding accounting practice of BC Hydro. Concentric notes that original cost amounts within the BC Hydro accounting system have been reset to the then existing net book value during two separate International Financial Reporting Standards ("IFRS") based implementations. Within these implementations, the net book value of the asset amounts were not changed, however the original cost was reset to the then existing net book value and the accumulated depreciation balances were reset to zero. As such, the continued use of the remaining life calculations applied to each specific asset is reasonable and continues to be the appropriate method of depreciation expense calculation. As these calculations are performed internally within the BC Hydro SAP system, this report does not include depreciation rate calculations.

The Straight-Line method, Average Life Group ("ALG") procedure, applied on a remaining life basis as used within the BC Hydro SAP system is a commonly used depreciation calculation procedure that has been widely accepted in jurisdictions throughout North America and for most regulated utilities in the province of British Columbia. While Concentric notes that this calculation method is usually applied on an account basis, the calculations as applied within the BC Hydro systems on an individual asset basis provides the same calculation basis and Concentric recommends its continued use.

As part of this study, Concentric Advisors reviewed the operating considerations and typical asset configurations throughout the BC Hydro system, through the completion of detailed operational staff discussions. Due to the ongoing COVID-19 pandemic at the time of the completion of this study, site tours were unable to be carried out.

2 PLAN OF STUDY

This study is presented in the following order:

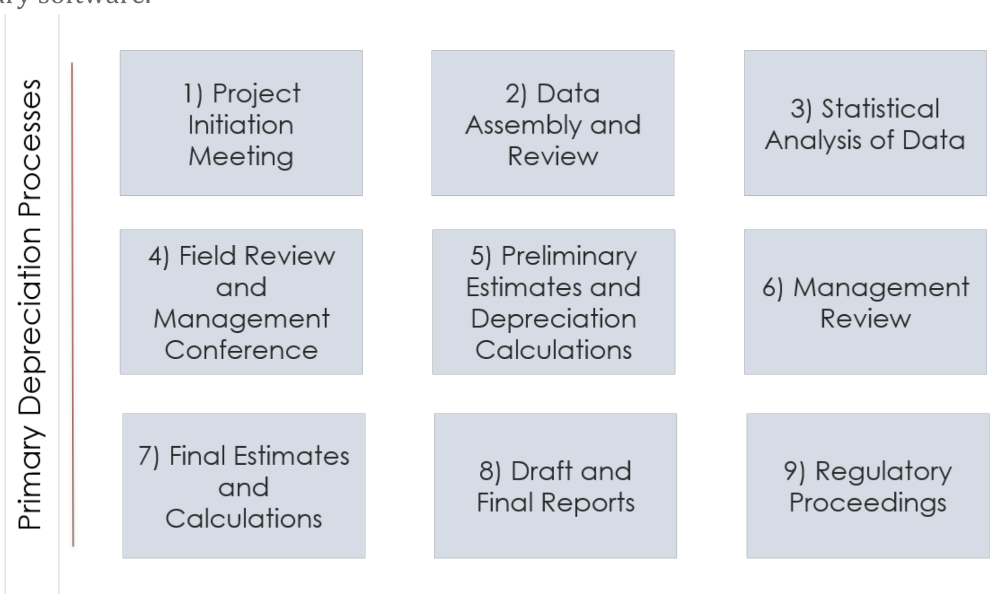
Section 1:	Study Highlights, presents a brief summary of the depreciation study and results
Section 2:	Contains statements with respect to the plan and the Basis of the Study
Section 3:	Development of the Required Average Service Life and Net Salvage Estimates, presents descriptions of the methods used and factors considered in the service life and net salvage studies
Section 4:	Results of Study, presents summaries by depreciable group of annual depreciation in Tables 1, 2, and 3
Section 5:	Estimation of Survivor Curves, is an overview of Iowa curves and the Retirement Rate Analysis
Section 6	Presents the results of the Net Salvage Study

2.1 Depreciation

A full and comprehensive depreciation study includes the following components:

1. supported recommendations regarding Average Service Life estimates for each account;
2. supported recommendations regarding estimated Net Salvage requirements for each account; and
3. a document explaining the procedures followed and justifying the results in a format suitable for submission to senior management and regulatory authorities.

A diagram of the nine primary processes followed by Concentric in the development of the depreciation study is provided below. Each of the steps is undertaken by Concentric using proprietary software.



2.2 Information Provided by BC Hydro

BC Hydro has provided Concentric with required information, as of March 31, 2020, for all accounts being studied. This information has been compiled from the plant accounting records and includes the following:

- current balances by vintage year for each account (aged balances). The balances provide the amount of investment sorted by installation year currently in operation. This file is only inclusive of current plant in service and does not include any retirement information; and
- retirement transactions for all accounts. The transactions include information regarding the transaction year of the retirement, the installation year of the asset being retired, and the original cost of the asset being retired.
- cost of removal (dismantling) and gross salvage transactions requiring the recovery of net salvage through March 31, 2020. The transactions include information regarding the transaction year of the retirement, the costs associated with the retirement, and any gross salvage proceeds from the sale or reuse of the property.

2.3 Procedures Performed

The above data was reviewed and reconciled to Company control schedules to ensure accuracy and reasonableness. These checks include that the surviving investment by account equals (or can be reconciled to) the Company's gross plant in service and accumulated depreciation ledger balances. In addition, Concentric performed the following procedures to form the basis of the results of this study:

- confirm accounting policies being followed in accordance with International Financial Reporting Standards principles;
- conduct interviews with BC Hydro personnel to obtain understanding of company operations;
- completed an actuarial analysis for all depreciable accounts; and
- comparison against industry peers that operate facilities similar to BC Hydro's regulated hydro fleet.

3 DEVELOPMENT OF DEPRECIATION RATES

3.1 Depreciation

Depreciation, as applied to depreciable assets, means the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of assets in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand and requirements of public authorities, and, in the case of electric companies, the exhaustion of natural resources.[1]

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a time period by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing electric utility service. Normally, the time over which the fixed capital cost is allocated to the cost of service, is equal to the time over which an item renders service – that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the Straight-Line method of depreciation.

BC Hydro continues to determine depreciation using the Straight-Line method for all plant comprising regulated assets, based on the Average Life Group Procedure – Remaining Life Technique. The Average Life Group Procedure is the most commonly used depreciation procedure for North American utilities, whereby one average service life estimate is applied to all assets and vintages within the asset class. The Remaining Life Technique calculates depreciation on the basis of recovering the net book value of the investment over the remaining life of an asset, or group of assets, with no provision for separate accumulated depreciation true-up. As such, a common life and salvage estimate is applied to each of the assets. Concentric finds the application of the Straight-Line method and the Average Life Group Procedure – Remaining Life Technique results in a reasonable recovery of BC Hydro's capital investment over time and recommends their continued application.

3.2 Estimation of Average Service Life and Net Salvage

3.2.1 Average Service Life

The use of an average service life or a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units, or by constructing a survivor curve plotting the number of units which survive at successive ages using the retirement rate method of analysis.

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. The Iowa

[1] Federal Energy Regulatory Commission -Part 201- Uniform System of Accounts Prescribed for Electric Companies Subject to the Provisions of the Electric Act Definitions

curves *"…were sorted into three groups according to whether the mode was to the left, approximately coincident with, or to the right of the average-life ordinate. The curves in each of these three groups were then sub-classified in accordance with the height of the mode, taking also into consideration the distance of the mode to the left or right of the average life."* [2] The Iowa curves are described as L-type (i.e. left-moded), R-type (i.e. right-moded), and S-type (i.e. symmetrical). Further development resulted in the introduction of O-type (i.e. origin-moded curves) where the greatest frequency of retirement occurs at the origin, or immediately after age zero. Individual type curves are further depicted with numerical subscripts which represent the relative heights of the modes of the frequency curves within each family.

The program that is used by Concentric for statistical smooth curve fitting utilizes an internal "goodness-of-fit" criterion known as the Residual Measure. This Residual Measure is based on a least squares solution of the differences between the stub curve (or original data points) and smooth survivor curve which also requires a balancing of the differences above and below the stub curve.

The criterion of goodness-of-fit is the mean square of the differences between the points on the stub and fitted smooth survivor curves. The residual measure, or standard error of estimate, shown in the output format is the square root of this mean square. As such, the lower the Residual Measure the better the statistical fit between the analyzed Iowa curve and the observed data points. Concentric follows the widely used practice of fitting Iowa curves up to one percent of the maximum exposures. This standard practice is utilized to minimize the influence of typically small retirements applied to similarly small exposures which may unduly affect the Iowa curve fitting process. However, Concentric will recognize the observed data points beyond the one percent of maximum exposures if it is determined that the additional data is a valid consideration for life recommendation.

A discussion of the general concept of survivor curves and retirement rate method is presented in Section 7.

3.2.2 Survivor Curve Judgements

The service life used in the depreciation and amortization calculations were based on informed professional judgment which incorporated a review of management's plans, policies and outlook, a general knowledge of the electric utility industry, and comparisons of the service life estimates from Concentric's studies of other electric utilities. The use of survivor curves, to reflect the expected dispersion of retirement, provides a consistent method of estimating depreciation for assets. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts not subject to amortization accounting.

The procedure for estimating service lives consisted of compiling historical data for the plant accounts or depreciable groups, analyzing this history through the use of widely accepted techniques, and forecasting the survivor characteristics for each depreciable group on the basis of interpretations of the historical data and the probable future. Probable future expectations included management and operational staff interviews. The combination of the historical experience and the probable

[2] Robley Winfrey, Statistical Analyses of Industrial Property Retirements, Bulletin 125 revised (Engineering Research Institute, Iowa State University, 1935) 65

future expectations yielded estimated survivor curves from which the average service lives were derived.

The resultant depreciation rates are summarized in the applicable tables of this study (Section 4). The depreciation rates should be reviewed periodically to reflect the changes that result from plant and reserve account activity.

3.2.3 Operations Discussions

Discussions with operations representatives undertaken as part of this study provided Concentric with an understanding of the type of assets in service for the electric system. These discussions provide Concentric with the necessary background to make an assessment of the physical installations of the BC Hydro plant, and to understand the type of plant in service and the operating conditions of the facilities.

Operational interviews were undertaken to understand the historic operating conditions that have led to retirement of plant in the past and to understand the current condition of the assets which may impact future retirement plans. Operational interviews covered the following topics:

- Operating history of assets in service;
- Replacement history of major asset components and review of any significant retirement programs;
- General operating experience of the major asset components;
- Review of any life restricting operational issues;
- Review of instances where advancements in technology may cause changes to average service life indications; and
- Discussions of the manner in which BC Hydro's assets may differ from peer assets.

3.2.4 Peer Analysis

In order to provide a comparison for each account grouping, Concentric selected a peer group of companies to use in the development of average service lives. The companies selected for comparison were all companies for which Concentric has recently completed depreciation studies relating to Canadian electric generation, transmission, and/or distribution plants. As such, Concentric was able to make a meaningful comparison giving consideration to factors such as, capitalization and retirement policies, maintenance practices, and general operational practices. The companies selected for comparison were:

- Ontario Power Generation;
- Manitoba Hydro;
- Newfoundland and Labrador Hydro Corporation (NALCOR);
- FortisBC Energy; and
- New Brunswick Power.

The above utilities provided Concentric Advisors with a comparable base of average service life estimates to use in the development of the service life estimates for BC Hydro's hydroelectric asset classes through Concentric's professional judgement.

3.2.5 Professional Judgement

The use of professional judgment in the development of average service life estimates is a practice that is appropriate and has been used for many years in North American regulatory jurisdictions. When available, the use of statistical analysis of the historic retirement transactions combined with the use of professional judgment, which includes review of accounting procedures and practices, use of operational staff interviews, review of prior studies, and review of the approved life estimates of peer companies, provides the most complete method of service life analysis.

3.2.6 Life Span Dates

Life expectancy of electric generation and substation plant assets is impacted not only by physical wear and tear of the assets but also by economic factors including the feasibility of the economic replacement of major operating components or the economic viability of the plant as a whole. In circumstances where the replacement of major operating components is not economically feasible, the life of the major component can be the determining factor of the generation and substation plant and all of the assets within the plant. As such, the remaining depreciation life of electric generation and substation plant assets is the lesser of the physical life expectation of the asset or the period to the end of the life span of the generation or substation plant.

The use of life span dates for determining depreciable lives for regulated electric generation plant is common throughout many North American regulatory jurisdictions. The basis for the determination of the life span date is usually based on one or more of the following:

- the physical life estimation of the major and vital components of the generating and substation plant;
- the duration of operating licenses;
- precedent and policy of the regulatory jurisdiction;
- expiration of the supply source for which the generation plant is dependent; and
- expiration of market demand upon which the generation plant is dependent.

The majority of BC Hydro's regulated hydroelectric stations do not require an end of life date as there are currently no factors reasonably expected to limit their life. With regular maintenance and replacement of components, hydroelectric stations, including associated civil structures, are typically expected to operate for very long periods.[3]

The Burrard Synchronous Condense Facility is expected to be removed from service in fiscal year 2025. As such, it has been assigned a four-year remaining life and all assets included at the Burrard

[3] Although dams can be considered a life-limiting component for hydroelectric generating facilities, in practice this does not result in an establishment of a specific life span date as the dams are expected to be in use for the foreseeable future with regular maintenance.

Synchronous Condense Facility are depreciated at 25 percent of the net book value as at March 31, 2021.

The following sites have economic planning horizons assigned due to upcoming terminal retirements:

Site	Economic Planning Horizon	Remaining Life as of March 31, 2020
Balfour	2023	3
Coquitlam	2022	2
Dal Grauer	2035	15
Fairmont	2024	4
Fort Steele	2022	2
George Dickie	2023	3
Glenmore	2024	4
Horne Payne	2025	5
Lougheed	2024	4
Murrin	2035	15
Murrin #1 Dal Grauer Circuit	2033	13
Norgate	2024	4
Quesnel	2022	2
Richmond	2024	4
Scott Road	2023	3
Sumas Way	2024	4
Surrey	2022	2
Wilsey Dam	2029	9

We recommend the locations in the above table be all depreciated on a remaining life basis incorporating the above life-span dates. The net book value of all assets located within these sites are depreciated at a rate of 1/Remaining Life Span.

3.3 Account Reorganization

Concentric reviewed the account structure currently being used by BC Hydro to find accounts where duplication may exist. This was done to ensure efficiency within the accounting practices and reduce regulatory burden. While the combination and reorganization of these accounts will streamline the accounting process, Concentric understands that there may be a large amount of work to input these new accounts and accurately transfer assets between accounts. As such, while Concentric is recommending the transfer of assets into the following account structure within the test period of this depreciation study, the depreciation study is being submitted with the currently approved account structure.

VEHICLE ACCOUNTS

2020 Plant in Service	Previously Approved Life	Concentric Recommended Life
$255,207,136	Varies	Varies

The assets in these accounts relate to vehicle fleet owned by BC Hydro. These assets are a variety of sizes and types and have a variety of expected lives. Through the completion of the depreciation study, Concentric was made aware that the currently utilized account structure for vehicles was leading to non-homogeneous assets being grouped together. Consequently, vehicles were retired before the expected end of life and/or with lower than expected proceeds per the asset class, leading to losses on retirement. Concentric recommends BC Hydro examine the vehicles accounts and create a set of accounts that better aligns with the actual use of vehicles assets. In discussion with BC Hydro operations and management, Concentric recommends the following account structure be created:

Account Name	Assets Included	Proposed Asset Life	Proposed Net Salvage
Light Vehicles	Automobiles SUVs Cargo and cutaway vans Pick-up trucks one ton and under	10	15%
Medium Vehicles	Service Body trucks Flat Deck trucks	10	9%
Walk-in Van	Walk-in Vans	12	9%
Bucket Trucks > 50’	Bucket Trucks >50’	14	5%
Bucket Trucks 40 – 50’	Bucket Trucks 40-50’	12	5%
Bucket Trucks < 40’	Bucket Trucks < 40’	10	5%
Heavy Digger Derrick and Fire Truck	Heavy Digger Derrick Fire Truck	15	5%
Heavy Flat Deck, Dump Trucks, Highway Tractors	Heavy Flat Deck Dump Trucks Highway Tractors	12	5%
Trailers	Trailers	15	17%
Equipment	Snow vehicles Sweeper	16	7%

	Loader/Backhoe Ride-Rails Forklift / Pallet Jack Other Equipment (e.g., mobile welder and compressor)		

As the above accounts have not received approval from the British Columbia Utilities Commission, Concentric recommends the following lives be utilized until the new account structure can be created. Upon approval of the updated account structure and the creation of new accounts, Concentric recommends that the following accounts be closed:

Account Number	Account Description	Currently Approved Life	Currently Approved Net Salvage	Proposed life	Proposed Net Salvage
C81001	Automobiles	8	20%	10	15%
C81101	Trucks < 1 Ton 2 Wheel Drive	8	20%	10	15%
C81201	Trucks < 1 Ton 4 Wheel Drive	8	20%	10	15%
C81301	Trucks > = 1 Ton 2 Wheel Drive	13	15%	10	9%
C81302	Truck > = 1 Ton 2 Wheel Drive	13	5%	10	9%
C81401	Trucks > = 1 Ton 4 Wheel Drive	13	25%	12	5%
C81501	Trucks > = 1 Ton 6 Wheel Drive	12	10%	14	5%
C81601	Tractor, Highway	9	10%	12	5%
C81701	Aerial Device	13	10%	12	5%
C81702	Line / Service / Van Body	15	15%	10	9%
C81703	Derricks / Diggers	15	20%	15	5%
C81704	Ride-A-Rails	25	15%	16	7%
C82501	Forklift / Pallet Jack	20	20%	16	7%
C82502	Snow Vehicle	20	40%	15	10%

C82503	Sweeper	15	15%	16	7%
C82504	Loader / Backhoe	17	45%	16	7%
C82505	Trailer, Reel / Pole / Utility	20	10%	18	10%
C82506	Welder, Mobile, Self-Powered	15	15%	15	10%
C82507	Compressor, Mobile, Self-Powered	15	10%	15	10%

3.4 Net Salvage Estimates

Concentric is aware of BCUC directives 39 and 40 to review the impact of dismantling costs contained in the British Columbia Utilities Commission (BCUC) Decision and Order G-246-20 dated October 2, 2020. As such, Concentric has completed a review of different net salvage recovery mechanisms used throughout North America and the applicability of these mechanisms to the BC Hydro system. The results of this review are attached in the document entitled "BC HYDRO – Report on Applicability of Inclusion of Net Salvage in the Depreciation Rate Calculations". In this report, Concentric recommends the traditional approach to net salvage applied on a functional group basis.

The net salvage estimates used in the depreciation calculations were based on informed professional judgment which incorporated a review of management's plans, policies and outlook, a general knowledge of the electric utility industry, and comparisons of the net salvage estimates from Concentric's studies of other electric utilities.

The estimates of net salvage for the mass property accounts were based in part on historical data related to actual retirement activity for the years 2011 through 2020 at the functional group level. Gross salvage and cost of removal and related to experienced retirements were used. Given that the historic data was available at an aggregated functional level, Concentric recommends that the net salvage percentage be determined at a functional level as follows:

- Generation accounts;
- Transmission accounts;
- Distribution accounts;
- General Plant accounts;
- Vehicle accounts.

In the development of the estimated net salvage percentage for each of the above functional groups, Concentric removed specific accounts that would not be expected to incur costs of removal or retirement, and any assets with an existing Asset Retirement Obligation ("ARO").

Percentages of the cost of plant retired were calculated for each component of net salvage on an annual, three-year, five-year, and on a cumulative moving average basis. The same net salvage percentage was applied to all assets within the same functional group for accounts within the group that would be expected to incur costs of removal or retirement.

3.5 Average Service Life Assessments

Concentric has reviewed the average service life estimates for BC Hydro's asset categories, based on March 31, 2020 asset values.

The following discussion, dealing with a number of accounts which comprise the majority of the investment analyzed, presents an overview of the factors considered by Concentric in the determination of the average service life estimates. The survivor curve estimates for the remainder of the accounts not discussed in the following sections were based on similar considerations.

ACCOUNT C11650 – CONTRIBUTIONS – INFRASTRUCTURE RIGHTS

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$6,259,569	0.02%	35	35-SQ

The assets in this account relate to contributions made related to the assets in Account C52201 – Distribution, Transformers. Consequently, the life of this account should be tied to the life of Account C52201. As such Concentric is recommending an Iowa 35-SQ to match the life of Account C52201.

ACCOUNT C22005 – BUILDING, COMPOSITE POOL

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$561,958,586	1.99%	60	65-R3

The assets in this account relate to electric reliability focused buildings throughout British Columbia. These buildings are typically built out of cinder blocks in a variety of styles based on when the buildings were built and the purpose of the building.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2011 through 2020 of $12,551,395 were recorded and have resulted in actual observed data points as depicted on page 5-43. The best fitting Iowa Curve using the currently approved 60-year life is the Iowa 60-R5 with a residual measure of 0.3136. An Iowa 65-R3 provides a better visual fit with a residual measure of 0.4645. A review of peer Canadian electric utilities provides a range from 50 years to 75 years. Based on the above and on Concentrics' experience, an Iowa 65-R3 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 65-R3 to represent the future expectations for the investment in this account.

ACCOUNT C22007 – BUILDINGS, ENVELOPE

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$170,299,646	0.60%	30	35-R3

The assets in this account relate to the outer building envelope related to buildings throughout British Columbia. This includes assets such as doors, windows, siding, structural masonry, and insulation.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2011 through 2020 of $476,562 were recorded and have resulted in actual observed data points as depicted on page 5-48. Peer utilities do not typically have an account with the envelope related assets alone. Consequently, the assets in this account tend to have longer lives in peer utilities and therefore, the peer review is of limited value. As there have been minimal retirements in the preceding nine years, Concentric views that a slight life extension is warranted at this time. Based on the above and on Concentrics' experience, an Iowa 35-R3 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 35-R3 to represent the future expectations for the investment in this account.

ACCOUNT C22009 – BUILDINGS, HVAC SYSTEMS AND COMPONENTS

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$101,296,784	0.36%	15	20-R3

The assets in this account relate to the heating, ventilation, and air conditioning ("HVAC") systems located in buildings throughout British Columbia.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2011 through 2020 of $1,568,375 were recorded and have resulted in actual observed data points as depicted on page 5-51. The best fitting Iowa Curve using the currently approved 15-year life is the Iowa 15-R4 with a residual measure of 0.1335. An Iowa 20-R3 provides a better residual measure of 0.0869. Peer utilities do not typically have an account with the HVAC related assets alone. Consequently, the assets in this account tend to have longer lives in peer utilities and therefore, the peer review is of limited value. Based on the above and on Concentrics' experience, an Iowa 20-R3 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 20-R3 to represent the future expectations for the investment in this account.

ACCOUNT C23201 – PENSTOCK, STEEL

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$410,680,827	1.46%	75	85-R4

The assets in this account relate to the steel penstocks located in hydroelectric generation sites. The majority of penstocks on the BC Hydro system are steel. Most steel penstocks have a coating.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. There were no retirements recorded between 2011 and 2020. As such, the actuarial analysis is of limited value. A review of peer Canadian electric utilities provides a range from 60 years to 90 years; however, there is often a mix of materials in the penstock account. Therefore, it is expected that there may be some divergence in the life of this account between different utilities. As there have not been any retirements in the preceding nine years, Concentric views that a life extension is warranted at this time. Based on the above and on Concentrics' experience, an Iowa 85-R4 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 85-R4 to represent the future expectations for the investment in this account.

ACCOUNT C23202 – PENSTOCK, CONCRETE

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$85,009,389	0.30%	100	85-R4

The assets in this account relate to the concrete penstocks located in hydroelectric generation sites. The majority of penstocks on the BC Hydro system are steel. Most concrete penstocks have a coating, however none of the coatings are polyethylene.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. There were no retirements recorded between 2011 and 2020. As such, the actuarial analysis is of limited value. A review of peer Canadian electric utilities provides a range from 60 years to 90 years; however, there is often a mix of materials in the penstock account. Therefore, it is expected that there may be some divergence in the life of this account between different utilities. Based on the above and on Concentrics' experience, an Iowa 85-R4 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 85-R4 to represent the future expectations for the investment in this account.

ACCOUNT C23801 - CRANES

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$115,886,373	0.41%	60	65-R4

The assets in this account relate to powerhouse and gantry cranes, located on the BC Hydro generation dams. These assets are typically long lived with minimal modernization required.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2012 through 2020 of $5,387,660 were recorded and have resulted in actual observed data points as depicted on page 5-100. The best fitting Iowa Curve using the currently approved 60-year life is the Iowa 60-R3.5 with a residual measure of 0.2036. An Iowa 65-R4 provides a residual measure of 0.3377. A review of peer

Canadian electric utilities provides a range from 55 years to 70 years. Based on the above and on Concentrics' experience, an Iowa 65-R4 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 65-R4 to represent the future expectations for the investment in this account.

ACCOUNT C24301 – SLOPE STABILIZATION

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$163,033,255	0.58%	100	70-R3

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2013 through 2020 of $2,503 were recorded and have resulted in actual observed data points as depicted on page 5-124. As the level of retirements is minimal, the actuarial analysis is of limited value. Peer utilities do not typically have an account with slope stabilization assets alone. Consequently, the peer review is of limited value. Discussions with BC Hydro operations staff indicate that the life of this account should decrease due to the life decreases in similar accounts. At this time, Concentric recommends an Iowa 70-R3 to represent the future expectations for the investment in this account.

ACCOUNT C25101 – STRUCTURE, SUPPORT, STEEL

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$184,451,646	0.65%	65	55-R4

The assets in this account relate to buildings throughout British Columbia. BC Hydro has been working to replace wood buildings with steel buildings where appropriate.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2013 through 2020 of $1,475,173 were recorded and have resulted in actual observed data points as depicted on page 5-131. The best fitting Iowa Curve using the currently approved 65-year life is the Iowa 65-R5 with a residual measure of 0.2535. An Iowa 55-R4 provides a residual measure of 0.4445. A review of peer Canadian electric utilities provides a range from 55 years to 65 years. Based on the above and on Concentrics' experience, an Iowa 55-R4 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 55-R4 to represent the future expectations for the investment in this account.

ACCOUNT C41007 – TURBINE, HYDRO, COMPOSITE POOL

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$415,468,606	1.47%	50	55-R3

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2013 through 2020 of $462,118 were recorded and have resulted in actual observed data points as depicted on page 5-232. The best fitting Iowa Curve using the currently approved 50-year life is the Iowa 50-R5 with a residual measure of 0.4982. An Iowa 55-R3 provides a residual measure of 0.6834. Historical data indicates that a life as long as 100 years may be appropriate; however, Concentric believes that an extension in life of 100 percent is not warranted at this time. A review of peer Canadian electric utilities provides a range from 55 years to 70 years. Based on the above and on Concentrics' experience, an Iowa 55-R3 is a reasonable expectation for the investment in this account. This account will require close monitoring in future depreciation studies, and possibly a future life extension if the data continues to show that such an extension is warranted. At this time, Concentric recommends an Iowa 55-R3 to represent the future expectations for the investment in this account.

ACCOUNT C42001 – COILS, STATOR

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$207,996,660	0.74%	30	35-R3.5

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2012 through 2020 of $9,372,606 were recorded and have resulted in actual observed data points as depicted on page 5-243. The best fitting Iowa Curve using the currently approved 30-year life is the Iowa 30-R5 with a residual measure of 0.7352. An Iowa 35-R3.5 provides a better residual measure of 0.421. Peer utilities do not typically have an account with coil assets alone. Consequently, the peer review is of limited value. Based on the above and on Concentrics' experience, an Iowa 35-R3.5 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 35-R3.5 to represent the future expectations for the investment in this account.

ACCOUNT C52202 – DISTRIBUTION, CUT OUTS

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$58,991,451	0.21%	25	35-R0.5

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2013 through 2020 of $15,731,969 were recorded and have resulted in actual observed data points as depicted on page 5-319. The best fitting Iowa Curve using the currently approved 25-year life is the Iowa 25-L0 with a residual measure of 0.2713. An Iowa 35-R0.5 provides a residual measure of 0.7625. Peer utilities do not typically have an account with cut outs alone. Consequently, the peer review is of limited value. Based on the above and on Concentrics' experience, an Iowa 35-R0.5 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 35-R0.5 to represent the future expectations for the investment in this account.

ACCOUNT C54102 – BREAKER, GAS (Sf6) 12 / 25 kV

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$178,778,377	0.64%	30	35-R3

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2011 through 2020 of $1,751,155 were recorded and have resulted in actual observed data points as depicted on page 5-371. The best fitting Iowa Curve using the currently approved 30-year life is the Iowa 30-R3.5 with a residual measure of 0.0775. An Iowa 35-R3 provides a residual measure of 0.0843. Peer utilities typically group all breakers into a single account. Consequently, the peer review is of limited value. Discussions with BC Hydro operations staff indicate that the life of this account should increase due to the life increases in similar accounts. At this time, Concentric recommends an Iowa 35-R3 to represent the future expectations for the investment in this account.

ACCOUNT C55101 – CONDUCTOR, OVERHEAD > OR = 60 kV

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$749,347,904	2.66%	60	55-R3

The assets in this account relate to overhead transmission conductor. There is currently a replacement program related to 69 kV copper conductor located primarily in urban areas. This replacement program is on the scale of $2 million to $3 million per year. Discussions with operations staff indicated that the life for these assets should be at least as long as the life of poles. Concentric has recommended maintaining the currently approved life of transmission pole structures at 50 years. Additionally, it is expected that transmission conductor should have a longer life than distribution conductor.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2013 through 2020 of $10,980,174 were recorded and have resulted in actual observed data points as depicted on page 5-399 with a residual measure of 0.4188. An Iowa 55-R3 provides a residual measure of 0.6568. A review of peer Canadian electric utilities provides a range from 45 years to 85 years. Based on the above and on Concentrics' experience, an Iowa 55-R3 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 55-R3 to represent the future expectations for the investment in this account which aligns with the views expressed by operations staff

ACCOUNT C55102 – CONDUCTOR, OVERHEAD < 60 kV

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$782,029,570	2.78%	45	50-R1

The assets in this account relate to approximately 48,000 kilometers of distribution overhead conductor. This conductor is more commonly installed in rural areas of the province and is subject to damage due to motor vehicle accidents as well as damage caused by storms. Prior to 2004, automatic splices were used to connect or repair distribution overhead conductor which resulted in some premature failures. However, since 2004 compression splices have been used which do not have the same risk of premature failure. One of the major drivers of retirement in this account are system improvement and capacity growth projects. Based on discussions with operations staff BC Hydro believes these assets should have a similar life as distribution wood pole structures. Concentric has recommended maintaining the currently approved life of distribution pole structures at 50 years. Due to its normally smaller conductor sizes, it is expected that distribution overhead conductor should, in general, have a shorter life than transmission overhead conductor. Concentric has recommended lengthening the life of distribution overhead conductor to 50 years.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2013 through 2020 of $37,784,836 were recorded and have resulted in actual observed data points as depicted on page 5-403. The best fitting Iowa Curve using the currently approved 45-year life is the Iowa 45-R5 with a residual measure of 0.4828. An Iowa 50-R1 provides a residual measure of 0.8209. A review of peer Canadian electric utilities provides a range from 45 years to 60 years. Based on the above and on Concentrics' experience, an Iowa 50-R1 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 50-R1 to represent the future expectations for the investment in this account.

ACCOUNT C55401 – BUSWORK & STATION CONDUCTOR

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$422,095,765	1.50%	60	55-R4

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2013 through 2020 of $6,621,634 were recorded and have resulted in actual observed data points as depicted on page 5-430. The best fitting Iowa Curve using the currently approved 60-year life is the Iowa 60-R4 with a residual measure of 0.0464. An Iowa 55-R4 provides a residual measure of 0.0836. A review of peer Canadian electric utilities provides an estimate of 50 years. Based on the above and on Concentrics' experience, an Iowa 55-R4 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 55-R4 to represent the future expectations for the investment in this account.

ACCOUNT C59001 – POWER SUPPLY, UNINTERUPTIBLE

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$4,440,828	0.02%	15	5-SQ

The assets in this account relate to power units supporting the corporate network. These are between one and six kV in size and are retired on a three to five-year schedule. Consequently, the life of these assets is dependent on management discretion surrounding the retirement policy. As such, Concentric recommends utilizing amortization accounting for these assets with a life equal to the longest retirement period. Based on the above and on Concentric's experience, an Iowa 5-SQ is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 5-SQ to represent the future expectations for the investment in this account.

ACCOUNT C59202 – ELECTRIC VEHICLE CHARGING STATION

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$0	0.00%	N/A	7-R3

The assets in this account relate to the upcoming Electric Vehicle Direct Current Fast Charging Program. These assets are located downstream of the electric service and consist solely of the battery charger system. These assets are highly technological in nature and are subject to the fast-paced nature of retirements common in technological accounts. As many of the forces of retirements anticipated in this account are related to the pace of change of technology, it is important that this account have a short average service life. There are few peer utilities in Canada with approved lives for electric vehicle charging stations; however, Concentric has carried out discussions with personnel at many utilities across Canada in anticipation of upcoming technological changes. It is the experience of Concentric that the assets included in this account are expected to live approximately five to ten years. As such, Concentric recommends an Iowa 7-R3 to represent the future expectations for the investment in this account.

ACCOUNT C59301 – STORAGE BATTERIES, BANK

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$33,649,647	0.12%	20	15-R4

The assets in this account relate valve regulated lead-acid ("VLRA") batteries which form part of the uninterruptable power source. Conversations with operations and management suggest that the assets in this account are subject to a maximum life of 15 years. Consequently, the life of these assets is dependent on management discretion surrounding the retirement policy.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2013 through 2020 of $126,840 were recorded and have resulted in actual observed data points as depicted on page 5-458. The best fitting Iowa Curve using the currently approved 20-year life is the Iowa 20-R5 with a residual measure of 0.0498. An Iowa 15-R4 provides a residual measure of 0.7087. While the fit to historical data is not as good with the 15-R4, it is expected that the assets currently in this account will have a shorter life than those in the past. Therefore, the actuarial analysis was afforded limited weighting. A review of peer Canadian electric utilities provides an estimate of 26 years. Based on the above and on Concentrics' experience, an Iowa 15-R4 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 15-R4 to represent the future expectations for the investment in this account.

ACCOUNT C61101 – ALARM / SECURITY SYSTEM

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$65,791,138	0.23%	20	15-R3.5

The assets in this account are related to the security apparatus located on BC Hydro generation, substation and properties (non-energized) sites. These assets tend to be technological in nature, which generally has a life shortening effect. Some examples of assets included are cabling, trenching, access control and management, control panels, sirens, strobes, and cameras. As technology improves, it is expected that the lives of these assets will shorten.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2012 through 2020 of $10,093,188 were recorded and have resulted in actual observed data points as depicted on page 5-474. The best fitting Iowa Curve using the currently approved 20-year life is the Iowa 20-R0.5 with a residual measure of 0.5688. An Iowa 15-R3.5 provides a residual measure of 0.4311. Peer utilities do not typically have an account with security and alarm assets alone. Consequently, the peer review is of limited value. Based on the above and on Concentrics' experience, an Iowa 15-R3.5 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 15-R3.5 to represent the future expectations for the investment in this account.

ACCOUNT C68302 – RADIO, MICROWAVE, DIGITAL

2020 Plant in Service	Investment %	Previously Approved Life	Concentric Recommended Life
$40,725,868	0.14%	35	20-R3

The assets in this account are related to the operational communication system utilized throughout British Columbia. These assets provide the backbone of the SCADA and protection system and are housed in control buildings. Analogue radio systems were phased out in the early 2000's and replaced by a digital system. The first generation of digital microwave radios were installed in the late 1990's and are currently undergoing replacements. These assets have attained ages of about 22 – 23 years and are being replaced beyond the end of life. It is expected that the technology in these accounts will continue to have a life shortening impact on the average service life going forward.

The retirements, additions and other plant transactions through the end of fiscal year 2020 were analyzed by the retirement rate method. Retirements for the period 2011 through 2020 of $3,576,344 were recorded and have resulted in actual observed data points as depicted on page 5-516. The best fitting Iowa Curve using the currently approved 35-year life is the Iowa 35-R2 with a residual measure of 2.1121. An Iowa 20-R3 provides a residual measure of 4.5228. While the fit to historical data is not as good with the 20-R3, there has been limited retirements recorded. Therefore, the actuarial analysis was afforded limited weighting for this study. As the first generation of these assets begins to retire, a more relevant retirement dispersion will be evident in future depreciation studies. A review of peer Canadian electric utilities provides an estimate of 8 to 20 years. Based on the above and on Concentrics' experience, an Iowa 20-R3 is a reasonable expectation for the investment in this account. As such, Concentric recommends an Iowa 20-R3 to represent the future expectations for the investment in this account.

4 RESULTS OF STUDY

4.1 Qualification of Results

The average service life and net salvage percentage estimates are the principal results of the study and are shown in Tables 1, 2, and 3. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual parameters. An assumption that depreciation parameters can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and salvage and for the change of the composition of property in service.

BC Hydro Power Authority

* The depreciation rates are implied in that they are based on the whole life of the asset class and would be applicable to the original cost (pre-IFRS deemed cost adjustments) of assets. As BC Hydro calculates Depreciation in its financial system by dividing the asset net book value by the remaining life of the asset, the useful lives rather than depreciation rates are applicable for BC Hydro

** Estimated fiscal 2023 Depreciation Expense based on assets in service as of March 31,2021

7 ESTIMATION OF SURVIVOR CURVES

7.1 Average Service Life

All assets have a service life, which is defined as "the period of time from its installation until it is retired from service"[4]. All account groups of property are made up of various assets with differing service lives and investment values. To calculate a depreciation rate, one must first calculate an average life for all assets in a single account. This can be done by ascertaining the age at retirement for every asset in an account and plotting it as a percentage of the units surviving at each age interval (a "Survivor Curve"). From the average life for each account, remaining lives can then be found which are then used to calculate the annual depreciation accruals and ultimately depreciation rate. A discussion of the general concept of survivor curves is presented and the Iowa type survivor curves are reviewed.

7.2 Survivor Curves

A survivor curve is defined as "a graph of the percent of units remaining in service expressed as a function of age"[5] . To calculate the average life of the group, the remaining life expectancy, the probable life and the frequency curve, one must first create a survivor curve. Figure 1 shows a typical 40-R4 smoothed survivor curve as well as the accompanying derived curves. The type 40-R4 refers to the Iowa type curve, whose designation will be explained in further detail in the next section

To calculate the average service life, one must calculate the area under the survivor curve and divide by the percent surviving at age zero. The remaining life is equal to the area under the survivor curve and to the right of the current age, divided by the percent surviving at the current age. In Figure 1, for example, the hatched area to the right of age 45 divided by 28.9 percent surviving balance represents the remaining life for an asset that has reached that age. The probable life is "the total life expectancy of the property surviving at any age and is equal to the remaining life plus the current age."[6] If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve is calculated by taking the difference between the percent surviving on successive years on the survivor curve [7]. Alternatively, frequency can be empirically determined by finding the amount of retirements at any given age. Plotting retirement frequency from the youngest to oldest ages and then taking the cumulative frequencies will generate percent surviving versus age.

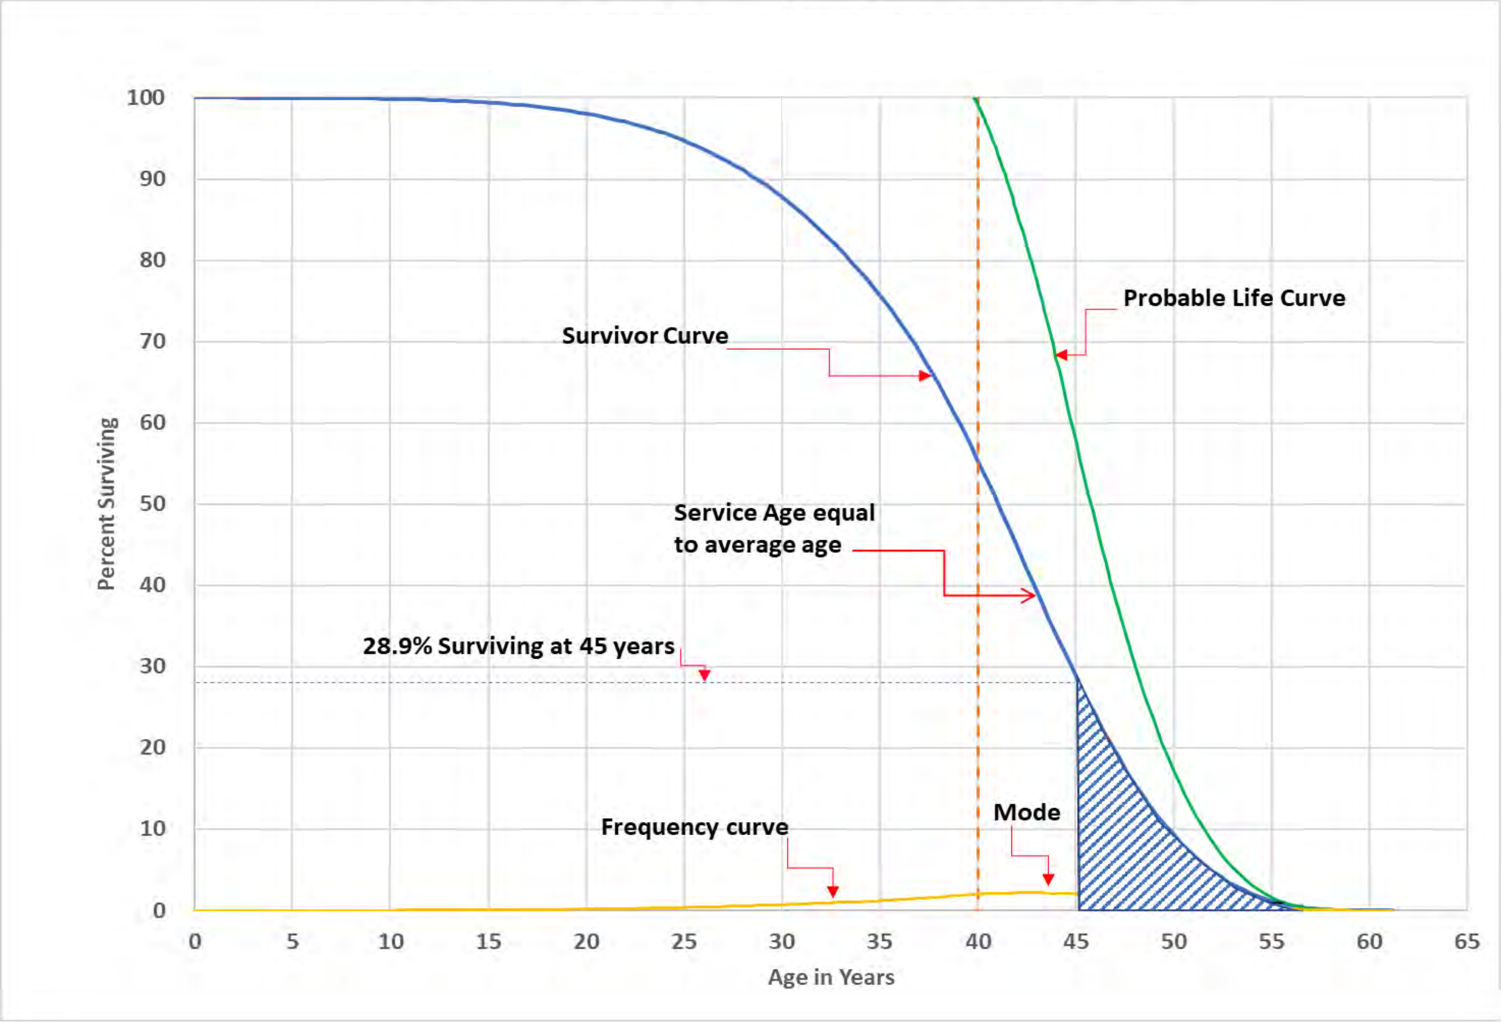
FIGURE 1: TYPICAL SURVIVOR CURVE (40-R4) AND DERIVED CURVES



7.3 Iowa Type Curves

In 1931, Robley Winfrey and Edwin Kurtz of the Engineering Research Institute at Iowa State University published Bulletin 103, which laid the groundwork for what would eventually be known as the Iowa Curves. "The 13 type curves can be used as valuable aids in forecasting the probable future service lives of individual items and of groups of items of different kinds of physical equipment"[8]. The 13 curves described in Bulletin 103 eventually became a series of 22 generalized survivor curves which are used throughout the regulated utility industry. These 22 curves were described in Bulletin 125, published in 1967 by Harold A. Cowles, which became known as the Iowa curves.

The Iowa curves are organized with three variables: the average life of the plant; the location of the mode; and the variation of the life. All Iowa curves have both a letter and a number to represent the shape and height of the mode. The L curves, or left-moded curves, are used when the mode of the curve should be to the left of the average life. There are six L curves are presented in Figure 2. The R curves, or right-moded, are used when the mode of the curve should be to the right of the average life. There are five R curves, which are presented in Figure 3. The S curves, or symmetrically-moded, are used when the mode is equal to the average life. There are seven S curves, which are presented in Figure 4. The O curves, or origin curves, are used when the mode occurs at age 0. There are four O curves, which are presented in Figure 5. There are some occasions where it is appropriate to use a half curve. In these cases, the curve is assumed to be exactly half way between the two curves.

In addition to Bulletin 125, Iowa curves have also been presented in subsequent Experiment Station bulletins and in the text Engineering Valuation and Depreciation [9]. In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis [10] presenting his development of the fourth family consisting of the four O-type survivor curves.

7.4 Retirement Rate Method of Analysis

The retirement rate method is a widely accepted actuarial method used to create survivor curves. This method is also referred to as an original life table. These survivor curves can then be used to determine the average service life of a plant account. The retirement rate method is thoroughly explained in several publications, including Statistical Analyses of Industrial Property Retirements,[11] Engineering Valuation and Depreciation [12] and Depreciation Systems [13].

The retirement rate method is a subgroup of the placement and the experience band methods, as described in "Depreciation Systems". The placement band method creates a survivor curve which describes the life characteristics of assets placed into service during a selected timeframe. The experience band method creates a survivor curve which describes the life characteristics of assets removed from service during a selected time frame. The retirement rate method creates both placement and experience bands to give the most complete or representative data. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

7.5 Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2008-2017 during which there were placements during the years 2003-2017. In order to illustrate the summation of the aged data by age interval, the data was compiled in the manner presented in Schedules 1 and 2. In Schedule 1 (page 9-10), the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the asset invested in 2003 were retired in 2008. The $10,000 retirement occurred during the age interval between 4 ½ and 5 ½ years (2008 - 2003) on the basis that approximately one-half of the amount of property was installed prior to and after July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2008 retirements of 2003 installations and ending with the 2016 retirements of the 2011 installations. Thus, the total amount of $143,000 for age interval 4½-5½ equals the sum of:

$10 + $12 + $13 + $11 + $13 + $13 + $15 + $17 + $19 + $20= $143 k

[11] Anson, Winfrey & Hempstead, supra note 7
[12] Anson, Winfrey & Hempstead, supra note 7
[13] Wolf & Fitch, supra note 2

Other transactions which affect the group are recorded in a similar manner in Schedule 2 (page 9-11). The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements but are used in developing the exposures at the beginning of each age interval.

7.6 Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 (page 9-13). The surviving plant at the beginning of each year from 2007 through 2016 is recorded by year in the portion of the table titled "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition, are obtained by adding or subtracting the net entries shown on Schedules 1 and

2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2013 are calculated in the following manner:

Exposures at age 0	=	amount of addition	=	$750,000
Exposures at age ½	=	$750,000 - $ 8,000	=	$742,000
Exposures at age 1½	=	$742,000 - $18,000	=	$724,000
Exposures at age 2½	=	$724,000 - $20,000 - $19,000	=	$685,000
Exposures at age 3½	=	$685,000 - $22,000	=	$663,000

For the entire experience band 2008-2018, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

$255 + $268 + $ 284 + $311 + $334 + $374 + $405 + $448 + $501 $ $609 = $3,789k

7.7 Original Life Tables

The original life table, illustrated in Schedule 4 (page 9-15) is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100 percent at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15		
Exposures at age 4½	=	$3,789,000		
Retirements from age 4½ to 5½	=	$143,000		
Retirement Ratio	=	$143,000 ÷ $3,789,000	=	0.0377
Survivor Ratio	=	1.000 - 0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15) x (0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless. The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

SCHEDULE 4: ORIGINAL LIFE TABLE - CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2008-2017					Placement Band 2003-2017

13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	**44,780**	**1,606**			

- Exposure and Retirement Amounts are in Thousands of Dollars
- Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
- Column 3 from Schedule 1, Column 12, Retirements for Each Year.
- Column 4 = Column 3 divided by Column 2.
- Column 5 = 1.0000 minus Column 4.
- Column 6 = Column 5 multiplied by Column 6 as of the Preceding Age Interval.

7.8 Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100 percent to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percentages surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

IN THE MATTER OF an application by BC Hydro

BC HYDRO

REPORT ON APPLICABILITY OF INCLUSION OF NET SALVAGE IN THE DEPRECIATION RATE CALCULATIONS

DRAFT

August 31, 2021

WRITTEN EVIDENCE OF

CONCENTRIC ADVISORS ULC.

TABLE OF CONTENTS

I. Introduction

Q1. PLEASE STATE YOUR NAME AND BUSINESS ADDRESS.

My name is Larry E. Kennedy, and my business address is 200 Rivercrest Drive, Suite 277, Calgary Alberta T2C 2X5.

Q2. BY WHOM AND IN WHAT CAPACITY ARE YOU EMPLOYED?

I am a Senior Vice President of Concentric Advisors ULC, a wholly owned Canadian subsidiary of Concentric Energy Advisors ("Concentric"). Concentric is a management consulting firm specializing in financial and economic services to the energy industry.

Q3. WHAT IS YOUR AREA OF EXPERTISE?

I have been employed in the public utility sector in the specialized fields of regulated plant accounting, capital recovery and development of depreciation and capital recovery strategies for over 40 years. I have spent the last 22 years in a consulting role providing expert testimony on the topic of depreciation, regulatory plant accounting, GAAP accounting related to regulated entities, and stranded cost issues. Additionally, I am a member of the teaching faculty of the Society of Depreciation Professionals and have presented to a number of organizations on the topics of depreciation, utility asset valuation and stranded cost. My C.V. and list of testimony are attached to this evidence as Attachment 1.

Q4. WHAT IS THE PURPOSE OF THIS REPORT?

Concentric was retained by BC Hydro to provide this Report to respond to the BCUC Directives in Order G-246-20 stating:

Therefore, the Panel directs BC Hydro to provide in its next RRA, an assessment of whether its current practice of expensing dismantling costs as they occur would result in intergenerational inequity and to provide options on how it could calculate and collect dismantling costs to better promote intergenerational equity. For these reasons, the

Panel approves the use of the Dismantling Cost Regulatory Account, as requested by BC Hydro, for the Test Period only.

Given the intergenerational equity concerns, the Panel directs BC Hydro to include in its upcoming depreciation study a net salvage study and, in the RRA immediately after the completion of the depreciation and net salvage studies, report on the results and recommendations, as well as BC Hydro's plan to implement those recommendations"[1]

This report will provide a conceptual background related to the options available for the recovery of the of future cost of removal/retirement options (including the policy of expensing dismantling costs upon occurrence), potential implementation strategies for each of the options and provides Concentric's recommendations on both the approach and implementation.

Q5. HOW IS THE BALANCE OF THIS REPORT ORGANIZED?

Part II of this report includes a detailed discussion related to the methods of recovery of future cost of removal/retirement expenditures and is followed by a summary of the methods. Part III provides Concentric's recommendation after consideration is given to all relevant factors. Part IV provides a recommended implementation approach.

II. REVIEW OF POTENTIAL METHODS

Q6. PLEASE SUMMARIZE THE VIABLE OPTIONS FOR CONSIDERATION?

While a number of methods have been proposed throughout North America, I considered the following alternatives to be most applicable in the current BC Hydro circumstances:

1. Use of the Traditional method to calculate the required net salvage percentage;
2. Use of the Constant Dollar Net Salvage (CDNS) to calculate the required net salvage percentage;
3. Expensing cost of removal as incurred (also known as "Pay as you go");
4. Capitalizing cost of removal to the installation cost of replacement; and

---

[1] BCUC Order, Section 4.5.2, page 124 of 204

5. Trust Fund and Securitization methods

Q7. PLEASE DISCUSS THE TRADITIONAL APPROACH.

The use of the Traditional Method of net salvage analysis is the most widely used approach in North America.

With the traditional method, the estimation of net salvage percentages are developed using the following steps:

1. The annual retirement, gross salvage and cost of removal transactions are extracted from the plant accounting systems over a period of observation – normally at least a 10-year period.
2. A net salvage amount (gross salvage proceeds less cost of retirement) is calculated for each historic year. Additionally, a net salvage amount is calculated for each historic three-year rolling band, each historic 5-year rolling band and a life to date rolling band.
3. The net salvage amount determined above is compared to the original booked costs retired for each period in the manner described, which results in a net salvage percentage of original costs retired for each year, in addition to three-year rolling bands and the most recent five-year rolling band.
4. The annual, the three-year rolling average, and the most recent five-year rolling average net salvage percentages are analyzed to determine a reasonable estimated net salvage percentage. At this point the net salvage percentage is based purely upon statistical analysis.
5. Each account is then compared to the net salvage percentage currently approved and compared to peer utility companies. Based on the statistical analysis, the review of current and peer company net salvage percentages, and on the professional judgement of the depreciation consultant, a net salvage percentage is determined for each account.
6. The net salvage percentage is then used in the depreciation rate calculations in the depreciation study.

The resultant net salvage percentage can then be either included as part of the depreciation rate calculation thereby being included in the depreciation expense and accumulated depreciation accounts. Alternatively, many organizations (and in particular, those following IFRS) use a second depreciation rate calculation specific to net salvage and carry the depreciation related to net salvage in a separate income statement account and the accumulated balances are recorded in a regulatory deferral account. The deferral account grows to accumulate the future expenditure requirements and is drawn down by those future expenditures at the time of asset retirement.

<u>Advantages of this approach</u>

- Is the method currently approved by the BCUC for FortisBC Inc, FortisBC Energy, and Pacific Northern Gas.
- Is generationally equitable – Those customers benefiting from the asset in service are responsible for the total cost of the asset, including the costs of retirement of the asset.
- Is the most widely used and accepted method for the proactive recovery of cost of retirement/removal expenditures.
- Adjusts for inflation in the future requirement of net salvage – the underlying assumption is that the long-term historic rate of inflation will be indicative of the future long-term rate of inflation.
- Is well understood by most regulators.

<u>Disadvantages of this approach</u>

- Does not deal with the issue of technological change in the assets currently being retired as compared to those historically retired.
- Assumes that the future work to retire assets will be the same as historic work – for example, changing environmental standards are not specifically considered in the calculations.
- Can prematurely erode rate base.

Q8. PLEASE DISCUSS THE CDNS METHOD.

The CDNS approach is similar to the calculations made for the determination of an Asset Retirement Obligation and is therefore consistent with IFRS regarding estimating future costs of removal. With this method, all historic transactions are revalued to a current cost to allow for a current cost percentage of net salvage with all impacts of historic inflation removed. The current cost estimate is then inflated using unique estimates for future inflation, with the resultant inflated amount potentially discounted to current day dollars to reflect the fact that the dollars collected today will not be used for many years into the future.

There are three components to the development of an appropriate future net salvage percentage for mass property accounts.

Firstly, an estimate of the current net cost of removal of facilities is developed. The ratio of net salvage costs to the original cost of plant retired is developed and used as one indicator of the current estimated cost of removal. In this method, each of the transactions is brought forward to the current point in time, thereby resulting in the historical ratio of cost of removal to original costs being retired having all impacts of inflation removed.

The second component step is to determine the cost required at the time of forecast retirement. Once the current estimate of the net costs of removal are established, the current estimate needs to be adjusted to recognize the impacts of inflation over the estimated remaining life of the account. In developing the inflation estimate to be applied to the current cost of removal estimate, the constant dollar method requires the application of a forward-looking estimate of the rate of inflation for labour costs associated with the retirement of facilities. The rate of inflation for labour costs is the primary driver of the future costs of retirement, and as the current cost estimate has had all impacts of inflation removed, an appropriate estimate of the future rate of inflation related to labour must be estimated. Such estimates are usually based on the company's inflation rates used in long term capital forecasts for future system expenditures or from published long term economic forecasts of inflation.

Lastly, to recognize that the funds collected in current periods will not be expensed until potentially many years into the future, a discounted cash flow calculation is required. In this manner, the fact that the utility has received the benefit of the funds as working capital through the inclusion of the requirement into the current period revenue requirements, an appropriate discount rate to discount the future cash expenditures to the current period must be estimated.

Advantages of this approach

- Is the method currently approved by the OEB for Enbridge Gas.
- Is generationally equitable – Those customers benefiting from the asset in service are responsible for the total cost of the asset, including the costs of retirement of the asset.
- Adjusts for inflation in the future requirement of net salvage – an independent estimate of the future levels of inflation are used rather than the assumption that the historic levels of inflation will be repeated in the future.
- Reduces the net negative salvage burden on current customers – through the use of the discounting the current recovery is assumed to reduce the requirement for credit or other financing for current operations.
- Calculations are similar to ARO calculations – as such, the external accounting community tends to like this form of estimation of the future costs.

Disadvantages of this approach

- The calculations are complex resulting in an increased burden in explaining to the regulator and customer groups. Often the method is rejected because of the complexity.
- Requires specific estimates of historic inflation and future discount rates.

Q9. PLEASE DISCUSS THE METHOD TO EXPENSE COST OF REMOVAL AS INCURRED (PAY AS YOU GO APPROACH).

With this method, as currently used by BC Hydro, the required cost of removal/retirement is estimated by the utility for the test period and included into the revenue requirement. This method, also known as the “Pay as you Go” approach, is most widely used in circumstances where the applicable regulator does not permit inclusion of net negative salvage costs into the depreciation rate calculations, and therefore the cost of removal expenditures are expensed for financial reporting purposes when incurred. This method results in challenges as the expenditures are estimated and included in the revenue requirement during a rate application and recovery is normally approved based on the rate case estimates. There is a risk of either over or under collection through tolls of the actual required amounts. In some circumstances, regulators allow for the differences between the estimated and actual amounts to be deferred until future tests period, at which point the disposition of the deferred account can be established. However, not all regulators allow for any true up of cost differences between the forecast and actual amounts.

Advantages of this approach

- No estimate of either historic or future inflation required – given that the costs are current there is no need to factor for future inflation in the estimated amounts.
- The calculations are simple and based on near term estimates for which contracts may be issued at the time of the rate case resulting in reduced forecast error in actual versus estimated costs.
- Is compliant with most accounting guidelines.

Disadvantages of this approach

- Is not generally equitable – the users who benefit from the assets providing utility service are not responsible for the total costs of the asset providing that service.
- There is increased utility risk that cost variances will be to the account of the utility and not recoverable from ratepayers.

Q10. PLEASE DISCUSS THE CAPITALIZING COST OF REMOVAL TO THE INSTALLATION COST OF A REPLACEMENT ASSET.

In recent years, some utilities reporting under IFRS have adopted a hybrid approach, wherein costs of removal associated with replacement projects are charged to the installation costs associated with the new asset. This method is limited to the ability to consider the removal of the old (or replaced) assets to be an integral function to prepare the site for the installation of the new asset in accordance with IAS 16. Utilities have developed varying interpretations of this requirement, with some utilities requiring the replacement asset to be in the exact same location (same hole for Poles, same foundation base for transformers, etc.), while others have taken a more liberal approach to the replacement assets being within the same area (often arguing the replaced asset must be removed for site access etc.).

In circumstances where the "site preparation or directly attributable" argument cannot be made, the costs of removal of the replaced assets are generally expensed as incurred or held for future treatment within a deferred account.

Advantages of this approach

- No estimate of either historic or future inflation required – given that the costs are current there is no need to factor for future inflation in the estimated amounts. Additionally, the original cost of the replaced assets is not considered in this in this calculation; therefore, any impact of historic inflation is not relevant.
- The calculations are simple and based on near-term estimates for which contracts may be issued at the time of the rate case, resulting in reduced forecast error in actual versus estimated costs.
- Meets IFRS guidelines – reduces the need for any type of regulatory deferral account treatment.

Disadvantages of this approach

- Is not generally equitable – the users who benefit from the assets providing utility service are not responsible for the total costs of the asset providing that service.
- Inflates the amount of future depreciation expense, which will compound with each generation of asset replacement. Ultimately the final users of the system will be faced with an exponential amount of costs of removal for investment that they receive no benefit from.
- There is increased utility risk that cost variances will be to the account of the utility and not recoverable from ratepayers.

Q11. PLEASE DISCUSS THE USE OF TRUST FUNDS OR SECURITIZATION TO PROVIDE FOR FUTURE COSTS OF REMOVAL/RETIREMENT.

These methods involve the creation of an external fund for the purpose of financing a future defined obligation (such as costs of removal), with customers paying a surcharge on current use to fund the future obligation. Contributions to the fund are invested with earnings from the return on the investment in the trust fund adding to fund levels. In many jurisdictions, the establishment of a trust fund may require enabling legislation. Once allowed by statute, the utility requests regulatory approval to establish the trust fund, with proposed governance of all aspects of fund management including a periodic review of funding levels and the investment portfolio.

In the circumstance of a trust fund, establishment of the fund or funds will involve a transfer of the Accumulated Depreciation associated with the funding that has occurred to date. The transfer amount requires an assessment of alternative tax treatments accorded to potential trust vehicles. The trust fund(s) are supported by ratepayer charges that are invested in equities and bonds by a fund management entity. Periodic regulator review of the funding status of the fund balance related to the required level of funding incorporating current estimates of future required expenditures – and investment performance. Upon retirement of assets, the funds are disbursed to supplement underfunded Cost of Removal balances.

In the circumstances of use of Securitization, legislation authorizes establishment of a Special Purpose Entity (SPE) for a dedicated purpose (e.g., recovery of future costs of removal requirements). The legislation typically includes language that protects bondholders from regulatory risk. The regulator issues an order with adequate protections to enable low-cost financing, after finding that there is a NPV benefit to customers. The utility issues bonds to finance early retirement of assets. Undepreciated asset balances are removed from utility rate base and no longer earn a return. Ratepayers are responsible for a customer charge that may be subject to periodic true-ups to ensure that it is sufficient to meet bond obligations by a non-bypassable surcharge over the term of the bonds that is passed through the SPE to bondholders. The customer charge may be subject to periodic true-ups to ensure that it is sufficient to meet bond obligations.

<u>Advantages of these approaches</u>

- Provide a means to recover costs from ratepayers that benefit from the assets during the life of the asset.
- Provides a method for the ratepayer contributions to grow within the trust resulting in lower amounts of customer contributions as compared to other methods.

- In case of Securitization, the utility is provided with a near-term infusion of cash to offset the seeding of the trust funds.

Disadvantages of these approaches

- Regulatory oversight can present an administrative burden
- Securitization tends to reduce future utility earnings unless it is accompanied by re-investment opportunities (e.g., assets that support clean energy).
- Credit ratings are sensitive to increasing capital costs associated with investments to build resiliency against and respond to climate change events (e.g., California wildfires).
- There are consequences to an over reliance on securitization, including deterioration of credit metrics, reduced financing flexibility and crowding out new rate base investments.

III. CONCENTRIC RECOMMENDATION

Q12. PLEASE OUTLINE THE OBJECTIVES THAT SHOULD BE CONSIDERED IN THE REVIEW OF VARIOUS OPTIONS FOR THE INCLUSION OF FUTURE REMOVAL/RETIREMENT EXPENDITURES INTO THE DEPRECIATION RATE CALCUATIONS.

The available options should be considered in light of the following principles

- Alignment and matching of the depreciation expense to the rate base providing used and useful service;
- Ability of the method to respond to changes in the cost of removal estimates;
- Ability to deal with the impacts of inflation;
- Impact on the revenue requirement;
- To ensure the future cost requirements are adequately provided for;
- Provide for a smoothed methods of Cost of Removal/Retirement recovery; and
- Regulator acceptance.

Q13. PLEASE PROVIDE A COMPARISON OF EACH OF THE ALTERNATIVE OPTIONS TO THE OVERALL OBJECTIVE AS DESCRIBED ABOVE.

The following table provides a comparative analysis of each of the 5 options to the overall principles identified above as they relate to the specific circumstances of BC Hydro at this time. Each option has been assigned a comparative ranking of 1 through 5, based on the comparative ranking of the options as compared to each other option. A ranking of 1 would indicate the best compliance of the 5 options, whereas a ranking of 5 indicates the worst ranking of the specific option as compared to the other options.

SUMMARY OF COMPLIANCE OF EACH OPTION TO THE OVERALL OBJECTIVES

Option / Principle	Traditional Method	Constant Dollar Net Salvage (CDNS)	Expense Cost of Removal as incurred	Capitalizing Cost of Removal as an Installation cost of replacement Assets	Trust Funds and Securitization Methods
1. Matching depreciation expense to used and useful rate base	1	2	4	5	3
2. Ability to respond to changes in Cost of Removal estimates	3	2	1	4	5
3. Ability to deal with the impacts of inflation	3	1	4	5	2
4. Impact on the revenue requirement	3	2	5	4	1
5. To ensure the future cost of removal/retirement requirements are adequately provided for	1	2	4	5	3
6. Provides for a smoothed method	2	3	5	4	1
7. Regulator Acceptance	1	5	2	4	3
Total Ranking	**14**	**17**	**25**	**31**	**17**

Q14. ARE THERE ANY DIFFERENCES IN UNDERLYING REGULATORY PRINCIPLES BETWEEN THE METHODS?

Yes. The above methods can be categorized into two groups, namely, the methods that provide for the future costs of removal/retirement on a retrospective rate making approach and those that recover the funding requirement with a prospective rate making approach.

Retrospective ratemaking approaches to the recovery of costs of removal address costs of removal after the retirement event has occurred and the amount to be recovered is known. A "pay-as-you-go" or "capitalize to the cost of the replacement asset" model does not address concerns related to customer bill impacts. Utilities and regulators often prefer to smooth out large bill impacts either by using a future deferral/regulatory asset approach or recovering a relatively large unfunded cost of removal over a longer period through securitization.

Prospective ratemaking tools anticipate future cost recovery challenges and are designed to build up a balance by collecting funds from current ratepayers that can be applied in later years. Nuclear decommissioning trust funds are an example that collects funds from customers while the plant is operating to fund a future – and large – investment to decommission the plant after it shuts down. Depreciation expense methodologies address a similar goal by accurately reflecting the future "Cost of Removal" through either the Traditional or CDNS methods described above, when calculating depreciation rates.

Q15. WHAT ARE THE ADVANTAGES OF ONE RATE MAKING APPROACH OVER THE OTHER IN THE SPECIFIC CIRCUMSTANCES OF RECOVERY OF COSTS OF REMOVAL?

The prospective ratemaking approaches better comply with the regulatory principle that cost recovery of all investment related to an asset should occur over the period in which the asset is in used and useful service. For example, the Federal Energy Regulatory Commission (FERC) prescribes that:

> *Depreciation, as applied to depreciable electric plant, means the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of electric plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance.*[2] [emphasis added]

---

[2] Federal Energy Regulatory Commission -Part 201- Uniform System of Accounts Prescribed for Electric Companies Subject to the Provisions of the Electric Act Definitions

The FERC also describes the service value to be recovered as:

> *Service value means the difference between original cost and net salvage value of electric plant.*[2]

The accounting concepts of matching revenues to the related expenses within the same accounting period also lends support to the prospective approach as it better aligns the return on rate base to the depreciation expense component of the revenue requirement.

The most significant advantage of the retrospective approaches is the fact that the amount to be recovered is known. However, the true-up mechanisms used with the prospective methods achieves a similar result by trueing up of the accumulated depreciation accounts.

Q16. PLEASE OUTLINE YOUR RECOMMENDATION GIVING CONSIDERATION TO THE SPECIFIC CIRCUMSTANCES OF BC HYDRO.

When considering both the ranking of the various options to the identified principles, and the preference of most regulators to adopt a prospective rate making approach, I find the Traditional Method to be most appropriate for BC Hydro at this time.

The recommended Traditional Approach is consistent with the recent approvals by the BCUC for the use of this same Traditional Approach for FortisBC Inc., FortisBC Energy, and Pacific Northern Gas. It is also the most accepted method of recovering future costs of removal by regulators throughout North America.

IV. IMPLEMENTATION APPROACH

Q17. PLEASE DESCRIBE YOUR RECOMMENDED METHOD FOR THE IMPLEMENTATION OF THE RECOVERY OF FUTURE COSTS OF REMOVAL/RETIREMENT THROUGH THE TRADITIONAL METHOD.

Section 3-4 of the Concentric Depreciation Study report describes the need to develop the net salvage percentages at an aggregated functional group level, with each aggregated function group being composed of the specific accounts within the functional group that would be expected to incur future costs of removal or retirement. Additionally, any accounts that have a current Asset Retirement Obligation (ARO) were excluded in order to ensure that there is no overlapping of recovery of the retirement costs.

The recovery of the future costs of removal on a prospective ratemaking approach through use of the Traditional Method will eliminate the need for the currently estimated revenue requirement inclusion of the current period cost of removal. As such, the impact of implementation of the Traditional Approach will be partially offset by the exclusion of the pay as you go estimates currently being included in the revenue requirement. However, it is recognized that the implementation of the Traditional Method will have a revenue requirement impact, even after consideration that the "Pay as you go" amounts are eliminated. As such, a phase-in period is often considered to be appropriate when the Traditional Method is introduced.

A phasein to complete implementation of the Traditional Method as soon as practicable best aligns with the objectives outlined in this Report. However, implementation should also consider the need to mitigate rate impacts. As such, in my opinion, a period of complete implementation covering a period of up to 10 years is recommended.

Q18. DOES THIS CONCLUDE YOUR REPORT?

Yes.

LARRY E. KENNEDY, CDP

Senior Vice President

Mr. Kennedy has been in the pipeline, electric, gas utility and municipal infrastructure business for 40 years. As Senior Vice President, Concentric Advisors, ULC, Mr. Kennedy has provided professional consulting services to gas and electric utilities including generation facilities (including nuclear facilities), and high voltage transmission lines, large diameter transmission pipelines, railway systems and municipally owned utility systems. Previously, Mr. Kennedy was with Gannett Fleming Canada ULC, for over 17 years, where he was responsible for completing depreciation studies and provided advice related to large capital program spending and controls for many regulated North American utilities. Mr. Kennedy was also employed by Interprovincial Pipelines Limited (now Enbridge Pipelines) for 15 years in several plant accounting and regulatory positions and with Nova Gas Transmission Pipelines (now TC Energy) for three years as a Depreciation Specialist.

Mr. Kennedy has provided expert witness testimony related to depreciation, capital accounting issues, utility valuation, and property tax issues before several North American regulatory bodies. Mr. Kennedy has completed numerous seminars and all courses offered by Depreciation Programs, Inc. Mr. Kennedy is a member of the teaching faculty of the Society of Depreciation Professionals ("SDP") and has presented depreciation and capital accounting related topics to the SDP, Canadian Electric Association, Canadian Gas Association, Canadian Property Taxpayers Association, Alberta Utilities Commission, British Columbia Utilities Commission and the Canadian Energy Pipeline Association. Mr. Kennedy is a past Society of Depreciation Professionals President.

PERSONAL INFORMATION

- Diploma, Applied Arts - Business Administration, Northern Alberta Institute of Technology, 1978
- Member, Society of Depreciation Professionals
- Certified Depreciation Professional

EXPERIENCE

Representative Project Experience

- Alberta Departments of Energy and Forestry and Agriculture: Detailed toll comparison and valuation models were developed to provide a comparison of the toll fairness of each of the Provinces Rural Electrification Associations ("REA") to the comparable Investor Owned Utilities ("IOU") for the 32 REA's currently operating in Alberta. In addition to providing a toll comparison of the REA and IOU, a fair market valuation for each of the REA's was also prepared. The final report of the toll compatibility and specific valuations were submitted to the Alberta Department of Energy and the Alberta Department of Forestry and Agriculture. Mr. Kennedy was the Responsible Officer on this project.
- Alliance Pipeline L.P. A number of depreciation studies have been completed by Mr. Kennedy for both the Canadian and US assets of Alliance Pipelines. The most recent

studies completed in 2012 for Submission to the National Energy Board of Canada and to the Federal Energy Regulatory included operational discussions related to the gas transmission plant, the service life analysis for all accounts using the retirement rate analysis, discussion with management regarding outlook, and the inclusion of an Economic Planning Horizon.

- AltaGas Utilities Inc.: A number of depreciation studies have been completed, which included the assembly of basic data from the Company's accounting systems, statistical analysis of retirements for service life and net salvage indications, discussions with management regarding the outlook for property, and the calculations of annual and accrued depreciation. The studies were prepared for submission to the Alberta Energy and Utilities Board ("Board"). Mr. Kennedy has appeared before the Alberta Utilities Commission on behalf of AltaGas on a number of occasions.
- AltaLink LP: An initial study was developed for submission to the Alberta Utilities Commission ("AUC") in 2002. The study included the estimation of service life characteristics, and the estimation of net salvage requirements for all electric transmission assets. A net salvage study and technical update was also filed with the Board in 2004. Since 2004, additional depreciation studies were filed in 2005, 2010 and 2012, 2016 and 2018. The 2010, 2012, 2016 and 2018 studies included a number of provisions in order to ensure compliance to Alberta's Minimum Filing Requirements for depreciation studies and for compliance to the International Financial Reporting Standards. These studies also specifically analyzed the pace of technical change in the Alberta Electric system, and recently have specifically considered the impacts of early retirements caused by storms and forest fires.
- ATCO Electric: Studies have included the development of annual and accrued depreciation rates for the electric transmission and distribution systems for the Alberta assets of ATCO Electric, in addition to the generation, transmission, and distribution assets of Northland Utilities Inc. (NWT) and the distribution assets of Northland Utilities (Yellowknife) Inc. The ATCO Electric studies were submitted to the AUC for review, while the NWT and Northland Utilities (Yellowknife) Inc. studies were submitted to the Northwest Territories Utilities Board and Yukon Electric Company Limited (YECL) was submitted to the Yukon Public Utilities Board. These studies also specifically analyzed the pace of technical and recently have specifically considered the impacts of early retirements caused by storms and forest fires.
- ATCO Gas: Studies were prepared in 2010 and 2018 which were the subject of a review by the AUC. Elements of all of the studies included the service life analysis for all accounts using the retirement rate analysis, discussion with management regarding outlook, and the estimation of net salvage requirements. These studies also specifically analyzed the pace of technical change in the Alberta Gas system, and recently have specifically considered the impacts of early retirements caused by storms and forest fires.
- Montana-Dakota Utilities Co.: A study was developed to determine the appropriate depreciation parameters for all electric generation, transmission and distribution assets.

The study and associated expert testimony were submitted to the Montana Public Service Commission in 2018. Elements of the study included a field review of electric generation and transmission plant, the service life analysis for all accounts using the retirement rate analysis, discussion with management regarding outlook and the estimation of the retirement of generation facilities due to environmental legislation and estimation of net salvage requirements.

- Great Plains Natural Gas Co.: Annual updates of depreciation rates and net salvage requirements were calculated and submitted to the Minnesota Department of Commerce in both 2017 and 2018.
- Centra Gas Manitoba, Inc.: The study included development of annual and accrued depreciation rates for all gas plant in service. Elements of the study included a field inspection of metering and compression facilities, service buildings and other gas plant; service life analysis for all accounts using the retirement rate analysis on a combined database developed from actuarial data and data developed through the computed method; discussions with management regarding outlook; and the estimation of net salvage requirements. A similar study was completed in 2006, 2011, and 2015. The 2011 and 2015 studies were the subject of a review by the Manitoba Public Utilities Board in 2012 and 2016. Mr. Kennedy has also consulted on issues regarding International Financial Reporting Standards ("IFRS") compliance and required componentization.
- Enbridge Gas Distribution Inc.: Full and comprehensive depreciation studies have been completed in 2009 and 2011. The 2009 study also included review of the company's gas storage operations. Both studies included the development of annual and accrued depreciation rates for all depreciable natural gas distribution, transmission and general plant assets. Elements of the studies included the service life analysis for all accounts using the computed mortality method of analysis, discussion with management regarding outlook and the estimation of net salvage requirements. Studies were prepared for submission to the Ontario Energy Board.
- Mr. Kennedy has also completed an allocation of the accumulated depreciation accounts into the amounts related to the recovery of original cost and the amounts recovered in tolls for the future removal of assets currently in service. The allocations were determined as of December 31, 2009 and were deemed by the company's external auditors to be in conformance with proper accounting standards and procedures. In 2013, a review of the reserve required for the future removal of assets currently in service was undertaken by Mr. Kennedy. The results of the review were summarized in evidence presented by Mr. Kennedy to the Ontario Energy Board.
- ENMAX Power Corporation: Studies have included the development of annual and accrued depreciation rates for all depreciable electric transmission assets. Elements of the studies included the service life analysis for all accounts using the retirement rate analysis, discussion with management regarding outlook, and the estimation of net salvage requirements. Studies were prepared for submission to the Alberta Department

of Energy and more recently for submission to the Alberta Energy and Utilities Board. Similar studies have also been completed for submission for the ENMAX Electric Distribution assets for submission to the AUC. The ENMAX distribution asset assignments also included an extensive asset verification project where the plant accounting and operational asset records were verified to the field assets actually in service.

- Fortis Group of Companies: Studies have included the development of annual and accrued depreciation rates for the electric distribution assets in Alberta and for the generation, transmission, and distribution assets in British Columbia. The FortisBC Inc. studies were completed and filed with the British Columbia Utilities Commission ("BCUC") in 2005, 2010, 2011 and 2018 encompassing both the FortisBC electric and natural gas companies. FortisAlberta Inc. studies were completed in 2004 (updated in 2005), 2009 and 2010. Elements of the studies included the development of average service lives using the retirement rate method of analysis, development of net salvage estimates, compliance with IFRS, and the determination of appropriate annual accrual and accrued depreciation rates. The most recent studies also specifically analyzed the pace of technical change in the Electric systems, and specifically considered the impacts of retirements, system modernization and technical enchantments to the assets.

- International Financial Reporting Standards ("IFRS"): Mr. Kennedy has been retained by numerous clients encompassing most Canadian Provinces and Territories. The assignments included the review of company's assets and depreciation practices to provide opinion on the compliance to the IFRS. The assignments have also included the issuance of opinion to the External Auditors of Utilities to comment on the manner in which the Utilities can minimize differences in the regulatory ledgers and the accounting records used for financial disclosure purposes. Mr. Kennedy has also presented to the Canadian Electric Association, the Society of Depreciation Professionals, the Canadian Energy Pipeline Association and to the BCUC on this topic.

- Mackenzie Valley Pipeline Project: This assignment included the review of the proposed depreciation schedule for the proposed Mackenzie Valley Pipeline. The review included a discussion of the policies used by the company and the depreciation concepts to be included in a depreciation schedule for a Greenfield pipeline. The review was supported through appearance at the oral public hearings before the National Energy Board of Canada ("NEB").

- Manitoba Hydro: A study was developed to determine the appropriate depreciation parameters for all electric generation, transmission and distribution assets. The study was submitted to the Manitoba Public Utilities Board. Elements of the study included a field review of electric generation and transmission plant, the service life analysis for all accounts using the retirement rate analysis, discussion with management regarding outlook and the estimation of net salvage requirements. A similar study was also completed in 2006 and in 2011. The 2011 depreciation study was the subject of a review by the Manitoba Public Utilities Board in 2012. Mr. Kennedy has also consulted with Manitoba Hydro on issues regarding IFRS compliance and required componentization.

- National Grid USA Service Company Limited: A depreciation study was completed in 2020 for the National Grid High Voltage Direct Current (HVDC) electric interstate transmission line. The study included consideration of the average service life of the system components, the level of components of the system and the compliance of the recommended componentization to the FERC Uniform System of Accounts. The resultant study was used by the company in filings with the Federal Energy and Regulatory Commission (FERC).
- New Brunswick Power: Mr. Kennedy completed a comprehensive depreciation review of the electric generation (including the nuclear facilities), transmission, distribution and general plant assets. The review, which was prepared for submission to the New Brunswick Public Utilities Board, included a significant amount of discussion regarding the development of depreciation policy for the company. The study also included development of procedures to extract data from the company databases, tours of the company facilities, interviews with operational and management representatives, development of appropriate net salvage rates, development of average service life estimates, and the compilation of the report.
- Newfoundland and Labrador Hydro (NALCOR): Mr. Kennedy developed comprehensive depreciation studies that included the development of depreciation policy and rates for NALCOR. The studies provided a significant review of the previous depreciation policy, which included use of a sinking fund depreciation method and provided justification for the conversation to the straight-line depreciation method. The study, which was prepared for submission to the Newfoundland and Labrador Utilities Commission, included a significant amount of discussion regarding the development of depreciation policy for the company. The study also included development of procedures to extract data from the company databases, tours of the company facilities, interviews with operational and management representatives, development of appropriate net salvage rates, development of average service life estimates, and the compilation of the report for submission in a General Tariff Application. Additional studies were also completed in 2008 and 2010. The 2010 and 2017 studies were the subject of Regulatory Review in 2012 and 2019.
- Ontario Power Generation: Assignments have included a review of the Depreciation Review Committee process completed in 2007. This review provided recommendations for enhanced internal processes and controls in order to ensure that the depreciation expense reflects the annual consumption of service value. Additionally, full assessments of the lives of the regulated assets of the company's electric generation hydro and nuclear plants were completed in 2011 and 2013 and were submitted to the Ontario Energy Board for review.
- TransCanada Pipelines Limited - Alberta Facilities: The assignment included working with the company to develop the appropriate depreciation policy to align with the organization's overall goals and objectives. The resulting depreciation study, which was submitted to the Alberta Energy and Utilities Board, incorporated the concepts of time-based depreciation for gas transmission accounts and unit-based depreciation for

gathering facilities. The data was assembled from two different accounting systems and statistical analysis of service life and net salvage were performed. For gathering accounts, the assignment included the oversight of the development of appropriate gas production and ultimate gas potential studies for specific areas of gas supply. Field inspections of gas compression, metering and regulating, and service operations were conducted. Studies were completed in 2002 and 2004, 2007, 2009 and 2012, 2015, and 2018.

- TransCanada Pipelines Limited - Mainline Facilities: The study prepared for submission to the NEB included the development of annual and accrued depreciation rates for gas transmission plant east of the Alberta - Saskatchewan border. Elements of the study included a field inspection of compression and metering facilities, service life and net salvage analysis for all accounts. The study was completed in 2002 and was supported through an appearance before the NEB. Study updates have been completed in 2005, 2007, 2009 and an additional full and comprehensive study was completed in 2011, and 2017. The 2011 study was fully supported through an appearance before the NEB in 2012.

- Viking Gas Transmission Company - The assignment included working with the company to develop the appropriate depreciation policy to align with the organization's overall goals and objectives. The resulting depreciation study, which was submitted to the Federal Energy and Regulatory Commission, incorporated the concepts of time-based depreciation for gas transmission accounts and development of Economic Planning Horizons.

Fiscal 2021 Financial Schedules and Variance Explanations

BC Hydro
Power smart

BC Hydro Fiscal 2021 Annual Report to the British Columbia Utilities Commission

Attachment 1 to Section 6

Fiscal 2021 Financial Schedules and Variance Explanations

Table of Contents

List of Tables

In sections 1 through 9, variance explanations are provided for actual gross amounts in fiscal 2021 compared to the F2020–F2021 RRA decision (**Decision**) amounts. Apart from domestic energy sales variances, all explanations are provided where variances between actual and Decision amounts are greater than 10 per cent, with a minimum variance threshold of $5 million. Domestic energy sales variance explanations are provided for each customer sector.

1 Domestic Energy Sales Variance Explanations (Schedule 14.0)

This section compares fiscal 2021 actual domestic energy sales amounts in GWh with the fiscal 2021 Decision.

Table 1 Fiscal 2021 Domestic Energy Sales Variances

		Schedule	F2021			
	(GWh)	Reference	Decision	Actual	Diff	% Diff
			1	2	3=2-1	4=3/1
1	Residential	14.0 L1	17,927	18,982	1,055	6%
2	Light Industrial and Commercial	14.0 L2	18,744	18,091	(653)	-3%
3	Large Industrial	14.0 L3	13,203	12,438	(765)	-6%
4	Other	14.0 L4:L10	2,066	1,628	(438)	-21%
5	**Total Domestic Energy Sales**	14.0 L11	**51,940**	**51,139**	(801)	-2%

Pursuant to Directive 4 of the Decision, this variance analysis includes an estimate of the extent of any variance that is attributed to and independent from the COVID-19 pandemic. Developing a precise estimate of load variance due to the COVID-19 pandemic is difficult because it involves a comparison of “what if” scenarios and forecasts, for which there are no measurable “after-the-fact” metrics. In particular, the COVID-19 Scenario A used to estimate the potential load impacts in fiscal 2021 was developed relative to the March 2020 Load Forecast whereas the F2020-F2021 RRA was based on the October 2018 Load Forecast, but then reduced by 2.6 per cent in accordance with the BCUC’s decision on that application. Since the March 2020 Load Forecast was a comprehensive forecast with updates to all input assumptions, the extent to which these assumptions differ from assumptions underpinning the F2020-F2021 RRA make it difficult to attribute variances due to the pandemic relative to the October 2018 Load Forecast.

For the purpose of responding to Directive 4, BC Hydro applied a simplified approach. We compared fiscal 2021 actual energy (GWh) consumption against fiscal 2020 actual consumption by major customer group. We then compared those differences to the net effect of COVID-19 Scenario A load impacts on the March 2020 Load Forecast for fiscal 2021. This comparison indicates that the differences between fiscal 2021 actuals and fiscal 2020 actuals are similar to the net effect of the assumed load declines reflected in the COVID-19 Scenario A on the March 2020 Load Forecast.

Following this, we assessed the variance results against our typical variance factors such as residential account growth, temperature, and specific large industrial account information to determine whether any variances can be clearly attributed to factors other than the COVID-19 pandemic.

Overall, actual domestic energy sales in fiscal 2021 were 801 GWh (or 2 per cent) lower than the fiscal 2021 Decision. This was due to:

- Line 1 - Actual residential sales were 1,055 GWh (or 6 per cent) higher than the fiscal 2021 Decision. Variances in residential sales are driven by three main factors: electricity sales per account (use per account), temperature, and number of accounts. In fiscal 2021, the residential sales variance was driven primarily by higher than expected use per account. Higher use per account variance can be driven by many different factors. While the exact drivers in this case are not known, the likely primary driver is the COVID-19 pandemic, which saw residential customers spend more time at home, working from home, and studying from home, resulting in higher consumption. The number of accounts was slightly favourable. The total number of residential accounts was 10,600 (less than 1 per cent) higher than plan and did not contribute significantly to the sales variance. There was a small offsetting variance for temperature, which was slightly unfavourable. Temperatures were close to normal, with warmer temperatures in December and January offset by colder temperatures in February and several other months of the year.

Actual fiscal 2021 sales are higher than fiscal 2020 actual sales and both the October 2018 and March 2020 Load Forecast sales expectations for fiscal 2021. Actual fiscal 2021 sales are directionally consistent with the COVID-19 Scenario A projection that residential sales would increase relative to the pre-pandemic March 2020 Load Forecast. While the net increase was not as large as projected, it was still higher relative to the fiscal 2021 Decision. Based on the above comparisons and consideration of temperature and account information, BC Hydro believes the positive fiscal 2021 sales variance can be largely attributed to the COVID-19 pandemic.

- Line 2 - Actual light industrial and commercial sales were 653 GWh (or 3 per cent) lower than the fiscal 2021 Decision. The commercial sector is comprised of a diverse group of business classes and lower energy consumption can generally be attributed to many different factors. For fiscal 2021 we expected the primary factor was closures and curtailments due to public health orders relating to the COVID-19 pandemic. To confirm this BC Hydro compared fiscal 2021 actual load to fiscal 2020 actual load. The business classes with the largest reduction in their load were offices, accommodations, food services, entertainment, recreation, shopping centers, and educational services. Actual fiscal 2021 sales are lower than fiscal 2020 actual sales and both the October 2018 and March 2020 Load Forecast sales expectations for fiscal 2021. Actual fiscal 2021 sales are directionally consistent with the COVID-19 Scenario A projection that sales would decline relative to the pre-pandemic March 2020 Load Forecast. While the net decline was not as large as projected, it was still lower relative to the fiscal 2021 Decision. Based on the above comparisons BC Hydro believes the negative fiscal 2021 sales variance is largely attributable to the COVID-19 pandemic.

- Line 3 - Actual large industrial sales were 765 GWh (or 6 per cent) lower than the fiscal 2021 Decision. Actual fiscal 2021 sales are lower than fiscal 2020 actual sales and both the October 2018 and March 2020 Load Forecast sales expectations for fiscal 2021. Actual fiscal 2021 sales are also consistent with COVID-19 Scenario A sales projections and underlying account assumptions. Based on the above comparison BC Hydro believes the negative fiscal 2021 sales variance is largely attributable to the COVID-19 pandemic.
- Line 4 – The original forecast for the Other customer sector was 1,650 GWh. As required by Directive 4 of BCUC Order G-246-20 BC Hydro increased the forecast by 25.2 percent for a revised forecast of 2,066 GWh in the fiscal 2021 Decision. Actual energy sales to the Other customer sector of 1,628 GWh were more consistent with the original forecast and were 438 GWh or 21 per cent lower than the revised forecast.

2 Domestic Revenue Variance Explanations (Schedule 14.0)

This section compares fiscal 2021 actual domestic revenue amounts with the fiscal 2021 Decision.

Table 2 Fiscal 2021 Domestic Revenues Variances

	($ million)	Schedule Reference	F2021 Decision	F2021 Actual	F2021 Diff	F2021 % Diff
			1	2	3=2-1	4=3/1
1	Residential	14.0 L12	2,140.4	2,210.2	69.8	3%
2	Light Industrial and Commercial	14.0 L13	1,905.9	1,830.4	(75.6)	-4%
3	Large Industrial	14.0 L14	852.2	761.7	(90.5)	-11%
4	Other	14.0 L15:L21	188.9	148.2	(40.7)	-22%
5	Subtotal	14.0 L22	5,087.4	4,950.4	(137.0)	-3%
6	Revenue from Deferral Rider	14.0 L23	-	0.0	0.0	0%
7	**Total Domestic Revenues**	14.0 L24	**5,087.4**	**4,950.4**	(137.0)	-3%

Actual domestic revenues in fiscal 2021 were $137.0 million (or 3 per cent) lower than the fiscal 2021 Decision. This was primarily due to:

- Line 1 - Residential revenue was $69.8 million (or 3 per cent) higher, driven by higher sales, as described in section 1 above, partially offset by COVID-19 Relief Program grants of $37.3 million;
- Line 2 - Light industrial and commercial revenue was $75.6 million (or 4 per cent) lower, mainly due to lower sales, as described in section 1 above, as well as $6.3 million of COVID-19 Relief program waivers provided to small business customers;
- Line 3 - Large industrial customer revenue was $90.5 million (or 11 per cent) lower due to lower sales, as described in section 1, as well as a lower average rate. The lower average rate was due to $13.3 million of lower demand charges provided as COVID-19 relief and due to a different mix of customer rates than planned; and
- Other revenue was $40.7 million (or 22 per cent) lower, mainly due to the lower sales described in section 1.

3 Cost of Energy Variance Explanations (Schedule 4.0)

This section compares fiscal 2021 actual sources of energy supply and cost of energy amounts with the fiscal 2021 Decision.

Table 3 Fiscal 2021 Sources of Supply

	(GWh)	Schedule Reference	F2021 Decision	Actual	Diff	% Diff
			1	2	3=2-1	4=3/1
1	Water Rentals	4.0 L1	44,522	49,796	5,275	12%
2	IPPs and Long-Term Commitments	4.0 L5	15,238	14,630	(608)	-4%
3	Market Electricity Purchases	4.0 L8	1,326	-	(1,326)	-100%
4	Natural Gas for Thermal Generation	4.0 L2	195	150	(46)	-23%
5	Surplus Sales	4.0 L9	(3,515)	-	3,515	-100%
6	System Imports	4.0 L10	-	999	999	0%
7	System Exports	4.0 L11	-	(9,082)	(9,082)	0%
8	Net Purchases (Sales) from Powerex	4.0 L12	(279)	-	279	-100%
9	Non-Integrated Area	4.0 L6	120	107	(13)	-11%
10	Exchange Net	4.0 L3	(250)	(355)	(105)	42%
11	**Total Sources of Supply**	4.0 L14	**57,357**	**56,245**	(1,112)	-2%

Actual fiscal 2021 sources of supply were 1,112 GWh (or 2 per cent) lower than the fiscal 2021 Decision. This was primarily due to:

- Lines 3, 5, 6, 7, and 8 – Higher net market exports[1] of 5,615 GWh driven by lower domestic load requirements and higher water inflows starting in late summer.

Partially offset by:

- Line 1 - Higher hydro generation of 5,275 GWh due to higher water inflows as mentioned above.

[1] The adoption of the 2020 TPA resulted in a change in the presentation of energy transactions (the sale and purchase of electricity) between BC Hydro and Powerex. The terms “Market Electricity Purchases” (Line 3 in Table 3), “Surplus Sales” (Line 5 in Table 3), and “Net Purchases (Sales) from Powerex” (line 8 in Table 3) were replaced by “System Imports” (line 6 in Table 3) and “System Exports” (line 7 in Table 3).

Table 4 Fiscal 2021 Cost of Energy Variances

	($ million)	Schedule Reference	F2021 Decision	F2021 Actual	F2021 Diff	F2021 % Diff
			1	2	3=2-1	4=3/1
	Heritage Energy					
1	Water Rentals	4.0 L15	323.2	333.2	10.0	3%
2	Natural Gas for Thermal Generation	4.0 L16	8.5	6.5	(2.0)	-24%
3	Domestic Transmission - Other	4.0 L17	24.4	25.5	1.1	5%
4	Non-Treaty Storage and Libby Coordination Agreements	4.0 L18	(11.7)	(49.9)	(38.1)	325%
5	Remissions and Other	4.0 L19	(26.7)	(42.0)	(15.4)	58%
6	**Subtotal**	4.0 L20	**317.7**	**273.3**	(44.4)	-14%
	Non-Heritage Energy					
7	IPPs and Long-Term Commitments	4.0 L21	1,410.8	1,404.0	(6.8)	0%
8	Non-Integrated Area	4.0 L22	30.2	26.0	(4.1)	-14%
9	Gas & Other Transportation	4.0 L23	2.5	5.3	2.7	107%
10	Water Rentals (Waneta 2/3)	4.0 L24	3.7	3.2	(0.5)	-13%
11	**Subtotal**	4.0 L25	**1,447.2**	**1,438.5**	(8.6)	-1%
	Market Energy					
12	Market Electricity Purchases	4.0 L26	43.7	0.0	(43.7)	-100%
13	Surplus Sales	4.0 L27	(165.1)	0.0	165.1	-100%
14	System Imports	4.0 L28	0.0	26.9	26.9	0%
15	System Exports	4.0 L29	0.0	(227.9)	(227.9)	0%
16	Net Purchases (Sales) from Powerex	4.0 L30	6.1	0.0	(6.1)	-100%
17	Domestic Transmission - Export	4.0 L31	17.0	11.6	(5.4)	-32%
18	**Subtotal**	4.0 L32	(98.4)	(189.4)	(91.0)	93%
19	**Total Gross Cost of Energy**	1.0 L1	**1,666.5**	**1,522.4**	(144.0)	-9%

Fiscal 2021 actual gross Cost of Energy was $144.0 million (or 9 per cent) lower than the fiscal 2021 Decision. This was primarily due to:

- Line 4 - Higher benefits associated with Non-Treaty Storage and Libby Coordination agreements of $38.1 million due to higher net water releases in the current year and more favourable prices during releases relative to forecast;
- Line 5 - Higher recoveries from remissions and other of $15.4 million due to higher water use planning remissions for the Bridge River System and John Hart Generating Station;

- Lines 12 to 16 – Lower Market Energy costs[2] of $85.7 million due to higher net market exports of 5,615 GWh (Lines 3,5,6,7 and 8 of Table 3 - Fiscal 2021 Sources of Supply) driven by lower domestic load requirements and higher inflows in fiscal 2021; and
- Line 17 – Lower domestic transmission costs of $5.4 million, reflecting the new method of allocation of point-to-point charges between BC Hydro and Powerex as a result of the 2020 Transfer Pricing Agreement (2020 TPA). In particular, there is no longer an hourly determination of whether hourly export quantities reflect domestic sales versus trade activity. The revised calculation reflects the principles of section 6.2 of the 2020 TPA to provide a reasonable allocation of the point-to-point transmission costs incurred by BC Hydro in respect of Powerex's trading activities.

Directive 5 of the BCUC's Decision on BC Hydro's Fiscal 2022 Revenue Requirements Application (BCUC Order No. G-187-21) directed BC Hydro to report on the historic actual system imports/exports divided into flexible and non-flexible (i.e., according to the format in the 2020 TPA). Table 5 provides the fiscal 2021 actual system imports/exports divided into flexible and non-flexible.

[2] The 2020 Transfer Pricing Agreement (2020 TPA) came into effect on April 1, 2020 as directed by Order in Council No. 172 (BC Reg 88/2021) and approved by the BCUC Order No. G-127-21. The adoption of the 2020 TPA resulted in a change in the presentation of energy transactions (the sale and purchase of electricity) between BC Hydro and Powerex. The terms "Market Electricity Purchases" (line 12 in Table 4), "Surplus Sales" (line 13 in Table 4), and "Net Purchases (Sales) from Powerex" (line 16 in Table 4) were replaced by "System Imports" (line 14 in Table 4) and "System Exports" (line 15 in Table 4).

Table 5 Fiscal 2021 Actual System Imports/Exports Divided into Flexible and Non-Flexible

	F2021 Actual	
	$ million	**GWh**
System Imports		
Non-Flexible imports	4.6	61
Flexible imports	22.3	938
Total System Imports	26.9	999
System Exports		
Non-Flexible exports	(12.5)	(1,182)
Flexible exports	(215.3)	(7,900)
Total System Exports	(227.9)	(9,082)
Net System Imports / (Exports)	**(201.0)**	**(8,083)**

4 Operating Costs and Provisions Variance Explanations (Schedule 5.0)

This section compares fiscal 2021 actual gross operating costs and provisions amounts with the fiscal 2021 Decision.

Table 6 Fiscal 2021 Operating Costs and Provisions Variances

	($ million)	Schedule Reference	F2021 Decision	F2021 Actual	F2021 Diff	F2021 % Diff
			1	2	3=2-1	4=3/1
1	Integrated Planning	5.0 L1	292.0	308.8	16.7	6%
2	Capital Infrastructure Project Delivery	5.0 L2	81.1	80.8	(0.3)	0%
3	Operations	5.0 L3	244.3	265.2	21.0	9%
4	Safety	5.0 L4	57.5	55.7	(1.8)	-3%
5	Finance, Technology, Supply Chain	5.0 L5	264.8	277.3	12.5	5%
6	People, Customer, Corporate Affairs	5.0 L6	111.1	121.3	10.2	9%
7	Other	5.0 L7	(244.4)	(273.4)	(28.9)	12%
8	**Base Operating Costs**	5.0 L8	**806.4**	**835.7**	29.4	4%
9	IFRS Ineligible Capitalized Costs	5.0 L9	192.5	192.5	-	0%
10	Waneta 2/3	5.0 L10	5.9	5.8	(0.0)	-1%
11	Customer Crisis Fund	5.0 L11	5.3	2.9	(2.4)	-45%
12	**Subtotal**	5.0 L12	**203.6**	**201.2**	(2.4)	-1%
13	Deferred Account Additions	5.0 L16	-	(0.0)	(0.0)	0%
14	Regulatory Account Additions	5.0 L27	125.4	91.8	(33.6)	-27%
15	**Subtotal**		**125.4**	**91.8**	(33.6)	-27%
16	**Total Gross Operating Costs**	5.0 L27	**1,135.4**	**1,128.7**	(6.6)	-1%
17	Net Provisions & Other	5.0 L41	95.4	110.7	15.3	16%
18	Regulatory Account Additions - Provisions & Other	5.0 L49	-	53.0	53.0	0%
19	**Total Gross Provisions & Other**	5.0 L50	**95.4**	**163.7**	68.3	72%
20	**Total Gross Operating Costs and Provisions**	1.0 L2	**1,230.8**	**1,292.4**	61.7	5%

Fiscal 2021 actual gross Operating Costs and Provisions were $61.7 million (or 5 per cent) higher than the fiscal 2021 Decision. Of this amount, $53.0 million (line 18 in Table 6 above) was related to higher regulatory account additions for provisions and other, $29.4 million (line 8 in Table 6 above) was related to higher base operating costs, and $15.3 million (line 17 in Table 6 above) was related to higher net provisions and other. These amounts were partially offset by $33.6 million (line 14 in Table 6 above) related to lower regulatory account additions for operating costs.

Variances of $53.0 million related to higher regulatory account additions for provisions and other and variances of $33.6 million related to lower regulatory account additions for operating costs, netting to $19.4 million were primarily due to:

- An increase in the Environmental Provisions Regulatory Account of $51.2 million due to an increase in the Polychlorinated Biphenyl (**PCB**) provision of $20.5 million and an increase in the Asbestos Remediation provision of $30.7 million. The provisions increased due to increases in forecast PCB and Asbestos remediation costs, partially offset by reductions in the present value of future expenditures due to increases in discount rates;
- An increase in the Project Write-Off Costs Regulatory Account of $16.4 million due to $9.3 million project write-offs attributable to fiscal 2020 that was recorded prospectively in fiscal 2021 in accordance with Directive 32 of the BCUC's Decision on the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (received in fiscal 2021) and $7.1 million project write-offs relating to fiscal 2021. Itemized project write-offs deferred to the Project Write-off Costs Regulatory Account can be found in F Appendix L of the Fiscal 2022 Revenue Requirements Application for fiscal 2020, and Appendix P of the Fiscal 2023 to Fiscal 2025 Revenue Requirements Application for fiscal 2021; and
- Other variances, totalling $0.3 million.

Partially offset by:

- Lower than planned increase in the Demand-Side Management Regulatory Account of $17.6 million due to fewer industrial customers advancing incentive projects than planned, COVID-19 restrictions impacting program operations, and shifts in completion of low carbon electrification customer projects to other fiscal years;
- A decrease in the Storm Restoration Costs Regulatory Account of $14.2 million due to:
  - $10.0 million lower than planned expenditures for storm restoration. Planned storm restoration expenditures are based on a five-year average of actual

storm restoration costs. In fiscal 2021, BC Hydro experienced relatively less storm activity (fewer and less severe wildfires, windstorms, snow events) and accordingly, actual storm restoration costs were lower than plan.

- $4.2 million reduction attributable to fiscal 2020 that was recorded prospectively in fiscal 2021 in accordance with Directive 19 of the BCUC's Decision on the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (received in fiscal 2021) that increased the BCUC approved storm restoration cost plan by $4.2 million.

- Decrease in the Real Property Sales Regulatory Account of $10.9 million attributed to the fiscal 2020 amount that was recorded prospectively in fiscal 2021 in accordance with Directive 41 of the BCUC's on the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (received in fiscal 2021); and
- Decrease in the Post-Employment Benefit (**PEB**) Current Pension Costs Regulatory Account of $5.8 million due to the increase in the discount rate from 3.33 per cent in the fiscal 2021 Decision vs 3.83 per cent in the fiscal 2021 actuals.

Variances of $29.4 million related to base operating costs were primarily due to higher than planned personnel costs, including employees unable to charge to capital/maintenance work programs as a result of the COVID-19 social distancing measures BC Hydro put in place in March 2020, additional vegetation work and expenditures to support Mandatory Reliability Standards compliance requirements, partially offset by lower costs due to maintenance work not proceeding as planned as a result of the COVID-19 pandemic.

Variances of $15.3 million related to net provisions and other were primarily due to non-recoverable amounts.

5 Taxes Variance Explanations (Schedule 6.0)

This section compares fiscal 2021 actual taxes amounts with the fiscal 2021 Decision.

Table 7 Fiscal 2021 Taxes Variances

	($ million)	Schedule Reference	F2021 Decision	F2021 Actual	F2021 Diff	F2021 % Diff
			1	2	3=2-1	4=3/1
1	Grants in Lieu	6.0 L15	114.8	117.3	2.5	2%
2	School Taxes	6.0 L16	146.8	138.7	(8.0)	-5%
3	Waneta 2/3 Property Taxes	6.0 L17	0.6	0.8	0.2	25%
4	**Subtotal Before Regulatory Accounts**	6.0 L17	**262.2**	**256.8**	(5.4)	-2%
5	Deferred Account Additions	6.0 L	-	-	-	N/A
6	**Total Gross Taxes**	1.0 L3	**262.2**	**256.8**	(5.4)	-2%

Fiscal 2021 actual gross Taxes of $256.8 million were comparable to the fiscal 2021 Decision of $262.2 million.

6 Amortization Variance Explanations (Schedule 7.0)

This section compares fiscal 2021 actual amortization amounts with the fiscal 2021 Decision.

Table 8 Fiscal 2021 Amortization Variances

	($ million)	Schedule Reference	F2021 Decision	F2021 Actual	F2021 Diff	F2021 % Diff
			1	2	3=2-1	4=3/1
1	Amortization of Capital Assets	7.0 L5	904.5	905.6	1.2	0%
2	IPP Capital Leases	7.0 L7	90.1	90.1	-	0%
3	Other Leases	7.0 L8	3.4	4.1	0.6	18%
4	**Subtotal Before Regulatory Accounts**		**998.0**	**999.8**	1.8	0%
5	Deferred Account Additions	7.0 L10	-	(0.3)	(0.3)	0%
6	**Total Gross Amortization**	1.0 L4	**998.0**	**999.5**	1.6	0%

Fiscal 2021 actual gross Amortization of $999.5 million was comparable to the fiscal 2021 Decision amount of $998.0 million.

7 Finance Charges Variance Explanations (Schedule 8.0)

This section compares fiscal 2021 actual finance charges amounts with the fiscal 2021 Decision.

Table 9 Fiscal 2021 Finance Charges Variances

	($ million)	Schedule Reference	F2021 Decision	Actual	Diff	% Diff
			1	2	3=2-1	4=3/1
1	Sinking Fund Income	8.0 L9	(7.7)	(8.9)	(1.2)	15%
2	Long-Term Debt Costs	8.0 L10	851.5	821.5	(29.9)	-4%
3	Short-Term Debt Costs	8.0 L11	69.6	12.4	(57.2)	-82%
4	Interest Capitalized	8.0 L12	(242.6)	(225.9)	16.7	-7%
5	Other (Income) / Loss	8.0 L13	45.1	46.2	1.0	2%
6	IPP Capital Leases	8.0 L14	46.1	46.1	-	0%
7	Accretion - Non-Deferrable	8.0 L15	1.3	1.1	(0.2)	-19%
8	Non-Current PEB	8.0 L16	(42.2)	64.0	106.2	-252%
9	Other Leases	8.0 L17	1.0	1.4	0.4	37%
10	**Subtotal Before Regulatory Accounts**	8.0 L18	**722.0**	**757.8**	35.8	5%
11	Regulatory Account Additions	8.0 L7	21.3	(506.2)	(527.5)	-2477%
12	**Total Gross Finance Charges**	1.0 L5	**743.3**	**251.6**	(491.8)	-66%

Fiscal 2021 actual gross Finance Charges were $491.8 million (or 66 per cent) lower than the fiscal 2021 Decision. This was primarily due to:

- Line 3 - Lower short-term debt costs of $57.2 million due to lower interest rates and lower outstanding short-term debt balance; and
- Line 11 - Lower regulatory account additions of $527.5 million primarily due to an increase in the fair value of future debt hedges as a result of increases in forward interest rates. Gains on future debt hedges are offset by higher interest costs when the future debt is issued.

Partially offset by:

- Line 4 - Lower interest capitalized of $16.7 million due to lower work in progress balances eligible for interest during construction; and

- Line 8 - Higher non-current PEB costs of $106.2 million due to a lower liability discount rate for estimating pension plan income in actuals versus the expected long-term rate of return on pension plan assets used for the fiscal 2021 Decision.

8 Miscellaneous Revenue Variance Explanations (Schedule 15.0)

This section compares fiscal 2021 actual miscellaneous revenue amounts with the fiscal 2021 Decision.

Table 10 Fiscal 2021 Miscellaneous Revenue Variances

	($ million)	Schedule Reference	F2021 Decision	Actual	Diff	% Diff
			1	2	3=2-1	4=3/1
1	Amortization of Contributions	15.0 L1+L8+L12	63.1	64.3	1.2	2%
2	External OATT	15.0 L4	15.9	14.1	(1.8)	-11%
3	FortisBC Wheeling Agreement	15.0 L5	5.3	5.2	(0.1)	-1%
4	Secondary Revenue (MMBU, Secondary Use, Other)	15.0 L6+L11+L28	24.2	32.4	8.3	34%
5	Interconnections	15.0 L7	2.2	8.3	6.1	278%
6	Meter/Trans Rents & Power	15.0 L14	14.9	16.4	1.5	10%
7	Smart Metering & Infrastructure	15.0 L15	1.7	1.6	(0.1)	-5%
8	Diversion Net Recoveries	15.0 L16	0.1	0.1	(0.0)	-7%
9	Other Operating Recoveries	15.0 L17	4.6	4.0	(0.6)	-12%
10	Customer Crisis Fund Rider Revenue	15.0 L18	5.3	2.9	(2.4)	-45%
11	Waneta 2/3	15.0 L24	86.9	86.5	(0.4)	0%
12	Corporate General Rents	15.0 L26	3.8	2.8	(1.0)	-25%
13	Late Payment Charges	15.0 L27	8.1	7.8	(0.3)	-4%
14	NTL Supplemental Charge	15.0 L9	2.3	2.4	0.1	3%
15	Other (Income) / Loss	15.0 L2+L19+L29	5.4	7.3	1.9	35%
16	**Subtotal Before Regulatory Accounts**	15.0 L31	**243.6**	**256.1**	12.6	5%
17	Deferral Account Additions	15.0 L33	3.5	5.0	1.5	43%
18	**Total Gross Miscellaneous Revenue**	1.0 L7	**247.0**	**261.1**	14.1	6%

Fiscal 2021 actual gross Miscellaneous Revenue was $14.1 million (or 6 per cent) higher than the fiscal 2021 Decision. This was primarily due to:

- Line 4 - Higher secondary revenue of $8.3 million, primarily due to a number of factors including higher than planned third party projects for shared assets, new customer agreement rate structure and prior year settlements, higher than planned volume of scrap sales, and higher than planned number of house moves and temporary connections; and

- Line 5 - Higher interconnections of $6.1 million, primarily due to higher than planned project revenues from feasibility, system and facilities studies.

9 Summary of Inter-Segment Revenue Variance Explanations (Schedule 3.0)

This section compares fiscal 2021 actual inter-segment revenue amounts with the fiscal 2021 Decision.

Table 11 Fiscal 2021 Inter-Segment Revenue Variances

	($ million)	Schedule Reference	F2021 Decision	F2021 Actual	F2021 Diff	F2021 % Diff
			1	2	3=2-1	4=3/1
1	Powerex - Business Support Allocation	3.0 L1	(2.9)	(2.9)	-	0%
2	Mark to Market Losses (Gains)	3.0 L2	-	90.0	90.0	0%
3	Powerex PTP Charges	3.0 L3	(34.0)	(41.7)	(7.8)	23%
4	BC Hydro PTP Charges	3.0 L4	(35.0)	(30.4)	4.7	-13%
5	**Total Inter-Segment Revenue**	1.0 L8	**(71.9)**	**15.0**	86.9	-121%

Fiscal 2021 actual Inter-Segment revenues were $86.9 million (or 121 per cent) lower than the fiscal 2021 Decision due to higher mark to market losses (line 2 in Table 11 above) of $90.0 million related to transactions under the Transfer Pricing Agreement between BC Hydro and Powerex, and higher point-to-point transmission charges of $3.1 million (line 3 and 4 in Table 11 above), primarily due to an increase in the BC Hydro Open Access Transmission Rate (**OATT**) for fiscal 2020 resulting from the BCUC's Decision on BC Hydro's Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (BCUC Order G-246-20). The market to market losses are fully offset in Powerex's net income and have no impact on BC Hydro's consolidated net income or to ratepayers.

10 Capital Expenditures and Capital Additions Variance Explanations

The following tables and discussion provide information on the variances between fiscal 2021 actual capital expenditures and capital additions compared to the fiscal 2021 Decision amounts in the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application, which was based on a Currency Date of April 1, 2018.

On an annual basis, BC Hydro manages over 900 projects and programs in various phases. Capital expenditures and capital additions in a fiscal year are impacted by a number of factors that may give rise to variances from plan, including project progression and timing, potential changes in scope due to as-found equipment conditions or other factors to meet business requirements, and cost changes due to market conditions or other factors.

In addition, capital projects frequently take several years to complete, and any variances from plan in a particular year may be offset by project expenditures and additions in a subsequent year. The variances provided are against planned annual capital expenditures and additions and are not necessarily reflective of the total project cost. While year-over-year capital project cash flows may vary from annual plan amounts, overall BC Hydro is delivering its projects on budget as reported through BC Hydro's Service Plan Budget to Actual Cost performance metric.

Variances are provided for each main asset category in the tables below. The amounts presented in the tables in this section may not add due to rounding. The actual capital additions information has been presented using the same classification as the planned capital additions as presented in the tables in Chapter 6 of BC Hydro's Fiscal 2020 to Fiscal 2021 Revenue Requirements Application.

The COVID-19 pandemic has had an impact on the delivery of BC Hydro's capital investments in fiscal 2021, as projects and programs with construction or field work were required to incorporate new safety protocols which resulted in slowing or delaying aspects of the work. BC Hydro also made decisions to delay work to manage risk to the system in the event of a COVID outbreak. In this report we have identified significant costs and (or) schedule COVID-19 impacts known as of March 31, 2021 to the projects and programs in fiscal 2021 and provided variance explanations in each section below.

In general, explanations are provided where variances between actual and planned amounts are greater than 10 per cent, with a minimum variance threshold of $10 million.

10.1 Overall Capital Expenditures and Additions Variance Explanations

Table 12 and Table 13 below provide BC Hydro's fiscal 2021 capital expenditures and capital additions by main asset category.

Table 12 Fiscal 2021 Capital Expenditures Variances

($ million)	F2021			
	Decision	**Actual**	**Diff**	**% Diff**
	1	2	3=2-1	4=3/1
Generation	435.5	300.0	(135.5)	-31%
Site C Project	1,535.5	1,725.0	189.5	12%
Transmission & Distribution	946.8	970.9	24.1	3%
Business Support				
Technology	56.0	90.8	34.8	62%
Properties	55.3	56.0	0.7	1%
Fleet	27.8	31.4	3.6	13%
Business Support - Other	47.2	23.4	(23.9)	-51%
Total Gross	**3,104.1**	**3,197.5**	**93.4**	**3%**
Less: Contribution in Aid	(148.4)	(195.7)	(47.3)	32%
Total	**2,955.7**	**3,001.8**	**46.1**	**2%**

Table 13 Fiscal 2021 Capital Additions Variances

($ million)	F2021			
	Decision	Actual	Diff	% Diff
	1	2	3=2-1	4=3/1
Generation	297.0	102.6	(194.4)	-65%
Site C Project	189.4	220.9	31.5	17%
Transmission & Distribution	770.3	824.6	54.3	7%
Business Support				
Technology	75.5	164.9	89.4	118%
Properties	55.6	70.9	15.3	27%
Fleet	27.8	26.8	(1.0)	-4%
Business Support - Other	43.5	22.7	(20.8)	-48%
Total Gross	**1,459.1**	**1,433.4**	**(25.7)**	**-2%**
Less: Contribution in Aid	(165.8)	(180.7)	(14.9)	9%
Total	**1,293.2**	**1,252.7**	**(40.5)**	**-3%**

Fiscal 2021 capital expenditures were $93.4 million (or 3 per cent) above the Fiscal 2021 Decision, excluding contribution in aid, primarily because:

- The Site C project was $189.5 million above plan primarily due to acceleration of the main civil work to meet the river diversion milestone date and unplanned COVID-19 pandemic related costs to comply with the COVID-19 safety requirements, as discussed in section 10.6; and
- Technology was $34.8 million above plan due to scope changes and schedule extensions for various projects as discussed in section 10.5.

The increase in capital expenditures above was partially offset by the lower than planned Generation capital expenditures of $135.5 million, primarily due to schedule changes for various projects as discussed in section 10.2.

Fiscal 2021 capital additions were $25.7 million (or 2 per cent) below the fiscal 2021 Decision, excluding contribution in aid, primarily due to the following:

- Generation capital additions were below plan by $194.4 million, primarily due to schedule changes for various projects and delays which shifted the timing of placing certain assets in-service, as discussed in section 10.2.

The decrease in capital additions above was partially offset by the following:

- Technology was above plan by $89.4 million, primarily due to the Supply Chain Applications project (included in the Technology line) as the project in-service date was delayed which shifted the timing from fiscal 2020 to fiscal 2021. This delay was due to a schedule extension for the build and testing activities, as well as the delay in the project go-live training, in response to the COVID-19 pandemic;
- Transmission and Distribution capital additions were above plan by $54.3 million, primarily due to schedule changes for various projects and programs which shifted the timing of placing certain assets in-service, as discussed in section 10.3 and 10.4; and
- The Site C project was $31.5 million above plan primarily because the in-service of the outdoor portion of the Peace Canyon Gas Insulated Switchgear occurred in fiscal 2021 as discussed in section 10.6.

10.2 Generation Capital Expenditures and Additions Variance Explanations

Generation capital expenditures and capital additions in fiscal 2021 are presented in Table 14 and Table 15 below. Results exclude amounts for the Site C project, which are presented separately in section 10.6 below.

Table 14 Fiscal 2021 Generation Capital Expenditures Variances (excluding Site C Project)

($ million)	F2021			
	Decision	**Actual**	**Diff**	**% Diff**
	1	2	3=2-1	4=3/1

Growth Capital

Fiscal 2021 capital expenditures and capital additions for Generation Growth Capital were comparable to the fiscal 2021 Decision.

Redevelopment/ Rehabilitation

Fiscal 2021 capital expenditures and capital additions were comparable to the fiscal 2021 Decision.

Dam Safety

Fiscal 2021 capital expenditures were $74.2 million (or 57 per cent) below the fiscal 2021 Decision. This was primarily because:

- The Comox - Puntledge Flow Control Improvements project was $14.9 million below plan because the design was delayed due to greater than anticipated level of design complexity as well as delays of planned site inspections due to the COVID-19 pandemic;
- The Strathcona Upgrade Discharge project was $12.1 million below plan because the design was delayed due to the complexity of gate reliability and seismic withstand requirements;
- The Terzaghi - Spillway Chute Access Improvement project was $10.8 million below plan because of schedule delays in finalizing the Conceptual Design to appropriately balance worker risk, overall cost, and long-term maintenance;
- The W.A.C. Bennett Dam Recommission / Seal Spillway Sluice Gates project was $9.8 million below plan because the project was delayed due to the addition of scope to design new stoplogs which were required to facilitate the project work;
- The John Hart Dam Seismic Upgrade project was $6.6 million below plan because design activities were completed over a longer time period, with a lower rate of spend than was assumed at the time the Plan was established. More detailed bottom up planning was completed after the Plan was established which resulted in a longer design schedule and a lower rate of spend than was assumed in the Plan;

- The Various Sites - Reservoir Booms Replacement was $5.1 million below plan because the project was initiated later than originally contemplated due to extended project planning and scheduling;
- The W.A.C. Bennett Dam Spillway Gate Upgrade project was $4.1 million below plan because of contractor delays in finalizing a contract and execution of the work;
- The Alouette Improve Headworks & Surge Tower Seismic Stability project was $4.1 million below plan because of a delay in completing the Identification Phase due to prolonged engagement and consultation with Indigenous groups and stakeholders;
- The Alouette - Environmental Flow Discharge Upgrade and LLO Sealing project was $2.2 million below plan because of schedule delays resulting from putting the project on hold for one year due to capital project investigation funding constraints;
- The Duncan Dam Replace Spillway Gates project was $2.2 million below plan because the project Implementation Phase was shifted from calendar year 2020 to calendar year 2022 to allow additional time to perform site investigations that verified the viability of gate life extension through refurbishment as the preferred alternative selection, rather than more costly gate replacements; and
- The Revelstoke Improve Left Bank Slope Stability project was $2.1 million below plan because of construction delays related to the COVID-19 pandemic.

The decrease in capital expenditures outlined above was partially offset by:

- The Revelstoke Replace Downie Slide Instrumentation project was $3.9 million above plan because of higher costs due to unforeseen complexities with accessing the remote site.

The remaining below plan variance of $4.1 million was due to smaller variances on various projects.

Fiscal 2021 capital additions were $10.3 million (or 23 per cent) below the fiscal 2021 Decision. This was primarily because:

- The Terzaghi - Spillway Chute Access Improvement project was $12.0 million below plan because project in-service date was delayed due to the time required to finalize the Conceptual Design to appropriately balance worker risk, overall cost, and long-term maintenance;
- The Revelstoke Improve Left Bank Slope Stability project was $11.5 million below plan because the project in-service date was delayed due to construction delays related to the COVID-19 pandemic;
- The Various Sites - Reservoir Booms Replacement was $5.9 million below plan because the project was initiated later than originally contemplated due to extended planning and scheduling; and
- The MCA - Rehabilitate Vertical Movement Gauges project was $2.9 million below plan because the project in-service date was delayed due to additional time required to complete the final instrumentation connection and calibration.

The decrease in capital additions outlined above was partially offset by:

- The W.A.C. Bennett Dam Spillway Gate Upgrade project was $22.9 million above plan because the project in-service date was delayed from fiscal 2020 to fiscal 2021 due to contractor related delays in finalizing a contract and executing work.

The remaining below plan variance of $0.9 million was due to smaller variances on various projects.

When considering the non-financial impacts of these lower than planned capital expenditures and capital additions arising from schedule delays, particularly with respect to the risk position of BC Hydro's dam fleet, please refer to BC Hydro's response to BCUC Information Request 1.53.4 of the Fiscal 2022 Revenue Requirements Application. In that response, BC Hydro explained that the dynamic and complex "brown field" nature of these projects and the need to balance several competing priorities can sometimes lead to schedule delays. BC Hydro further explained that interim controls – either operational or physical – are put into place to manage any deficiency to a tolerable state until the deficiency can be addressed through the project, so that schedule delays within dam safety projects do not typically have a significant impact on the risk position of BC Hydro's dam fleet.

Sustaining – Other

Fiscal 2021 capital expenditures were $139.0 million (or 38 per cent) below the fiscal 2021 Decision. This was primarily because:

- The Cheakamus Recoat Units 1 and 2 Penstocks (Interior and Exterior) project was $22.6 million below plan because the fiscal 2021 work program was delayed due to the restaged exterior coating scope of work;
- The Wahleach Recoat Penstock (Interior and Exterior) project was $15.5 million below plan because of a lack of Generator outage availability;
- The G.M. Shrum Upgrade HVAC System project was $15.4 million below plan because of a schedule delay due to rescoping and re-planning of the project;
- The Bridge River 2 - Strip and Recoat Penstock 2 Interior project was $8.6 million below plan because the project work was delayed due to the COVID-19 pandemic;
- The Bridge River 1 Replace Units 1-4 Generators / Governors project was $8.6 million below plan because of a schedule delay due to a procurement

strategy change and due to Directive 29 of the BCUC's Decision on BC Hydro's Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (BCUC Order G-246-20) which directed BC Hydro to file a joint application for the Bridge River 1 Replace Units 1-4 Generators / Governors project and the Bridge River Transmission project;

- The Mica Upgrade HVAC System project was $8.5 million below plan because the project schedule and associated cashflow were revised due to design elaboration and constructability reviews during the Definition Phase;
- The Kootenay Canal Modernize Controls project was $7.2 million below plan because of longer than expected Conceptual and Feasibility Design Phases due to resource constraints, design complexities and scope confirmation;
- The Bridge River 2 Upgrade Units 5 and 6 project was $6.3 million below plan due to cost savings during construction;
- The Revelstoke Replace Fire Alarm System project was $4.7 million below plan because the construction start date changed due to an updated construction schedule from the contractor;
- The Jordan - Upgrade Governor & PRV Controls project was $4.7 million below plan because the unit outage required for construction was deferred due to design elaboration and coordination with the Jordan River - Switchyard Upgrade project to minimize outages at Jordan River substation;
- The Seton - Upgrade Unit project was $4.4 million below plan because the project was placed on hold to evaluate alternatives for a hydraulic bypass system;
- The Bridge River 1 - Strip and Recoat Penstocks 1-4 Interior project was $4.4 million below plan because the project construction start date was delayed in order to align outages with the Bridge River 1 Replace Units 1-4 Generators /

Governors project. The scope for the two projects is separate but this approach provides efficiency and improves system water management;

- The Cheakamus Units 1 and 2 Generator Replacement project was $4.1 million below plan because the project was three months ahead of schedule and therefore part of the spend was in the prior fiscal period;
- The Mica - Intake Gantry Crane Refurbishment project was $3.8 million below plan because the project construction start date was deferred due to worker camp capacity restrictions related to the COVID-19 pandemic;
- The G.M. Shrum G1 to 10 Control System Upgrade project was $3.6 million below plan because of a schedule delay due to the COVID-19 pandemic and the Site C river diversion which deferred planned outage work;
- The Ladore - Redevelop Unit 1 project was $3.3 million below plan because the project was cancelled due to re-evaluation of the project need and timing; and
- The Mica Upgrade 600V Circuit Breakers project was $2.9 million below plan because additional time was required to complete the detailed design.

The decrease in capital expenditures outlined above was partially offset by:

- The MCA - Replace Reactors 5RX3 and 5RX4 project was $16.0 million above plan because this was an unplanned emergency replacement of failed equipment.

The remaining below plan variance of $26.4 million was due to smaller variances on many offsetting projects.

Fiscal 2021 capital additions were $257.8 million (or 82 per cent) below the fiscal 2021 Decision. This was primarily because:

- The Bridge River 2 Upgrade Units 7 and 8 project was $54.7 million below plan because the project in-service date was delayed due to an equipment fault resulting in the delay of Unit 7 commissioning;
- The Cheakamus Recoat Units 1 and 2 Penstocks (Interior and Exterior) project was $31.5 million below plan because the project in-service date was delayed due to the restaged exterior coating scope of work;
- The Wahleach Recoat Penstock (Interior and Exterior) project was $26.0 million below plan because the project in-service date was delayed due to the lack of Generator outage availability;
- The Bridge River 2 - Strip and Recoat Penstock 2 Interior project was $16.6 million below plan because the project in-service date was delayed due to crew size restrictions from the COVID-19 pandemic;
- The G.M. Shrum G1 to 10 Control System Upgrade project was $15.4 million below plan because the project in-service date was delayed due to the COVID-19 pandemic and Site C river diversion which deferred planned outage work;
- The Mica Upgrade HVAC System project was $12.6 million below plan because the project in-service date was delayed due to an updated project schedule resulting from design elaboration and progression of project planning activities;
- The Mica Upgrade 600V Circuit Breakers project was $12.0 million below plan because the project in-service date was delayed due to design delays and longer manufacturing lead times than planned;
- The Hugh Keenleyside Replace Service Water Piping project was $8.8 million below plan because the project in-service date was delayed due to reprioritization of capital projects and maintenance work at Hugh Keenleyside in response to COVID-19 impacts;

- The Seven Mile Replace Unit 1-4 Exciter Transformers project was $8.6 million below plan because the project schedule was updated as a result of the design scope elaboration, project planning and early contract engagement in the Definition Phase. The forecast in-service date is updated to fiscal 2022;
- The Cheakamus Replace Units 1 and 2 Turbine Inlet Valves project was $7.3 million below plan because of a schedule delay due to defects in the turbine inlet valves cast bodies that required recasting;
- The Bridge River 2 Upgrade Units 5 and 6 project was $6.5 million below plan because of cost savings during construction and delayed reconciliation of final contractor costs;
- Various - Water License Renewal was $5.3 million below plan because the project in-service date was delayed due to the Comptroller of Water Rights requesting more time to decide on the Water Licence Renewals;
- The Waneta – Sustaining project costs were $5.2 million below plan because the project in-service dates were delayed mainly due to the Unit 3 Life Extension work Definition Phase taking longer than anticipated causing the Implementation Phase to be delayed;
- The G.M. Shrum Draft Tube Maintenance Gates Refurbishment project was $4.5 million below plan because the project in-service date was delayed due to work being delayed by the COVID-19 pandemic;
- The Peace Canyon Draft Tube Maintenance Gates Refurbishment project was $4.4 million below plan because the project in-service date was delayed due to work being delayed by the COVID-19 pandemic;
- The Mica - Recoat Intake Maintenance Gates & Draft Tube Maintenance Gates project was $4.3 million below plan because the project in-service date was delayed due to work being delayed by the COVID-19 pandemic;

- The Alouette Upgrade Station Service project was $4.3 million below plan because the project in-service date was delayed due to an additional switching study and grounding test;
- The Cheakamus Units 1 and 2 Generator Replacement project was $4.2 million below plan because of lower trailing costs due to fewer risks materializing;
- The Mica Upgrade Town Site Building Roofs project was $4.1 million below plan because the project in-service date was delayed due to a work assessment review deferring construction work and worker camp capacity restrictions related to the COVID-19 pandemic; and
- The Peace Canyon Electrical Protection Upgrade project was $4.0 million below plan because the project was delayed by two years in order to move the required outage at Peace Canyon outside of the Site C diversion period.

The remaining below plan variance of $17.5 million was due to smaller variances on many offsetting projects.

Non-Integrated Areas and Diesel and Thermal Generation

Fiscal 2021 capital expenditures and additions for Non-Integrated Areas and Diesel and Thermal Generation were comparable to the fiscal 2021 Decision.

Portfolio Risk Adjustment

The Portfolio Risk Adjustment is meant to account for the uncertainty in the schedule and cost of projects. The Portfolio Risk Adjustment amount is calculated using a Monte Carlo simulation. A probability distribution is determined, based on historical Project Delivery performance information. The calculated Portfolio Risk Adjustment amount represents the difference (by fiscal year) between the expected value of the simulated portfolio forecast and the sum of individual project forecasts in the baseline Capital Plan.

The Fiscal 2021 Decision Portfolio Risk Adjustment amount was $(65.2) million for capital expenditures and $(74.6) million for capital additions.

10.3 Transmission Capital Expenditures and Additions Variance Explanations

Transmission fiscal 2021 capital expenditures and capital additions are provided in Table 16 and Table 17, below.

Table 16 Fiscal 2021 Transmission Capital Expenditures Variances

($ million)	F2021			
	Decision	**Actual**	**Diff**	**% Diff**
	1	2	3=2-1	4=3/1
Transmission Growth				
Regional System Reinforcement	91.1	38.0	(53.1)	-58%

Total	**200.4**	**280.0**	**79.6**	**40%**

Transmission Growth - Regional System Reinforcement

Fiscal 2021 capital expenditures were $53.1 million (or 58 per cent) below the fiscal 2021 Decision primarily because:

- The Peace Region Electric Supply (**PRES**) project was $27.9 million below plan primarily because BC Hydro received contributions of $25 million from the Government of Canada which were not accounted for in the fiscal 2021 RRA plan. Project costs were also lower than planned;

- The East Vancouver - Substation Construction project was $9.1 million below plan because the project has been delayed for three years, following the purchase of property for the development of a West End Substation. This purchase allowed BC Hydro to proceed with the preferred project staging (i.e., constructing the West End Substation first, while delaying the construction of the East Vancouver Substation);
- The West Kelowna Transmission and Westbank Upgrade projects were $8.9 million below plan because the Transmission project returned to the Conceptual Design Stage to re-evaluate the existing alternatives and consider new alternatives in response to a higher than anticipated revised cost estimate for the Leading Alternative; and
- The Bridge River Transmission project was $8.5 million below plan because conceptual design was delayed in order to allow additional time to complete the business case and develop a regulatory application in accordance with Directive 29 of the BCUC's Decision on the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application.

The decrease in capital expenditures outlined above was partially offset by above plan smaller variances of $1.3 million from various projects.

Fiscal 2021 capital additions were $39.2 million (or 67 per cent) above the fiscal 2021 Decision primarily because:

- The PRES project was $43.1 million above plan because the substation assets were placed in service ahead of Plan in fiscal 2021 due to their construction being completed ahead of schedule.

The increase in capital additions outlined above was partially offset by:

- The George Tripp Station Modification project was $2.7 million below plan because the project in-service date was delayed due to longer design duration as a result of resource constraints, and longer construction duration as a result of system constraints impacting the availability of required line outages; and

- $1.2 million smaller below plan variances on various projects.

Transmission Growth – Bulk System Reinforcement

Fiscal 2021 capital expenditures were $46.8 million (or 108 per cent) below the fiscal 2021 Decision primarily because:

- The Peace to Kelly Lake Capacitors project was $41.1 million below plan because the project was cancelled. Based on updated load forecast information, BC Hydro determined that the need for an increase in the transfer capability along the Peace Region to Kelly Lake transmission corridor to deliver power to the load centers in the south of the province could be delayed until after fiscal 2031. The sustainment portion of the project was grouped into a new project – the Peace to Kelly Lake Sustainment Project.

The remaining below plan variance of $5.7 million was due to smaller variances on various projects.

Fiscal 2021 capital additions were comparable to the fiscal 2021 Decision.

Transmission Growth – Transmission Load Interconnection

Fiscal 2021 capital expenditures were comparable to the fiscal 2021 Decision.

Fiscal 2021 capital additions were $25.5 million (or 158 per cent) above the fiscal 2021 Decision primarily because:

- The UBC Load Increase Stage 2 project was $36.7 million above plan because the project was put into service in fiscal 2021, ahead of the planned fiscal 2022 in-service date as project schedule risks did not materialize and therefore the project schedule contingency was not used.

The increase in capital additions outlined above was partially offset by:

- $11.2 million below plan variances that resulted from various third-party driven customer projects due to the timing of projects being planned and put in-service.

All other line items under Transmission Growth in fiscal 2021 for both capital expenditures and capital additions were comparable to the fiscal 2021 Decision.

Transmission Sustain-Stations

Circuit Breakers

Fiscal 2021 capital expenditures and capital additions were comparable to the fiscal 2021 Decision.

Other Power Equipment

Fiscal 2021 capital expenditures were comparable to the fiscal 2021 Decision.

Fiscal 2021 capital additions were $26.3 million (or 52 per cent) below the fiscal 2021 Decision. This was primarily due to the following:

- The BR1 T3 & BRT T4A Replacement project was $18.8 million below plan because the T4 portion of the project schedule was delayed during the Identification Phase to allow additional time to complete the alternative analysis and selection. The T3 portion of the project was prioritized and moved to a separate project due to the unplanned failure of BR1 T3; and
- The Peace Region to Kelly Lake - Reactor Replacement (Phase 1) project was $9.3 million below plan because the second reactor installation schedule was delayed due to the COVID-19 pandemic.

The decrease in capital additions above was partially offset by $1.8 million of smaller above plan variances on various projects.

Protection and Control

Fiscal 2021 capital expenditures were comparable to the fiscal 2021 Decision.

Fiscal 2021 capital additions were $10.3 million (or 79 per cent) below the fiscal 2021 Decision. This was primarily because:

- The SCADA RTU Replacement - Stage 9 project was $3.5 million below plan because the project in-service date was delayed due to project design deliverables completion delays as a result of resources being shifted to the other higher priority work such as Mandatory Reliability Standards (**MRS**) compliance related projects; and
- The SCADA RTU Replacement - Stage 10 project was $3.3 million below plan because the project in-service date was delayed due to project design deliverable completion delays as a result of resources being shifted to the other higher priority work such as MRS compliance related projects.

The remaining below plan variance of $3.5 million was due to smaller variances on various projects.

Stations Auxiliary Equipment

Fiscal 2021 capital expenditures were $14.0 million (or 47 per cent) below the fiscal 2021 Decision primarily due to the following:

- The Joseph Creek (**JOE**) Substation Upgrade project was $5.7 million below plan because project was put on-hold pending the review and finalization of the Wood Pole Substations Strategy during the Identification Phase;
- The Lumby No. 2 - Substation Wood Pole Replacement project was $3.2 million below plan because the project was delayed pending the review and finalization of the Wood Pole Substations Strategy and due to resource constraints; and

- The Station Wood Pole Replacement Program - Chase (**CHS**) Substation project was $1.9 million below plan because the project start was delayed pending the review and finalization of the Wood Pole Substation Strategy.

The remaining variance of $3.2 million was due to smaller below plan variances on various projects.

Fiscal 2021 capital additions were $19.9 million (or 74 per cent) below the fiscal 2021 Decision primarily because:

- The Wood Pole Substation Replacement – Britannia Substation (**BTA**) project was $5.9 million below plan because the construction schedule was delayed due to a prolonged procurement process. A further delay occurred while the project waited for an approved customer outage for the project to resolve final construction deficiencies;
- The Wood Pole Substation Replacement Program - Chase Substation (**CHS**) project was $3.1 million below plan because the project start was delayed pending the review and finalization of the Wood Pole Substation Strategy;
- The Wood Pole Substation Replacement Program - Clinton Substation (**CLN**) project was $2.4 million below plan because the project in-service date was delayed pending the review and finalization of the Wood Pole Substation Strategy;
- The Como Lake (**COK**) Substation Cable Replacement was $1.7 million below plan because the project in-service date was delayed due to resource constraints and station outage constraints. The procurement of power cables was also delayed due to the COVID-19 pandemic; and
- The Fire Risk Program for Stations was $1.3 million below plan because the project in-service date was delayed due to change of scope and work methodology and due to the COVID-19 pandemic.

The remaining variance of $5.5 million was due to smaller below plan variances on various projects.

Station Risk Mitigation

Fiscal 2021 capital expenditures were comparable to the fiscal 2021 Decision.

Fiscal 2021 capital additions were $13.6 million (or 68 per cent) below the fiscal 2021 Decision. This was primarily because:

- The Oil Spill Containment - F17/F18 (ALZ / MDN) project for the Atchelitz and Meridian Substations was $7.2 million below plan because the project in-service date was delayed due to the COVID-19 pandemic.

The remaining variance of $6.4 million was due to smaller below plan variances on various projects.

Telecommunication

Fiscal 2021 capital expenditures were comparable to the fiscal 2021 Decision.

Fiscal 2021 capital additions were $28.8 million (or 77 per cent) below the fiscal 2021 Decision. This was primarily due to the following:

- The Vancouver Island Radio System project was $21.5 million below plan because the project in-service date was delayed due to issues related to the supply and performance of the telecom equipment. Additional time and effort were required for procurement, testing, standardization of new equipment, and development of new system architecture; and
- The CPM MW Repeater Building Replacement project was $5.1 million below plan because the project in-service date was delayed due to the COVID-19 pandemic and due to Communication, Protection and Control resource constraints.

The decrease in capital additions above was partially offset by:

- The Copper Mountain ice mitigation project was $6.6 million above plan because the in-service date was delayed from fiscal 2020 to fiscal 2021 due to a deficiency that was required to be rectified prior to the project being put in service.

The remaining below plan variance of $8.8 million was due to smaller variances on various projects.

Transmission Sustain-Lines

Cable Sustainment

Fiscal 2021 capital expenditures were $11.6 million (or 131 per cent) below the fiscal 2021 Decision. This was primarily because:

- The Gulf Islands - Transmission Reinforcement was $5.3 million below plan because the project initiation was delayed to allow more time to complete planning activities including the identification and evaluation of additional alternatives; and
- The Asset Retirement Obligation (**ARO**) provision adjustment of ($3.4) million on the 230 kV and 138 kV Submarine Cables was re-evaluated at the fiscal 2021 year-end which resulted in an adjustment reducing the liability by $3.4 million.

The remaining below plan variance of $2.9 million was due to variances on many smaller projects.

Fiscal 2021 capital additions were comparable to the fiscal 2021 Decision.

All other line items under Transmission Sustain-Lines in fiscal 2021 for both capital expenditures and capital additions were comparable to the fiscal 2021 Decision.

Portfolio Risk Adjustment

The Portfolio Risk Adjustment is meant to account for the uncertainty in the schedule and cost of projects. The Portfolio Risk Adjustment amount is calculated using a Monte Carlo simulation. A probability distribution is determined, based on historical Project Delivery performance information. The calculated Portfolio Risk Adjustment amount represents the difference (by fiscal year) between the expected value of the simulated portfolio forecast and the sum of individual project forecasts in the baseline Capital Plan.

The Fiscal 2021 Decision Portfolio Risk Adjustment amount was $(39.0) million in capital expenditures and $(90.0) million in capital additions.

Contribution in Aid

Fiscal 2021 Transmission Contribution in Aid expenditures were comparable to the fiscal 2021 Decision.

Fiscal 2021 Transmission Contribution in Aid additions were $20.6 million (or 71 per cent) below the fiscal 2021 Decision due to timing differences on the completion of customer work and a lower volume of third-party requests for relocations than originally planned.

10.4 Distribution Capital Expenditures and Additions Variance Explanations

Distribution fiscal 2021 actual to Fiscal 2021 Decision capital expenditures and capital additions are provided in Table 18 and Table 19, below.

The distribution system improvement portfolio is primarily comprised of small projects, with the average project size in the $1 million to $2 million range with short duration.

The System Expansion and Improvement portfolio is subject to rapidly changing priorities and the planning processes must be dynamic to respond to the emerging needs on the distribution system. This may result in variances in the timing and selection of projects in the portfolio in a given year.

Table 18 Fiscal 2021 Distribution Capital Expenditures Variances

($ million)	F2021			
	Decision	**Actual**	**Diff**	**% Diff**
	1	2	3=2-1	4=3/1

Distribution Growth – Customer Driven

Fiscal 2021 capital expenditures were $81.8 million (or 35 per cent) above the fiscal 2021 Decision due to an increase in distribution customer driven extension activities, meter purchases for secondary connections, the Ministry of Transportation and Infrastructure relocation activities and the required design effort to support these increases. This work is difficult to plan as it is dependent on customer requests and their related timing. The increase in capital expenditures was partially offset by the increase in contributions received, as explained in the Contribution in Aid section below.

Fiscal 2021 capital additions were $33.8 million (or 14 per cent) above the fiscal 2021 Decision primarily due to the increase in capital expenditures as well as the timing of a few major customer projects going in-service in fiscal 2021.

Distribution Growth - System Expansion and Improvement

Growth-driven system expansion and improvement expenditures address existing capacity constraints to meet anticipated customer load growth. The priority of growth-driven system upgrades is influenced by new customer load connections and general load growth from existing customers. This category of expenditures is subject to year over year fluctuations from plan as a result of changes in scope, cost and schedule for projects as well as variances between forecast and actual customer load growth.

Fiscal 2021 capital expenditures were $24.7 million (or 49 per cent) above the fiscal 2021 Decision primarily because:

- The Bringing additional capacity from ARN to Tilbury project was $6.7 million above plan because of increased construction costs and duration mainly due to adverse as-found ground condition areas which resulted in unplanned spend in fiscal 2021;
- The LM-COQ-694 COK Distribution Egress Reinforcement project was $6.5 million above plan because additional time was required to complete the work and there were additional costs for water treatment plants and dewatering;
- The LM-FVW-701 - New KI2 duct bank egress & Feeder project was $5.8 million above plan due to civil cost escalations, extra cable costs, nighttime work due to a request from the Ministry of Transportation and Infrastructure and dewatering costs;
- The New MUR Circuit to Offload MUR 12F66 and MUR 12F84 project was $5.2 million above plan due to additional scope and a delay in the in-service date;

- The System Improvement Minor Capital Program was $4.4 million above plan due to higher volumes of work driven by new customer connections and general load growth from existing customers;
- The FV-CHK-018 New ALZ 25F82 to offload WAH 25F51 project was $2.7 million above plan because the project was expected to be completed in fiscal 2020. The project was delayed to fiscal 2021 due to additional reconductoring and underground work added to the project scope; and
- The HPN 12F54, 72Q, 73Q, and 324 Voltage Conversion project was $2.7 million above plan because work was delayed to fiscal 2021 by the high volume of customer vault negotiations required and slower than expected permitting for underground work;

The increase in capital expenditures above was partially offset by:

- The Three new MLE Feeders to offload CBN project was $7.3 million below plan because the project completion date was delayed due to the timing of MLE feeder positions being available in the substation which is currently being upgraded in a separate project;
- The Two Fleetwood feeders to offload McLellan project was $6.9 million below plan because the project completion date was delayed due to scope changes;

The remaining above plan variance of $4.9 million was due to smaller variances on various projects.

Fiscal 2021 capital additions were $31.4 million (or 30 per cent) below the fiscal 2021 Decision primarily due to the following:

- The Two Fleetwood feeders to offload McLellan project was $13.2 million below plan because the project completion date was delayed due to scope changes;

- The HPN 77Q, 323, 326 and 327 Voltage Conversion Preparation project was $10.0 million below plan because the project completion date was delayed due to a high volume of customer vault negotiations;
- The Three new MLE Feeders to offload CBN project was $8.7 million below plan because the project completion date was delayed due to the timing of MLE feeder positions being available in the substation which is currently being upgraded in a separate project;
- The 12F51 & 53 HPN Voltage Conversion project was $8.0 million below plan because the project completion date was delayed due to customer equipment procurement delays;
- The New MUR Circuit to Offload MUR 12F66 and MUR 12F84 project was $7.3 million below plan because the project completion date was delayed due to additional scope for a duct bank;
- The Voltage Conversion Prep for RIM Substation project was $7.3 million below plan because the project completion date was delayed due to removal of scope from the project;
- The Lower Mainland - George Dickie Feeder Voltage Conversion project was $5.0 million below plan because the project completion date was delayed to accommodate the customers' conversion schedules. There were also fewer poles replaced than planned; and
- The LM-VAN-076 West End Voltage Conversion project was $3.4 million below plan because the project completion date was delayed due to delays in customer vault negotiations.

The decrease in capital additions above was partially offset by:

- The Bringing additional capacity from ARN to Tilbury project was $28.5 million above plan because the project in-service date was delayed from fiscal 2020 to fiscal 2021 due to increased construction duration mainly due to as-found ground conditions in the area; and

- Above plan variances of $3.0 million from various smaller projects.

Uneconomic Extension Assistance

Fiscal 2021 capital expenditures and capital additions were comparable to the Fiscal 2021 Decision.

Distribution Sustain - System Expansion and Improvement

System expansion and improvement sustaining expenditures maintain and improve distribution system performance including addressing customer reliability, safety risks and meeting regulatory, legal or environmental requirements.

Fiscal 2021 capital expenditures were $10.9 million (or 19 per cent) below the Fiscal 2021 Decision primarily because:

- The Downtown Vancouver - Underground Murrin Feeders to Eliminate H-Frames in Gastown was $10.6 million below plan because of delays in the City of Vancouver’s approval of designs.

The remaining below plan variance of $0.3 million was due to smaller variances on various projects.

Fiscal 2021 capital additions were $21.8 million (or 29 per cent) below the Fiscal 2021 Decision primarily due to the following:

- The Downtown Vancouver - Underground Murrin Feeders to Eliminate H-Frames in Gastown was $11.6 million below plan because the in-service date was delayed to fiscal 2022 mainly due to delay related to the City of Vancouver’s approval of designs;

- The New DGR Circuit for Customer Vaults at Pacific and Howe project was $5.5 million below plan because the project in-service date was delayed due to the COVID-19 pandemic and City of Vancouver traffic permit restrictions;
- The New DGR Circuit for Customer Vaults at Drake and Howe project was $8.8 million below plan because the project in-service date was delayed as the construction schedule for the project was sequenced to be after the New DGR Circuit for Customer Vaults at Pacific and Howe project, which was delayed, as explained above;
- The Merritt - New Merritt 25F114 Douglas Lake Ranch project was $2.3 million below plan because of a delay in the resolution of property access issues; and
- The Primary Metering Kit Replacement project was $2.2 million below plan because the project in-service date was delayed as a result of procurement delays for PCB metering kits.

The decrease in capital additions above was partially offset by:

- The H-Frame Elimination - Chinatown project was $8.4 million above plan because the project was placed in-service in fiscal 2021 instead of fiscal 2020, as originally forecasted; and
- Above plan variances of $0.2 million from various smaller projects.

Distribution Sustain - Asset Replacement

Distribution Asset replacements are planned and adjusted as an entire program based on inspections and changes in the prioritization of different assets.

Fiscal 2021 capital expenditures were $34 million (or 29 per cent) above the fiscal 2021 Decision primarily due to higher volumes of underground and overhead replacements; partially offset by lower volume of joint-use pole replacements and true-up of the third-party recoveries received.

Fiscal 2021 capital additions were $13.8 million (or 12 per cent) above the fiscal 2021 Decision primarily due to higher volumes of underground replacements and overhead replacements.

Contribution in Aid

Fiscal 2021 Distribution Contribution in Aid expenditures were $53.0 million (or 40 per cent) above the fiscal 2021 Decision primarily due to higher than planned distribution customer driven extension activities.

Fiscal 2021 Distribution Contribution in Aid additions were $35.5 million (or 26 per cent) above fiscal 2021 Decision primarily due to the increase in capital expenditures as explained above.

10.5 Business Support Capital Expenditures and Additions Variance Explanations

Business Support includes capital expenditures and additions for Technology, Properties, Fleet, and Other categories. Business Support Fiscal 2021 capital expenditures and capital additions are presented by category in the tables below.

Table 20 Fiscal 2021 Business Support Capital Expenditures Variances

($ million)	F2021			
	Decision	**Actual**	**Diff**	**% Diff**
	1	2	3=2-1	4=3/1
Business Support				
Technology and other Technology (Tables 21 and 27)	56.0	90.8	34.8	62%
Properties	55.3	56.0	0.7	1%
Fleet	27.8	31.4	3.6	13%
Business Support - Other	47.2	23.4	(23.9)	3%
Total	**186.3**	**201.6**	**15.3**	**8%**

Table 21 Fiscal 2021 Business Support Capital Additions Variances

($ million)	F2021			
	Decision	Actual	Diff	% Diff
	1	2	3=2-1	4=3/1
Business Support				
Technology and other Technology (Tables 22 and 28)	75.5	164.9	89.4	118%
Properties	55.6	70.9	15.3	27%
Fleet	27.8	26.8	(1.0)	-4%
Business Support - Other	43.5	22.7	(20.8)	-48%
Total	**202.4**	**285.3**	**82.9**	**41%**

Technology

Table 22 Fiscal 2021 Technology Capital Expenditures Variances

($ million)	F2021			
	Decision	Actual	Diff	% Diff
	1	2	3=2-1	4=3/1
Technology	55.5	89.6	34.1	61%
Total	**55.5**	**89.6**	**34.1**	**61%**

Table 23 Fiscal 2021 Technology Capital Additions Variances

($ million)	F2021			
	Decision	Actual	Diff	% Diff
	1	2	3=2-1	4=3/1
Technology	75.0	164.9	89.9	120%
Total	**75.0**	**164.9**	**89.9**	**120%**

Fiscal 2021 capital expenditures were $34.1 million (or 61 per cent) above the fiscal 2021 Decision. This was primarily due to the following:

- The Supply Chain Applications project was $7.9 million above plan because the project was planned for completion in fiscal 2020 with no planned fiscal 2021 expenditures. The schedule was extended to complete the build and testing activities, due to a combination of increased project complexity and the COVID-19 pandemic. The COVID-19 pandemic also resulted in additional cost to rework and deliver the training remotely;

- The Information Technology Service Management Toolset project was $4.3 million above plan because the project was planned for completion in fiscal 2020 with no planned fiscal 2021 expenditures. The impact to schedule and costs was due to additional project design considerations and complexity, as well as a change to the accounting treatment for license purchases;
- The Windows 10 PC OS Upgrade project was $4.2 million above plan because the project was planned for completion in fiscal 2020 with no planned fiscal 2021 expenditures. The impact to schedule and cost was primarily due to additional deployment activities and security controls;
- The Microsoft Exchange 2010 to 2016 Upgrade project was $4.1 million above plan because the project was planned for completion in fiscal 2020 with no planned fiscal 2021 expenditures. The impact to schedule and cost was due to BC Hydro’s decision to leverage Microsoft’s cloud solution for its email application following a change to *BC’s Freedom of Information and Protection of Privacy Act*;
- The Energy Management System 3.3 Upgrade project was $3.0 million above plan because the project was not in the fiscal 2021 Decision. BC Hydro reprioritized this project to begin in the test period, in order to maintain operational stability and continue to maintain compliance with MRS requirements;
- The Customer Connect Web-Enablement Project was $2.4 million above plan because the project was planned for completion in fiscal 2020 with no planned fiscal 2021 expenditures. The schedule was extended due to project complexity and resource availability issues;
- The PowerOn 4.3 Upgrade project was $2.3 million above plan because the project was not in the fiscal 2021 Decision. BC Hydro reprioritized this project to

begin in the test period, in order to maintain operational stability and vendor support.

The remaining above plan variance of $5.9 million was due to variances on many smaller projects.

Fiscal 2021 capital additions were $89.9 million (or 120 per cent) above the fiscal 2021 Decision. This was primarily because:

- The Supply Chain Applications project was $67.5 million above plan primarily due to the in-service date being delayed to fiscal 2021 as a result of a schedule extension for the build and testing activities as well as a delay in the project go-live training due to the COVID-19 pandemic.

The remaining above plan variance of $22.4 million was due to the portfolio adjustment of ($10.5) million in the Fiscal 2021 Plan, and variances of $11.9 million from various smaller projects.

Properties

Table 24 Fiscal 2021 Properties Capital Expenditures Variances

($ million)	F2021			
	Decision	Actual	Diff	% Diff
	1	2	3=2-1	4=3/1
Building Development	39.7	14.4	(25.3)	-64%
Building Improvements and Others	15.6	41.6	26.0	167%
Total	**55.3**	**56.0**	**0.7**	1%

Table 25 Fiscal 2021 Properties Capital Additions Variances

($ million)	F2021			
	Decision	Actual	Diff	% Diff
	1	2	3=2-1	4=3/1
Building Development	40.0	23.5	(16.5)	-41%
Building Improvements and Others	15.6	47.4	31.8	204%
Total	**55.6**	**70.9**	15.3	27%

BC Hydro's approach is to manage the Properties' Building Improvements projects and Building Development projects as a combined Building Projects portfolio to meet the annual plan. As some projects are delayed, others are advanced, based on changing priorities which may include asset condition or operational requirements.

Fiscal 2021 capital expenditures for Properties' Building Projects were comparable to the fiscal 2021 Decision.

Fiscal 2021 capital additions for Properties' Building Projects were $15.3 million (or 27 per cent) above the fiscal 2021 Decision. This is primarily because of the following:

- A reprioritization of Building Improvement projects within the portfolio resulted in $31.8 million of additions above Plan, reflecting the shorter time for these projects to come into service as compared to the larger Building Development projects;
- Long Beach Field Building Redevelopment project was $8.7 million above Plan due to the in-service date moving to fiscal 2021 due to delays in obtaining two building permits; and
- Materials Management Building Redevelopment project was $2.4 million above Plan because the as-found conditions on the renovation part of this project resulted in additional permitting and construction costs.

The increase in capital additions above was partially offset by:

- The Chilliwack Facility Building Redevelopment project was $28.2 million lower than Plan as it was delayed due to the challenges in acquiring suitable land for the new field office.

The remaining above plan variance of $0.6 million was due to smaller variances on various projects.

Fleet

Table 26 Fiscal 2021 Fleet Capital Expenditures Variances

($ million)	F2021			
	Decision	**Actual**	**Diff**	**% Diff**
	1	2	3=2-1	4=3/1
Fleet	27.8	31.4	3.6	13%
Total	**27.8**	**31.4**	**3.6**	**13%**

Table 27 Fiscal 2021 Fleet Capital Additions Variances

($ million)	F2021			
	Decision	**Actual**	**Diff**	**% Diff**
	1	2	3=2-1	4=3/1
Fleet	27.8	26.8	(1.0)	-4%
Total	**27.8**	**26.8**	**(1.0)**	**-4%**

Fiscal 2021 capital expenditures and capital additions for Fleet were comparable to the fiscal 2021 Decision.

Business Support - Other and Other Technology

Table 28 Fiscal 2021 Business Support –Other and Other Technology Capital Expenditures Variances

($ million)	F2021			
	Decision	**Actual**	**Diff**	**% Diff**
	1	2	3=2-1	4=3/1
Business Support - Other	47.2	23.4	(23.9)	-51%
Other Technology	0.5	1.2	0.7	-60%
Total	**47.7**	**24.6**	**(23.2)**	**-49%**

Table 29 Fiscal 2021 Business Support –Other and Other Technology Capital Additions Variances

($ million)	F2021			
	Decision	**Actual**	**Diff**	**% Diff**
	1	2	3=2-1	4=3/1
Business Support - Other	43.5	22.7	(20.8)	-48%
Other Technology	0.5	-	(0.5)	-100%
Total	**44.0**	**22.7**	**(21.3)**	**-48%**

Business Support - Other

Business Support – Other is comprised of capital expenditures such as security equipment, field tools and minor equipment.

Fiscal 2021 capital expenditures for Business Support - Other were $23.9 million (or 51 per cent) below the Fiscal 2021 Decision primarily because:

- The Squamish Area Reinforcement Property Acquisition project (Project B in Appendix I of the F2020-F2021 RRA) was $10.4 million below plan because the project was cancelled. The decision was based on an updated load forecast, and it was determined that the additional capacity in the area will not be required until approximately 2040;
- The Oil Management Department Tank Farm Upgrade was $6.2 million below plan because of the scale and complexity of the design work resulting in delays and a revised project schedule; and
- The Learning & Development – Energized Training Substation was $6.0 million below plan because the project was cancelled due to shifting priorities and uncertainty with regard to the site location.

The remaining below plan variance of $1.3 million was due to variances on various smaller projects.

Fiscal 2021 capital additions for Business Support - Other were $20.8 million (or 48 per cent) below the fiscal 2021 Decision primarily because:

- The Squamish Area Reinforcement Property Acquisition project (Project B in Appendix I of the F2020-F2021 RRA) was $10.4 million below plan because the project was cancelled, as explained above; and
- The Oil Management Department Tank Farm Upgrade was $8.5 million below plan because the project was delayed due to a revised project schedule.

The remaining below plan variance of $1.9 million was due to variances on various smaller projects.

Other Technology

Fiscal 2021 capital expenditures and capital additions were comparable to the fiscal 2021 Decision.

10.6 Site C Project Capital Expenditures and Additions Variance Explanations

Site C Project fiscal 2021 capital expenditures and capital additions are presented in the tables below.

Table 30 Fiscal 2021 Site C Project Capital Expenditures Variances

($ million)	F2021			
	Decision	**Actual**	**Diff**	**% Diff**
	1	2	3=2-1	4=3/1
Total Site C	**1,535.5**	**1,725.0**	**189.5**	**12%**

Table 31 Fiscal 2021 Site C Project Capital Additions Variances

($ million)	F2021			
	Decision	**Actual**	**Diff**	**% Diff**
	1	2	3=2-1	4=3/1
Total Site C	**189.4**	**220.9**	**31.5**	17%

Fiscal 2021 capital expenditures were $189.5 million (or 12 per cent) above the fiscal 2021 Decision. Variances were primarily due to:

- Unplanned COVID-19 monthly premiums related to contractor costs to comply with COVID-19 safety requirements;
- Acceleration of main civil work to meet river diversion milestone date;
- Higher than planned costs for highway re-alignment and quarry work; and

- Reservoir clearing expenditures originally planned for fiscal 2020 that were incurred in fiscal 2021.

These were partially offset by a slowdown of generating and spillway work to essential work due to the COVID-19 pandemic earlier in the fiscal year and the timing of property acquisitions.

Further detail on the reasons for these variances are provided in BC Hydro's Site C quarterly progress reports to the BCUC.

Fiscal 2021 capital additions were $31.5 million (or 17 per cent) above the fiscal 2021 Decision primarily due to:

- In-service of the outdoor portion of the Peace Canyon Gas-Insulated Switchgear (part of the Transmission-related assets) originally planned for fiscal 2020 that occurred in fiscal 2021; and
- Higher than planned costs for the first transmission line that was placed in-service in fiscal 2021.

11 Capital Projects and Programs: First Full Funding Amount vs Estimate at Completion

In compliance with BCUC Order No. G-313-19,[3] Table 32 below provides a comparison of the First Full Funding (**FFF**) amount and estimate at completion (**EAC**) for all projects and programs of projects that meet the following criteria:

- Achieved final in-service date between April 1, 2020 and March 31, 2021; or final in-service date achieved prior to this fiscal year and where the remaining capital expenditures have increased 25 per cent or more and a minimum

[3] BCUC Order G-313-19 from the Review of the Regulatory Oversight of Capital Expenditures and Projects proceedings, page 27, "The final, actual cost for completed capital projects and programs above a materiality threshold."

amount of $0.5 million compared to the estimated remaining capital expenditures when previously reported;[4] and

- Met a materiality threshold of total capital expenditures of at least $20 million for Power System and Building projects and programs, and $10 million for Technology projects and programs. These align with the thresholds for inclusion in Appendix J in future revenue requirements applications; and
- Were not recurring projects and programs that were financially authorized at a group, program or other aggregated level. This ensures consistency with the information provided in the Attachment to Section 7.

[4] The increase of 25 per cent and a minimum amount of $0.5 million compared to amounts previously reported criteria will be used going forward as this is the first time providing this report.

Table 32 includes the variance between the EAC[5] and the FFF[6] amount and provides a brief explanation for any variance greater than or equal to 10 per cent.

Table 32 Projects and Programs with Final In-Service Dates between April 1, 2020 to March 31, 2021

($ million)

900749	Bringing additional capacity from ARN to Tilbury (FV-FVW-057)	N/A	N/A	F2021	N	22.0	23.7	N/A	29.7	30.1	8.1	37%	C	N/A
T001127	Supply Chain Applications	N/A	Page 121	F2021	N	61.1	-	N/A	67.5	69.0	7.9	13%	D	N/A
YT-00708	ITSM Tool	N/A	N/A	F2021	N	1.7	-	N/A	17.4	17.4	15.7	924%	E	N/A

Note 1	BCUC Application refers to CPCN or Section 44.2 Applications
Note 2	Actual in-service date refers to the final project in-service date achieved
Note 3	Financally closed is when the project has completed all project closing procedures, no additional incremental costs are expected, and project has been closed in the financial system
Note 4	First Full Funding refers to the total capital cost of the project (excluding project reserve) when it was first approved for full Implementation Phase by BC Hydro
Note 5	Authorized Amount refers to the total capital cost of the project, including project reserve, included in the F20-21 RRA Appendix I
Note 6	LTD costs refer to the life-to-date capital costs as of March 31, 2021
Note 7	Estimate at Completion refers to the forecasted capital cost when the project is expected to be financially closed

Note A: The Fort St. John and Taylor Electric Supply project was $5.4 million (or 12 per cent) above plan because the substation civil construction costs and general site costs were higher than the estimate.

Note B: The W.A.C. Bennett Dam Spillway Gate Upgrade project was $7.4 million (or 17 per cent) below plan because the project team worked with the Design-Build contractor to re-plan and optimize construction work which reduced on-site duration and costs.

5 The estimate at completion (**EAC**) is the forecast of capital expenditures for the project or program at financial close. It includes the actual capital cost of the project or program at the in-service date plus any estimated trailing costs to address deficiencies or to otherwise complete the project or program and achieve financial close.

6 The First Full Funding (**FFF**) amount includes actual capital expenditures incurred during the Identification and Definition Phases plus the estimate of capital expenditures for the Implementation Phase approved before the Implementation Phase. Approval of First Full Funding is required to start the Implementation Phase.

Note C: The Bringing additional capacity from ARN to Tilbury project was $8.1 million (or 37 per cent) above plan because the work methodology was changed for a portion of the civil construction which led to higher cost than the estimate.

Note D: The Supply Chain Applications project was $7.9 million (or 13 per cent) above plan because there were project schedule extensions and additional costs associated with the build and testing activities due to a combination of increased project complexity and the COVID-19 pandemic. The COVID-19 pandemic also resulted in additional cost to re-work and deliver the training remotely.

Note E: The Information Technology Service Management Toolset (**ITSM**) project was $15.7 million (or 924 per cent) above plan because the prepaid and future software subscription license costs, which were originally expected to be operating costs, were determined to be eligible for capitalization. There were also cost increases due to project complexity and additional design considerations.

BC Hydro Fiscal 2023 to Fiscal 2025

Revenue Requirements Application

Appendix Y

Expert Report on Benchmarking Terms of Reference

BEFORE THE
BRITISH COLUMBIA UTILITIES COMMISSION

British Columbia Hydro & Power Authority ("BC Hydro") Application to the British Columbia Utilities Commission ("Commission") for Approval of Revenue Requirements and Rates for Fiscal 2023-Fiscal 2025

EXPERT REPORT OF

WILLIAM P. ZARAKAS

ON BEHALF OF

BC HYDRO

August 17, 2021

TABLE OF CONTENTS

CONSIDERATIONS AND RECOMMENDATIONS FOR
COST BENCHMARKING TERMS OF REFERENCE

I. INTRODUCTION AND SUMMARY OF OPINION

A. NATURE OF THE ENGAGEMENT

1. I understand that BC Hydro has developed a proposed terms of reference for the use of regularly scheduled statistical cost benchmarking in its ongoing Revenue Requirements Applications. Specifically, the cost benchmarking that BC Hydro proposes includes:

   a. Cost and performance benchmarking of various detailed aspects of BC Hydro's transmission and distribution operations, following the approach and form of a report by First Quartile (dated December 10, 2020) which BC Hydro discussed in the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application;

   b. Cost and performance benchmarking of generation facilities, following the approach and form of the Generation Knowledge Services report authored by Guidehouse (dated January 2020), which BC Hydro discussed in the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application;

   c. Benchmarking of BC Hydro's compensation ("total rewards") for the range of employment levels, following the approach and form of the Morneau Shepell report (dated April 2018), which BC Hydro discussed in the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application;

   d. Cost benchmarking of its operations and maintenance (O&M) costs, similar to the approach and format that The Brattle Group used in a prior analysis and discussed in BC Hydro's Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (Appendix T); and

   e. A review of BC Hydro's operating costs compared to other Canadian integrated electric utilities, substantially in the form of the study which BC Hydro provided as part of the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (Appendix U).

2. BC Hydro has requested that I review the above referenced studies and provide my opinion concerning:

a. The value or appropriateness of the reports in total as an overall suite of benchmarking studies, developed with the purpose of improving BC Hydro's performance in the subject areas, and also to inform the review of cost forecasts in regulatory proceedings;

b. The appropriateness of the proposed frequency of the reports;

c. Whether the design, peer groups and data sets used in the previous iterations of items (d) and (e) above remain appropriate as predetermined parameters for future statistical cost benchmarking reviews.

3. Also, BC Hydro requested that I provide my assessment of the suggestions put forward by other parties in recent proceedings with regard to statistical cost benchmarking, including:

   a. Annual reporting metrics to track historical trends and discontinuities as suggested by RCIA in Table 1 of its Final Argument in the proceeding to review BC Hydro's PBR Report;

   b. Multi-dimensional indexes and econometric models as described by Dr. Mark Lowry in his September 8, 2020 presentation during the proceeding to review BC Hydro's PBR Report; and,

   c. A total factor productivity study to establish a productivity factor to assess the reasonableness of cost forecasts, as explored by BCOAPO IR 1.9.1 during the proceeding to review BC Hydro's PBR Report.

4. The letter of instruction pertaining to this engagement is included as an Appendix to this report.

B. SUMMARY OF OPINIONS

5. BC Hydro requested that I provide my opinion concerning the appropriateness of its proposed suite of cost benchmarking studies for inclusion as terms of reference in Revenue Requirement Applications (RRAs) that it may have before the BCUC. I understand that BC Hydro is putting forward the proposed terms of reference so that the BCUC can assess the utility's relative level of operating efficiency, and possibly use these data to adjust the costs that BC Hydro includes in its RRA if warranted.

6. I considered various factors in assessing whether BC Hydro's proposed cost benchmarking terms and conditions are appropriate for the subject task, primarily including whether they provide meaningful information to the BCUC during proceedings involving Revenue Requirements Applications, and whether the benchmarking studies are useful to BC Hydro managers in their efforts to continually improve the utility's processes and performance. I also considered whether the methodologies and data underlying the benchmarking studies were sufficiently transparent and replicable.

7. I considered two broad types of statistical cost benchmarking methodologies. The first type follows the unit cost benchmarking methodology, which involves selecting and then comparing cost performance metrics for BC Hydro against a panel of peer utilities. Examples include the First Quartile, Guidehouse and Brattle reports listed above. The second type involves more statistically complex benchmarking models that use data from a panel of peer utilities to parameterize utility cost drivers and operating scale in order to estimate BC Hydro's relative efficiency level as a single value.

8. The unit cost benchmarking approach is transparent, understandable and replicable. Furthermore, aggregate metrics (e.g., total operations and maintenance costs) can be disaggregated, so that specific performance areas can be examined and opportunities for performance improvements can be identified. The primary criticisms of the unit cost benchmarking approach is that:1) this effort usually produces multiple metrics that do not necessarily roll up neatly into a single efficiency value; and 2) the approach relies on imperfect peer panels which may distort the relative efficiency of the utility being benchmarked.

9. The primary virtue of the more statistically complex benchmarking (i.e., econometric based modeling) is that the end result is a single number that ostensibly reflects the subject utility's relative level of cost efficiency. Furthermore, proponents of these statistical methods contend that the resulting efficiency indicator accounts for unique cost drivers and the multiple dimensions of utility operations, and ensures that comparisons with other utilities are accurate. However, econometric benchmarking studies also necessarily rely on imperfect peer panels as well as on several more technical assumptions, which leads to considerable debate among experts with respect to functional form, computational approaches, and other modeling decisions.

Furthermore, the resulting efficiency rating is considered “black box” information to utility managers and does not provide them information relevant to their own process improvement efforts.

10. I find that BC Hydro’s proposed terms of reference is appropriate for the BCUC to adopt because the proposed suite of studies are more transparent, understandable and replicable than the alternative econometrically based cost benchmarking studies. In addition, BC Hydro’s proposed suite of benchmarking studies provides value to BC Hydro’s managers and is informative to the BCUC in their review of cost forecasts during the Revenue Requirements Application process. BC Hydro’s proposed suite of benchmarking studies can also be updated on a regular basis, which will allow the BCUC to have access to current data and analysis during its deliberations.

II. QUALIFICATIONS

11. I am William P. Zarakas. I am a Principal with The Brattle Group, an economics consulting firm. I hold a leadership position in Brattle’s Retail Energy Practice, and I lead much of Brattle’s project work in the areas of performance based regulation, cost analysis and benchmarking, utility business models, benefit-cost analyses (e.g., grid modernization, reliability and resilience) and rate and pricing analyses. I also work on economic and regulatory matters in the telecommunications industry, including the economics and financial feasibility of building out broadband infrastructure and regulatory matters concerning network access and pricing. I have also provided expert testimony on cost benchmarking that was included as Appendix T in BC Hydro’s Fiscal 2020 to Fiscal 2021 Revenue Requirements Application.[1]

12. I have provided testimony and expert reports on matters concerning electric utility regulatory frameworks and approaches and cost analyses, as well as competition and regulatory issues in the telecommunications industry. My testimony and expert reports have been presented before the Federal Energy Regulatory Commission (FERC), state regulatory commissions, the Federal Communications Commission (FCC), the Securities and Exchange Commission (SEC), the

---

1 British Columbia Utilities Commission – Review of British Columbia Hydro and Power Authority’s Performance Based Regulation Report – Project No. 1599045, British Columbia Hydro and Power Authority Fiscal 2020 to Fiscal 2021 Revenue Requirements Application, Appendix T (“Brattle Report”).

Copyright Royalty Judges (Library of Congress), the U.S. Congress, arbitration panels, and courts of law. I have also authored reports concerning special investigations on behalf of corporate boards of directors and audits of management practices and operational and financial performance on behalf of regulatory commissions.

13. I hold an M.A. in economics from New York University and a B.A., also in economics, from the State University of New York. I have authored articles in industry periodicals and journals on economic and regulatory matters. I have also taken and instructed courses on economic and regulatory matters. My curriculum vitae is provided in Appendix B.

III. DUTY OF INDEPENDENCE

14. I understand that while I have been hired by BC Hydro, I have a duty to assist the Commission and that I am not to be an advocate for BC Hydro or any other party ("Duty of Independence").

15. I certify that I am aware of my Duty of Independence, and that I have prepared my report in accordance with that Duty of Independence. Furthermore, I certify that if I am called to give oral or written testimony, I will give that testimony in conformity with the Duty of Independence.

IV. ISSUES

A. CONTEXT

16. In its broadest sense, benchmarking refers to the comparison of one party's performance and/or processes in a specified area to an external standard or to the performance of peers. Frequently, the purpose of a benchmarking exercise is for a firm to self-assess its performance and identify areas for improvement. Benchmarking of costs and/or service quality may also be used by regulators (of utilities) to assess the performance of the firms under their jurisdiction.

17. The overall efficiency of a firm (in this case, an electric utility) is a function of the amount and combination of the inputs that it uses (in its production process) to the outputs that it ultimately generates. Inputs include labor, materials, rentals and services, as well as the deployment of capital assets, which are substantial for capital intensive industries such as electric utilities.

Capital assets are particularly challenging to address in a benchmarking exercise because deployed capital is acquired at a specific point in time but delivers a flow of service over many subsequent time periods. Capital therefore needs to be imputed in order to reflect an annualized number, which requires a range of assumptions and modeling techniques. This presents a sizable challenge with respect to completing a study of the overall efficiency of a utility (such as BC Hydro) compared to a set of comparable utilities. Thus, many cost benchmarking studies are frequently prescribed to specific areas of utility operations.[2]

18. BC Hydro has proposed that a suite of five cost and performance benchmarking studies be adopted as terms of reference for the use of regularly scheduled statistical cost benchmarking in its ongoing Revenue Requirements Applications. Two studies in the suite (the Brattle study and BC Hydro's cost comparison analysis) provide high level cost benchmarking of BC Hydro's non-fuel operations and maintenance (NFOM) costs, with the Brattle study benchmarking BC Hydro against a panel of US electric utilities that are of similar size and hydroelectric generating capacity, and BC Hydro's study providing an indicative comparison to other Canadian vertically integrated electric utilities. The First Quartile benchmarking study takes a deeper dive into transmission and distribution (T&D) operations and maintenance (O&M) costs as well as capital expenditures. The Guidehouse GKS Hydro study takes a similar approach, taking a deeper dive into hydroelectric generating station O&M costs and capital investments. Finally, the total rewards employee compensation benchmarking study takes a deep dive into labor costs, which constitute a large portion of BC Hydro's total O&M costs. The suite of benchmarking studies proposed by BC Hydro thus provide information and perspective on NFOM and on capital expenditure levels for hydro generation, transmission and distribution.

---

2 One analytic techniques that measures all of a firm's inputs and outputs is Total factor productivity (TFP), an analytic element that is frequently considered in determining the X factor (i.e., productivity offset) in the index (i.e., I-X) approach to multiyear rate plans. But even here, TFP measures the difference between the growth rates of a firm's physical outputs and physical inputs; it does not provide the relative rankings of an individual firm's efficiency compared to a panel of peers. Also, TFP analysis requires application of "advanced theoretical techniques to combine disparate inputs and outputs into single input and output indexes suitable for comparison to one another." Makholm, J., Ros, A., & Case, M. *Total factor productivity and performance-based ratemaking for electricity and gas distribution*. Presented at the 31st Annual Eastern Conference of the Center for Research in Regulated Industries.

19. Approaches to cost benchmarking range from comparisons of disaggregate unit cost metrics (e.g., substation maintenance cost per customer) to benchmarking based on considerably more complex statistical applications, such as econometric cost function modeling, stochastic frontier analysis and data envelopment analysis.

20. The five cost benchmarking studies referenced above are examples of unit cost benchmarking, which involves compiling relevant and consistent data for a peer group of utilities that, ideally, have similar cost drivers and face similar business issues. This type of cost benchmarking is widely used by utility managers in assessing performance and identifying opportunities for improvement. The cost metrics themselves tend to be straightforward, easy to understand and directly applicable to the utility business area under study. Finally, comparing unit costs (e.g., per customer and/or per kWh) allows for comparisons across utilities of different sizes – although this is not a perfect solution for adjusting for scale effects.

21. The more statistically complex cost benchmarking approaches referenced above involve estimating a level of efficiency (with respect to total costs or a subset thereof) after taking account of cost drivers and scale factors using econometric modeling techniques.[3]

    a. Under the econometric approach, historical operating data from a group of utilities are used to estimate the parameters of a model, which are then used to generate a cost benchmark for the utility under study, where that benchmark aims to account for the subject utility's specific circumstances.

    b. The use of a multi-dimensional scale index is similar to the econometric approach discussed above, but generates an efficiency measure that takes into account multiple dimensions of scale (*i.e.*, the number of customers, generating capacity, and net generation) but not other cost drivers.

22. These types of analyses are less intuitive than the unit cost benchmarking described earlier. While they may be used by some regulatory commissions as part of index-based rate cases (*e.g.*,

---

3 *See*, for example, Mark Newton Lowry, Review of British Columbia Hydro and Power Authority's Performance Based Regulation Report, September 9, 2020, ("Lowry Presentation") at 11-17.

I – X), they are infrequently used by utility managers themselves in assessing the utility's performance or its processes, or in associated improvement efforts.

23. The end result of these types of statistical cost benchmarking involves an estimate of how close (or how far off) the subject utility's cost performance is compared to the peer panel reference point (e.g., average or top quartile). Examples of such results were shown in Dr. Lowry's presentation to the BCUC (submitted September 9, 2020) in which he showed the cost efficiencies for 59 electricity distributors in Ontario. There, distribution utilities are ranked based on their difference from the econometric study benchmark, with cost efficiency levels below the benchmark indicating higher performance.[4]

B. BC HYDRO'S PROPOSED COST BENCHMARKING STUDIES

24. Three of the cost benchmarking studies proposed by BC Hydro are "subscription" services. That is, they are benchmarking studies performed by external consulting firms that take a deep dive into specified areas of utility performance based on data sets compiled from publicly available information (e.g., FERC Form 1) and proprietary sources (e.g., surveys answered by participating utilities). These studies are performed regularly, frequently annually.

    a. First Quartile Consulting conducts an annual study on electric utility transmission and distribution (T&D) operations. In 2020, 27 utilities participated in First Quartile's T&D benchmarking study, including US investor owned and municipal electric utilities, Canadian utilities, one utility outside of North America and two utilities that participated only with respect to their transmission operations. The First Quartile report compares BC Hydro to the above peer group in a range of T&D cost areas, and provides information on how BC Hydro compares to the peer panel with respect to very detailed cost areas that may assist BC Hydro managers identify areas for highly specified performance improvement. These include, for example, spending on pole inspections and electric substation staffing levels.

---

[4] See Transcript from British Columbia Utilities Commission Workshop, September 8, 2000 at 233; *see* Mark Newton Lowry, Review of British Columbia Hydro and Power Authority's Performance Based Regulation Report, September 9, 2020, at 67-68.

b. GKS (Generation Knowledge Service) Hydro is a benchmarking study of approximately 500 hydroelectric stations with benchmarking study participants predominantly represented from the US and Canada, as well as other representation from Europe, New Zealand and South America. The most recent study was dated January 2020. The areas of hydro performance include operations, maintenance, investment, engineering and support; performance with respect to BC Hydro's Aberfeldie, Seton, Bridge River 1-2 and Mica hydro stations are compared to the GKS peer panel.

c. Morneau Shepell (now LifeWorks) completed an employee compensation benchmarking study for BC Hydro dated April 2018. The study benchmarked "total rewards" to employees, which includes cash compensation, incentive plans, health benefits, time-off provisions and flexible work arrangements for the full range of BC Hydro employees, from IBEW employees through senior managers and directors. The total rewards study employed a panel of 15 peer companies selected by BC Hydro (but which are redacted in the study for purposes of confidentiality). The study found that with respect to total reward compensation: BC Hydro falls within +/- 10% of the market median for nine of the ten job categories; in one job category BC Hydro's total reward compensation is less than 90% of the market median; and in none of the job categories considered does BC Hydro's total reward compensation exceed 110%.

25. The remaining two studies referenced by BC Hydro provide a more aggregate analysis of BC Hydro's non-fuel operations and maintenance costs (NFOM). Specifically, the scope of these studies includes all of BC Hydro's operations and maintenance costs, except the costs of fuel and water rentals that are used in the power production process.

a. The Brattle Group cost benchmarking study compares BC Hydro to a utility peer panel of US electric utilities by way of a series of unit cost metrics, such as power production O&M costs per generated MWh and per customer, and non-power production O&M costs per delivered MWh and per customer. The Brattle cost benchmarking study also examined cost areas at a more disaggregated level, such as customer facing functions (composed of customer accounts, customer service and informational expenses, and sales), albeit at a less detailed level than a more focused benchmarking study. Brattle's analysis was based on US electric utilities because of the availability and consistency of operations and maintenance cost data provided by utilities in FERC Form 1 submissions. The utility peer panel to which the subject utility is compared is an important consideration. The peer panel for the Brattle study was selected based on a combination of utility size (as measured by delivered power) and hydro generating capacity. However, the Brattle study makes clear that there will be few cases in which utilities are fully similarly situated, which makes peer panels less than perfect.

Brattle's overall conclusion was that "BC Hydro's non-fuel operations and maintenance expenses … are comparatively lower than peer utilities, and in many cases fall in the first quartile, a sought-after position (from a cost perspective, assuming that the utility provides sufficient levels of service). Much of this strong showing is due to BC Hydro's strong unit cost performance in power production NFOM."[5] The Brattle analysis also found that BC Hydro showed strong performed even after excluding power production NFOM; specifically BC Hydro was in the first quartile with respect to the non-power production NFOM metric. BC Hydro had moved up from the second quartile of unit cost performance for this metric in the earlier years of the study period, mainly due to improvements in its cost performance in transmission and distribution.

b. In addition, BC Hydro prepared an indicative cost comparison, using similar metrics to those used by The Brattle Group but using publicly-available information on Canadian electric utilities FortisBC Inc., Manitoba Hydro, and Hydro Quebec as the peer panel. As indicated above, the scope of The Brattle Group's cost benchmarking study was limited to US electric utilities due to the availability of complete and consistent O&M cost data. Canadian electric utilities are not required to file such data, under a consistent accounting standard or otherwise. BC Hydro developed comparable operating cost data for these utilities by assessing each utility's operating costs, number of customers, and sales volume and making assumptions in order to align costs and ensure some degree of consistency. BC Hydro's cost comparison indicated that its costs were in line with those of the Canadian utility peer panel on both a per MWh and a per customer basis.

[5] Brattle Report, para. 53.

26. Brattle's NFOM cost benchmarking study and BC Hydro's operating cost review, together with the three deep dive benchmarking studies provide a relatively complete assessment of BC Hydro's comparative cost performance in these areas.

C. RELEVANT ISSUES

27. The usefulness and appropriateness of BC Hydro's proposed terms of reference concerning regularly scheduled statistical cost benchmarking – or the usefulness and appropriateness of alternate statistical cost benchmarking studies – depends on the BCUC's intended use of such information. I understand that BC Hydro has proposed the referenced suite of benchmarking in order to inform the BCUC in its assessment of BC Hydro's RRA cost forecast. In addition, the studies included in BC Hydro's proposed terms of reference are also applicable to the BCUC's review of alternate regulatory frameworks, such as one involving an I-X index.[6]

28. In the case of cost forecasts, a cost benchmarking study may provide information regarding the level to which BC Hydro is an efficient electric utility from an O&M perspective. In addition, the T&D and hydro generation studies also provide information benchmarks concerning BC Hydro's capital spending in these areas.

29. In the discussion below, I assess whether BC Hydro's proposed terms of reference concerning regularly scheduled statistical cost benchmarking studies are appropriate and provide sufficient value to assist in BC Hydro's efforts to continuously improve its O&M performance and also are appropriate and provide value to the BCUC in its review of cost forecasts in regulatory proceedings. I will also address the appropriateness of BC Hydro's proposed reporting schedule and the appropriateness of the peer panels and data used in the NFOM studies performed by The Brattle Group (of US electric utilities) and BC Hydro (of select Canadian electric utilities).

---

6 With respect to indexed multi-year rate plans, cost benchmarking may inform the "stretch factor" that may be added to the I - X formula, resulting in a new formula of the form I - (X + Stretch). Specifically, a stretch factor may be used to account for a utility's relative efficiency at the onset of a PBR plan. A relatively inefficient utility may be subject to a high stretch factor (because it should be able to realize efficiencies that others in the industry have already realized), while a relatively efficient utility would be subject to a low (or perhaps no) stretch factor.

V. DISCUSSION

30. As indicated in Section I (A) above, BC Hydro requested that I assess and provide my opinion on whether the utility's proposed cost benchmarking studies provide value and/or are appropriate for purposes of: 1) enabling BC Hydro to improve its performance in the subject cost benchmarking areas; and, 2) to inform the review of cost forecasts in regulatory proceedings.

A. ENABLING BC HYDRO TO IMPROVE ITS PERFORMANCE

31. The three deep dive cost benchmarking studies that BC Hydro included as part of the proposed terms of reference were initiated by BC Hydro's managers – outside of any regulatory considerations – for the purpose of allowing them to better understand and improve upon the utility's performance with respect to T&D operations, hydro generation operations and employee compensation.[7] The focus of these benchmarking studies are therefore, and understandably, sufficiently granular in order for BC Hydro's managers to identify specific and actionable areas of improvement. BC Hydro will almost certainly continue to participate in these cost and performance benchmarking studies, irrespective of regulatory reporting requirements. This also means that including these studies in the terms of reference will not add additional costs in order to comply with regulatory requirements.

32. The more aggregated NFOM studies (i.e., the Brattle cost benchmarking study using US utilities and BC Hydro's review of the operating costs of other Canadian integrated electric utilities) are also of value to BC Hydro's managers in improving operations, albeit less so than the disaggregated and focused benchmarking studies referenced above. I understand that these two cost analyses were developed primarily to convey BC Hydro's overall level of operational efficiencies to the BCUC in a prior regulatory proceeding. Nonetheless, these studies highlight how the granular cost areas come together to affect BC Hydro's overall financial performance.

33. The Brattle and BC Hydro cost analyses are understandable to BC Hydro managers, who routinely examine cost drivers. These managers may also contribute to improving peer panels or other aspects of the analysis based on their experience and understanding of the utility business

[7] These efforts are sometimes referred to as "continuous improvement."

and their familiarity with other utilities. In contrast, the econometric and/or multidimensional scale index approaches discussed above provide black box indicators of BC Hydro's relative cost efficiency, which BC Hydro's managers would have to accept on faith. Similarly, an econometric study that arrives at a single efficiency measure covering multiple functional areas of the utility provides little actionable information to managers or regulators. It does not highlight areas for potential improvement, or areas where the utility's performance is already satisfactory or better.

B. INFORMING REGULATORY PROCEEDINGS

34. The aggregate NFOM cost benchmarking studies, with the supporting disaggregate cost and performance benchmarking studies discussed above, also provide sufficient information to regulators in assessing BC Hydro's relative cost efficiency – and are accordingly valuable and appropriate in this regard. A particularly relevant question is whether these studies provide greater relevance to the BCUC in regulatory reviews than do alternate cost benchmarking studies, notably those relying on econometric or multidimensional scale index based approaches.

35. A key argument espoused by proponents of the econometric and index approaches to statistical cost benchmarking, is that the end result is a single number that reflects a utility's relative level of cost efficiency.[8] Proponents of these statistical methods contend that the resulting efficiency indicator accounts for unique cost drivers and the multiple dimensions of utility operations (e.g., scale, delivery and generation volume, transmission and distribution line lengths, and customers served), ensuring that comparisons with other utilities are accurate. As a corollary, these proponents also contend simpler forms of cost benchmarking, notably the unit cost approach used by Brattle and BC Hydro in their respective NFOM studies, do not fully account for these factors, leading to less reliable results.

36. However, econometric benchmarking studies also necessarily rely on assumptions with respect to functional form, computational approaches, and other modeling decisions. The resulting studies are also subject to considerable criticism among experts who debate arcane statistical and econometric concepts. For example, as part of a regulatory proceeding involving determination

[8] *See, e.g.*, Pacific Economics Group Research LLC. Review of BC Hydro's PBR Report. September 8, 2020.

of a multiyear revenue requirements for distribution network service providers (DNSPs), the Australia Energy Regulator retained an economic consulting firm to estimate relative DNSP efficacy levels using a statistical cost benchmarking approach. The resulting efficiency levels were challenged by some DNSPs who argued that the multilateral total factor productivity index approach used by the AER's consultant was inappropriate and that other techniques (such as a least squares translog model) were better suited to the circumstances at hand.[9]

37. Thus, any efficiency measure estimated under econometric and/or index approaches is far from indisputable and requires judgement in its own right. It is not surprising, then, that when determining which approach to take concerning the stretch factor in an index-based rates plan – which, as discussed above, is informed by cost efficiency analysis – the Alberta Utilities Commission concluded that "the determination of the size of a stretch factor is, to a large degree, based on a regulator's judgement and regulatory precedent and does not have a 'definitive analytical source' like the TFP study represents."[10]

38. Unit cost type benchmarking studies, including that conducted by The Brattle Group, also involve judgement, particularly in the selection of a utility peer panel.[11] The selection of a peer panel combined with the denominator of the unit metrics considered (e.g., per customer, per delivered kWh, per generated kWh, etc.) are the mechanisms used in unit cost based benchmarking to address the cost driver, scale and business condition considerations discussed above. Unit cost benchmarking results provide indications of relative efficiency, with the caveat that the definition of "relative" can be somewhat sensitive to the composition of the peer panel, which in itself is constrained by the availability of data from other utilities.[12] Unit cost

9 Economic Benchmarking Assessment of Operating Expenditure for NSW and ACT Electricity DNSPs, prepared for Australian Energy Regulator, Economic Insights Pty Ltd, 17 November 2014. Statistical Benchmarking for NSW Power Distributors, Pacific Economics Group Research LLC, 19 January 2015.

10 The Alberta Utilities Commission Decision 2012-237: Rate Regulation Initiative Distribution Performance-Based Regulation Application No. 1606029 Proceeding ID No. 566 September 12, 2012. Para 497.

11 "Ideally, the utilities included in a benchmarking peer panel should be relatively similar to the utility under study, however, perfect matches are rarely achieved. Nonetheless, selecting a reasonable peer panel is a particularly important part of cost benchmarking—for somewhat obvious reasons. Selecting inefficient or otherwise high cost utilities for a peer panel—intentionally or otherwise—may make the utility under study appear more efficient than it actually is, and vice versa. Accordingly, considerable attention is afforded the peer panel selection process." Brattle Report, para. 23.

12 The results of econometric or index-based approaches to benchmarking can also be sensitive to the composition of the peer panel, and are similarly constrained by data availability.

benchmarking studies may also be improved over time as participating parties – utility managers or otherwise – provide input into the peer panel selection process.

39. With respect to the cost benchmarking of BC Hydro's NFOM costs against US utilities (following the approach and format used by The Brattle Group):

The design, data set and peer groups are appropriate to apply to future cost benchmarking studies and to include in the terms of reference for the use of regularly scheduled statistical cost benchmarking in ongoing Revenue Requirements Applications. However, I also note that this cost benchmarking is an ongoing and evolving process. The above framework should be modified if participants provide insight and/or information that could improve it, particularly with respect to the peer panel.

40. With respect to BC Hydro's review of operating costs of Canadian integrated electric utilities (following the approach and format used by BC Hydro):

The data set and peer groups are limited by the aforementioned unavailability of consistent and comparable data. Understanding this limitation, the design, data set and peer groups are appropriate to apply to future reviews and to include in the terms of reference for the use of regularly scheduled statistical cost benchmarking in ongoing Revenue Requirements Applications. For this case, the framework should be updated as additional data becomes available for BC Hydro peers, particularly if new data allow for the inclusion of additional Canadian integrated electric utilities.

41. With respect to the performance and cost benchmarking of BC Hydro's T&D operations, generation facilities and total rewards compensation (following the approach and format used by First Quartile, Guidehouse and Morneau Shepell, now LifeWorks):

These benchmarking studies are specialties of the sponsoring firms, have evolved over many years and are improved on an ongoing basis. My review indicates that the design, data set and peer groups are appropriate to apply to future cost benchmarking studies and to include in the terms of reference for the use of regularly scheduled statistical cost benchmarking in ongoing Revenue Requirements Applications. However, the design, data sets and peer groups likely are modified on an ongoing basis in response to new information and insight and changes in participating utilities. Accordingly, I defer to the judgements of the sponsoring firms as to the future design, data and peer groups used in these studies.

42. BC Hydro also requested that I provide my opinion with respect to the appropriateness of how frequently the various benchmarking reports will be provided to the BCUC. Two of the subject benchmarking reports (First Quartile's benchmarking study of T&D operations and Guidehouse's GKS Hydro benchmarking study) are conducted, and will likely continue to be conducted, on an annual basis. Thus, these studies should be made available to the BCUC for review during the course of each of BC Hydro's Revenue Requirements Application.

43. The remaining three studies – the Brattle NFOM cost benchmarking study, the BC Hydro operating cost review and Morneau Shepell's (now LifeWorks') total reward benchmarking study – were conducted at the request of BC Hydro and, to my knowledge, are not part of an ongoing annual update. For these studies, BC Hydro should consider periodically updating Brattle's NFOM cost benchmarking study of US electric utilities in Revenue Requirements Applications to reflect the most current utility data reported to FERC. Such updates may be performed by BC Hydro, Brattle, or another consulting firm.

44. As indicated earlier (and discussed in Appendix U of BC Hydro's Fiscal 2020 to Fiscal 2021 Revenue Requirements Application), BC Hydro's review of Canadian integrated electric utility operating costs involved considerable effort to gather and compile data and ensure consistent application. Unlike the updating and systemization associated with the other benchmarking studies in BC Hydro's proposal, limited data availability make it so that updating the review of Canadian utilities will likely continue to be labor intensive and continue to require revisiting assumptions. Regular updates of this study would likely be of value to the BCUC in its review of BC Hydro's future Revenue Requirements Applications. However, the factors above need to be taken into account when setting an update schedule.

45. Updated results for LifeWorks' total reward benchmarking study may also be informative to the BCUC when it is reviewing the costs provided by BC Hydro in its Revenue Requirements Applications. LifeWorks data sets are proprietary; I have no visibility into how frequently they are updated. I defer to LifeWorks to determine whether frequent updates of this study are cost effective.

C. ASSESSMENT OF SUGGESTIONS MADE BY OTHER PARTIES

46. BC Hydro requested that I provide my assessment of the suggestions put forward by other parties in recent proceedings with regard to statistical cost benchmarking, specifically suggestions and recommendations raised by Residential Consumer Intervener Association (RCIA), BCUC Staff's independent consultant (Dr. Mark Lowry) and the British Columbia Old Age Pensioner's Organization (BCOAPO) et al.

47. RCIA has suggested that BC Hydro report on roughly 25 performance metrics that cover various aspects of O&M costs, capital expenditures and the number of employees in specified areas (i.e., full time equivalents or FTEs). In addition, RCIA proposed that BC Hydro report on historical trends (e.g., last 10 years) and forecasts for system reliability (i.e., SAIDI and SAIFI), customer rates, and capital spending.

48. I have reviewed performance metrics and performance incentive mechanisms (PIMs) in various jurisdictions and found that, while there is no standard for the number of metrics or PIMs reported, practical considerations suggest that such tracking should start off at a simple and manageable level, and address priority issues. Not all of the measures on RCIA's list are necessarily efficiency type metrics (e.g., dollars in deferral accounts as a percentage of total O&M dollars). However, with respect to RCIA's proposed metrics that address BC Hydro's relative efficiency as a utility, the performance and cost benchmarking studies proposed by BC Hydro provide detailed information on many of the areas raised by RCIA, albeit in a different format (e.g., the First Quartile report includes historic metrics with respect to T&D capital expenditures and O&M costs). BC Hydro and the BCUC can consider modified and/or additional metrics as they gain experience in benchmarking and metrics reporting.

49. Also, RCIA's proposal primarily involves metrics that track BC Hydro's own current and historic performance. This makes it easier to acquire the necessary data than would be the case under a peer panel approach to benchmarking – although compiling these metrics would require additional (and potentially significant) effort on the part of the BC Hydro.[13] Tracking a utility's

---

[13] As indicated earlier, Canadian electric utilities do not report cost and performance data under a consistent accounting standard or otherwise. Also, for US electric utilities, data necessary to fill in the metrics for several of the metrics proposed by RCIA are not directly available in public filings and/or would require additional research and consistency checking – beyond that required for the metrics included in the Brattle report.

own historic performance provides a view of trends, but it does not necessarily fulfill the goal of assessing the utility's relative level of efficiency by sizing it up against peers, and therefore may not provide a full picture of industry trends. For example, a decline in cost performance may be due to increases in input prices that affect the entire industry, not just the utility under study. Focusing solely on BC Hydro's own historic performance may also present disincentives concerning performance improvement; *i.e.*, it may be reluctant to improve performance if it expects that it may have trouble continuing to meet that level on an ongoing basis. As a result, it is reasonable for BC Hydro to focus its efforts on the peer-based suite of benchmarking studies it has proposed.

50. BCUC Staff's independent consultant, Dr. Mark Lowry, provided a range of recommendations concerning possible features and applications of a performance based regulatory (PBR) framework as part of the Commission's Review of British Columbia Hydro and Power Authority's Performance Based Regulation Report – Project No. 1599045. In his discussion of the possible adoption of an I – X framework, Dr. Lowry recommended that BC Hydro's relative level of efficiency be estimated using econometric or indexed based models, which are applications of statistical cost benchmarking. The resulting efficiency level would inform the selection of a "Stretch" or "S" factor, which I described earlier,[14] and would be incorporated into the I – X framework. Specifically, the annual rate (or revenue) adjustment formula would be I – (X + S), with the additional possibility of other factors also be introduced into the formula (e.g., Y, K and Z among others).

51. Earlier in this report, I discussed that despite the virtue that the econometric and index approaches would produce a single relative efficiency number for BC Hydro, these modeling techniques are highly technical and involve considerable expert judgement. For business purposes, the resulting efficiency number is produced via a "black box" that is not accessible or understandable to most utility managers – so cannot be expected to be used in an actionable way to improve BC Hydro's operations. There is also uncertainty among regulators as to the merits of directly translating the efficiency levels produced by econometric or index models into an S factor, with Alberta Utilities Commission concluding that size of a stretch factor is based more

[14] See FN 6.

on judgement than the output of a statistical cost benchmarking model. Furthermore, the measure of relative efficiency produced by the econometric and index approaches provides little information to the BCUC concerning the specific areas of BC Hydro underperformance, if that were to be the case.

52. I understand that in the current context, BC Hydro is proposing to use cost benchmarking studies to inform the BCUC of its relative O&M cost performance and not proposing an I – X framework or an associated S factor. In this regard, BC Hydro's proposed benchmarking studies will provide sufficient and meaningful information to the BCUC. BC Hydro's proposed benchmarking studies will also be more transparent and understandable than the econometric and index based statistical cost benchmarking models that were recommended to estimate an S factor.

53. BCOAPO raised a question (in Information Request No. 1.9.1, including Nos. 1.9.1.1 though 1.9.1.3.2, dated: January 7, 2021) concerning whether the X factor is a form of statistical benchmarking, whether it can provide an external benchmark for BC Hydro's performance, and whether it can be used to establish an appropriate cost forecast for use in a MYRP or cost of service regulation (COSR) based rate plan.

54. In general, the X factor reflects the *average* historic productivity trends (i.e., changes in inputs per unit of output) for a peer group of utilities, compared to the economy overall. Thus, the X factor differs from statistical cost benchmarking, which is concerned with determining *relative* levels of cost efficiency. The X factor may be able to be used to determine the appropriate forecast of BC Hydro's costs, but it is not intended for that purpose. Instead, it would be more appropriate to review the cost benchmarking analysis that is used to inform the S factor, described earlier, and incorporate consideration of BC Hydro's relative level of operating efficiency into forecasts of BC Hydro's O&M costs.

Dear Sirs/Mesdames

Re: British Columbia Hydro & Power Authority ("BC Hydro") Application to the British Columbia Utilities Commission ("Commission") for Approval of Revenue Requirements and Rates for Fiscal 2023-Fiscal 2025 ("Regulatory Proceeding")

As you are aware, we act on behalf of BC Hydro in the above referenced Regulatory Proceeding. This letter of instruction confirms your engagement for the provision of an independent expert report to be introduced into evidence in that Regulatory Proceeding on the topic of regularly-scheduled statistical cost benchmarking. It outlines the issues to be addressed and provides some general guidance as to the format of your report.

Apart from our instructions below as to the issues to be addressed and the format of your report, the contents of your report are entirely for you in the exercise of your independent professional judgment. We are retaining you to provide independent expert evidence for the above captioned Regulatory Proceeding, not as an advocate for our client. The integrity of your conclusions is dependent upon your objectivity.

<u>Matters on Which Your Opinion is Requested</u>

BC Hydro has committed to developing a proposed terms of reference for regularly-scheduled statistical cost benchmarking going forward. BC Hydro's proposal is set out in the table below.

FASKEN

Item #	Type of Statistical Cost Benchmarking	Frequency
1	Comparisons across various maintenance categories, including distribution, transmission, vegetation and stations, to help compare performance and identify areas of opportunity in comparison to industry peers, substantially in the form of the First Quartile report dated December 10, 2020 which BC Hydro discussed in the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application.	Each Revenue Requirements Application (i.e., approximately every three years), starting with the Revenue Requirements Application covering fiscal 2026
2	Comparisons of cost and performance of generation facilities to define specific steps to improve the cost or performance of those facilities relative to other utilities, substantially in the form of the Guidehouse (formerly Navigant) Generation Knowledge Services report dated January 2020, which BC Hydro discussed in the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application.	Each Revenue Requirements Application (i.e., approximately every three years), starting with the Revenue Requirements Application covering fiscal 2026
3	An assessment of employee compensation relative to median market rates, substantially in the form of the Morneau Shepell report dated April 2018, which BC Hydro discussed in the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application.	Alternating Revenue Requirements Applications (i.e., approximately every five to six years), with the next reports being provided as part of the Revenue Requirements Application covering fiscal 2026
4	A cost benchmarking study of operations and maintenance costs against a peer panel of electric utilities, substantially in the form of the benchmarking report dated February 18, 2019 which you authored and which BC Hydro filed as part of the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (Appendix T).	Alternating Revenue Requirements Applications (i.e., approximately every five to six years), with the next reports being provided as part of the Revenue Requirements Application covering fiscal 2026
5	A review of the operating costs of other Canadian integrated electric utilities, substantially in the form of the study which BC Hydro provided as part of the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (Appendix U).	Alternating Revenue Requirements Applications (i.e., approximately every five to six years), with the next reports being provided as part of the Revenue Requirements Application covering fiscal 2026

You are requested to evaluate BC Hydro's proposal for future statistical cost benchmarking, considering any factors that you regard as relevant in your expert opinion. At a minimum, we would ask that you include discussion of:

FASKEN

- the value of appropriateness of the reports in total as an overall suite of benchmarking studies to improve performance and to inform the review of cost forecasts in regulatory proceedings;

- the appropriateness of the proposed frequency of the reports;

- whether the design, peer groups and data sets used in the previous iterations of 4 and 5 remain appropriate as predetermined parameters for future statistical cost benchmarking / review;

- your assessment of the following suggestions put forward by other parties in recent proceedings:

  - The annual reporting metrics to track historical trends and discontinuities as suggested by RCIA in Table 1 of its Final Argument in the proceeding to review BC Hydro's PBR Report.

  - Multi-dimensional indexes and econometric models as described by Dr. Mark Lowry in his September 8, 2020 presentation during the proceeding to review BC Hydro's PBR Report.

  - A total factor productivity study to establish a productivity factor to assess the reasonableness of cost forecasts, as explored by BCOAPO IR 1.9.1 during the proceeding to review BC Hydro's PBR Report.

<u>Documents and Information Provided</u>

A copy of each of the reports referenced above is being provided to you with this letter. BC Hydro has obtained approval from the authors of items #1-3 to provide the reports to you on the following basis: This letter confirms your agreement that, unless BC Hydro specifically indicates otherwise, these reports cannot be used for any purpose other than creating your report for BC Hydro. The prior reports cannot be used to support your work for other clients or your own internal research efforts.

Portions of the Morneau Shepell report being provided to you, including the names of the peer companies and peer-specific data, remains redacted to comply with confidentiality requirements required by Morneau Shepell. A summary of the redacted information is attached to this letter.

BC Hydro will make available any other information that you require for your analysis, subject to contractual limitations on our ability to disclose third-party benchmarking information. You can assume, for the purposes of your analysis, that information provided by BC Hydro is accurate.

<u>Overview of the Structure of Your Report</u>

We request that your independent expert report be set out consistently with the following structure.

FASKEN

A. Introduction and Summary of Opinion

Your introduction should

- reference the nature of your engagement as an independent expert as per this letter, and
- set forth, in a summary fashion, your independent expert opinion.

B. Qualifications

Please state your professional qualifications, technical education, training and experience. Explain how your expertise relates to the subject matter of your opinions. Your detailed *curricula vitae* should be attached as an appendix.

C. Duty of Independence

We confirm that you have a duty to assist the Commission and are not to be an advocate for any party ("Duty of Independence"). In this section of your report, we require that you certify the following:

- You are aware of your Duty of Independence,
- You have prepared your report in accordance with the Duty of Independence, and
- If called to give oral or written testimony, you will give that testimony in conformity with the Duty of Independence.

D. Issues

This section should set out the issues as posed in this letter.

E. Discussion

Under this heading, you should set out in full your independent objective opinions. You should provide the reasons for your opinions including reference to pertinent facts or assumptions, any research you conducted that led you to form the opinion, and any applicable technical or other documents, standards, guidelines, etc.

F. Conclusion

You may provide a conclusion if you wish.

Appendices

Please include this letter, and the *curricula vitae* of those people responsible for the content of your report, as appendices to your report. If additional instructions are required, then

FASKEN

supplementary letters of instruction from us should also be attached to your report. You may attach other documents or schedules that elaborate on, or are integral to your analysis.

In conclusion, if you have any questions with respect to the nature and scope of your engagement, please contact the writer at your soonest convenience.

Yours truly,

FASKEN MARTINEAU DuMOULIN LLP

Attachment 1: Summary of Redacted Information in Morneau Shepell Report

There are 15 comparator organizations in the Morneau Shepell benchmarking study:

- Five of these companies are from the utilities sector from across Canada, and this group is comprised of a mix of vertically integrated, crown corporation, and investor-owned utilities. The number of employees range from approximately 2,500 to 10,000, with an average of about 5,000.

- Five of these companies are from the public sector in British Columbia, including government agencies, crown corporations and municipal organizations. These cover different businesses and services, and range in size from around 900 employees to 26,000 employees, with an average of about 7,500.

- Five of these companies are in the private sector. Most have a corporate presence across Canada, and are very active in British Columbia. The services provided by these companies include engineering, construction services, forestry, financial services and telecommunications. The size of these companies vary from approximately 2,500 to over 50,000.

APPENDIX B:

CURRICULUM VITAE OF WILLIAM P. ZARAKAS

WILLIAM P. ZARAKAS
Principal

Boston, MA | +1.617.864.7900 | Bill.Zarakas@brattle.com

William Zarakas is an expert on economic and regulatory matters in the telecom, media, and energy industries.

Mr. Zarakas holds a leadership role in Brattle's Telecommunications, Internet, and Media practice. He has provided expert reports and testimonies in a range of regulatory proceedings concerning the economic analysis of mergers among telecom carriers and media companies; competition in telecom markets; forbearance from price regulation; infrastructure access, sharing and pricing arrangements; the economics and financial feasibility of deploying broadband networks; analysis and valuation of wireless spectrum bands and holdings; and the distribution of royalties and retransmission fees in the cable and satellite TV industries.

Mr. Zarakas also leads much of Brattle's work related to evolving utility regulatory and business models, including the application of performance-based regulation (PBR) and regulatory reform and incentives designed to improve efficiencies and advance policy goals, such as decarbonization and customer engagement. He works extensively on benefit-cost analyses, particularly with respect to investments in grid modernization, reliability, resilience, and smartening the grid. He has authored a wide range of reports and articles on PBR, "utility of the future" visions and implementation, the utility platform and multi-sided markets, and competition in the retail electricity sector.

Additionally, Mr. Zarakas has led special investigations on behalf of corporate boards of directors, as well as audits of management practices and operational and financial performance on behalf of regulatory commissions. He has provided expert testimony and reports before the Federal Communications Commission, the Federal Energy Regulatory Commission, the Securities and Exchange Commission, the Copyright Royalty Judges (Library of Congress), the US Congress, state regulatory agencies, arbitration panels, and foreign governments and courts of law.

Competition and Antitrust. Recent work includes:

- Conducted merger simulation analysis, submitted testimony and provided ongoing support on the potential effects of the merger of mobile wireless carriers Sprint and T-Mobile, under review before the US Federal Communications Commission, the Department of Justice, and various state Attorneys General on behalf of DISH Network.
- Conducted merger analysis, submitted testimony and provided ongoing support on the potential effects of the merger of Sinclair Broadcast Group and Tribune Media, under review before the US Federal Communications Commission on behalf of DISH Network.
- Conducted merger analysis, submitted testimony and provided ongoing support on the potential effects of the mergers of Comcast-Time Warner Cable; AT&T-Time Warner; and, Disney-Fox.
- Conducted competitive analysis, submitted testimony, and provided expert support in a regulatory proceeding before the Federal Communications Commission on competition issues in dedicated internet bandwidth services, including possession of market power and assessment of market power abuse on behalf of Sprint Corporation.
- Analyzed effectiveness of retail competition in U.S. electricity markets.

- Analyzed market structure and degree of competition in U.S. retail telecom markets and authored expert reports with regard to Petitions for FCC to forbear from price regulating resale services and UNEs on behalf of Granite Telecom and Incompas.
- Analyzed acquisition price premium in merger of cross-state gas and electric utilities on behalf of TECO Energy, Inc., New Mexico Gas Company, Inc in a matter before the New Mexico Public Regulatory Commission.
- Analyzed prospective merger savings and divestiture losses for electric and gas utilities in merger applications before the U.S. Securities and Exchange Commission (SEC).

Spectrum Valuation and Due Diligence. Work includes:

- Led numerous analyses of the values of wireless spectrum in the U.S., Canada, the Middle East and North Africa (MENA), and other geographic markets. Scope of analyses included: PCS, AWS, 2.3-2.5 GHz, SMR, PLMR, IVDS, MSS and Big Leo spectrum bands, among others, for purposes of planning, transactional analysis, regulatory proceedings, domestic and international arbitration, and commercial litigation.
- Conducted analyses and authored expert reports concerning utility use of private networks vs. leased spectrum, and valuations of 900 MHz spectrum.
- Led due diligence of acquisition of spectrum holdings and telecom assets for major telecom carrier.
- Led due diligence of northwestern U.S. electric and gas utility on behalf of buyer; analysis included comprehensive sales, revenue, and operating and capital cost modeling and scenarios.

Telecom Regulatory and Compliance. Work includes:

- Analyzed and provided testimony in matters concerning acces and foreclosure of network elements and services.
- Developed cost and revenue models to estimate costs, feasibility and customer rates associated with deploying wireless broadband to Alaska and rural areas in the continental U.S. on behalf of GCI Communications for FCC proceedings regarding the Connect America Fund and Mobility Fund.
- Analysis and expert reports on matters concerning pole attachment rates before the FCC on behalf of electric utilities.
- Led comprehensive modeling concerning costs and rates for unbundled network elements (UNEs), undertaken in fulfillment of requirements associated with the Telecommunications Act of 1996, using the Total Element Long Run Incremental Cost (TELRIC) methodology

Utility Regulatory and Business Models. Analyzed, advised and/or testified on matters concerning regulatory frameworks, performance-based regulation (PBR) and utility business models, notably with respect to emerging competitive alternatives and network integration. Recent work includes:

- Analyzed implementation of New York's Reforming the Energy Vision by modeling the economics of the utility platform model, access pricing and financial impacts of retail competition on utility.
- Analyzed, advised and/or testified on matters concerning performance incentive mechanism (PIMs); e.g., analyses of: New York's "earnings adjustment mechanisms" on behalf of New York's six investor owned utilities) and performance measures and incentive structures on behalf of the Hawaiian Electric Companies.

- Surveyed and analyzed PBR frameworks and applications, including multi-year rate plans (MRPs), PIMs and other alternative regulatory mechanisms, including the U.K.'s "RIIO" model.
- Surveyed and analyzed regulatory approaches to setting electric distribution reliability standards around the world on behalf of the Australian Energy Market Commission (AEMC).
- Modeled multi-variate "utility of future" scenarios using system dynamic approach on behalf of utilities and industry groups.
- Advised Board of Directors of a major generation and transmission (G&T) cooperative and its member electric distribution cooperatives on matters concerning: asset valuations, risk management strategy, merger and acquisition options, and outlook for retail electric markets.

Infrastructure and Investment Analysis. Analyzed and testified on matters concerning infrastructure economics and financial feasibility. Work includes:

- Led benefit-cost and economic "break-even" analysis of utility system reliability and resilience investment using a value of lost load (VOLL) methodology on behalf of Public Service Electric & Gas Company (PSE&G).
- Conducted financial feasibility analysis concerning deployment of a broadband communications network for an Asian electric utility.
- Analyzed economics and financial feasibility of providing (wholesale) transport and (retail) broadband services for multiple U.S. electric utilities.

Management Analysis and Audits. Recent work includes:

- Led strategic organizational options analysis for the Board of Trustees of the Long Island Power Authority (LIPA).
- Led special investigations; e.g., economic analysis of "swap" transaction for the Special Committee of the Board of Directors of Global Crossing.
- Led management and/or regulatory audits of utilities and telecommunications carriers on behalf of state regulatory commissions Alabama, Kentucky, Maryland, New York and Pennsylvania.

Other Regulatory Analyses. Recent work includes:

- Led benchmarking studies of utility costs and regulatory practices.
- Analyzed markets for and costs of providing utility pole attachments.
- Calculated total factor productivity (TFP) and X factors in price regulation proceedings involving utilities before state regulatory commissions and incumbent telecommunications carriers before the FCC.
- Analyzed costs and value of retransmitted television programming in cable and satellite video markets on behalf of Music Claimants in proceedings involving distribution of royalty funds.
- Examined impact of regulatory fees and constraints on economic output in 22 countries in the Middle East and Africa for international mobile carrier.

Expert Testimony

Expert reports entitled Comments on Commissioner Anthony's Principles for Performance Incentive Mechanisms Before the Rhode Island Public Utilities Commission (May 7, 2020).

Declaration of William Zarakas Verizon Maryland LLC, Complainant v. The Potomac Edison Company, Defendant, in a Pole Attachment Complaint Before the Federal Communications Commission, Proceeding No. 19-355, Bureau ID No. EB-19-MD-009 (February 1, 2020)

Declaration of William Zarakas Verizon Pennsylvania LLC and Verizon North LLC, Complainants v. Metropolitan Edison Company, Pennsylvania Electric Company, and Penn Power Company, Defendant, in a Pole Attachment Complaint Before the Federal Communications Commission, Proceeding No. 19-354, Bureau ID No. EB-19-MD-008 (February 1, 2020)

Declaration of William P. Zarakas BellSouth Telecommunications, LLC d/b/a AT&T Florida, Complainant, v. Florida Power & Light Company, Respondent, in a Pole Attachment Complaint Before the Federal Communications Commission, Proceeding No. 19-187, Bureau ID No. EB-19-MD-006 (September 12, 2019).

Direct Testimony of William Zarakas In the Matter of the Application of Potomac Electric Power Company for the Authority to Implement a Multiyear Rate Plan for Electric Distribution Service in the District of Columbia, Formal Case No. 1156 (May 30, 2019); Second Supplemental Direct Testimony (January 21, 2020); Rebuttal Testimony (April 6, 2020).

Declarations of Coleman Bazelon, Jeremy Verlinda, and William Zarakas Before the Federal Communications Commission In the Matter of Applications of T-Mobile US, Inc. and Sprint Corporation for Consent to Transfer Control of Licenses and Authorizations, WT Docket No. 18-197

- May 1, 2019, Response to Israel, Katz, and Keating April 12, 2019 Declaration
- March 28, 2019, Response to Compass Lexecon February 20, 2019 Declaration and Mark McDiarmid March 6, 2019 Declaration
- March 25, 2019, Response to Applicants' February 7 Filings on Diversion Ratios
- March 18, 2019, Reply to Cornerstone's "Response to Dish's February 19 and 25 Submissions"
- February 19, 2019, Reply to Cornerstone "Response to Dish and CWA Comments"
- February 4, 2019, Network Model's Sensitivity to Millimeter Wave Adjustments
- January 28, 2019, Response to Applicant Filings on Diversion Ratios
- December 4, 2018, Further Reply Declaration of Coleman Bazelon, Jeremy Verlinda, and William Zarakas

Declaration (August 27, 2018) and Reply Declaration (October 31, 2018) of Joseph Harrington, Coleman Bazelon, Jeremy Verlinda, and William Zarakas Before the Federal Communications Commission In the Matter of Applications of T-Mobile US, Inc. and Sprint Corporation for Consent to Transfer Control of Licenses and Authorizations, WT Docket No. 18-197

"The Role of Competitive Bidding Based Prices in Determining the Rural Rate," William Zarakas and Augustin J. Ros, In the Matter of Promoting Telehealth and Telemedicine in Rural America, Before the Federal Communications Commission, WC Docket No. 17-130 (May 24, 2019).

Response to PC 51 Request for Comments, Prepared for Joint Utilities of Maryland, Prepared by William Zarakas, Sanem Sergici, Pearl Donohoo-Vallett, and Nicole Irwin in Exploring the Use of Alternative Rate Plans or Methodologies to Establish New Base Rates for an Electric Company of Gas Company Before the Public Service Commission of Maryland, PC 51 (March 29, 2019).

Declaration of William Zarakas and Dr. Eliana Garces Before the Federal Communications Commission In the Matter of Tribune Media Company (Transferor) and Nexstar Media Group, Inc. (Transferee) Consolidated Application for Consent to Transfer Control, MB Docket No. 19-30 (March 18, 2019).

Expert Report of William P. Zarakas On Behalf of BC Hydro, BC Hydro Fiscal 2020—Fiscal 2021 Revenue Requirements Application to the British Columbia Utilities Commission (February 8, 2019).

Direct and Rebuttal Testimony of William P. Zarakas On Behalf of Public Service Company of Oklahoma Before the Corporation Commission of the State of Oklahoma In the Application of the Public Service Company of Oklahoma For an Adjustment To Its Rates and Charges and the Electric Service Rules, Regulations and Conditions of Service For Electric Service in the State of Oklahoma, Cause No. PUD 201800085 (September 21, 2018, February 5, 2019).

Declaration of William P. Zarakas Before the Federal Communications Commission In the Matter of Petition of USTelecom for Forbearance Pursuant to 47 U.S.C. § 160(c) to Accelerate Investment in Broadband and Next-Generation Networks WC Docket No. 18-141, Opposition of Granite to USTelecom's Forebearnace Petition (August 6, 2018).

Declaration of William P. Zarakas Before the Federal Communications Commission In the Matter of Petition of USTelecom for Forbearance Pursuant to 47 U.S.C. § 160(c) to Accelerate Investment in Broadband and Next-Generation Networks WC Docket No. 18-141, Opposition of Incompas, FISPA, Midwest Association of Competitive Communications, and the Northwest Telecommunciations Association (August 6, 2018)

Expert report on behalf of GCI Communications "Rate of Return Analysis of GCI's TERRA Network," by William P. Zarakas, Agustin J. Ros, and Nicholas E. Powers. Prepared for GCI Communication Corp., March 30, 2018, in connection with the FCC's investigation of the Rural Health Care Telecommunications Program.

Expert report on behalf of GCI Communications before the Federal Communications Commission, In the Matter of Connect America Fund and Universal Service Reform, WC Docket No. 10-90 and WT Docket No. 10-208A: analysis of the FCC's Rural Health Care Program Funding and Recipients, by William Zarakas, Augustin Ros, David Kwok, and M. Elaine Cunha, September 2017.

Declaration (August 7, 2017) and Reply Declaration (August 29, 2017) of William P. Zarakas and Jeremy A. Verlinda Before the Federal Communications Commission In the Matter of Tribune Media Company (Transferor) and Sinclair Broadcast Group, Inc. (Transferee), Consolidated Applications for Consent to Transfer Control, MB Docket No. 17-179.

Before the State of New York Public Service Commission In the Matter of Earnings Adjustment Mechanism and Scorecard Reforms Supporting the Commission's Reforming the Energy Vision, Case 16-M-0429, On Behalf of the New York Joint Utilities (Central Hudson Gas and Electric Corporation, Consolidated Edison Company of New York, Inc., New York State Electric & Gas Corporation, Niagara Mohawk Power Corporation d/b/a National Grid, Orange and Rockland Utilities, Inc., and Rochester Gas and Electric Corporation), Report: "Assessment of Load Factor as a System Efficiency Earnings Adjustment Mechanism," William Zarakas, Sanem Sergici, et. al. (February 10, 2017).

Declaration of William P. Zarakas Before the Federal Communications Commission In the Matter of Business Data Services in an Internet Protocol Environment, Investigation of Certain Price Cap Local Exchange Carrier Business Data Services Tariff Pricing Plans, Special Access for Price Cap Local Exchange Carriers, AT&T Corporation Petition for Rulemaking to Reform Regulation of Incumbent Local Exchange Carrier Rates for Interstate Special Access Services, WC Docket No. 16-143, WC Docket No. 15-247, WC Docket No. 05-25, RM-10593. Declaration of William P. Zarakas and Susan M. Gately (January 27, 2016); Supplemental Declaration of William P. Zarakas (March 24, 2016); Declaration of William P. Zarakas and Jeremy Verlinda (June 28, 2016, Attachment D to Comments of Sprint Corporation); Declaration of David E. M. Sappington and William P. Zarakas (June 28, 2016, Attachment E to Comments of Sprint Corporation); Further Supplemental Declaration of William P. Zarakas (August 9, 2016, Attachment A of Reply Comments of Sprint Corporation).

Declaration of William P. Zarakas Before the Federal Communications Commission In the Matter of Verizon Virginia. LLC and Verizon South, Inc., Complainants, v. Virginia Electric and Power Company d/b/a Dominion Virginia Power, Docket No. 15-90, File No. EB-15-MD-006 (November 18, 2015).

Declaration of William P. Zarakas and Matthew Aharonian in the United States Court for the District of Columbia Circuit United States Telecom Association, Petitioner, v. Federal Communications Commission and the United States of America, Respondents, Case No. 15-1063 (and consolidated cases) (May 22, 2015).

Declarations Before the Federal Communications Commission In the Matter of Application of Comcast Corporation, General Electric Company and NBC Universal, Inc. for Comcast to Assign or Transfer Control of Licenses, Federal Communications Commission, MB Docket No. 10-56. Analysis of the FCC's Vertical Foreclosure and Nash Bargaining Models Applied To The Proposed Comcast-Time Warner Cable Transaction (December 21, 2014) and Supplemental Declaration: Analysis of the FCC's Vertical

Foreclosure and Nash Bargaining Models Applied To The Proposed Comcast-Time Warner Cable Transaction (March 5, 2015).

Before the Public Utilities Commission of the State of Hawaii, In The Matter of Public Utilities Commission Instituting an Investigation to Reexamine the Existing Decoupling Mechanisms for Hawaiian Electric Company, Inc., Hawaii Electric Light Company, Inc., and Maui Electric Company, Limited, Docket No. 2013-1041, On Behalf of the Hawaiian Electric Companies. Report: "Targeted Performance Incentives: Recommendations to the Hawaiian Electric Companies," Prepared For The Hawaiian Electric Companies, William P. Zarakas and Philip Q Hanser (September 15, 2014).

Before the New Mexico Public Regulatory Commission, In The Matter Of The Application of TECO Energy, Inc., New Mexico Gas Company, Inc. and Continental Energy Systems, LLC, For Approval of TECO Energy Inc.'s Acquisition of New Mexico Gas Intermediate, Inc. and For All Other Approvals and Authorizations Required To Consummate and Implement The Acquisition, Utility Case No. 13-00231-UT, On Behalf of TECO Energy, Inc., New Mexico Gas Company, Inc. and Continental Energy Systems, LLC, Joint Applicants (March 2014).

"Analysis of Benefits: PSE&G's Energy Strong Program," by Peter Fox-Penner and William P. Zarakas Before the New Jersey Board of Public Utilities In the Matter of the Petition of Public Service Electric and Gas Company for Approval of the Energy Strong Program, Docket No. EO13020155 and GO13020156 (October 7, 2013).

"Review and Analysis of Service Quality Plan Structure In The Massachusetts Department of Public Utilities Investigation Regarding Service Quality Guidelines For Electric Distribution Companies and Local Gas Distribution Companies." Philip Q Hanser, David E. M. Sappington and William P. Zarakas, Massachusetts D.P.U. 12-120 (March 2013).

"Alaska Mobile Broadband Cost Model, Before The Federal Communications Commission In The Matter Of Connect America Fund and Universal Service Reform – Mobility Fund. WC Docket No. 10-90 and WT Docket No. 10-208A." William P. Zarakas and Giulia McHenry (February 2013; updated May 2016, with David Kwok).

Expert Report of William P. Zarakas In The United States District Court For The Northern District of Florida MCI Communications Services, Inc., Plaintiff v. Murphree Bridge Corporation, Defendant, Case No. 5:09-cv-337 (February 19, 2010).

Testimony of William P. Zarakas Before The Copyright Royalty Judges, Library of Congress, Washington D.C. In The Matter of Distribution of the 2004 and 2005 Cable Royalty Funds, Docket No. 2007-3 CRB CD 2004-20 (June 1, 2009).

Declaration of William P. Zarakas In The Circuit Court of Fairfax County, Virginia In The Matter of Sharon Dougherty, Plaintiff Vs. Thomas J. Dougherty, Defendant Case No. CL 2007-008757 (October 2008).

Expert report Public Service Company of New Mexico vs. Smith Bagley, Inc. and Lite Wave Communications LLC In The United States District Court For The District of New Mexico (March 2007).

"Comparative Market Value Analysis of Upper 700 MHz Public Safety Spectrum" Before the Before the Federal Communications Commission In the Matter of The Development of Operational, Technical and Spectrum Requirements for Meeting Federal, State and Local Public Safety Communications Requirements Through the Year 2010, WT Docket No. 96-86 (June 2006).

"Analysis of Potential Lost Profits Associated With The Alleged Breach of Contract Between Orbcomm and Orbcomm Asia Limited" Before the American Arbitration Association (May 2006).

Expert report Before the Federal Communications Commission In Petition of ACS of Anchorage, Inc. Pursuant to Section 10 of the Communications Act of 1934, as amended, for Forbearance from Sections 251(c)(3) and 251(d)(1) In the Anchorage LEC Study Area, WC Docket No. 05-281 (January 9, 2006).

Letter report of William Zarakas and Dorothy Robyn Before the U.S. House of Representatives Committee on Energy and Commerce and the U.S. Senate Committee on Commerce, Science and Transportation regarding the value of wireless spectrum in the 700 MHz band (May 18, 2005).

Expert report in MCI WorldCom Network Services, Inc. v. MasTec, Inc. Before the United States District Court Southern District of Florida, Case No. 01-2059-CIV-GOLD (May 2002).

Direct and Rebuttal testimony Before the Federal Communications Commission In the Matter of Virginia Cable Telecommunications Association v. Virginia Electric and Power Company, d/b/a Dominion Virginia Power and Dominion North Carolina Power, PA No. 01-005 (December 21, 2001).

"Analysis Of The Economic Impact Of A Divestiture Of The Gas Operations Of Rochester Gas And Electric Corporation" Before the U.S. Securities and Exchange Commission included in Form U-1 Application/ Declaration Under The Public Utility Holding Company Act of 1935 in the combination of Energy East Corporation with RGS Energy Group, Inc. (June 20, 2001) in Exhibit J-1 (May 15, 2001).

"Analysis Of The Economic Impact Of A Divestiture Of The Gas Operations Of Sierra Pacific Resources" Before the U.S. Securities and Exchange Commission included in Form U-1 Application/ Declaration Under The Public Utility Holding Company Act of 1935 in the acquisition by Sierra Pacific Resources of Portland General Electric Company, 2000 in Exhibit H-1 (January 31, 2000).

"Analysis Of The Economic Impact Of A Divestiture Of The Gas Operations Of Energy East" Before the U.S. Securities and Exchange Commission included in Form U-1 Application/ Declaration Under The Public Utility Holding Company Act of 1935 in the combination of Energy East Corporation with CMP Group, Inc. and with CTG Resources, Inc. in Exhibit J-1 (October 29, 1999).

Supplemental Affidavit of William Zarakas Before the Supreme Court of the State of New York, County of Niagara in Village of Bergen, et al. vs. Power Authority of the State of New York, February 1999.

Direct (December 15, 1997) and Rebuttal (March 9, 1998) Panel Testimony of William P. Zarakas and D. Daonne Caldwell Before the North Carolina Utilities Commission In Re: Proceeding to Determine Permanent Pricing for Unbundled Network Elements, Docket No. P-100, SUB 133D.

Direct (November 3, 1997) and Rebuttal (November 25, 1997) Panel Testimony of William P. Zarakas and D. Daonne Caldwell Before the South Carolina Public Service Commission In Re: Proceeding to Review BellSouth Telecommunications, Inc.'s Cost Studies for Unbundled Network Elements, Docket No. 97-374-C.

Direct Panel Testimony of William P. Zarakas and D. Daonne Caldwell Before the Florida Public Service Commission In Re: Petition of AT&T, MCI, and MFS for Arbitration with BellSouth Concerning Interconnection, Rates, Terms and Conditions of a Proposed Agreement, Docket Nos. 960757-TP/960833-TP/960846-TP/960916-TP/971140-TP (November 13, 1997).

Direct (October 10, 1997) and Rebuttal (October 17, 1997) Panel Testimony of William P. Zarakas and D. Daonne Caldwell Before the Tennessee Regulatory Authority In Re: Contested Cost Proceeding to Establish Final Cost Based Rates for Interconnection and Unbundled Network Elements, Docket No. 97-01262.

Direct (August 29, 1997) and Rebuttal (September 12, 1997) Panel Testimony of William P. Zarakas and D. Daonne Caldwell before the Alabama Public Service Commission In Re: Generic Proceeding: Consideration of TELRIC Studies, Docket No. 26029.

Direct (April 30, 1997) and Rebuttal (September 8, 1997) Panel Testimony of William P. Zarakas and D. Daonne Caldwell before the Georgia Public Service Commission In Re: Review of Cost Studies, Methodologies and Cost-Based Rates for Interconnection and Unbundling of BellSouth Telecommunications Services, Docket No. 7061-U.

Diraect (July 11, 1997) and Rebuttal (September 5, 1997) Panel Testimony of William P. Zarakas and D. Daonne Caldwell Before the Louisiana Public Service Commission In Re: Review of Consideration of BellSouth Telecommunications, Inc.'s TSLRIC and LRIC Cost Studies to Determine Cost of Interconnection Services and Unbundled Network Components, to Establish Reasonable, Non-Discriminatory, Cost-Based Tariff Rates, Docket Nos. U-22022/22093.

Direct and Rebuttal Testimony Before the Virginia State Corporation Commission on Behalf of United Telephone - Southeast, Inc. and Centel Corporation (May 1994).

Direct and Rebuttal Testimony Before the Tennessee Public Service Commission on Behalf of United Telephone - Southeast, Inc., Docket No. 93-04818 (January 28, 1994).

Direct and Rebuttal Testimony Before the Florida Public Service Commission on Behalf of Southern Bell Telephone & Telegraph Company, Docket No. 920260-TL (December 10, 1993).

Direct and Rebuttal Testimony Before the Tennessee Public Service Commission on behalf of South Central Bell, Docket Nos. 92-13527 and 93-00311 (March 22 and March 29, 1993).

Mr. Patrick Wruck
Commission Secretary and Manager
Regulatory Support
British Columbia Utilities Commission
Suite 410, 900 Howe Street
Vancouver, BC V6Z 2N3

Dear Mr. Wruck:

RE: Project No. 1599164
British Columbia Utilities Commission (BCUC or Commission)
British Columbia Hydro and Power Authority (BC Hydro)
Fiscal 2022 Revenue Requirements Application (the Application)

BC Hydro writes in response to various Directives in BCUC Order No. G-187-21 to provide our Compliance Filing for the Fiscal 2022 Revenue Requirements Application which includes updated Financial Schedules as well as updated rate schedules.

As discussed further in section 3 of the attached filing, BC Hydro is also applying to establish the Low Carbon Fuel Credits Regulatory Account to implement Directive 26 of the Decision. BC Hydro submits that this new regulatory account is required so that the actual value of low carbon fuel credits flows back to BC Hydro's ratepayers.

For further information, please contact Joe Maloney at 604-623-4348 or bchydroregulatorygroup@bchydro.com.

Yours sincerely,

Chris Sandve
Chief Regulatory Officer

List of Appendices

1 Introduction

On June 17, 2021, the British Columbia Utilities Commission (**BCUC**) issued Order No. G-187-21, providing its Decision on BC Hydro's Fiscal 2022 Revenue Requirements Application (**Decision**). The Decision directed adjustments to BC Hydro's revenue requirements for fiscal 2022. BC Hydro provides this filing in response to those Directives and to apply for a regulatory account – the Low Carbon Fuel Credits Variance Regulatory Account - which BC Hydro submits is necessary to implement Directive 26 so that the actual value of low carbon fuel credits flows back to BC Hydro's ratepayers (**Compliance Filing and Application to Establish the Low Carbon Fuel Credits Variance Regulatory Account**).

Specifically, this Compliance Filing and Application to Establish the Low Carbon Fuel Credits Variance Regulatory Account:

- Recalculates BC Hydro's revenue requirements based on the Panel's determinations in its Decision and provides revised Financial schedules to the Application (Appendix A) and updated rate schedules (Appendix B) reflecting the BCUC's Decision and accompanying Order. The recalculated revenue requirements result in a rate increase of 1.00 per cent for fiscal 2022 compared to the interim rate increase of 1.16 per cent approved by the BCUC on January 5, 2021.[1] For further information, refer to section 2 below.

  Appendix B provides updated Electric Tariff Rate Schedules that reflect a rate increase of 1.00 per cent and updated Open Access Transmission Tariff (**OATT**) rates for fiscal 2022. Included in Appendix B are a black-lined and a clean copy of the applicable Electric Tariff Rate Schedules and applicable OATT Rate Schedules. The source documents of the rate sheets are attached

1 Refer to BCUC Order No. G-1-21.

to the electronic version of this submission for stamping by the BCUC and return to BC Hydro; and

- Applies to establish the Low Carbon Fuel Credits Variance Regulatory Account to capture the difference between planned and actual revenues from low carbon fuel credits in a given year so that the actual value of low carbon fuel credits flows back to BC Hydro's ratepayers. Appendix C provides a Draft Order for the establishment of this regulatory account. For further information, refer to section 3 below.

2 Recalculation of Revenue Requirements and Updates to Financial Schedules

2.1 Directive 1 – Revised Rates and Financial Schedules

Directive 1 of the Decision directed BC Hydro to recalculate its revenue requirements based on the Panel's determinations in its Decision and to provide revised Financial schedules (Appendix A) and updated rate schedules (Appendix B).

As shown in Table 2-1 below, Directives 22, 24, and 26 result in adjustments to the revenue requirements for fiscal 2022. Directive 25 did not have an impact on the revenue requirements in fiscal 2022 as all of the costs related to electric vehicle charging stations, including depreciation, were removed from the revenue requirements in accordance with Directive 24.

On January 5, 2021, the BCUC approved an interim rate increase of 1.16 per cent. BC Hydro has calculated the impact of the adjustments to the revenue requirements noted above and determined that the revised fiscal 2022 rate increase is 1.00 per cent. Table 2-1 below provides a summary of the rate adjustments for each of these directives. Each adjustment is explained in further detail in the sub-sections that follow.

Table 2-1 Revised Fiscal 2022 Rate Increase Reflecting BCUC's Decision

Description	Directive	F2022 Revenue Requirement ($ million)	F2022 Rate Increase (%)	Refer to Section
Interim rate increase		**5,211.7**	**1.16**	
Amend fiscal 2022 interconnection revenue to $4.6 million, and increase associated operating costs	22	(0.5)	(0.01)	2.2
Remove fiscal 2022 electric vehicle charging stations costs	24 & 25	(2.7)	(0.05)	2.3
Suspend fiscal 2022 recovery of forecast Electric Vehicle Costs Regulatory Account Balance and associated interest	24 & 25	(5.0)	(0.10)	2.4

Description	Directive	F2022 Revenue Requirement ($ million)	F2022 Rate Increase (%)	Refer to Section
Increase fiscal 2022 miscellaneous revenue by the estimated value of Low Carbon Fuel Credits planned to be transferred to third parties, with offsetting decrease to planned Trade Income	26	0.0	0.00	2.5
Reduce External OATT Revenue[2]		0.1	0.00	
Impact Subtotal		**(8.1)**	**(0.16)**	
Revised revenue requirement and rate increase		**5,203.6**	**1.00**	

As shown in Table 2-1 above, the difference between the interim rate increase of 1.16 per cent in fiscal 2022 and BC Hydro's calculation of a 1.00 per cent rate increase in fiscal 2022 is primarily due to the impact of deferring costs related to electric vehicle charging stations, which is explained further in sections 2.3 and 2.4 below.

Customers have been paying rates that reflect the interim rate increase of 1.16 per cent since April 1, 2021. BC Hydro plans to start charging customers the new rate, reflecting the final rate increase of 1.00 per cent, on September 1, 2021 and will provide customers with a one-time on-bill credit for the amount they overpaid from April 1, 2021 to August 31, 2021. BC Hydro expects to begin issuing this one-time on-bill credit on customers' bills later in September 2021. In order for bill credits to be issued on this timeline, BC Hydro requires the BCUC's confirmation of the revised rate increases by no later than August 13, 2021. Further information on BC Hydro's approach to bill credits is provided in section 2.6 below.

2 As a result of the adjustments ordered by the BCUC, the forecast Transmission Revenue Requirement (**TRR**) for fiscal 2022 is reduced by $8.2 million. The main driver of the reduction is additional BC Hydro revenue from Low Carbon Fuel Credits (Directive No. 26), a portion of which is allocated to the benefit of transmission customers. As a result of the reduced TRR, the forecast external OATT revenue was lowered by $0.1 million (or 0.0 per cent impact on the fiscal 2022 rate increase).

2.2 Directive 22 – Amended Interconnection Revenue

Directive 22 directed BC Hydro to amend its forecast for interconnection revenue in fiscal 2022 to $4.6 million, the same figure as BC Hydro's most recent forecast for fiscal 2021, and to make any corresponding adjustments to forecast costs required to generate this level of interconnection revenue.

This adjustment is reflected in the revised financial schedules provided in Appendix A and is shown in Table 2-2 below.

Table 2-2 Impact of Amended Interconnection Revenue

$ million	Schedule Reference	Fiscal 2022 Decision
Miscellaneous Revenue		
Increase Transmission - Interconnections	15.0, L7	2.3
Operating Costs		
Increase Interconnections and Shared Assets	5.1, L5	1.8
Reduce F22 revenue requirement		**(0.5)**

BC Hydro increased its forecast interconnection revenue from $2.3 million to $4.6 million and made corresponding adjustments to its forecast costs required to generate this level of revenue in the amount of $1.8 million. The total impact on the revenue requirements in the Test Period is ($0.5) million. This results in a (0.01) per cent decrease to fiscal 2022 rates.

2.3 Directive 24 – EV Charging Stations Cost Recovery

Directive 24 directed BC Hydro to remove all fiscal 2022 costs related to its electric vehicle charging stations that meet the definition of a prescribed undertaking under the *Greenhouse Gas Reduction (Clean Energy) Regulation* from the Test Period revenue requirements and to defer these costs to the Electric Vehicle Costs Regulatory Account. In addition, Directive 24 directed BC Hydro to suspend the recovery of fiscal 2020 and fiscal 2021 costs previously deferred to the Electric

Vehicle Costs Regulatory Account, which had been included in the Test Period revenue requirements.

In accordance with this Directive, BC Hydro has removed operating costs, amortization and cost of energy related to electric vehicle charging stations, as well as the recovery of the previously deferred costs, from the Test Period revenue requirements and deferred them to the Electric Vehicle Costs Regulatory Account, as directed. The total impact on the revenue requirements in the Test Period is ($7.7) million. This results in a 0.15 per cent decrease to fiscal 2022 rates (0.05 per cent due to the deferral of fiscal 2022 costs and 0.10 per cent due to the suspension of recovery of the fiscal 2020 and fiscal 2021 costs). The fiscal 2022 ending balance of the Electric Vehicle Costs Regulatory Account is $7.7 million, as shown in Table 2-3 below.

Table 2-3 Electric Vehicle Costs Regulatory Account Balance

$ million	Schedule Reference	F2022 Decision
Beginning of Year	2.2, L185	4.8
Adjustment to Opening Balance	2.2, L186	0.0
Additions - Operating Costs	2.2, L187	1.8
Additions - Cost of Energy	2.2, L188	0.4
Additions - Depreciation	2.2, L189	0.5
Interest	2.2, L190	0.2
Recovery	2.2, L191	0.0
End of Year	2.2, L192	**7.7**

Table 2-6 below shows the schedule lines in Appendix A that are primarily impacted by these Directives.

Table 2-4 Summary of Impact of Removal of Electric Vehicle Charging Stations Costs on Revenue Requirements

$ million	**Schedule Reference**	**F2022 Decision**
Operating Costs		
Reduce Line Asset Planning (and increase deferral)	5.1, L4	(1.0)
Reduce Customer Service (and increase deferral)	5.6, L2	(0.8)
Cost of Energy		
Increase deferral of EV Cost of Energy	4.0, L61	(0.4)
Amortization		
Increase deferral of EV Depreciation - New Assets	7.0, L20	(0.3)
Increase deferral of EV Depreciation - Existing Assets	7.0, L21	(0.2)
Subtotal – Deferrals of EV Costs in F22		(2.7)
EV Costs Regulatory Account		
Reduce recovery of EV Costs Reg. Acct. balance	5.0, L35	(4.9)
Increase regulatory account interest	2.2, L190	(0.1)
Subtotal – No Recovery of Reg. Acct. in F22		(5.0)
Reduce F22 revenue requirement		**(7.7)**

The $2.7 million subtotal shown in Table 2-4 above for fiscal 2022 electric vehicle costs matches the amount provided in BC Hydro's response to BCUC IR 1.1.3 in Exhibit B-4, during the Fiscal 2022 Revenue Requirements Application proceeding.

The $4.9 million shown in the Table 2-4 above for the planned recovery of the Electric Vehicle Costs Regulatory account balance in fiscal 2022 matches the amount shown in Appendix A, Schedule 2.2, line 192, which was based on the fiscal 2021 forecast ending balance in the account.

2.4 Directive 25 – EV Charging Stations Depreciation Rate

Directive 25 denied the depreciation rates for BC Hydro's electric vehicle charging stations. The Panel recommended that the BC Hydro Public Electric Vehicle Fast Charging Rate Application proceeding review the depreciation rates for BC Hydro's electric vehicle charging stations.

Since the fiscal 2022 costs related to the electric vehicle charging stations were removed from BC Hydro's revenue requirements pursuant to Directive 24, this directive does not have any further impact on the revised rate increase.

2.5 Directive 26 – Low Carbon Fuel Credits

Directive 26 directed BC Hydro to increase its fiscal 2022 forecast revenue by the estimated value of the low carbon fuel credits that it plans to transfer to other parties, if any, during fiscal 2022. It also directed BC Hydro to record forecast revenue, in all future revenue requirement applications, based on an estimate of the value of the low carbon fuel credits that it plans to transfer to other parties.

BC Hydro has estimated a value for the forecast revenue related to low carbon fuel credits to comply with Directive 26. This value was calculated based on a historic five-year average, which is the same approach used to calculate Trade Income for rate-making purposes. The low carbon fuel credit market is relatively new, and the policy framework continues to be developed. As a result, the volume of credits that BC Hydro will actually receive in a given fiscal year and the price that BC Hydro receives for these credits, is highly uncertain. For example, in calendar 2020 the average price per low carbon fuel credit was $250.44; however, the price per credit ranged from a low of $32.50 per credit to a high of $385.20 per credit in that year.[3] A five-year average calculation accounts for this uncertainty.

Under this approach, BC Hydro calculated a dollar amount for each fiscal year as:

- The number of credits transferred by BC Hydro to Powerex in each fiscal year; multiplied by

[3] https://www2.gov.bc.ca/assets/gov/farming-natural-resources-and-industry/electricity-alternative-energy/transportation/renewable-low-carbon-fuels/rlcf-017.pdf

- The observed market prices for the corresponding calendar year as reported by the Ministry of Energy, Mines and Low Carbon Innovation.[4,5]

The above formula was used to calculate a dollar amount for each of fiscal years 2016, 2017, 2018, 2019 and 2020 (the same fiscal years used to calculate planned Trade Income in fiscal 2022). The five-year average was then calculated as the average of those amounts, which is $31.4 million for fiscal 2022. BC Hydro has increased fiscal 2022 miscellaneous revenues by that amount.

The derivation of the annual and five-year average amounts is shown in Table 2-5 below.

Table 2-5 Value of Low Carbon Fuel Credits Calculation of Five-Year Average Fiscal 2016 to Fiscal 2020

		F2016	F2017	F2018	F2019	F2020	5 Year Average (F2016 to F2020)
A	Number of Low Carbon Fuel Credits transferred to Powerex	217,740	145,831	144,160	154,895	153,535	
B	Average Price per Credit ($)	$ 169.95	$ 170.93	$ 164.30	$ 193.44	$ 269.33	
C=A*B	Value of Low Carbon Fuel Credits ($ million)	**$ 37.0**	**$ 24.9**	**$ 23.7**	**$ 30.0**	**$ 41.4**	**$ 31.4**

As discussed further in section 3 below, because this methodology uses the observed market prices for the corresponding year, as reported by the Ministry of Energy, Mines and Low Carbon Innovation, as an input, it overstates the stand-alone value of the low carbon fuel credits to BC Hydro. BC Hydro and Powerex are currently in the early stages of negotiating a new transfer pricing agreement for low carbon fuel credits with a transfer price that reflects the stand-alone value of the low carbon fuel credits to BC Hydro.

[4] https://www2.gov.bc.ca/assets/gov/farming-natural-resources-and-industry/electricity-alternative-energy/transportation/renewable-low-carbon-fuels/rlcf-017.pdf

[5] The results reported by the Ministry of Energy, Mines and Low Carbon Innovation are in calendar years. BC Hydro has mapped calendar year 2019 to fiscal 2020, since nine of the 12 months in calendar year 2019 are in fiscal 2020. Likewise, calendar year 2018 was mapped to fiscal 2019, and so on.

The uncertainty around the low carbon fuel credits market and policy framework, along with the fact that BC Hydro and Powerex are currently negotiating a transfer pricing agreement for BC Hydro's low carbon fuel credits, means that actual revenues from low carbon fuel credits are likely to vary from forecast revenues, in fiscal 2022 and in prospective years.

Accordingly, in section 3 below, BC Hydro is seeking approval to establish the Low Carbon Fuel Credits Variance Regulatory Account to capture, on an ongoing basis, the difference between forecast and actual miscellaneous revenue from low carbon fuel credits so that the actual value of low carbon fuel credits flows back to BC Hydro's ratepayers.

In addition to increasing fiscal 2022 miscellaneous revenue by $31.4 million, BC Hydro has made an equivalent reduction to planned fiscal 2022 Trade Income. Since Powerex has been receiving these credits at zero cost and the sales of these credits have been reflected in Powerex's actual net income, which is used to calculate the rolling five-year average of Trade Income, any credit revenue included in BC Hydro's revenue forecast must be offset by an equivalent reduction in planned Trade Income, to prevent double-counting.[6]

Table 2-6 below shows the schedule lines in Appendix A that are impacted by this Directive.

6 Section 4(4) of Direction No. 8 requires the BCUC to use BC Hydro's forecast of trade income for rate-making purposes.

Table 2-6 Summary of Impact of Increase in Forecast Revenue by Estimated Value of Low Carbon Fuel Credits on Revenue Requirements

$ million	Schedule Reference	F2022 Decision
Miscellaneous Revenue		
Increase Low Carbon Fuel Credits Revenue	15.0, L29	(31.4)
Powerex Trade Income		
Reduce Powerex Trade Income	1.0, L18	31.4
Reduce F22 revenue requirement		**0.0**

2.6 Treatment of Closed Customer Accounts When Crediting Bills

The recalculation of the revenue requirements results in a smaller bill increase in fiscal 2022 compared to the interim rates that were approved and have been in effect since April 1, 2021.

As explained in section 2.1 above, BC Hydro plans to start charging customers the new rate, reflecting the final rate increase of 1.00 per cent, on September 1, 2021 and will provide customers with a one-time on-bill credit for the amount they overpaid from April 1, 2020 to August 31, 2021. BC Hydro expects to begin issuing this one-time credit on customers' bills later in September 2021.

The approach to issuing this one-time bill credit must consider customers that terminated their BC Hydro service(s) between April 1, 2021 and August 31, 2021 and no longer have any active accounts to which the credit(s) may be applied. In many instances, providing credits to these customers will result in BC Hydro incurring incremental costs greater than the amount of the bill credit because it would be necessary to attempt to locate the former customer and issue them a refund cheque. The estimated incremental cost of sending a refund cheque is $20 per customer, which includes postage and bank fees, and additional labour costs to investigate forwarding addresses and cancel refund cheques that Canada Post cannot deliver and are returned to BC Hydro. In comparison, given the small adjustment to fiscal 2022 rates, most residential customers will receive a credit of less than $1.

For this reason, BC Hydro proposes a practical approach to providing refunds to customers with non-active accounts that is consistent with the approach previously accepted by the BCUC for the application of credits resulting from the further decrease to BC Hydro’s interim fiscal 2021 rates, following the BCUC’s Decision on BC Hydro’s Fiscal 2020 to Fiscal 2021 Revenue Requirements Application. This approach is as follows:

- If a former customer is due a credit greater than $10, BC Hydro will attempt to identify the forwarding address of the former customer and mail a refund cheque to them. If a forwarding address cannot be identified, the credit will be applied to their closed account; and
- If a former customer is due a credit less than $10, BC Hydro will apply the credit to their closed account.

When a credit has been applied to a former customer’s closed account:

- The credit amount would be transferred to a new account should the former customer apply for service again; or
- Upon request from the former customer, the credit balance would be issued to them as a refund cheque or transferred to the account of another active customer, as designated by the former customer.

3 Application to Establish the Low Carbon Fuel Credits Variance Regulatory Account

BC Hydro is seeking BCUC approval for the establishment of the Low Carbon Fuel Credits Variance Regulatory Account to capture the difference between planned and actual miscellaneous revenues from low carbon fuel credits in a given year so that the actual value of low carbon fuel credits flows back to BC Hydro's ratepayers.

3.1 Background

In Undertaking No. 24, BC Hydro provided the following background information with regard to low carbon fuel credits.[7]

Under the *Greenhouse Gas Reduction (Renewable and Low Carbon Fuel Requirements) Act* and the *Renewable and Low Carbon Fuel Requirements Regulation* (collectively, the **Low Carbon Fuel Standard** or **LCFS**), suppliers of low carbon fuels, such as BC Hydro, are the entities that are eligible to receive low carbon fuel credits.

The basic elements of the LCFS are as follows:

- The LCFS sets carbon intensity targets that decline each year;
- Fuel suppliers generate credits for supplying fuels with a carbon intensity below the targets and receive debits for supplying fuels with a carbon intensity above the targets;
- The debits and credits are proportional to the emissions a fuel generates over its full life cycle;
- Credits can be traded between fuel suppliers or banked for future use; and

[7] Refer to Undertaking No. 24 in Exhibit B-9.

- At the end of each compliance period, suppliers must have a balance of zero or more credits to avoid non-compliance penalties.

Recognizing that the LCFS awards low carbon fuel credits to suppliers of low carbon fuels rather than to end users, BC Hydro's approach has been to use the revenue from the credits to reduce the overall revenue requirement for the benefit of all ratepayers. This approach recognizes that investments in clean energy infrastructure, which have been funded by all ratepayers, have resulted in low carbon electricity, which is the primary reason that BC Hydro is able to acquire credits under the LCFS.

In BC Hydro's response to BCOAPO IR 1.67.1 in Exhibit B-5, BC Hydro stated that it received 137 low carbon fuel credits related to the ownership/operation of its electric vehicle charging stations for the 2018 calendar year.

In the March 5, 2021 Review Session on BC Hydro's Fiscal 2022 Revenue Requirements Application, BC Hydro explained that it also receives low carbon fuel credits related to the supply of electricity, as a low carbon fuel, for other means of transportation, such as SkyTrain.[8] This accounts for the vast majority of the low carbon fuel credits received by BC Hydro. As shown in Table 2-5 above, BC Hydro transferred 153,535 low carbon fuel credits to Powerex in fiscal 2020.

BC Hydro transfers its low carbon fuel credits to Powerex in accordance with section 8 of the *Greenhouse Gas Reduction (Renewable and Low Carbon Fuel Requirements) Act* and section 11.11 of the *Renewable and the Low Carbon Fuel Requirements Regulation*. The transfer is currently made at zero cost, pursuant to an agreement between the parties, and all revenue earned by Powerex from the

[8] Transcript Volume 2, page 322, Fiscal 2022 Revenue Requirements Application, Review Session, March 5, 2021.

sale of credits flows back to BC Hydro ratepayers via Trade Income and the Trade Income Deferral Account.

The parties initially decided to transfer these credits to Powerex at zero cost. At the time, it was challenging to develop any framework that could reasonably reflect the stand-alone value of these credits to BC Hydro because:

- The market for low carbon fuel credits was relatively new, with a limited number of transactions, participants and public information;
- Legislation was evolving and uncertain, impacting the number of credits available to participants; and
- There was, and continues to be, ongoing uncertainty around the timing and volume of transfers of fuel credits from government to market participants.

In its Decision, the BCUC stated:

> "However, since the cost to generate these credits are included in BC Hydro's cost of service calculation, to arrive at an accurate net cost of service, it is necessary to include the value of these credits as revenue. Having the value of the credits embedded in Powerex's net income does not provide an accurate net cost of the BC Hydro activity that generated the credits. Further, including the value of the credits in Powerex's net income does not ensure that their value flows back to BC Hydro's ratepayers. For example, Powerex losses on other activities could, potentially, reduce Powerex's net income to zero or below, in which case none of the value of the credits would flow back to BC Hydro's ratepayers via Trade Income and the Trade Income Deferral Account.
>
> The Panel acknowledges that it cannot compel Powerex to provide the monetized amount of the credits that Powerex sells after it has received them at no cost from BC Hydro. The Panel also recognizes that the amount received by Powerex would not be the same as the amount that BC Hydro would have received had it sold the credits directly. However, BC Hydro can provide the BCUC with the quantity of credits that it has transferred or

plans to transfer to Powerex or other parties and a value can be estimated based on the market value of the credits."

3.2 Implementation of Directive 26

Directive 26 directs BC Hydro to increase its fiscal 2022 forecast revenue by the estimated value of the low carbon fuel credits that it plans to transfer to other parties, if any, during fiscal 2022. It also directs BC Hydro to record in all future revenue requirement applications, the forecast revenue based on an estimate of the value of the low carbon fuel credits that it plans to transfer to other parties.

BC Hydro and Powerex have been engaged in the process of negotiating a transfer pricing agreement that would recognize the stand-alone value of BC Hydro's low carbon fuel credits. BC Hydro and Powerex expect to finalize this transfer pricing agreement by the end of fiscal 2022.

As explained in section 2.5 above, while a new transfer pricing agreement is being negotiated, BC Hydro has estimated a value for low carbon fuel credits to comply with Directive 26. This value is $31.4 million, and BC Hydro has increased fiscal 2022 miscellaneous revenue by that amount.

The methodology used to estimate a value for low carbon fuel credits overstates the stand-alone value of the low carbon fuel credits to BC Hydro because it uses the observed market prices for the corresponding year, as reported by the Ministry of Energy, Mines and Low Carbon Innovation, which includes transactions by Powerex. As the BCUC stated in its Decision "The Panel also recognizes that the amount received by Powerex would not be the same as the amount that BC Hydro would have received had it sold the credits directly."[9] An appropriate transfer price, which reflects the stand-alone value of the low carbon fuel credits to BC Hydro, will result in a different realized value.

[9] Refer to page 105 of the Decision.

3.3 Low Carbon Fuel Credits Variance Regulatory Account

BC Hydro is applying to establish the Low Carbon Fuel Credits Variance Regulatory Account to capture, on an ongoing basis, the difference between forecast and actual miscellaneous revenue from low carbon fuel credits, and to apply interest on the balance of the account based on BC Hydro's current weighted average cost of debt.

This new regulatory account would be classified as a Cost of Energy Variance Account, which means that the balance of the account would be amortized into rates through the Deferral Account Rate Rider (**DARR**).

BC Hydro submits that this new regulatory account is necessary so that the actual value of low carbon fuel credits flows back to BC Hydro's ratepayers.

As discussed above, BC Hydro and Powerex are engaged in developing a transfer pricing agreement for BC Hydro's low carbon fuel credits, which will allow BC Hydro's revenue forecast to reflect the stand-alone value of the credits transferred to Powerex and deduct this value from Powerex's net income. As the BCUC stated in its Decision "The Panel also recognizes that the amount received by Powerex would not be the same as the amount that BC Hydro would have received had it sold the credits directly."[10]

In addition, even when it is in place, this transfer pricing agreement will not resolve the inherent uncertainty in the value associated with these credits going forward. Any forecast revenue from these credits will depend on the number of credits awarded in any given year as well as the price at which the credits are transferred to Powerex, both of which will be unknown at the time of future revenue requirements applications and which could vary depending on the terms of the transfer pricing agreement. Consequently, actual revenues from low carbon fuel credits (i.e., those

[10] Refer to page 105 of the Decision.

received from Powerex through a transfer price agreement) are likely to vary from forecast revenues in fiscal 2022 and prospective years.

Variances between planned and actual Powerex Trade Income are already captured in the Trade Income Deferral Account, which is also a Cost of Energy Variance Account, with the balance amortized into rates through the DARR. However, variances to the $31.4 million planned as miscellaneous revenue as a result of Directive 26 are not eligible for deferral treatment. This would mean that any variances would be to the account of the shareholder. If this were to occur, ratepayers would not be receiving the actual value of the credits (whether higher or lower than plan). Accordingly, BC Hydro submits that a regulatory account is required so that the actual value of low carbon fuel credits flows back to BC Hydro's ratepayers.

Tariff Sheets – Black-lined and Clean

1. RESIDENTIAL SERVICE

RATE SCHEDULES 1101, 1121 – RESIDENTIAL SERVICE

Availability	For Residential Service. Service is normally single phase, 60 hertz at the Secondary Voltage available. In BC Hydro's discretion, Service may be three phase 120/208 or 240 volts.
Applicable in	Rate Zone I.
Rate	1. Rate Schedule 1101 – Residential Service: **Basic Charge:** 20.77~~20.80~~ ¢ per day plus **Energy Charge:** (a) For Customers billed monthly: Step 1: First 675 kWh per month@ 9.39~~9.41~~ ¢/kWh Step 2: Additional kWh per month@ 14.08~~14.10~~ ¢/kWh (b) For Customers billed bi-monthly: Step 1: First 1350 kWh per two months@ 9.39~~9.41~~ ¢/kWh Step 2: Additional kWh per two months@ 14.08~~14.10~~ ¢/kWh Note: For billing purposes, Step 1 is pro-rated on a daily basis. **Minimum Charge:** The Basic Charge

	2. Rate Schedule 1121 – Multiple Residential Service: **Basic Charge:** 20.77~~20.80~~ ¢ per Dwelling per day plus **Energy Charge:** Per Dwelling (a) For Customers billed monthly: Step 1: First 675 kWh. per month@ 9.39~~9.41~~ ¢/kWh Step 2: Additional kWh per month@ 14.08~~14.10~~ ¢/kWh (b) For Customers billed bi-monthly: Step 1: First 1350 kWh per two months@ 9.39~~9.41~~ ¢/kWh Step 2: Additional kWh per two months@ 14.08~~14.10~~ ¢/kWh Note: For billing purposes, Step 1 is pro-rated on a daily basis. **Minimum Charge:** The Basic Charge per Dwelling
Discount for Ownership of Transformers	A discount of 25 ¢ per month per kW of Maximum Demand will be applied to amounts owing under Rate Schedule 1121 if the Customer supplies Transformation. BC Hydro will install Metering Equipment with both Demand and Energy measurement capability at the Secondary Voltage.
Special Conditions	1. The maximum capacity of all heating elements energized at any one time in all water heaters at the Premises served under these Rate Schedules must not exceed the greater of 1,500 watts and 45 watts per litre (200 watts per imperial gallon) of tank capacity, except with BC Hydro's advance written permission. 2. Rate Schedule 1121 applies if the Premises contains more than two Dwellings.

1. RESIDENTIAL SERVICE

RATE SCHEDULE 1105 – RESIDENTIAL SERVICE – DUAL FUEL (CLOSED)

Availability	For residential space heating and water heating. Electricity purchased under this Rate Schedule will be separately metered. Service is single phase, 60 hertz, at 120/240 or 240 volts. This Rate Schedule is available only for Premises served under this Rate Schedule on January 15, 1990 and continuously thereafter and only in Premises where there has been no change in Customer since April 1, 2008.
Applicable in	Rate Zone I in areas where and when, in BC Hydro's opinion, BC Hydro's transmission, sub-transmission and distribution circuit feeders are or will be capable of handling the load.
Rate	**Energy Charge:** 8.58 ¢ per kWh
Special Conditions	1. Service under this Rate Schedule is not available to any Premises where Service was previously supplied and Terminated. 2. BC Hydro will upgrade an existing Service Connection supplying firm load to serve additional load in accordance with the Electric Tariff, however, no new or additional load is permitted under this Rate Schedule at any time. All unauthorized consumption of Electricity as estimated by BC Hydro will be billed at the rate for Electricity on the appropriate default Residential Service Rate Schedule. 3. The maximum capacity of all heating elements energized at any one time in all water heaters at the Premises served under this Rate Schedule must not exceed the greater of 1,500 watts and 45 watts per litre (200 watts per imperial gallon) of tank capacity, except with BC Hydro's advance written permission.

Discount for Ownership of Transformers	A discount of 25 ¢ per month per kW of Maximum Demand will be applied to amounts owing under Rate Schedule 1127 if the Customer supplies Transformation. BC Hydro will install Metering Equipment with both Demand and Energy measurement capability at the Secondary Voltage.
Special Conditions	1. The maximum capacity of all heating elements energized at any one time in all water heaters at the Premises served under these Rate Schedules must not exceed the greater of 1,500 watts and 45 watts per litre (200 watts per imperial gallon) of tank capacity, except with BC Hydro's advance written permission. 2. Rate Schedule 1127 applies if the Premises contains more than two Dwellings.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under these Rate Schedules, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the rates under these Rate Schedules include a~~n interim~~ rate increase of 1.00~~1.16~~% before rounding.

1. RESIDENTIAL SERVICE

RATE SCHEDULE 1148 – RESIDENTIAL SERVICE – ZONE II (CLOSED)

Availability	For Residential Service in Rate Zone II where a permanent electric space heating system is in use, providing such system was installed prior to October 10, 1966. This Rate Schedule is available only to a Customer and Premises served under this Rate Schedule on April 24, 1992 and continuously thereafter.
Applicable in	Rate Zone II.
Rate	**Basic Charge:** 22.15~~22.18~~ ¢ per day plus **Energy Charge:** 11.25~~11.27~~ ¢ per kWh **Minimum Charge:** The Basic Charge
Special Conditions	The maximum capacity of all heating elements energized at any one time in all water heaters at the Premises served under this Rate Schedule must not exceed the greater of 1,500 watts and 45 watts per litre (200 watts per imperial gallon) of tank capacity, except with BC Hydro's advance written permission.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.

Discounts	1. A discount of 1½% will be applied to the above charges if a Customer's supply of Electricity is metered at a Primary Voltage. 2. A discount of 25 ¢ per Billing Period per kW of Billing Demand will be applied to the above charges if a Customer supplies Transformation. 3. If a Customer is entitled to both of the above discounts, the discount for metering at a Primary Voltage will be applied first.
Monthly Minimum Charge	50% of the highest Demand Charge billed in any Billing Period wholly within an on-peak period during the immediately preceding 11 Billing Periods. For the purpose of this provision an on-peak period commences on November 1 in any year and terminates on March 31 of the following year.
Rate Schedules	1. Rate Schedule 1200: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and BC Hydro supplies Transformation. 2. Rate Schedule 1201: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and BC Hydro supplies Transformation. 3. Rate Schedule 1210: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and the Customer supplies Transformation. 4. Rate Schedule 1211: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and the Customer supplies Transformation.

Definitions	Billing Demand is the Maximum Demand in the Billing Period, subject to Special Condition No. 1. Billing Period means a month between regular meter readings, provided that in cases where meter readings are not available or are delayed for any reason BC Hydro may vary the number of days in the Billing Period.
Special Conditions	1. Metering Equipment with both Demand and Energy measurement capability will normally be installed. Until such Metering Equipment is installed, or if the installed Metering Equipment does not have Demand measurement capability, Billing Demand will be as estimated by BC Hydro. 2. Migration rule: Customers taking Service under these Rate Schedules will be moved to Service under Rate Schedule 1300, 1301, 1310 or 1311 (Small General Service) if Billing Demand in each of the last 12 consecutive Billing Periods was less than 35 kW.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under these Rate Schedules, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the rates under these Rate Schedules include a~~n~~ ~~interim~~ rate increase of 1.00~~1.16~~% before rounding.

2. GENERAL SERVICE

RATE SCHEDULES 1205, 1206, 1207 – GENERAL SERVICE – DUAL FUEL (CLOSED)

Availability	For general space heating, water heating and industrial process heating. Electricity purchased under these Rate Schedules will be separately metered. Service is 60 hertz single or three phase at the Secondary or Primary Voltage available. BC Hydro reserves the right to determine the voltage of the Service Connection. These Rate Schedules are available only for Premises served under these Rate Schedules on January 15, 1990 and continuously thereafter, only with respect to equipment served under these Rate Schedules on January 15, 1990 and continuously thereafter, and only in Premises where there has been no change in Customer since April 1, 2008.
Applicable in	Rate Zone I in areas where, in BC Hydro's opinion, BC Hydro's transmission, sub-transmission and distribution circuit feeders are or will be capable of handling the load.
Rate	Except as stated hereunder the rate will be: **Energy Charge:** First 8000 kWh per month @ 6.15~~6.16~~ ¢ per kWh All additional kWh per month @ 4.02~~4.03~~ ¢ per kWh
Rate Schedules	1. Rate Schedule 1205 – Small Commercial Applications: Applies to a Customer whose heating load is mostly in support of a commercial activity and whose firm Electricity is billed on a General Service (under 35 kW) Rate Schedule.

ACCEPTED:__________________________

ORDER NO.__________________________

____
COMMISSION SECRETARY

	2. Rate Schedule 1206 – Large Commercial Applications: Applies to a Customer whose heating load is mostly in support of a commercial activity and whose firm Electricity is billed on a General Service (35 kW and over) Rate Schedule. 3. Rate Schedule 1207 – Industrial Applications: Applies to a Customer whose heating load is mostly in support of an industrial activity and whose firm Electricity is billed on a General Service Rate Schedule or for farm use on a Residential Rate Schedule.
Special Conditions	1. Service under these Rate Schedules will not be available to any Premises beyond March 31, 2023. 2. These Rate Schedules are not available to Premises where Electricity under it was previously supplied and Terminated. 3. No other load than that stipulated in the Availability clause is permitted under these Rate Schedules. Any unauthorized use of Electricity or any refusal by a Customer to permit access to Premises in accordance with the Terms and Conditions of BC Hydro's Electric Tariff will result in immediate Termination under the applicable Rate Schedule and all unauthorized consumption as estimated by BC Hydro will be billed at the rate for Electricity on the appropriate default General Service Rate Schedule. 4. In addition to and without restriction of any other limitations of liability of BC Hydro, BC Hydro will specifically not be liable for any loss, damage, injury or expense occasioned to or suffered by any Customer receiving Service on these Rate Schedules, or by any other Person, for any reason whatsoever. 5. Replacement of existing heating equipment is allowed provided the rated capacity (equivalent kW) of the new equipment is not higher than the existing equipment. No new load or additional load is allowed

Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under these Rate Schedules, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the rates under these Rate Schedules include a~~n~~ ~~interim~~ rate increase of 1.00~~1.16~~% before rounding.

ACCEPTED:

ORDER NO.

COMMISSION SECRETARY

2. GENERAL SERVICE

RATE SCHEDULE 1234 – SMALL GENERAL SERVICE (UNDER 35 KW) – ZONE II

Availability	For all purposes where a meter with Demand measurement capability is not installed because the Customer's Demand as estimated by BC Hydro is less than 35 kW. Supply is 60 hertz, single or three phase at an available Secondary Voltage.
Applicable in	Rate Zone II.
Rate	**Basic Charge:** 26.56~~26.61~~ ¢ per day plus **Energy Charge:** First 7000 kWh per month @ 12.64~~12.66~~ ¢ per kWh All additional kWh per month @ 21.04~~21.07~~ ¢ per kWh **Minimum Charge:** The Basic Charge
Special Conditions	Special Conditions for Unmetered Service: 1. BC Hydro may permit unmetered Service under this Rate Schedule if it can estimate to its satisfaction the Energy used in kilowatt hours over a period of two months based on the connected load and the hours of use. 2. The Customer, if required by BC Hydro, will provide and maintain such controls, including timing devices, as BC Hydro considers necessary, and facilities satisfactory to BC Hydro for the maintenance of such controls. 3. The hours of use per period will be as specified by the Customer or as estimated by BC Hydro, whichever is greater.

4. The Customer will supply, install and maintain all wiring, fixtures, control devices and equipment, including the controls and devices described in Special Condition No. 2, at the expense of the Customer.

5. All wiring, fixtures, control devices and equipment and the method of installing, operating and maintaining the same are subject to the approval of BC Hydro which approval may be withdrawn by BC Hydro, at any time, at BC Hydro's sole discretion.

6. The Customer will notify BC Hydro immediately of any proposed or actual change in load, load characteristics, or hours of use.

7. BC Hydro may at any time, in its sole discretion, install Metering Equipment, and thereafter bill the Customer on the appropriate Rate Schedule as a metered account.

8. For display signs and signboard lighting, where hours of use are controlled by timing devices, the following turn-on times will apply, unless BC Hydro otherwise agrees in writing:

Period	Turn-on Time
January 1 to January 15:	4:00 p.m.
January 16 to February 28:	4:30 p.m.

COMMISSION SECRETARY

	9. In all cases, where hours of use of display signs or signboard lighting commence at dusk and are controlled either by timing devices or by photo-electric cells, the following hours of use for a period of two months will be deemed for billing purposes: Dusk to 10 p.m.: 216 hours Dusk to 11 p.m.: 270 hours Dusk to 12 p.m.: 330 hours Dusk to 1 a.m.: 380 hours Dusk to Dawn: 666 hours (All times are Pacific Time.)
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the rates under this Rate Schedule include a~~n~~ ~~interim~~ rate increase of 1.00~~1.16~~% before rounding.

2. GENERAL SERVICE

RATE SCHEDULE 1253 – DISTRIBUTION SERVICE – IPP STATION SERVICE

Availability	For Customers who are Independent Power Producers (**IPPs**) served at distribution voltage, on an interruptible basis.
Applicable in	Rate Zone I excluding Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Energy Charge:** The sum, over the billing period, of the hourly Energy consumed multiplied by the entry in the Intercontinental Exchange (**ICE**) Mid Columbia (Mid-C) Peak, and Mid-C Off-Peak weighted average index price as published by the ICE in the ICE Day Ahead Power Price Report that corresponds to the time when consumption occurred, during that hour.
Monthly Minimum Charge	$48.70~~48.78~~
Special Conditions	1. BC Hydro agrees to provide Electricity under this Rate Schedule to the extent that it has energy and capacity to do so. 2. BC Hydro may, without notice to the Customer, refuse to supply or terminate the supply of Electricity under this Rate Schedule if at any time BC Hydro does not have sufficient energy or capacity. 3. Prior to taking Electricity under this Rate Schedule, the Customer may be required to obtain approval from BC Hydro. BC Hydro will advise the Customer of the need to obtain approval prior to the taking of Electricity under this Rate Schedule. 4. Electricity taken under this Rate Schedule is to be used solely for maintenance and black-start requirements and will not displace electricity that would normally be generated by the Customer.

2. GENERAL SERVICE

RATE SCHEDULES 1255, 1256, 1265, 1266 – GENERAL SERVICE (35 KW AND OVER) – ZONE II

Availability	For all purposes. Supply is 60 hertz, single or three phase at Secondary or Primary Voltage. BC Hydro reserves the right to determine the voltage of the Service Connection.
Applicable in	Rate Zone II.
Rate	**Basic Charge:** 26.56~~26.61~~ ¢ per day plus **Energy Charge:** First 200 kWh per kW of Billing Demand per month @ 12.64~~12.66~~ ¢ per kWh All additional kWh per month @ 21.04~~21.07~~ ¢ per kWh
Discounts	1. A discount of 1½% will be applied to the above charges if a Customer's supply of Electricity is metered at a Primary Voltage. 2. A discount of 25 ¢ per month per kW of Billing Demand will be applied to the above rate if a Customer supplies Transformation. 3. If a Customer is entitled to both of the above discounts the discount for metering at a Primary Voltage will be applied first.
Monthly Minimum Charge	The monthly minimum charge to be paid by a Customer on Rate Schedule 1255, 1256, 1265 or 1266, as applicable, will be the charge the Customer would have been billed under Rate Schedule 1200, 1201, 1210 or 1211 (Exempt General Service – 35 kW and over), respectively.

ACCEPTED:________________________

ORDER NO.________________________

COMMISSION SECRETARY

Rate Schedules	1. Rate Schedule 1255: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and BC Hydro supplies Transformation.
	2. Rate Schedule 1256: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and BC Hydro supplies Transformation. 3. Rate Schedule 1265: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and the Customer supplies Transformation. 4. Rate Schedule 1266: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and the Customer supplies Transformation.
Special Conditions	1. Metering Equipment with both Demand and Energy measurement capability will normally be installed. Until such Metering Equipment is installed, or if the installed Metering Equipment does not have Demand measurement capability, Billing Demand will be as estimated by BC Hydro. 2. Where the Customer’s Demand is or is likely to be in excess of 45 kVA, BC Hydro may require such Customer to execute a special contract for Service, including such special conditions as BC Hydro, in its sole discretion considers necessary.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under these Rate Schedules, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the rates under these Rate Schedules include a~~n~~ ~~interim~~ rate increase of 1.00~~1.16~~% before rounding.

2. GENERAL SERVICE

RATE SCHEDULE 1268 – DISTRIBUTION SERVICE – IPP DISTRIBUTION TRANSPORTATION ACCESS

Availability	For Customers who have generators connected to BC Hydro's distribution system and who want to access BC Hydro's transmission system pursuant to and in accordance with BC Hydro's Open Access Transmission Tariff (OATT).
Applicable in	Rate Zone I excluding Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Distribution Transportation Charge:** 0.196 ¢ per kWh
Special Conditions	1. The Customer is required to pay the costs, including the cost of altering existing facilities, to connect the generator to BC Hydro's distribution system in accordance with BC Hydro's Connection Requirements for Utility or Non-Utility Generation, 35 kV and Below. 2. For Customers with self-generation (i.e., with a Customer Baseline Load (**CBL**) greater than zero), this Rate Schedule is only applicable to sales of Surplus Energy. It may not be used by self-generating Customers who appear to have varied their demand for power from BC Hydro based on the actual or anticipated difference between BC Hydro's rate for providing Service to them and the market price of power. 3. For the purposes of this Rate Schedule, "Surplus Energy" in any period is the energy made available from generation by the Customer calculated as the difference between the Customer's CBL and the Customer's actual consumption from BC Hydro in that period.

ACCEPTED:____________________

ORDER NO.____________________

COMMISSION SECRETARY

	4. The Customer's CBL is established, in general, by determining the Customer's Energy consumption, on a monthly basis, for the past three years; in cases where inadequate history exists, alternative methods may be used to determine a Customer's CBL. Once established, the Customer's CBL will not be automatically adjusted for changes in the Customer's net metered consumption from BC Hydro. Any subsequent changes to the CBL must be due to changes in the Customer's load and not due to changes in its generation. The Customer must provide metered output from its generator which demonstrates an increase in generation output commensurate in time and amount with the Surplus Energy transported using this Rate Schedule. Where it appears that the Customer has transported on this Rate Schedule Energy that is not Surplus Energy, BC Hydro will provide replacement energy to the Customer's load at market prices, subject to Commission approval for such sales. 5. The metering point to determine the electricity being delivered to BC Hydro's distribution system will be determined by BC Hydro. The electricity delivered to BC Hydro's distribution system will also be deemed to be delivered to BC Hydro's transmission system (that is, no distribution loss adjustment will be applied to the electricity from an independent power producer or self-generator when determining capacity and energy delivered to BC Hydro's transmission system).
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the rate under this Rate Schedule includes a~~n~~ ~~interim~~ rate increase of 1.00~~1.16~~% before rounding.

2. GENERAL SERVICE

RATE SCHEDULE 1280 – SHORE POWER SERVICE (DISTRIBUTION)

Availability	For the supply of Shore Power to Port Customers who qualify for General Service for use by Eligible Vessels while docked at the Port Customer's Port Facility, on an interruptible basis. Shore Power Service is supplied at 60 Hz, three phase at Primary Voltage.
Applicable in	Rate Zone I.
Rate	**Administrative Charge:** $150.00 per month plus **Energy Charge:** 10.442~~10.459~~ ¢ per kWh
Special Conditions	1. BC Hydro agrees to provide Electricity under this Rate Schedule to the extent that it has energy and capacity to do so. BC Hydro may refuse or Terminate Service under this Rate Schedule in circumstances where BC Hydro does not have sufficient energy or capacity. For greater certainty, BC Hydro will not be required to construct an Extension for the purpose of increasing the capacity of BC Hydro's distribution system to provide Shore Power Service under this Rate Schedule. 2. The terms and conditions under which Shore Power Service is supplied are contained in the Shore Power Service Agreement (Electric Tariff Supplement No. 86). The Port Customer will pay to BC Hydro the charges set out in this Rate Schedule in addition to any charges set out in the Shore Power Service Agreement. 3. A Port Customer that provides Port Electricity at a Port Facility under Rate Schedules 1600, 1601, 1610, 1611 or 1823 is not eligible to take Shore Power Service under this Rate Schedule to provide Port Electricity to that Port Facility, or any Port Facility served by the same BC Hydro delivery facilities.

ACCEPTED:______________________________

ORDER NO.______________________________

____
COMMISSION SECRETARY

	4. On each occasion, if any, that BC Hydro is required to dispatch power line technicians or other workers to operate the switchgear for each connect and disconnect of Eligible Vessels docked at the Port Customer's Port Facility, BC Hydro will charge, and the Port Customer will pay, the reasonable time and labour costs for this service. The charge will be based on prevailing BC Hydro contracted labour rates and will be separately itemized on the Port Customer's monthly bill.
Definitions	For purposes of this Rate Schedule, capitalized terms have the meanings given to them in Electric Tariff Supplement No. 86.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.

2. GENERAL SERVICE

RATE SCHEDULES 1300, 1301, 1310, 1311 – SMALL GENERAL SERVICE (UNDER 35 KW)

Availability	For Customers who qualify for General Service and whose Demand, metered or estimated by BC Hydro, as applicable, is less than 35 kW. Supply is 60 hertz, single or three phase at a Secondary or Primary Voltage.
Applicable in	Rate Zone I and Rate Zone IB.
Rate	**Basic Charge:** 36.22~~36.28~~ ¢ per day plus **Energy Charge:** 12.45~~12.47~~ ¢ per kWh **Minimum Charge:** The Basic Charge
Discounts	1. A discount of 1½% will be applied to the above charges if Customer's supply of Electricity is metered at a Primary Voltage. 2. A discount of 25 ¢ per month per kW of Demand will be applied if a Customer supplies Transformation. 3. If a Customer is entitled to both of the above discounts, the discount for metering at a Primary Voltage will be applied first.
Rate Schedules	1. Rate Schedule 1300: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and BC Hydro supplies Transformation. 2. Rate Schedule 1301: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and BC Hydro supplies Transformation.

ACCEPTED:____________________

	3. Rate Schedule 1310: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and the Customer supplies Transformation. 4. Rate Schedule 1311: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and the Customer supplies Transformation.
Special Conditions	Special Conditions for Unmetered Service: 1. BC Hydro may permit unmetered Service under these Rate Schedules if it can estimate to its satisfaction the Energy used in kilowatt hours over a period of two months based on the connected load and the hours of use. 2. The Customer, if required by BC Hydro, will provide and maintain such controls, including timing devices, as BC Hydro considers necessary, and facilities satisfactory to BC Hydro for the maintenance of such controls. 3. The hours of use per period will be as specified by the Customer, or as estimated by BC Hydro, whichever is greater. 4. The Customer will supply, install and maintain all wiring, fixtures, control devices and equipment, including the controls and devices described in Special Condition No. 2, at the expense of the Customer. 5. All wiring, fixtures, control devices and equipment and the method of installing, operating and maintaining the same are subject to the approval of BC Hydro which approval may be withdrawn by BC Hydro, at any time, at BC Hydro's sole discretion. 6. The Customer will notify BC Hydro immediately of any proposed or actual change in load, load characteristics, or hours of use.

7. BC Hydro may at any time, in its sole discretion, install Metering Equipment, and thereafter bill the Customer on the appropriate Rate Schedule as a metered account.

8. For display signs and signboard lighting, where hours of use are controlled by timing devices, the following turn-on times will apply, unless BC Hydro otherwise agrees in writing:

Period	Turn-on Time
January 1 to January 15:	4:00 p.m.
January 16 to February 28:	4:30 p.m.
March 1 to April 30:	6:30 p.m.
May 1 to August 15:	8:30 p.m.
August 16 to September 30:	6:30 p.m.
October 1 to November 15:	4:30 p.m.
November 16 to December 31:	4:00 p.m.

9. In all cases, where hours of use of display signs or signboard lighting commence at dusk and are controlled either by timing devices or by photo-electric cells, the following hours of use for a period of two months will be deemed for billing purposes:

Dusk to 10 p.m.:	216 hours
Dusk to 11 p.m.:	270 hours
Dusk to 12 p.m.:	330 hours
Dusk to 1 a.m.:	380 hours
Dusk to Dawn:	666 hours

(All times are Pacific Time.)

Monthly Minimum Charge	50% of the highest Demand Charge billed in any Billing Period wholly within an on-peak period during the immediately preceding 11 Billing Periods. For the purpose of this provision an on-peak period commences on November 1 in any year and terminates on March 31 of the following year.
Rate Schedules	1. Rate Schedule 1640: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and BC Hydro supplies Transformation. 2. Rate Schedule 1641: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and BC Hydro supplies Transformation. 3. Rate Schedule 1642: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and the Customer supplies Transformation. 4. Rate Schedule 1643: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and the Customer supplies Transformation.
Definitions	1. Billing Demand The Billing Demand will be the highest kW Demand between the hours 06:00 and 22:00 daily in the Billing Period. Notwithstanding the foregoing, the Billing Demand will be the highest kW Demand in the Billing Period for the purposes of determining: (i) any discount under this Rate Schedule for Customer supplied Transformation; and (ii) BC Hydro's contribution towards an Extension under section 8.3 (Extension Fee for Rate Zone I).

	2. Billing Period A month between regular meter readings, provided that where meter readings are not available or are delayed for any reason BC Hydro may vary the number of days in the Billing Period. 3. Electric Fleet Vehicle or Vessel A Vehicle or Vessel that: (a) Is powered entirely or partially by electricity; and (b) Is part of a group of similar Vehicles or Vessels that are used for similar purposes. 4. Vehicle A vehicle used for transportation, not run on rails, and includes, without limitation, buses, medium duty trucks and heavy duty trucks. 5. Vessel A watercraft used for transportation and includes, without limitation, passenger and vehicle ferries, tugs and barge transportation.
Special Conditions	1. Metering Metering Equipment with both Demand and Energy measurement capability will be installed. Only charging of Electric Fleet Vehicles or Vessels and related equipment will be served under these Rate Schedules. 2. Migration Customers taking service under these Rate Schedules will not be migrated to Rate Schedules 1300, 1301, 1310, or 1311 (Small General Service) or Rate Schedules 1500, 1501, 1510 or 1511 (Medium General Service) due to changes in load size. BC Hydro will review this Special Condition in its evaluation report planned for the third year after which the rate commences.

	3. Concurrent Service under other Rate Schedules BC Hydro will not provide service to equipment installed for service under these Rate Schedules under any other rate schedule except Rate Schedule 1901.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under these Rate Schedules, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the rates under these Rate Schedules include a~~n~~ ~~interim~~ rate increase of 1.00~~1.16~~% before rounding.

2. GENERAL SERVICE

RATE SCHEDULES 1650, 1651, 1652, 1653 – DEMAND TRANSITION RATE (150 KW AND OVER)

Availability	For Customers who qualify for General Service where the Customer is a business, government agency or other organization. For use only for separately metered charging of Electric Fleet Vehicles or Vessels owned or leased by, and operated by, the Customer, at Maximum Demand equal to or greater than 150 kW. Supply is 60 hertz, single or three phase at Secondary or Primary Voltage. BC Hydro reserves the right to determine the voltage of the Service Connection.
Applicable in	Rate Zone 1.
Termination Date	These Rate Schedules will terminate effective March 31, 2032. As of April 1, 2032 customers will be migrated to Rate Schedules 16xx or the otherwise applicable rate.
Rate	**Basic Charge:** 26.56~~26.61~~ ¢ per day plus **Demand Charge:** \$0 per kW of Billing Demand until March 31, 2026 plus **Energy Charge:** 9.12~~9.13~~ ¢ per kWh
Discounts	1. A discount of 1½% will be applied to the above charges if a Customer's supply of Electricity is metered at a Primary Voltage. 2. A discount of 25 ¢ per Billing Period per kW of Billing Demand will be applied to the above charges if a Customer supplies Transformation. 3. If a Customer is entitled to both of the above discounts, the discount for metering at a Primary Voltage will be applied first.

ACCEPTED:______________________________

ORDER NO.______________________________

COMMISSION SECRETARY

Monthly Minimum Charge	50% of the highest Demand Charge billed in any Billing Period wholly within an on-peak period during the immediately preceding 11 Billing Periods. For the purpose of this provision an on-peak period commences on November 1 in any year and terminates on March 31 of the following year.
Rate Schedules	1. Rate Schedule 1650: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and BC Hydro supplies Transformation. 2. Rate Schedule 1651: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and BC Hydro supplies Transformation. 3. Rate Schedule 1652: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and the Customer supplies Transformation. 4. Rate Schedule 1653: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and the Customer supplies Transformation.
Definitions	1. Billing Demand The Billing Demand will be the highest kW Demand in the Billing Period. 2. Billing Period A month between regular meter readings, provided that where meter readings are not available or are delayed for any reason BC Hydro may vary the number of days in the Billing Period.

3. Electric Fleet Vehicle or Vessel

   A Vehicle or Vessel that:

   (a) Is powered entirely or partially by electricity; and

   (b) Is part of a group of similar vehicles or Vessels that are used for similar purposes.

4. Vehicle

   A vehicle used for transportation, not run on rails, and includes, without limitation, buses, medium duty trucks and heavy duty trucks.

5. Vessel

   A watercraft used for transportation and includes, without limitation, passenger and vehicle ferries, tugs and barge transportation.

3. IRRIGATION SERVICE

RATE SCHEDULE 1401 – IRRIGATION SERVICE

Availability	For motor loads of 746 watts or more used for irrigation and outdoor sprinkling where Electricity will be used principally during the Irrigation Season as defined below. Supply is 60 hertz, single or three phase at the Secondary or Primary Voltage available. BC Hydro reserves the right to determine the voltage of the Service Connection.
Applicable in	Rate Zone I and Rate Zone IB.
Rate	1. During the Irrigation Season: **Energy Charge:** 6.08~~6.09~~ ¢ per kWh **Minimum Charge:** $6.08~~6.09~~ per kilowatt of connected load per month for a period of eight months commencing in March in any year whether Energy consumption is registered or not. 2. During the Non-Irrigation Season: **Energy Charge:** First 150 kWh @ 6.08~~6.09~~ ¢ per kWh All additional kWh @ 48.21~~48.28~~ ¢ per kWh **Minimum Charge:** Where Energy consumption is 500 kWh or less, Nil. Where Energy consumption is more than 500 kWh, $48.63~~48.71~~ per kilowatt of connected load.
Discount for Ownership of Transformers	A discount of 25 ¢ per month per kW of connected load will be applied to the above charges if a Customer supplies the Transformation.

Definitions	1. Irigation Season: In respect of each Service Connection the period commencing with a meter reading on or about March 1 in any year, having a mid-season meter reading on or about July 31, and ending with a meter reading on or about October 31 in that same year. BC Hydro may, in its discretion extend such period by postponing the termination date to any date not later than November 30, for the sole purpose of permitting a Customer to fill reservoirs necessary for the operation of the irrigation or sprinkling system. 2. Non-Irrigation Season: The period commencing at the end of one Irrigation Season and terminating at the beginning of the next Irrigation Season.
Special Conditions	1. No equipment provided with Electricity under this Rate Schedule will be served with Electricity under any other Rate Schedule while the Customer's Service Agreement under this Rate Schedule is in force. 2. Normally the Service Connection will be energized during the Non-Irrigation Season, but will be Disconnected if a Customer so requests. 3. The Minimum Charge during the Irrigation Season will commence in March for an account that has not been Terminated by the Customer, whether or not the Service Connection is energized and will be billed in two installments, at the end of July and at the end of October. 4. For the Irrigation Season, a bill will be rendered following the July and October meter readings. The first bill will be the greater of the Energy Charge and the Minimum Charge for the period March 1 to July 31. The second bill will be the greater of the Energy Charge for the season and the Minimum Charge for the season, less payment received for the first billing charges.

4. STREET LIGHTING SERVICE

RATE SCHEDULE 1701 – OVERHEAD STREET LIGHTING

Availability	For lighting of public highways, streets and lanes in cases where BC Hydro owns, installs and maintains the fixtures, conductors, controls and poles.	
Applicable in	Any area served by suitable overhead distribution lines.	
Rate	Per fixture per month as set out below:	
	50 watt or less LED unit	$15.23~~15.25~~
	51 to 80 watt LED unit	$18.96~~18.99~~
	81 to 120 watt LED unit	$23.74~~23.77~~
	greater than 120 watt LED unit	$27.85~~27.89~~
	*100 watt H.P. sodium vapour unit	$19.47~~19.50~~
	*150 watt H.P. sodium vapour unit	$23.23~~23.27~~
	*200 watt H.P. sodium vapour unit	$26.82~~26.86~~
	*175 watt mercury vapour unit	$21.40~~21.44~~
	*250 watt mercury vapour unit	$24.66~~24.70~~
	*400 watt mercury vapour unit	$31.78~~31.84~~
	Wattages are unit wattages for LED and lamp watts for high pressure sodium vapour and mercury vapour.	
	* Note Special Condition No. 2.	
Special Conditions	1. Connection Charge No charge will be made for Service Connections.	

ACCEPTED:________________________

ORDER NO.________________________

COMMISSION SECRETARY

2. Mercury Vapour and High Pressure Sodium Vapour

   Mercury vapour fixtures and high pressure sodium vapour fixtures are not available for new installations.

3. Extension Policy

   BC Hydro will construct a distribution Extension if required by the applicant in accordance with the Terms and Conditions of the Electric Tariff as applicable.

   When, at the Customer's request, a new fixture replaces an existing fixture, the Customer will pay to BC Hydro the original cost of the existing fixture, less any accumulated depreciation, and the cost of removing the existing fixture.

4. Relocation and Redirection of Fixtures

   The Customer will pay the full cost of relocating or redirecting fixtures when the change is made at the request of the Customer.

5. Design

   BC Hydro will design the installation of overhead street lighting fixtures.

6. Street Lights Failing to Operate

   BC Hydro will, without charge, replace street lights or components that fail to operate, unless breakage is the reason for such failure in which case the Customer will be charged the cost of the material required to make the fixture operate.

7. Term of Service Agreement

   The term of the initial Service Agreement under this Rate Schedule will be not more than five years; renewal periods will be for five years.

Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
Supplemental Charge	Effective May 1, 2021, a transition rate supplemental charge equal to $2.06 per fixture per month applies to all street lights billed under this Rate Schedule, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the rates under this Rate Schedule include a~~n~~ ~~interim~~ rate increase of 1.00~~1.16~~% before rounding. Effective May 1, 2021 this Rate Schedule includes an interim supplemental charge.

4. STREET LIGHTING SERVICE

RATE SCHEDULE 1702 – PUBLIC AREA ORNAMENTAL STREET LIGHTING

Availability	For lighting of public highways, streets and lanes and municipal pathways and for public area seasonal lighting displays, in those cases where the Customer owns, installs and maintains the standards, fixtures, conductors and controls.
Applicable in	All Rate Zones.
Rate	**Energy Charge:** For each unmetered fixture: 3.75 ¢ per watt of Billing Wattage per month For each metered fixture: 11.25~~11.27~~ ¢ per kWh
Definitions	Billable Wattage is the sum of all wattage, on all fixtures used by the Customer. For fixtures without dimming controls, the watts per fixture will include the wattage of the lamp plus, where applicable, the wattage of the ballast. For fixtures with dimming controls, the watts per fixture will be equal to: 1. The wattage of the lamp plus, where applicable, the wattage of the ballast, multiplied by 2. The ratio of effective fixture wattage after dimming to fixture wattage before dimming.

ACCEPTED:______________________________

ORDER NO.______________________________ ______________________________
COMMISSION SECRETARY

Special Conditions	1. Service Connection Where necessary BC Hydro will provide an overhead or underground Service Connection in accordance with the Terms and Conditions of the Electric Tariff. No Service Connection will be made to add any ornamental street lighting system which does not provide for eight or more street lighting fixtures except that, if the potential is 120/240 volts, at BC Hydro's discretion, a Service Connection may be made for a system of less than eight. Receptacle loads will be permitted for Service under this Rate Schedule provided that such receptacles are used predominantly for seasonal lighting displays, meaning that no more than 10% of the usage may be for other purposes. 2. Extension Policy BC Hydro will construct a distribution Extension if required by the applicant in accordance with the Terms and Conditions of the Electric Tariff. 3. Power Factor All installations of mercury vapour, sodium vapour or fluorescent lamps will be equipped with the necessary auxiliaries to assure that a Power Factor of not less than 90% lagging will be maintained. 4. Term of Service Agreement The term of the initial Service Agreement under this Rate Schedule will be not more than five years; renewal periods will be for five years.

5. Fixtures with Automated Dimming Controls

The following special terms and conditions apply to lighting fixtures fitted with dimming controls:

(a) For purposes of this Special Condition No. 5, "dimming controls" means control units or fittings attached to, or forming part of, a street lighting fixture capable of being programmed or remotely operated so as to reduce the lumens output of the lamps during specified hours each day while the lamps are in operation. The reductions may vary according to the hours of the day, the days of the week, and the seasons of the year.

(b) A Customer wishing to have fixtures with dimming controls separately rated under this Rate Schedule must submit a dimming schedule satisfactory to BC Hydro listing each light fixture fitted with dimming controls, the wattage of the fixture (including the lamp and, where applicable, the ballast), the dimming control setting or settings and the hours each day that the dimming control setting or settings will be in operation.

(c) Whenever the Customer wishes to make changes in the lighting fixtures listed in the dimming schedule or in the dimming control settings or hours of operation, the Customer will submit an updated lighting fixture schedule to BC Hydro listing any changes. Changes will be permitted on a semi-annual basis (twice per year).

4. STREET LIGHTING SERVICE

RATE SCHEDULE 1755 – PRIVATE OUTDOOR LIGHTING (CLOSED)

Availability	For outdoor lighting Service to illuminate property other than public streets or lanes (private property), where Service is provided from dusk to dawn and the supply is single phase, 60 hertz at the Secondary Voltage available. This Rate Schedule is available only in Premises served under this Rate Schedule on January 1, 1975 and only with respect to lights served under this Rate Schedule on January 1, 1975 and continuously thereafter, except BC Hydro may replace a mercury vapour unit with a high pressure sodium unit having approximately the same equivalent light output.
Applicable in	All Rate Zones.
Rate	**Charge per fixture per month as follows:** 1. Where a light is mounted on a pole that was installed by the Customer or by BC Hydro at the Customer's expense: 175 watt mercury vapour unit or replacement 100 watt H.P. sodium vapour unit — $18.25~~18.28~~ 400 watt mercury vapour unit or replacement 150 watt H.P. sodium vapour unit — $31.46~~31.51~~

	2. Where a light is mounted on a pole that is on public property, or an easement, and is part of BC Hydro's distribution system: 175 watt mercury vapour unit or replacement 100 watt H.P. sodium vapour unit — $19.38~~19.41~~ 400 watt mercury vapour unit or replacement 150 watt H.P. sodium vapour unit — $32.60~~32.65~~ 3. Where a light is mounted on a pole that was installed on the Customer's property by BC Hydro, at its expense, solely for the purpose of supporting the light: 175 watt mercury vapour unit or replacement 100 watt H.P. sodium vapour unit — $23.87~~23.90~~ 400 watt mercury vapour unit or replacement 150 watt H.P. sodium vapour unit — $37.57~~37.63~~ Except that if two or more lights are mounted at one time on the same pole the rates for the additional light or lights will be as set out under part 1 above.
Special Conditions	1. BC Hydro will provide and install: (a) An outdoor light consisting of luminaire, mast arm, ballast, lamp and photo-electric control, and (b) Not more than one span of overhead secondary conductors per light. 2. The Customer will be required to contribute the estimated cost of any plant required to make Secondary Voltage available at a point not more than one span from the light; such contribution is not subject to refund.

5. TRANSMISSION SERVICE

RATE SCHEDULE 1823 – TRANSMISSION SERVICE – STEPPED RATE

Availability	For all purposes. Supply is at 60 kV or higher. Customers supplied with Electricity under Rate Schedule 1825 (Time-of-Use) may only revert to Service under this Rate Schedule as permitted under Rate Schedule 1825.
Applicable in	Rate Zone I excluding the Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Demand Charge:** $8.642~~8.655~~ per kVA of Billing Demand per Billing Period plus **Energy Charge: A** For new Customers and Customers that do not have a CBL by order of the British Columbia Utilities Commission: 5.065~~5.073~~ ¢ per kWh for all kWh per Billing Period This rate will apply until the Customer has been supplied with Electricity under this Rate Schedule for 12 Billing Periods or another period approved by the British Columbia Utilities Commission, after which the Customer will be supplied with Electricity at the rate specified in Part B below.

ACCEPTED:______________________________

ORDER NO.______________________________ ______________________________
COMMISSION SECRETARY

	Energy Charge: B For Customers with a CBL: 4.507~~4.514~~ ¢ per kWh applied to all kWh up to and including 90% of the Customer's CBL in each Billing Year 10.095~~10.111~~ ¢ per kWh applied to all kWh above 90% of the Customer's CBL in each Billing Year Note: Customers previously supplied with Electricity under Rate Schedule 1825 will be subject to the rates in Part B above from the time the Customer commences taking Service under this Rate Schedule. **Monthly Minimum Charge:** $8.642~~8.655~~ per kVA of Billing Demand
Definitions	1. Billing Year The Billing Year is the 12 month billing period starting with the first day of the Billing Period which commences nearest to April 1 in each year, and ending on the last day of such 12-month Billing Period.

2. Billing Demand

The Billing Demand will be:

(a) The highest kVA Demand during the High Load Hours (**HLH**) in the Billing Period; or

(b) 75% of the highest Billing Demand for the Customer's Plant in the immediately preceding period of November to February, both months included; or

(c) 50% of the Contract Demand stated in the Electricity Supply Agreement for the Customer's Plant,

whichever is the highest value, provided that for new Customers the Billing Demand for the initial two Billing Periods will be the average of the daily highest kVA Demands for the Customer's Plant.

	3. Customer Baseline Load (**CBL**) The Customer Baseline Load (**CBL**) is the Customer's historic annual energy consumption in kWh as approved by the British Columbia Utilities Commission. The Customer's CBL will initially be determined by BC Hydro, and be subject to revision from time to time, in accordance with the criteria and procedures set forth in BC Hydro's "Customer Baseline Load (**CBL**) Determination Guidelines" (Electric Tariff Supplement No. 74). All CBLs will be subject to final approval of the British Columbia Utilities Commission. 4. High Load Hours (**HLH**) High Load Hours (**HLH**) is the period of hours from 06:00 to 22:00 Monday to Saturday, except for Statutory Holidays (New Year's Day, Family Day, Good Friday, Victoria Day, Canada Day, B.C. Day, Labour Day, Thanksgiving Day, Remembrance Day and Christmas Day). 5. Low Load Hours (**LLH**) Low Load Hours (**LLH**) are all hours other than HLH.
Special Conditions	1. A Customer having two or more operating plants may elect to have a single aggregated CBL determined for all or any combination of its operating plants in accordance with BC Hydro's "Customer Baseline Load (**CBL**) Determination Guidelines" (Electric Tariff Supplement No. 74). Thereafter, BC Hydro will issue a single bill for all operating plants included in the aggregation, and the Energy Charge payable will be determined on the basis of the aggregated CBL. However, the Demand Charge will continue to be determined separately for each operating plant.

ACCEPTED:________________________

ORDER NO.________________________ ________________________

COMMISSION SECRETARY

	2. If any initial, revised, or aggregate CBL for a Customer has not been determined by BC Hydro and approved by British Columbia Utilities Commission by the time at which the CBL would become effective, BC Hydro may determine the CBL on an interim basis and apply that CBL for the purposes of any billing periods and bills rendered to the Customer until such time as the CBL has been finally determined and approved by the British Columbia Utilities Commission, following which BC Hydro will make any necessary billing adjustments. 3. If a Customer taking Service at the rates in Part B of the Energy Charge rate section above Terminates Service under this Rate Schedule prior to the end of a Billing Year, the Customer's CBL or aggregate CBL will be prorated for the portion of the Billing Year during which the Customer was taking Service, and the prorated CBL or aggregate CBL will be used for the purposes of applying the rates in Part B to all energy consumption during the Billing Year up to the time of Termination. BC Hydro will make any necessary billing adjustments and bill the Customer for the difference (if any) owing.
Taxes	The rates set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Note	The terms and conditions under which Transmission Service is supplied are contained in Electric Tariff Supplement Nos. 5 and 6, or Electric Tariff Supplement Nos. 87 and 88, as applicable.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the rates under this Rate Schedule include a~~n~~ ~~interim~~ rate increase of 1.00~~1.16~~% before rounding.

5. TRANSMISSION SERVICE

RATE SCHEDULE 1825 – TRANSMISSION SERVICE – TIME-OF-USE (TOU) RATE

Availability	For Customers who provide notice by February 15 of each year and who at the time of application are eligible to take Service under Rate Schedule 1823 (Stepped Rate) at the Energy Charge rates set out in Part B of the rate section of that Rate Schedule, and who have entered into a TOU (Transmission Service) Agreement by March 15 of that year. Customers will start Service under Rate Schedule 1825 in the first Billing Period after April 1.
Applicable in	Rate Zone I excluding the Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Demand Charge:** $8.642~~8.655~~ per kVA of Billing Demand per Billing Period plus **Energy Charge:** 1. Winter HLH Period: 4.507~~4.514~~ ¢ per kWh applied to all kWh up to and including 90% of the Customer's Winter HLH Period CBL. 11.265~~11.282~~ ¢ per kWh applied to all kWh above 90% of the Customer's Winter HLH Period CBL. 2. Winter LLH Period: 4.507~~4.514~~ ¢ per kWh applied to all kWh up to and including 90% of the Customer's Winter LLH Period CBL. 10.210~~10.226~~ ¢ per kWh applied to all kWh above 90% of the Customer's Winter LLH Period CBL.

ACCEPTED:______________________________

ORDER NO.______________________________

____
COMMISSION SECRETARY

	3. Spring Period: 4.507~~4.514~~ ¢ per kWh applied to all kWh up to and including 90% of the Customer's Spring Period CBL. 9.093~~9.107~~ ¢ per kWh applied to all kWh above 90% of the Customer's Spring Period CBL. 4. Remaining Period: 4.507~~4.514~~ ¢ per kWh applied to all kWh up to and including 90% of the Customer's Remaining Period CBL applicable. 9.971~~9.987~~ ¢ per kWh applied to all kWh above 90% of the Customer's Energy CBL applicable in the Billing Period.
Definitions	1. Billing Demand The Demand for billing purposes will be: (a) The highest kVA Demand during the High Load Hours (**HLH**) in the Billing Period; or (b) 75% of the highest Billing Demand for the Customer's Plant in the immediately preceding period of November to February, both months included; or (c) 50% of the Contract Demand stated in the Electricity Supply Agreement for the Customer's Plant, whichever is the highest value.

2. Customer Baseline Load (CBL)

The Customer Baseline Load (**CBL**) is the Customer's historic consumption (in kWh) as approved by the British Columbia Utilities Commission. For the purposes of this Rate Schedule, the Customer's CBL will consist of four separate CBLs – one each for the Winter HLH Period, the Winter LLH Period, the Spring Period and the Remaining Period. The Customer's CBL will initially be determined by BC Hydro, and be subject to revision from time to time, in accordance with the criteria and procedures set forth in BC Hydro's "Customer Baseline Load (**CBL**) Determination Guidelines" (Electric Tariff Supplement No. 74). All CBLs will be subject to final approval of the British Columbia Utilities Commission.

3. High Load Hours (**HLH**)

High Load Hours (**HLH**) is the period of hours from 06:00 to 22:00 Monday to Saturday, except for Statutory Holidays (New Year's Day, Family Day, Good Friday, Victoria Day, Canada Day, B.C. Day, Labour Day, Thanksgiving Day, Remembrance Day and Christmas Day).

4. Low Load Hours (**LLH**)

The Low Load Hours (**LLH**) are all hours other than HLH.

5. Remaining Period

The Remaining Period is all Billing Periods other than the Winter Period or the Spring Period.

6. Spring Period

The Spring Period comprises the two Billing Periods starting with the first day of the Billing Period that commences nearest to May 1 each year and ending on the last day of the second Billing Period thereafter.

	7. Winter Period The Winter Period comprises four Billing Periods starting with the first day of the Billing Period that commences nearest to November 1 each year and ending on the last day of the fourth Billing Period thereafter.
Special Conditions	1. Service under this Rate Schedule will be provided only while a TOU (Transmission Service) Agreement with the Customer is in effect. 2. A Customer having two or more operating plants may elect to have a single aggregated CBL determined for all or any combination of its operating plants in accordance with BC Hydro's "Customer Baseline Load (CBL) Determination Guidelines" (Electric Tariff Supplement No. 74). Separate Energy CBL values will be determined for each plant and then aggregated. BC Hydro will issue a single bill for all operating plants included in an aggregation, and the Energy Charge payable will be determined on the basis of the aggregated Energy CBL value. The Demand Charge will continue to be determined separately for each operating plant. 3. If any initial, revised, or aggregate CBL for a Customer has not been determined by BC Hydro and approved by British Columbia Utilities Commission by the time at which the CBL would become effective, BC Hydro may determine the CBL on an interim basis and apply that CBL for the purposes of any billing periods and bills rendered to the Customer until such time as the CBL has been finally determined and approved by the British Columbia Utilities Commission, following which BC Hydro will make any necessary billing adjustments.

	4. In accordance with the TOU (Transmission Service) Agreement, the Customer will have a period of 30 days following approval of the Customer's initial CBL by the British Columbia Utilities Commission within which the Customer may, by written notice to BC Hydro, withdraw from taking Service under this Rate Schedule, and revert to taking Service under Rate Schedule 1823 (Stepped Rate). This right of withdrawal is available only when the Customer first subscribes to take Service under this Rate Schedule, and is applicable only in respect of the initial CBL determination. If the Customer exercises this right of withdrawal Rate Schedule 1823 will apply from the commencement of the then current Billing Year, and BC Hydro will make any necessary billing adjustments accordingly. 5. Customers taking Service under Rate Schedule 1852 (Modified Demand) may not also take Service under this Rate Schedule.
Taxes	The rates set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Note	The terms and conditions under which Transmission Service is supplied are contained in the Electricity Supply Agreement (Electric Tariff Supplement No. 5, or Electric Tariff Supplement No. 87, as applicable) as amended by the Electric Tariff Supplement No. 72 (TOU (Transmission Service) Agreement), and Electric Tariff Supplement No. 6, or Electric Tariff Supplement No. 88, as applicable.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the rates under this Rate Schedule include a~~n~~ ~~interim~~ rate increase of 1.00~~1.16~~% before rounding.

5. TRANSMISSION SERVICE

RATE SCHEDULE 1827 – TRANSMISSION SERVICE – RATE FOR EXEMPT CUSTOMERS

Availability	For all purposes. Supply is at 60 kV or higher. Only for City of New Westminster and University of British Columbia and other Customers exempted from Rate Schedule 1823 (Stepped Rate) by the British Columbia Utilities Commission.
Applicable in	Rate Zone I excluding the Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Demand Charge:** $8.642~~8.655~~ per kVA of Billing Demand per Billing Period plus **Energy Charge:** 5.065~~5.073~~ ¢ per kWh for all kWh in a Billing Period **Monthly Minimum Charge:** $8.642~~8.655~~ per kVA of Billing Demand
Definitions	1. Billing Demand The Billing Demand will be: (a) The highest kVA Demand during the High Load Hours (**HLH**) in the Billing Period; or (b) 75% of the highest Billing Demand for the Customer's Plant in the immediately preceding period of November to February, both months included; or (c) 50% of the Contract Demand stated in the Electricity Supply Agreement for the Customer's Plant, whichever is the highest value.

ACCEPTED:______________________

ORDER NO.______________________

____
COMMISSION SECRETARY

5. TRANSMISSION SERVICE

RATE SCHEDULE 1852 – TRANSMISSION SERVICE – MODIFIED DEMAND

Availability	To a Customer supplied with Electricity at 60 kV or higher who is taking Service under Rate Schedule 1823 (Stepped Rate) at the time of application, and is a party to a Modified Demand Agreement under Electric Tariff Supplement No. 54 which is in force, and which is in a location, as determined by BC Hydro, that will allow BC Hydro to curtail load to alleviate a potential local or regional transmission constraint, or take advantage of a market opportunity. The annual subscription period for new subscribers is from September 1 to October 31.
Applicable in	Rate Zone I excluding the Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Excess Demand Charge:** $8.642~~8.655~~ per kVA of metered kVA Demand in excess of the Maximum Demand Level during Low Load Hours
Definitions	1. Billing Demand The Billing Demand will be: (a) The highest kVA Demand during the High Load Hours (**HLH**) in the Billing Period; or (b) 75% of the highest Billing Demand for the Customer's Plant in the immediately preceding period of November to February, both months included; or (c) 50% of the Contract Demand stated in the Electricity Supply Agreement for the Customer's Plant, whichever is the highest value.

ACCEPTED:______________________

ORDER NO.______________________

____
COMMISSION SECRETARY

2. High Load Hours (**HLH**)

   High Load Hours (**HLH**) means the period(s) in a 24-hour day and during those days of a calendar week in which Electricity usage is typically highest in a particular region, as determined by BC Hydro in its discretion based on load characteristics and transmission constraints in that region from time to time, and designated in a Modified Demand Agreement.

3. Low Load Hours (**LLH**)

   Low Load Hours (**LLH**) are all hours other than HLH.

4. LLH CBL Energy

   LLH CBL Energy means the highest monthly energy consumption during the LLH over the last 12 Billing Periods, or an estimate of consumption if insufficient data is available.

5. Maximum Demand Level

   Maximum Demand Level has the meaning set out in the Modified Demand Agreement. For a Customer with more than one designated period of High Load Hours, separate Maximum Demand Levels will be stated for each corresponding period of Low Load Hours. For a Customer with a single designated period of High Load Hours, a single Maximum Demand Level will be stated for all Low Load Hours.

   The highest Maximum Demand Level will not exceed 95% of Contract Demand stated in the Customer's Electricity Supply Agreement, and is subject to local transmission availability.

Special Conditions	1. The terms and conditions under which Transmission Service is supplied are contained in Electric Tariff Supplement Nos. 5 and 6. The provisions of Rate Schedule 1823 (Stepped Rate) and Electric Tariff Supplement Nos. 5 and 6 continue to apply to Customers receiving Service under this Rate Schedule. In the case of a conflict between this Rate Schedule or the Modified Demand Agreement and Rate Schedule 1823 or Electric Tariff Supplement Nos. 5 or 6, the provisions of this Rate Schedule and the Modified Demand Agreement will govern. 2. If for any two Billing Periods the total energy consumed under Rate Schedule 1852, during the LLH, is greater than the LLH CBL Energy by 10% or more, the highest kVA Demand in each such Billing Period during the High Load Hours will be adjusted by the ratio of the average monthly LLH Energy during such two Billing Periods over the LLH CBL Energy. The adjusted highest kVA Demand will apply for a period of 12 months after the second Billing Period included in the adjustment calculation. The LLH CBL Energy will be recalculated using the consumption history of the most recent 12 Billing Periods. 3. The Minimum Reduction under the Modified Demand Agreement will be the greater of 50% of the difference between the Maximum Demand Level and the LLH CBL Demand, and 10 MW. 4. The Maximum Number of Demand Reduction Transactions under the Modified Demand Agreement will be the greater of Maximum Duration multiplied by the Maximum Number of Demand Reduction Transactions, and 48 hours.
Taxes	The rates set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.

5. TRANSMISSION SERVICE

RATE SCHEDULE 1853 – TRANSMISSION SERVICE – IPP STATION SERVICE

Availability	For Customers who are Independent Power Producers (**IPPs**) served at transmission voltage, on an interruptible basis.
Applicable in	Rate Zone I excluding Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Energy Charge:** The sum, over the Billing Period, of the hourly energy consumed multiplied by the entry in the Intercontinental Exchange (**ICE**) Mid-Columbia (Mid-C) Peak, and Mid-C Off-Peak weighted average index price as published by the ICE in the ICE Day Ahead Power Price Report that corresponds to the time when consumption occurred, during that hour
Monthly Minimum Charge	$48.70~~48.78~~
Special Conditions	1. BC Hydro agrees to provide Electricity under this Rate Schedule to the extent that it has energy and capacity to do so. 2. BC Hydro may, without notice to the Customer, refuse to supply or terminate the supply of Electricity under this Rate Schedule if at any time BC Hydro does not have sufficient energy or capacity. 3. Prior to taking Electricity under this Rate Schedule, the Customer may be required to obtain approval from BC Hydro. BC Hydro will advise the Customer of the need to obtain approval prior to the taking of Electricity under this Rate Schedule. 4. Electricity taken under this Rate Schedule is to be used solely for maintenance and black-start requirements and will not displace electricity that would normally be generated by the Customer.

Taxes	The rates and Monthly Minimum Charge set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the Monthly Minimum Charge under this Rate Schedule includes a~~n~~ ~~interim~~ rate increase of 1.00~~1.16~~% before rounding.

5. TRANSMISSION SERVICE

RATE SCHEDULE 1880 – TRANSMISSION SERVICE – STANDBY AND MAINTENANCE SUPPLY

Availability	For Customers supplied with Electricity under Rate Schedule 1823 (Stepped Rate), 1825 (TOU Rate), 1827 (Rate for Exempt Customers), 1828 (Biomass Energy Program) or 1852 (Modified Demand), on an interruptible basis.
Applicable in	Rate Zone I excluding the Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Administrative Charge:** $150.00 per Period of Use plus **Energy Charge:** During the Period of Use, 10.095~~10.111~~ ¢ per kWh of metered Rate Schedule 1880 energy consumption, determined as set out below
Definitions	1. HLH Reference Demand HLH Reference Demand is the highest kVA Demand in the HLH for the current Billing Period prior to the Period of Use, but excluding any prior Period of Use. If the Period of Use extends over an entire Billing Period, the highest kVA Demand in the HLH from the prior Billing Period will be used in determining the HLH Reference Demand, excluding any Period of Use in the prior Billing Period. For the purpose of determining HLH Reference Demand, the HLH periods are as defined in Rate Schedule 1823, 1825, 1827, 1828 or 1852, whichever is applicable.

ACCEPTED:__________________________

ORDER NO.__________________________

____
COMMISSION SECRETARY

	2. Period of Use A period of consecutive hours during which Electricity is taken under this Rate Schedule. The Period of Use is as defined by the Customer when requesting Service from BC Hydro under this Rate Schedule 1880 and may extend into subsequent Billing Periods.
Rate Schedule 1880 Energy Determination	During HLH periods, the kWh consumption on an hourly basis which exceeds the HLH high kWh per hour within the Period of Use or portion thereof where HLH high kWh per hour is the product of HLH Reference Demand multiplied by the Power Factor for the half hour when the HLH Reference Demand occurred. For the purpose of the Rate Schedule 1880 Energy Determination, the HLH periods are as defined in Rate Schedule 1823, 1825, 1827, 1828 or 1852, whichever is applicable.
Special Conditions	1. BC Hydro agrees to provide Electricity under this Rate Schedule to the extent that it has energy and capacity to do so. 2. BC Hydro may, without notice to the Customer, refuse to supply or terminate the supply of Electricity under this Rate Schedule if at any time during the Period of Use BC Hydro does not have sufficient energy or capacity.

3. This Rate Schedule is only for the following purposes:

   To provide Electricity the Customer would otherwise generate during periods when all or part of the Customer's electrical generating plant is curtailed.

   Electricity used for this purpose may be taken on an instantaneous basis when the impact of the instantaneous pickup of loads normally provided by the Customer's electrical generation units does not occur after BC Hydro has advised the Customer that a period of system constraint or potential system constraint exists.

   During periods of potential system constraints, BC Hydro will require Customers to arm load shedding relays to ensure that the loss of electricity production from a Customer's electrical generation unit will not result in a demand greater than the Customer's Maximum kVA Demand on BC Hydro's system. BC Hydro may require the Customer to provide it with control of these load shedding relays. During periods of potential system constraints, upon a Customer's request, BC Hydro will endeavour to provide Electricity normally provided by the Customer's electrical generation unit.

   The Customer is required to advise BC Hydro within 30 minutes of taking Electricity under this Rate Schedule for this purpose. If the Customer fails to advise BC Hydro within 30 minutes, measured Demand and Energy consumption will be billed under Rate Schedule 1823, 1825, 1827, 1828 or 1852, whichever is applicable.

4. Electricity taken under this Rate Schedule will not displace Electricity otherwise to be taken by the Customer under Rate Schedule 1823, 1825, 1827, 1828 or 1852.

   Electricity taken under this Rate Schedule will not displace electricity that would normally be generated by the Customer for the purpose of re-sale.

ACCEPTED:____________________

ORDER NO.____________________

COMMISSION SECRETARY

	5. In addition to the charges specifically set out in this Rate Schedule, the Customer will pay for any additional facilities required to deliver Electricity under this Rate Schedule provided that BC Hydro obtains the prior consent of the Customer for construction of the additional facilities. 6. A Customer may be required to allow BC Hydro to install metering and communication equipment to measure the electricity output of the Customer's self-generation unit. 7. BC Hydro will bill for Electricity taken under Rate Schedule 1880 at the same time it bills for Electricity taken under Rate Schedule 1823, 1825, 1827, 1828 or 1852, whichever is applicable.
Taxes	The rates set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Note	The terms and conditions under which Transmission Service is supplied are contained in Electric Tariff Supplement Nos. 5 and 6, or Electric Tariff Supplement Nos. 87 and 88, as applicable.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
~~Interim~~ Rate Increase	Effective April 1, 2021 the Energy Charge under this Rate Schedule includes a~~n~~ ~~interim~~ rate increase of 1.00~~1.16~~% before rounding.

ACCEPTED:______________________________

ORDER NO.______________________________ ______________________________
COMMISSION SECRETARY

5. TRANSMISSION SERVICE

RATE SCHEDULE 1891 – TRANSMISSION SERVICE – SHORE POWER SERVICE

Availability	For the supply of Shore Power to Port Customers for use by Eligible Vessels while docked at the Port Customer's Port Facility, on an interruptible basis. Supply is at 60 kV or higher.
Applicable in	Rate Zone I.
Rate	**Administrative Charge:** \$150.00 per month plus **Energy Charge:** 10.095~~10.111~~ ¢ per kWh for all kWh in a billing period
Definitions	For purposes of this Rate Schedule, capitalized terms have the meanings given to them in the Shore Power Service Agreement (Electric Tariff Supplement No. 86).
Special Conditions	1. BC Hydro agrees to provide Electricity under this Rate Schedule to the extent that it has energy and capacity to do so. BC Hydro may refuse Service under this Rate Schedule in circumstances where BC Hydro does not have sufficient energy or capacity. For greater certainty, BC Hydro will not be required to construct a System Reinforcement under Electric Tariff Supplement No. 6 to provide Shore Power Service under this Rate Schedule. 2. The terms and conditions under which Shore Power Service is supplied are contained in the Shore Power Service Agreement (Electric Tariff Supplement No. 86). The Port Customer will pay to BC Hydro the charges set out in this Rate Schedule in addition to any charges set out in the Shore Power Service Agreement.

	3. A Port Customer that provides Port Electricity at a Port Facility under Rate Schedules 1600, 1601, 1610, 1611 (Large General Service) or 1823 (Stepped Rate) is not eligible to take Shore Power Service under this Rate Schedule to provide Port Electricity to that Port Facility, or a Port Facility served by the same BC Hydro delivery facilities. 4. On each occasion, if any, that BC Hydro is required to dispatch power line technicians or other workers to operate the switchgear for each connect and disconnect of Eligible Vessels docked at the Port Customer's Port Facility, BC Hydro will charge, and the Port Customer will pay, the reasonable time and labour costs for this service. The charge will be based on prevailing BC Hydro contracted labour rates and will be separately itemized on the Port Customer's monthly bill.
Taxes	The rates set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.

5. TRANSMISSION SERVICE

RATE SCHEDULE 3808 – TRANSMISSION SERVICE – FORTISBC INC.

Availability	This Rate Schedule is available to FortisBC Inc. (FortisBC) in accordance with the terms and conditions of the Agreement between BC Hydro and FortisBC entered into and deemed effective July 1, 2014 (Power Purchase Agreement). Contract Demand must not exceed 200 MW in any hour.
Applicable in	For Electricity delivered to FortisBC at each Point of Delivery as defined in the Power Purchase Agreement.
Rate	**Demand Charge:** $8.642~~8.655~~ per kW of Billing Demand per Billing Month plus **Energy Charge:** Tranche 1 Energy Price: 5.065~~5.073~~ ¢ per kWh Tranche 2 Energy Price: 9.509 ¢ per kWh

ACCEPTED:______________________________

ORDER NO.______________________________ ______________________________
COMMISSION SECRETARY

Definitions	1. Billing Demand The Billing Demand in any Billing Month will be the greatest of: (a) The maximum amount of Electricity (in kW) scheduled under the Power Purchase Agreement, for any hour of the Billing Month; (b) 75% of the maximum amount of Electricity (in kW) scheduled under the Power Purchase Agreement in any hour in the 11 months of the Term immediately prior to the Billing Month (or less than 11 months, if the Effective Date is less than 11 months prior to the month); and (c) 50% of the Contract Demand (in kW) for the Billing Month. If FortisBC has reduced the Contract Demand in accordance with the Power Purchase Agreement, the amount of Electricity specified in item (b) above may not exceed an amount equal to 100% of the Contract Demand. 2. Maximum Tranche 1 Amount The Maximum Tranche 1 Amount for each Contract Year is 1,041 GWh. 3. Scheduled Energy Less Than or Equal to Annual Energy Nomination In any Contract Year, for the amount of the Scheduled Energy taken or deemed to be taken that is less than or equal to the Annual Energy Nomination, FortisBC will pay: (a) The Tranche 1 Energy Price for each kWh of such Scheduled Energy taken or deemed taken that is less than or equal to the Maximum Tranche 1 Amount; and (b) The Tranche 2 Energy Price for each kWh of such Scheduled Energy taken that exceeds the Maximum Tranche 1 Amount.

ACCEPTED:____________________________

ORDER NO.____________________________ ____________________________

COMMISSION SECRETARY

	4. Scheduled Energy Exceeding the Annual Energy Nomination In any Contract Year, for the amount of the Scheduled Energy taken or deemed to be taken that exceeds the Annual Energy Nomination, FortisBC will pay: (a) 150% of the Tranche 1 Energy Price, for each kWh of such Scheduled Energy taken or deemed taken that that exceeds the Annual Energy Nomination, but is less than or equal to the Maximum Tranche 1 Amount; and (b) 115% of the Tranche 2 Energy Price, for each kWh of such Scheduled Energy taken that exceeds the Annual Energy Nomination and also exceeds the Maximum Tranche 1 Amount. 5. Annual Minimum Take In any Contract Year, FortisBC will schedule and take an amount of Electricity equal to at least 75% of the Annual Energy Nomination, and will be responsible for any Annual Shortfall.
Note	The terms and conditions under which Service is supplied to FortisBC are contained in the Power Purchase Agreement.
Taxes	The rates and charges set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.

ACCEPTED:______________________

ORDER NO.______________________

Schedule 01

Point-To-Point Transmission Service

Availability	For transmission of electricity on a firm and non-firm basis from one or more Point(s) of Receipt (POR) to one or more Point(s) of Delivery (POD).
Rate for Long-Term Firm Service	The Reserved Capacity Charge for the Long-Term Firm Service Rate will be up to a maximum price as set out below except where the POD is a point of interconnection between the Transmission System and the transmission system of FortisBC Inc., in which case the rate shall be zero ($0.00). The Maximum Reserved Capacity Charge is $78,262~~78,862~~/MW of reserved capacity per year to be invoiced monthly. Reserved Capacity Billing Demand The Reserved Capacity Billing Demand is determined for each POR(s), POD(s) pair. The Reserved Capacity for each pair of POR(s) and POD(s) will be the maximum non-coincident sum of the designated POR(s) and POD(s) included in the pair.

Schedule 01 – Point-To-Point Transmission Service (continued)

Rate for Short-Term Firm and Non-Firm Service	The posted prices for Short-Term Firm and Non-Firm Service will be less than or equal to a maximum price ($/MWh) as set out below, except where the POD is a point of interconnection between the Transmission System and the transmission system of FortisBC Inc., in which case the rate shall be zero ($0.00). Maximum Price for: 1. Monthly delivery: $6,521.81~~6,571.79~~/MW of Reserved Capacity per month. 2. Weekly delivery: $1,505.03~~1,516.57~~/MW of Reserved Capacity per week. 3. Daily delivery: $214.42~~216.06~~/MW of Reserved Capacity per day. 4. Hourly delivery: $8.93~~9.00~~/MW of Reserved Capacity per hour. Discount Rate: For discounted paths posted on the Transmission Provider's OASIS, the Transmission Customer shall pay each month for Reserved Capacity Billing Demand the greater of the rates set forth below and the rate offered by the Transmission Customer and accepted by the Transmission Provider up to the maximum rate for Short-Term Firm and Non-Firm Service: 1. Hourly delivery: $3/MW of Reserved Capacity per hour in the Heavy Load Hour period (06:00-22:00, Monday - Saturday, excluding NERC holidays) and $1/MW of Reserved Capacity per hour for the Light Load Hour period (remaining hours and days). 2. Daily delivery: sum of the hourly delivery charge in the 24 hour period in the day.
Reserved Capacity for Short-Term Firm and Non-Firm Services	The Reserved Capacity shall be the maximum of the sum of non-coincident POD(s) Capacity Reservations or sum of non-coincident POR(s) Capacity Reservations.

Schedule 01 – Point-To-Point Transmission Service (continued)

Penalty Charge	In addition to the applicable rate for service and associated charges for Ancillary Services, a penalty charge will be applied to all unauthorized usage at a rate of 125 percent of the maximum hourly delivery charge.
Special Conditions	Discounts: The following conditions apply to discounts for transmission service: 1. any offer of a discount made by BC Hydro must be announced to all Eligible Customers solely by posting on the OASIS, 2 any customer-initiated requests for discounts (including requests for use by one's wholesale merchant or an affiliate's use) must occur solely by posting on the OASIS, 3. once a discount is negotiated, details must be immediately posted on the OASIS, and 4. for any discount agreed upon for service on a path, from POR(s) POD(s), BC Hydro must offer the same discounted transmission service rate for the same time period to all Eligible Customers on all unconstrained transmission paths that go to the same POD(s) on the Transmission System.
Taxes	The Rate and Charges contained herein are exclusive of applicable taxes.
Resales	The rates and rules governing charges and discounts stated above shall not apply to resales of transmission service, compensation for which shall be governed by section 23.1 of the Tariff
Note	The terms and conditions under which Transmission Service is supplied are contained in BC hydro's Open Access Transmission Tariff. Capitalized terms appearing in this Rate Schedule, unless otherwise noted, shall have the meaning ascribed to them therein.

Effective April 1, 2021, this ~~interim~~ rate schedule is approved.

Schedule 03

Scheduling, System Control, and Dispatch Service

Preamble	This service is required to schedule the movement of power through, out of, within, or into a Control Area. This service can be provided only by the operator of the Control Area in which the transmission facilities used for transmission service are located. Scheduling, System Control and Dispatch Service is to be provided directly by BC Hydro. The Transmission Customer must purchase this service from BC Hydro. The charges for Scheduling, System Control and Dispatch Service are to be based on the rates set forth below.
Availability	In support of Network Integration Transmission Service, Long and Short-Term Firm Point-to-Point Transmission Service, and Non-Firm Point-to-Point Transmission Service.
Rate	$0.152~~0.155~~ per MW of Reserved Capacity per hour.
Taxes	The Rate and Charges contained herein are exclusive of applicable taxes.
Note	A description of the methodology for discounting Scheduling, System Control and Dispatch Services provided under this Schedule is contained in Section 3 of the BC Hydro OATT.

Effective April 1, 2021, this ~~interim~~ rate schedule is approved.

1. RESIDENTIAL SERVICE

RATE SCHEDULES 1101, 1121 – RESIDENTIAL SERVICE

Availability	For Residential Service. Service is normally single phase, 60 hertz at the Secondary Voltage available. In BC Hydro's discretion, Service may be three phase 120/208 or 240 volts.
Applicable in	Rate Zone I.
Rate	1. Rate Schedule 1101 – Residential Service: **Basic Charge:** 20.77 ¢ per day plus **Energy Charge:** (a) For Customers billed monthly: Step 1: First 675 kWh per month@ 9.39 ¢/kWh Step 2: Additional kWh per month@ 14.08 ¢/kWh (b) For Customers billed bi-monthly: Step 1: First 1350 kWh per two months@ 9.39 ¢/kWh Step 2: Additional kWh per two months@ 14.08 ¢/kWh Note: For billing purposes, Step 1 is pro-rated on a daily basis. **Minimum Charge:** The Basic Charge

	2. Rate Schedule 1121 – Multiple Residential Service: **Basic Charge:** 20.77 ¢ per Dwelling per day plus **Energy Charge:** Per Dwelling (a) For Customers billed monthly: Step 1: First 675 kWh. per month@ 9.39 ¢/kWh Step 2: Additional kWh per month@ 14.08 ¢/kWh (b) For Customers billed bi-monthly: Step 1: First 1350 kWh per two months@ 9.39 ¢/kWh Step 2: Additional kWh per two months@ 14.08 ¢/kWh Note: For billing purposes, Step 1 is pro-rated on a daily basis. **Minimum Charge:** The Basic Charge per Dwelling
Discount for Ownership of Transformers	A discount of 25 ¢ per month per kW of Maximum Demand will be applied to amounts owing under Rate Schedule 1121 if the Customer supplies Transformation. BC Hydro will install Metering Equipment with both Demand and Energy measurement capability at the Secondary Voltage.
Special Conditions	1. The maximum capacity of all heating elements energized at any one time in all water heaters at the Premises served under these Rate Schedules must not exceed the greater of 1,500 watts and 45 watts per litre (200 watts per imperial gallon) of tank capacity, except with BC Hydro's advance written permission. 2. Rate Schedule 1121 applies if the Premises contains more than two Dwellings.

1. RESIDENTIAL SERVICE

RATE SCHEDULE 1105 – RESIDENTIAL SERVICE – DUAL FUEL (CLOSED)

Availability	For residential space heating and water heating. Electricity purchased under this Rate Schedule will be separately metered. Service is single phase, 60 hertz, at 120/240 or 240 volts. This Rate Schedule is available only for Premises served under this Rate Schedule on January 15, 1990 and continuously thereafter and only in Premises where there has been no change in Customer since April 1, 2008.
Applicable in	Rate Zone I in areas where and when, in BC Hydro's opinion, BC Hydro's transmission, sub-transmission and distribution circuit feeders are or will be capable of handling the load.
Rate	**Energy Charge:** 8.58 ¢ per kWh
Special Conditions	1. Service under this Rate Schedule is not available to any Premises where Service was previously supplied and Terminated. 2. BC Hydro will upgrade an existing Service Connection supplying firm load to serve additional load in accordance with the Electric Tariff, however, no new or additional load is permitted under this Rate Schedule at any time. All unauthorized consumption of Electricity as estimated by BC Hydro will be billed at the rate for Electricity on the appropriate default Residential Service Rate Schedule. 3. The maximum capacity of all heating elements energized at any one time in all water heaters at the Premises served under this Rate Schedule must not exceed the greater of 1,500 watts and 45 watts per litre (200 watts per imperial gallon) of tank capacity, except with BC Hydro’s advance written permission.

____
COMMISSION SECRETARY

Discount for Ownership of Transformers	A discount of 25 ¢ per month per kW of Maximum Demand will be applied to amounts owing under Rate Schedule 1161 if the Customer supplies Transformation. BC Hydro will install Metering Equipment with both Demand and Energy measurement capability at the Secondary Voltage.
Special Conditions	The maximum capacity of all heating elements energized at any one time in all water heaters at the Premises served under these Rate Schedules must not exceed the greater of 1,500 watts and 45 watts per litre (200 watts per imperial gallon) of tank capacity, except with BC Hydro's advance written permission.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under these Rate Schedules, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rates under these Rate Schedules include a rate increase of 1.00% before rounding.

2. GENERAL SERVICE

RATE SCHEDULES 1200, 1201, 1210, 1211 – EXEMPT GENERAL SERVICE (35 KW AND OVER)

Availability	For Customers who qualify for General Service where supply is 60 hertz, single or three phase at Secondary or Primary Voltage and Billing Demand is 35 kW or more. BC Hydro reserves the right to determine the voltage of the Service Connection.
Applicable in	Rate Zone IB.
Rate	**Basic Charge:** 26.56 ¢ per day plus **Demand Charge:** First 35 kW of Billing Demand per Billing Period @ \$0.00 per kW Next 115 kW of Billing Demand per Billing Period @ \$6.47 per kW All additional kW of Billing Demand per Billing Period @ \$12.41 per kW plus **Energy Charge:** First 14800 kWh of Energy consumption in the Billing Period @ 12.64 ¢ per kWh All additional kWh of Energy consumption in the Billing Period @ 6.07 ¢ per kWh
Discounts	1. A discount of 1½% will be applied to the above charges if a Customer's supply of Electricity is metered at a Primary Voltage. 2. A discount of 25 ¢ per Billing Period per kW of Billing Demand will be applied to the above charges if a Customer supplies Transformation.

ACCEPTED:______________________

ORDER NO.______________________

____
COMMISSION SECRETARY

	3. If a Customer is entitled to both of the above discounts, the discount for metering at a Primary Voltage will be applied first.
Monthly Minimum Charge	50% of the highest Demand Charge billed in any Billing Period wholly within an on-peak period during the immediately preceding 11 Billing Periods. For the purpose of this provision an on-peak period commences on November 1 in any year and terminates on March 31 of the following year.
Rate Schedules	1. Rate Schedule 1200: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and BC Hydro supplies Transformation. 2. Rate Schedule 1201: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and BC Hydro supplies Transformation. 3. Rate Schedule 1210: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and the Customer supplies Transformation. 4. Rate Schedule 1211: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and the Customer supplies Transformation.
Definitions	Billing Demand is the Maximum Demand in the Billing Period, subject to Special Condition No. 1. Billing Period means a month between regular meter readings, provided that in cases where meter readings are not available or are delayed for any reason BC Hydro may vary the number of days in the Billing Period.

ACCEPTED:____________________

ORDER NO.____________________

COMMISSION SECRETARY

Special Conditions	1. Metering Equipment with both Demand and Energy measurement capability will normally be installed. Until such Metering Equipment is installed, or if the installed Metering Equipment does not have Demand measurement capability, Billing Demand will be as estimated by BC Hydro. 2. Migration rule: Customers taking Service under these Rate Schedules will be moved to Service under Rate Schedule 1300, 1301, 1310 or 1311 (Small General Service) if Billing Demand in each of the last 12 consecutive Billing Periods was less than 35 kW.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under these Rate Schedules, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rates under these Rate Schedules include a rate increase of 1.00% before rounding.

2. GENERAL SERVICE

RATE SCHEDULES 1205, 1206, 1207 – GENERAL SERVICE – DUAL FUEL (CLOSED)

Availability	For general space heating, water heating and industrial process heating. Electricity purchased under these Rate Schedules will be separately metered. Service is 60 hertz single or three phase at the Secondary or Primary Voltage available. BC Hydro reserves the right to determine the voltage of the Service Connection. These Rate Schedules are available only for Premises served under these Rate Schedules on January 15, 1990 and continuously thereafter, only with respect to equipment served under these Rate Schedules on January 15, 1990 and continuously thereafter, and only in Premises where there has been no change in Customer since April 1, 2008.
Applicable in	Rate Zone I in areas where, in BC Hydro's opinion, BC Hydro's transmission, sub-transmission and distribution circuit feeders are or will be capable of handling the load.
Rate	Except as stated hereunder the rate will be: **Energy Charge:** First 8000 kWh per month @ 6.15 ¢ per kWh All additional kWh per month @ 4.02 ¢ per kWh
Rate Schedules	1. Rate Schedule 1205 – Small Commercial Applications: Applies to a Customer whose heating load is mostly in support of a commercial activity and whose firm Electricity is billed on a General Service (under 35 kW) Rate Schedule.

ACCEPTED:____________________

ORDER NO.____________________

COMMISSION SECRETARY

	2. Rate Schedule 1206 – Large Commercial Applications: Applies to a Customer whose heating load is mostly in support of a commercial activity and whose firm Electricity is billed on a General Service (35 kW and over) Rate Schedule. 3. Rate Schedule 1207 – Industrial Applications: Applies to a Customer whose heating load is mostly in support of an industrial activity and whose firm Electricity is billed on a General Service Rate Schedule or for farm use on a Residential Rate Schedule.
Special Conditions	1. Service under these Rate Schedules will not be available to any Premises beyond March 31, 2023. 2. These Rate Schedules are not available to Premises where Electricity under it was previously supplied and Terminated. 3. No other load than that stipulated in the Availability clause is permitted under these Rate Schedules. Any unauthorized use of Electricity or any refusal by a Customer to permit access to Premises in accordance with the Terms and Conditions of BC Hydro's Electric Tariff will result in immediate Termination under the applicable Rate Schedule and all unauthorized consumption as estimated by BC Hydro will be billed at the rate for Electricity on the appropriate default General Service Rate Schedule. 4. In addition to and without restriction of any other limitations of liability of BC Hydro, BC Hydro will specifically not be liable for any loss, damage, injury or expense occasioned to or suffered by any Customer receiving Service on these Rate Schedules, or by any other Person, for any reason whatsoever. 5. Replacement of existing heating equipment is allowed provided the rated capacity (equivalent kW) of the new equipment is not higher than the existing equipment. No new load or additional load is allowed

Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under these Rate Schedules, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rates under these Rate Schedules include a rate increase of 1.00% before rounding.

ACCEPTED:__________________________

2. GENERAL SERVICE

RATE SCHEDULE 1234 – SMALL GENERAL SERVICE (UNDER 35 KW) – ZONE II

Availability	For all purposes where a meter with Demand measurement capability is not installed because the Customer's Demand as estimated by BC Hydro is less than 35 kW. Supply is 60 hertz, single or three phase at an available Secondary Voltage.
Applicable in	Rate Zone II.
Rate	**Basic Charge:** 26.56 ¢ per day plus **Energy Charge:** First 7000 kWh per month @ 12.64 ¢ per kWh All additional kWh per month @ 21.04 ¢ per kWh **Minimum Charge:** The Basic Charge
Special Conditions	Special Conditions for Unmetered Service: 1. BC Hydro may permit unmetered Service under this Rate Schedule if it can estimate to its satisfaction the Energy used in kilowatt hours over a period of two months based on the connected load and the hours of use. 2. The Customer, if required by BC Hydro, will provide and maintain such controls, including timing devices, as BC Hydro considers necessary, and facilities satisfactory to BC Hydro for the maintenance of such controls. 3. The hours of use per period will be as specified by the Customer or as estimated by BC Hydro, whichever is greater.

ACCEPTED:____________________________

ORDER NO.____________________________

____
COMMISSION SECRETARY

4. The Customer will supply, install and maintain all wiring, fixtures, control devices and equipment, including the controls and devices described in Special Condition No. 2, at the expense of the Customer.

5. All wiring, fixtures, control devices and equipment and the method of installing, operating and maintaining the same are subject to the approval of BC Hydro which approval may be withdrawn by BC Hydro, at any time, at BC Hydro's sole discretion.

6. The Customer will notify BC Hydro immediately of any proposed or actual change in load, load characteristics, or hours of use.

7. BC Hydro may at any time, in its sole discretion, install Metering Equipment, and thereafter bill the Customer on the appropriate Rate Schedule as a metered account.

8. For display signs and signboard lighting, where hours of use are controlled by timing devices, the following turn-on times will apply, unless BC Hydro otherwise agrees in writing:

Period	Turn-on Time
January 1 to January 15:	4:00 p.m.
January 16 to February 28:	4:30 p.m.
March 1 to April 30:	6:30 p.m.
May 1 to August 15:	8:30 p.m.
August 16 to September 30:	6:30 p.m.
October 1 to November 15:	4:30 p.m.
November 16 to December 31:	4:00 p.m.

ACCEPTED:__________________________

ORDER NO.__________________________

COMMISSION SECRETARY

	9. In all cases, where hours of use of display signs or signboard lighting commence at dusk and are controlled either by timing devices or by photo-electric cells, the following hours of use for a period of two months will be deemed for billing purposes: Dusk to 10 p.m.: 216 hours Dusk to 11 p.m.: 270 hours Dusk to 12 p.m.: 330 hours Dusk to 1 a.m.: 380 hours Dusk to Dawn: 666 hours (All times are Pacific Time.)
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rates under this Rate Schedule include a rate increase of 1.00% before rounding.

2. GENERAL SERVICE

RATE SCHEDULE 1253 – DISTRIBUTION SERVICE – IPP STATION SERVICE

Availability	For Customers who are Independent Power Producers (**IPPs**) served at distribution voltage, on an interruptible basis.
Applicable in	Rate Zone I excluding Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Energy Charge:** The sum, over the billing period, of the hourly Energy consumed multiplied by the entry in the Intercontinental Exchange (**ICE**) Mid Columbia (Mid-C) Peak, and Mid-C Off-Peak weighted average index price as published by the ICE in the ICE Day Ahead Power Price Report that corresponds to the time when consumption occurred, during that hour.
Monthly Minimum Charge	$48.70
Special Conditions	1. BC Hydro agrees to provide Electricity under this Rate Schedule to the extent that it has energy and capacity to do so. 2. BC Hydro may, without notice to the Customer, refuse to supply or terminate the supply of Electricity under this Rate Schedule if at any time BC Hydro does not have sufficient energy or capacity. 3. Prior to taking Electricity under this Rate Schedule, the Customer may be required to obtain approval from BC Hydro. BC Hydro will advise the Customer of the need to obtain approval prior to the taking of Electricity under this Rate Schedule. 4. Electricity taken under this Rate Schedule is to be used solely for maintenance and black-start requirements and will not displace electricity that would normally be generated by the Customer.

ACCEPTED:__________________________

ORDER NO.____________________________

COMMISSION SECRETARY

2. GENERAL SERVICE

RATE SCHEDULES 1255, 1256, 1265, 1266 – GENERAL SERVICE (35 KW AND OVER) – ZONE II

Availability	For all purposes. Supply is 60 hertz, single or three phase at Secondary or Primary Voltage. BC Hydro reserves the right to determine the voltage of the Service Connection.
Applicable in	Rate Zone II.
Rate	**Basic Charge:** 26.56 ¢ per day plus **Energy Charge:** First 200 kWh per kW of Billing Demand per month @ 12.64 ¢ per kWh All additional kWh per month @ 21.04 ¢ per kWh
Discounts	1. A discount of 1½% will be applied to the above charges if a Customer's supply of Electricity is metered at a Primary Voltage. 2. A discount of 25 ¢ per month per kW of Billing Demand will be applied to the above rate if a Customer supplies Transformation. 3. If a Customer is entitled to both of the above discounts the discount for metering at a Primary Voltage will be applied first.
Monthly Minimum Charge	The monthly minimum charge to be paid by a Customer on Rate Schedule 1255, 1256, 1265 or 1266, as applicable, will be the charge the Customer would have been billed under Rate Schedule 1200, 1201, 1210 or 1211 (Exempt General Service – 35 kW and over), respectively.
Rate Schedules	1. Rate Schedule 1255: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and BC Hydro supplies Transformation.

	2. Rate Schedule 1256: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and BC Hydro supplies Transformation. 3. Rate Schedule 1265: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and the Customer supplies Transformation. 4. Rate Schedule 1266: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and the Customer supplies Transformation.
Special Conditions	1. Metering Equipment with both Demand and Energy measurement capability will normally be installed. Until such Metering Equipment is installed, or if the installed Metering Equipment does not have Demand measurement capability, Billing Demand will be as estimated by BC Hydro. 2. Where the Customer's Demand is or is likely to be in excess of 45 kVA, BC Hydro may require such Customer to execute a special contract for Service, including such special conditions as BC Hydro, in its sole discretion considers necessary.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under these Rate Schedules, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rates under these Rate Schedules include a rate increase of 1.00% before rounding.

ACCEPTED:____________________________

ORDER NO.____________________________

COMMISSION SECRETARY

2. GENERAL SERVICE

RATE SCHEDULE 1268 – DISTRIBUTION SERVICE – IPP DISTRIBUTION TRANSPORTATION ACCESS

Availability	For Customers who have generators connected to BC Hydro's distribution system and who want to access BC Hydro's transmission system pursuant to and in accordance with BC Hydro's Open Access Transmission Tariff (OATT).
Applicable in	Rate Zone I excluding Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Distribution Transportation Charge:** 0.196 ¢ per kWh
Special Conditions	1. The Customer is required to pay the costs, including the cost of altering existing facilities, to connect the generator to BC Hydro's distribution system in accordance with BC Hydro's Connection Requirements for Utility or Non-Utility Generation, 35 kV and Below. 2. For Customers with self-generation (i.e., with a Customer Baseline Load (**CBL**) greater than zero), this Rate Schedule is only applicable to sales of Surplus Energy. It may not be used by self-generating Customers who appear to have varied their demand for power from BC Hydro based on the actual or anticipated difference between BC Hydro's rate for providing Service to them and the market price of power. 3. For the purposes of this Rate Schedule, "Surplus Energy" in any period is the energy made available from generation by the Customer calculated as the difference between the Customer's CBL and the Customer's actual consumption from BC Hydro in that period.

ACCEPTED:______________________________

ORDER NO.______________________________ ______________________________

COMMISSION SECRETARY

	4. The Customer's CBL is established, in general, by determining the Customer's Energy consumption, on a monthly basis, for the past three years; in cases where inadequate history exists, alternative methods may be used to determine a Customer's CBL. Once established, the Customer's CBL will not be automatically adjusted for changes in the Customer's net metered consumption from BC Hydro. Any subsequent changes to the CBL must be due to changes in the Customer's load and not due to changes in its generation. The Customer must provide metered output from its generator which demonstrates an increase in generation output commensurate in time and amount with the Surplus Energy transported using this Rate Schedule. Where it appears that the Customer has transported on this Rate Schedule Energy that is not Surplus Energy, BC Hydro will provide replacement energy to the Customer's load at market prices, subject to Commission approval for such sales. 5. The metering point to determine the electricity being delivered to BC Hydro's distribution system will be determined by BC Hydro. The electricity delivered to BC Hydro's distribution system will also be deemed to be delivered to BC Hydro's transmission system (that is, no distribution loss adjustment will be applied to the electricity from an independent power producer or self-generator when determining capacity and energy delivered to BC Hydro's transmission system).
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rate under this Rate Schedule includes a rate increase of 1.00% before rounding.

ACCEPTED:__________________________

ORDER NO.__________________________

COMMISSION SECRETARY

2. GENERAL SERVICE

RATE SCHEDULE 1280 – SHORE POWER SERVICE (DISTRIBUTION)

Availability	For the supply of Shore Power to Port Customers who qualify for General Service for use by Eligible Vessels while docked at the Port Customer's Port Facility, on an interruptible basis. Shore Power Service is supplied at 60 Hz, three phase at Primary Voltage.
Applicable in	Rate Zone I.
Rate	**Administrative Charge:** \$150.00 per month plus **Energy Charge:** 10.442 ¢ per kWh
Special Conditions	1. BC Hydro agrees to provide Electricity under this Rate Schedule to the extent that it has energy and capacity to do so. BC Hydro may refuse or Terminate Service under this Rate Schedule in circumstances where BC Hydro does not have sufficient energy or capacity. For greater certainty, BC Hydro will not be required to construct an Extension for the purpose of increasing the capacity of BC Hydro's distribution system to provide Shore Power Service under this Rate Schedule. 2. The terms and conditions under which Shore Power Service is supplied are contained in the Shore Power Service Agreement (Electric Tariff Supplement No. 86). The Port Customer will pay to BC Hydro the charges set out in this Rate Schedule in addition to any charges set out in the Shore Power Service Agreement. 3. A Port Customer that provides Port Electricity at a Port Facility under Rate Schedules 1600, 1601, 1610, 1611 or 1823 is not eligible to take Shore Power Service under this Rate Schedule to provide Port Electricity to that Port Facility, or any Port Facility served by the same BC Hydro delivery facilities.

ACCEPTED:______________________________

ORDER NO.______________________________

____
COMMISSION SECRETARY

	4. On each occasion, if any, that BC Hydro is required to dispatch power line technicians or other workers to operate the switchgear for each connect and disconnect of Eligible Vessels docked at the Port Customer's Port Facility, BC Hydro will charge, and the Port Customer will pay, the reasonable time and labour costs for this service. The charge will be based on prevailing BC Hydro contracted labour rates and will be separately itemized on the Port Customer's monthly bill.
Definitions	For purposes of this Rate Schedule, capitalized terms have the meanings given to them in Electric Tariff Supplement No. 86.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.

2. GENERAL SERVICE

RATE SCHEDULES 1300, 1301, 1310, 1311 – SMALL GENERAL SERVICE (UNDER 35 KW)

Availability	For Customers who qualify for General Service and whose Demand, metered or estimated by BC Hydro, as applicable, is less than 35 kW. Supply is 60 hertz, single or three phase at a Secondary or Primary Voltage.
Applicable in	Rate Zone I and Rate Zone IB.
Rate	**Basic Charge:** 36.22 ¢ per day plus **Energy Charge:** 12.45 ¢ per kWh **Minimum Charge:** The Basic Charge
Discounts	1. A discount of 1½% will be applied to the above charges if Customer's supply of Electricity is metered at a Primary Voltage. 2. A discount of 25 ¢ per month per kW of Demand will be applied if a Customer supplies Transformation. 3. If a Customer is entitled to both of the above discounts, the discount for metering at a Primary Voltage will be applied first.
Rate Schedules	1. Rate Schedule 1300: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and BC Hydro supplies Transformation. 2. Rate Schedule 1301: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and BC Hydro supplies Transformation.

	3. Rate Schedule 1310: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and the Customer supplies Transformation. 4. Rate Schedule 1311: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and the Customer supplies Transformation.
Special Conditions	Special Conditions for Unmetered Service: 1. BC Hydro may permit unmetered Service under these Rate Schedules if it can estimate to its satisfaction the Energy used in kilowatt hours over a period of two months based on the connected load and the hours of use. 2. The Customer, if required by BC Hydro, will provide and maintain such controls, including timing devices, as BC Hydro considers necessary, and facilities satisfactory to BC Hydro for the maintenance of such controls. 3. The hours of use per period will be as specified by the Customer, or as estimated by BC Hydro, whichever is greater. 4. The Customer will supply, install and maintain all wiring, fixtures, control devices and equipment, including the controls and devices described in Special Condition No. 2, at the expense of the Customer. 5. All wiring, fixtures, control devices and equipment and the method of installing, operating and maintaining the same are subject to the approval of BC Hydro which approval may be withdrawn by BC Hydro, at any time, at BC Hydro's sole discretion. 6. The Customer will notify BC Hydro immediately of any proposed or actual change in load, load characteristics, or hours of use.

7. BC Hydro may at any time, in its sole discretion, install Metering Equipment, and thereafter bill the Customer on the appropriate Rate Schedule as a metered account.

8. For display signs and signboard lighting, where hours of use are controlled by timing devices, the following turn-on times will apply, unless BC Hydro otherwise agrees in writing:

Period	Turn-on Time
January 1 to January 15:	4:00 p.m.
January 16 to February 28:	4:30 p.m.
March 1 to April 30:	6:30 p.m.
May 1 to August 15:	8:30 p.m.
August 16 to September 30:	6:30 p.m.
October 1 to November 15:	4:30 p.m.
November 16 to December 31:	4:00 p.m.

9. In all cases, where hours of use of display signs or signboard lighting commence at dusk and are controlled either by timing devices or by photo-electric cells, the following hours of use for a period of two months will be deemed for billing purposes:

Dusk to 10 p.m.:	216 hours
Dusk to 11 p.m.:	270 hours
Dusk to 12 p.m.:	330 hours
Dusk to 1 a.m.:	380 hours
Dusk to Dawn:	666 hours

(All times are Pacific Time.)

2. GENERAL SERVICE

RATE SCHEDULES 1500, 1501, 1510, 1511 – MEDIUM GENERAL SERVICE (35 KW OR GREATER AND LESS THAN 150 KW)

Availability	For Customers who qualify for General Service and whose Billing Demand is equal to or greater than 35 kW but less than 150 kW, and whose Energy consumption in any 12-month period is equal to or less than 550,000 kWh. Supply is 60 hertz, single or three phase at Secondary or Primary Voltage. BC Hydro reserves the right to determine the voltage of the Service Connection.
Applicable in	Rate Zone I.
Rate	**Basic Charge:** 26.56 ¢ per day plus **Demand Charge:** $5.38 per kW of Billing Demand plus **Energy Charge:** 9.62 ¢ per kWh
Discounts	1. A discount of 1½% will be applied to the above charges if a Customer's supply of Electricity is metered at a Primary Voltage. 2. A discount of 25 ¢ per Billing Period per kW of Billing Demand will be applied to the above charges if a Customer supplies Transformation. 3. If a Customer is entitled to both of the above discounts, the discount for metering at a Primary Voltage will be applied first.

2. GENERAL SERVICE

RATE SCHEDULES 1640, 1641, 1642, 1643 – OVERNIGHT RATE (150 KW AND OVER)

Availability	For Customers who qualify for General Service where the Customer is a business, government agency or other organization. For use only for separately metered charging of Electric Fleet Vehicles or Vessels owned or leased by, and operated by, the Customer, at Maximum Demand equal to or greater than 150 kW. Supply is 60 hertz, single or three phase at Secondary or Primary Voltage. BC Hydro reserves the right to determine the voltage of the Service Connection.
Applicable in	Rate Zone 1.
Rate	**Basic Charge:** 26.56 ¢ per day plus **Demand Charge:** $12.26 per kW of Billing Demand per Billing Period plus **Energy Charge:** 7.41 ¢ per kWh
Discounts	1. A discount of 1½% will be applied to the above charges if a Customer's supply of Electricity is metered at a Primary Voltage. 2. A discount of 25 ¢ per Billing Period per kW of Billing Demand will be applied to the above charges if a Customer supplies Transformation. 3. If a Customer is entitled to both of the above discounts, the discount for metering at a Primary Voltage will be applied first.

Monthly Minimum Charge	50% of the highest Demand Charge billed in any Billing Period wholly within an on-peak period during the immediately preceding 11 Billing Periods. For the purpose of this provision an on-peak period commences on November 1 in any year and terminates on March 31 of the following year.
Rate Schedules	1. Rate Schedule 1640: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and BC Hydro supplies Transformation. 2. Rate Schedule 1641: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and BC Hydro supplies Transformation. 3. Rate Schedule 1642: Applies if a Customer's supply of Electricity is metered at a Secondary Voltage and the Customer supplies Transformation. 4. Rate Schedule 1643: Applies if a Customer's supply of Electricity is metered at a Primary Voltage and the Customer supplies Transformation.
Definitions	1. Billing Demand The Billing Demand will be the highest kW Demand between the hours 06:00 and 22:00 daily in the Billing Period. Notwithstanding the foregoing, the Billing Demand will be the highest kW Demand in the Billing Period for the purposes of determining: (i) any discount under this Rate Schedule for Customer supplied Transformation; and (ii) BC Hydro’s contribution towards an Extension under section 8.3 (Extension Fee for Rate Zone I).

	2. Billing Period A month between regular meter readings, provided that where meter readings are not available or are delayed for any reason BC Hydro may vary the number of days in the Billing Period. 3. Electric Fleet Vehicle or Vessel A Vehicle or Vessel that: (a) Is powered entirely or partially by electricity; and (b) Is part of a group of similar Vehicles or Vessels that are used for similar purposes. 4. Vehicle A vehicle used for transportation, not run on rails, and includes, without limitation, buses, medium duty trucks and heavy duty trucks. 5. Vessel A watercraft used for transportation and includes, without limitation, passenger and vehicle ferries, tugs and barge transportation.
Special Conditions	1. Metering Metering Equipment with both Demand and Energy measurement capability will be installed. Only charging of Electric Fleet Vehicles or Vessels and related equipment will be served under these Rate Schedules. 2. Migration Customers taking service under these Rate Schedules will not be migrated to Rate Schedules 1300, 1301, 1310, or 1311 (Small General Service) or Rate Schedules 1500, 1501, 1510 or 1511 (Medium General Service) due to changes in load size. BC Hydro will review this Special Condition in its evaluation report planned for the third year after which the rate commences.

Rate Increase	Effective April 1, 2021 the rates under these Rate Schedules include a rate increase of 1.00% before rounding.

2. GENERAL SERVICE

RATE SCHEDULES 1650, 1651, 1652, 1653 – DEMAND TRANSITION RATE (150 KW AND OVER)

Availability	For Customers who qualify for General Service where the Customer is a business, government agency or other organization. For use only for separately metered charging of Electric Fleet Vehicles or Vessels owned or leased by, and operated by, the Customer, at Maximum Demand equal to or greater than 150 kW. Supply is 60 hertz, single or three phase at Secondary or Primary Voltage. BC Hydro reserves the right to determine the voltage of the Service Connection.
Applicable in	Rate Zone 1.
Termination Date	These Rate Schedules will terminate effective March 31, 2032. As of April 1, 2032 customers will be migrated to Rate Schedules 16xx or the otherwise applicable rate.
Rate	**Basic Charge:** 26.56 ¢ per day plus **Demand Charge:** $0 per kW of Billing Demand until March 31, 2026 plus **Energy Charge:** 9.12 ¢ per kWh
Discounts	1. A discount of 1½% will be applied to the above charges if a Customer's supply of Electricity is metered at a Primary Voltage. 2. A discount of 25 ¢ per Billing Period per kW of Billing Demand will be applied to the above charges if a Customer supplies Transformation. 3. If a Customer is entitled to both of the above discounts, the discount for metering at a Primary Voltage will be applied first.

Definitions	1. Irrigation Season: In respect of each Service Connection the period commencing with a meter reading on or about March 1 in any year, having a mid-season meter reading on or about July 31, and ending with a meter reading on or about October 31 in that same year. BC Hydro may, in its discretion extend such period by postponing the termination date to any date not later than November 30, for the sole purpose of permitting a Customer to fill reservoirs necessary for the operation of the irrigation or sprinkling system. 2. Non-Irrigation Season: The period commencing at the end of one Irrigation Season and terminating at the beginning of the next Irrigation Season.
Special Conditions	1. No equipment provided with Electricity under this Rate Schedule will be served with Electricity under any other Rate Schedule while the Customer's Service Agreement under this Rate Schedule is in force. 2. Normally the Service Connection will be energized during the Non-Irrigation Season, but will be Disconnected if a Customer so requests. 3. The Minimum Charge during the Irrigation Season will commence in March for an account that has not been Terminated by the Customer, whether or not the Service Connection is energized and will be billed in two installments, at the end of July and at the end of October. 4. For the Irrigation Season, a bill will be rendered following the July and October meter readings. The first bill will be the greater of the Energy Charge and the Minimum Charge for the period March 1 to July 31. The second bill will be the greater of the Energy Charge for the season and the Minimum Charge for the season, less payment received for the first billing charges.

4. STREET LIGHTING SERVICE

RATE SCHEDULE 1701 – OVERHEAD STREET LIGHTING

Availability	For lighting of public highways, streets and lanes in cases where BC Hydro owns, installs and maintains the fixtures, conductors, controls and poles.
Applicable in	Any area served by suitable overhead distribution lines.
Rate	Per fixture per month as set out below: 50 watt or less LED unit $15.23 51 to 80 watt LED unit $18.96 81 to 120 watt LED unit $23.74 greater than 120 watt LED unit $27.85 *100 watt H.P. sodium vapour unit $19.47 *150 watt H.P. sodium vapour unit $23.23 *200 watt H.P. sodium vapour unit $26.82 *175 watt mercury vapour unit $21.40 *250 watt mercury vapour unit $24.66 *400 watt mercury vapour unit $31.78 Wattages are unit wattages for LED and lamp watts for high pressure sodium vapour and mercury vapour. * Note Special Condition No. 2.
Special Conditions	1. Connection Charge No charge will be made for Service Connections.

2. Mercury Vapour and High Pressure Sodium Vapour

   Mercury vapour fixtures and high pressure sodium vapour fixtures are not available for new installations.

3. Extension Policy

   BC Hydro will construct a distribution Extension if required by the applicant in accordance with the Terms and Conditions of the Electric Tariff as applicable.

   When, at the Customer's request, a new fixture replaces an existing fixture, the Customer will pay to BC Hydro the original cost of the existing fixture, less any accumulated depreciation, and the cost of removing the existing fixture.

4. Relocation and Redirection of Fixtures

   The Customer will pay the full cost of relocating or redirecting fixtures when the change is made at the request of the Customer.

5. Design

   BC Hydro will design the installation of overhead street lighting fixtures.

6. Street Lights Failing to Operate

   BC Hydro will, without charge, replace street lights or components that fail to operate, unless breakage is the reason for such failure in which case the Customer will be charged the cost of the material required to make the fixture operate.

7. Term of Service Agreement

   The term of the initial Service Agreement under this Rate Schedule will be not more than five years; renewal periods will be for five years.

Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
Supplemental Charge	Effective May 1, 2021, a transition rate supplemental charge equal to $2.06 per fixture per month applies to all street lights billed under this Rate Schedule, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rates under this Rate Schedule include a rate increase of 1.00% before rounding. Effective May 1, 2021 this Rate Schedule includes an interim supplemental charge.

4. STREET LIGHTING SERVICE

RATE SCHEDULE 1702 – PUBLIC AREA ORNAMENTAL STREET LIGHTING

Availability	For lighting of public highways, streets and lanes and municipal pathways and for public area seasonal lighting displays, in those cases where the Customer owns, installs and maintains the standards, fixtures, conductors and controls.
Applicable in	All Rate Zones.
Rate	**Energy Charge:** For each unmetered fixture: 3.75 ¢ per watt of Billing Wattage per month For each metered fixture: 11.25 ¢ per kWh
Definitions	Billable Wattage is the sum of all wattage, on all fixtures used by the Customer. For fixtures without dimming controls, the watts per fixture will include the wattage of the lamp plus, where applicable, the wattage of the ballast. For fixtures with dimming controls, the watts per fixture will be equal to: 1. The wattage of the lamp plus, where applicable, the wattage of the ballast, multiplied by 2. The ratio of effective fixture wattage after dimming to fixture wattage before dimming.

COMMISSION SECRETARY

Special Conditions	1. Service Connection Where necessary BC Hydro will provide an overhead or underground Service Connection in accordance with the Terms and Conditions of the Electric Tariff. No Service Connection will be made to add any ornamental street lighting system which does not provide for eight or more street lighting fixtures except that, if the potential is 120/240 volts, at BC Hydro's discretion, a Service Connection may be made for a system of less than eight. Receptacle loads will be permitted for Service under this Rate Schedule provided that such receptacles are used predominantly for seasonal lighting displays, meaning that no more than 10% of the usage may be for other purposes. 2. Extension Policy BC Hydro will construct a distribution Extension if required by the applicant in accordance with the Terms and Conditions of the Electric Tariff. 3. Power Factor All installations of mercury vapour, sodium vapour or fluorescent lamps will be equipped with the necessary auxiliaries to assure that a Power Factor of not less than 90% lagging will be maintained. 4. Term of Service Agreement The term of the initial Service Agreement under this Rate Schedule will be not more than five years; renewal periods will be for five years.

5. Fixtures with Automated Dimming Controls

The following special terms and conditions apply to lighting fixtures fitted with dimming controls:

(a) For purposes of this Special Condition No. 5, "dimming controls" means control units or fittings attached to, or forming part of, a street lighting fixture capable of being programmed or remotely operated so as to reduce the lumens output of the lamps during specified hours each day while the lamps are in operation. The reductions may vary according to the hours of the day, the days of the week, and the seasons of the year.

(b) A Customer wishing to have fixtures with dimming controls separately rated under this Rate Schedule must submit a dimming schedule satisfactory to BC Hydro listing each light fixture fitted with dimming controls, the wattage of the fixture (including the lamp and, where applicable, the ballast), the dimming control setting or settings and the hours each day that the dimming control setting or settings will be in operation.

(c) Whenever the Customer wishes to make changes in the lighting fixtures listed in the dimming schedule or in the dimming control settings or hours of operation, the Customer will submit an updated lighting fixture schedule to BC Hydro listing any changes. Changes will be permitted on a semi-annual basis (twice per year).

ACCEPTED:____________________________

ORDER NO.____________________________ ____________________________________

COMMISSION SECRETARY

	6. Unmetered Service (a) BC Hydro may permit unmetered Service under this Rate Schedule if it can estimate to its satisfaction the Energy used in kilowatt hours over a period of one month based on the connected load and hours of use. (b) The Customer will notify BC Hydro immediately of any proposed or actual change in load, or load characteristics, or hours of use. (c) BC Hydro, in its discretion, may at any time install Metering Equipment and thereafter bill the Customer on the Energy consumption registered.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rates under this Rate Schedule include a rate increase of 1.00% before rounding.

4. STREET LIGHTING SERVICE

RATE SCHEDULE 1703 – STREET LIGHTING SERVICE

Availability	For lighting of public highways, streets and lanes in those cases where the Customer owns, installs and maintains the fixtures, conductors and controls on poles of BC Hydro. Available only to Customers formerly taking Service on Rate Schedule 1755, 1756, 1757, 1758, 1759 or 1767, to the City of New Westminster in respect of a portion of D.L. 172, to the Municipality of Sparwood and to the City of Vancouver.
Applicable in	The Cities of Victoria and Prince Rupert, the Municipalities of Oak Bay, Esquimalt, Saanich and Central Saanich, the Village of Sidney, the unorganized areas of Port Renfrew and Shawnigan Lake, a portion of D.L. 172 in the City of New Westminster, Natal and the City of Vancouver.
Rate	**Energy Charge:** 3.75 ¢ per watt of Billing Wattage per month plus **Contact Charge:** $1.12 per contact per month The Contact Charge is a per fixture charge for the use of pole space.
Definitions	Billable Wattage is the sum of all wattage, on all fixtures used by the Customer. For fixtures without dimming controls, the watts per fixture will include the wattage of the lamp plus, where applicable, the wattage of the ballast. For fixtures with dimming controls, the watts per fixture will be equal to: 1. The wattage of the lamp plus, where applicable, the wattage of the ballast, multiplied by 2. The ratio of effective fixture wattage after dimming to fixture wattage before dimming.

Special Conditions	1. Extension Policy No Extension will be made to provide Service to street lights under this Rate Schedule. 2. Power Factor All installations of mercury vapour, sodium vapour or fluorescent lamps will be equipped with the necessary auxiliaries to assure that a Power Factor of not less than 90% lagging will be maintained. 3. Term of Service Agreement The term of the initial Service Agreement under this Rate Schedule will be not more than five years; renewal periods will be for five years. 4. Fixtures with Automated Dimming Controls The following special terms and conditions apply to lighting fixtures fitted with dimming controls: (a) For purposes of this Special Condition No. 4, “dimming controls” means control units or fittings attached to, or forming part of, a street lighting fixture capable of being programmed or remotely operated so as to reduce the lumens output of the lamps during specified hours each day while the lamps are in operation. The reductions may vary according to the hours of the day, the days of the week, and the seasons of the year. (b) A Customer wishing to have fixtures with dimming controls separately rated under this Rate Schedule must submit a dimming schedule satisfactory to BC Hydro listing each light fixture fitted with dimming controls, the wattage of the fixture (including the lamp and, where applicable, the ballast), the dimming control setting or settings and the hours each day that the dimming control setting or settings will be in operation.

4. STREET LIGHTING SERVICE

RATE SCHEDULE 1704 – TRAFFIC CONTROL EQUIPMENT

Availability	For lighting of traffic signals, traffic signs and traffic warning devices, and other equipment for controlling or directing vehicular or pedestrian traffic on public highways in those cases where the Customer owns, installs, and maintains the standards, fixtures, controls and associated equipment.
Applicable in	All Rate Zones.
Rate	**Energy Charge:** 11.25 ¢ per kWh
Special Conditions	1. Service Connections Where necessary BC Hydro will provide an overhead or underground Service Connection in accordance with section 3 of the Terms and Conditions (Provision of Electricity). 2. Unmetered Service (a) BC Hydro may permit unmetered Service under this Rate Schedule if it can estimate to its satisfaction the Energy used in kilowatt hours over a period of one month based on the connected load and hours of use. (b) The Customer shall notify BC Hydro immediately of any proposed or actual change in load, or load characteristics, or hours of use. (c) BC Hydro, in its discretion, may at any time install a meter or meters and thereafter bill the Customer on the consumption registered.

4. STREET LIGHTING SERVICE

RATE SCHEDULE 1755 – PRIVATE OUTDOOR LIGHTING (CLOSED)

Availability	For outdoor lighting Service to illuminate property other than public streets or lanes (private property), where Service is provided from dusk to dawn and the supply is single phase, 60 hertz at the Secondary Voltage available. This Rate Schedule is available only in Premises served under this Rate Schedule on January 1, 1975 and only with respect to lights served under this Rate Schedule on January 1, 1975 and continuously thereafter, except BC Hydro may replace a mercury vapour unit with a high pressure sodium unit having approximately the same equivalent light output.
Applicable in	All Rate Zones.
Rate	**Charge per fixture per month as follows:** 1. Where a light is mounted on a pole that was installed by the Customer or by BC Hydro at the Customer's expense: 175 watt mercury vapour unit or replacement 100 watt H.P. sodium vapour unit — $18.25 400 watt mercury vapour unit or replacement 150 watt H.P. sodium vapour unit — $31.46

ACCEPTED:____________________________

ORDER NO.____________________________

COMMISSION SECRETARY

	2. Where a light is mounted on a pole that is on public property, or an easement, and is part of BC Hydro's distribution system: 175 watt mercury vapour unit or replacement 100 watt H.P. sodium vapour unit — $19.38 400 watt mercury vapour unit or replacement 150 watt H.P. sodium vapour unit — $32.60 3. Where a light is mounted on a pole that was installed on the Customer's property by BC Hydro, at its expense, solely for the purpose of supporting the light: 175 watt mercury vapour unit or replacement 100 watt H.P. sodium vapour unit — $23.87 400 watt mercury vapour unit or replacement 150 watt H.P. sodium vapour unit — $37.57 Except that if two or more lights are mounted at one time on the same pole the rates for the additional light or lights will be as set out under part 1 above.
Special Conditions	1. BC Hydro will provide and install: (a) An outdoor light consisting of luminaire, mast arm, ballast, lamp and photo-electric control, and (b) Not more than one span of overhead secondary conductors per light. 2. The Customer will be required to contribute the estimated cost of any plant required to make Secondary Voltage available at a point not more than one span from the light; such contribution is not subject to refund.

ACCEPTED:____________________

ORDER NO.____________________

COMMISSION SECRETARY

	3. BC Hydro reserves the sole right to determine whether or not a light will be installed on a pole that is part of BC Hydro's distribution system. 4. The prior approval of BC Hydro is required if a Customer intends to install its own poles, and such poles will be maintained to BC Hydro's satisfaction at the Customer's expense. 5. BC Hydro will maintain all equipment owned by BC Hydro and will replace lamps which have failed. Any breakage will be repaired by BC Hydro at the Customer's expense.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rates under this Rate Schedule include a rate increase of 1.00% before rounding.

5. TRANSMISSION SERVICE

RATE SCHEDULE 1823 – TRANSMISSION SERVICE – STEPPED RATE

Availability	For all purposes. Supply is at 60 kV or higher. Customers supplied with Electricity under Rate Schedule 1825 (Time-of-Use) may only revert to Service under this Rate Schedule as permitted under Rate Schedule 1825.
Applicable in	Rate Zone I excluding the Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Demand Charge:** \$8.642 per kVA of Billing Demand per Billing Period plus **Energy Charge: A** For new Customers and Customers that do not have a CBL by order of the British Columbia Utilities Commission: 5.065 ¢ per kWh for all kWh per Billing Period This rate will apply until the Customer has been supplied with Electricity under this Rate Schedule for 12 Billing Periods or another period approved by the British Columbia Utilities Commission, after which the Customer will be supplied with Electricity at the rate specified in Part B below.

ACCEPTED:__________

ORDER NO.__________

COMMISSION SECRETARY

	Energy Charge: B For Customers with a CBL: 4.507 ¢ per kWh applied to all kWh up to and including 90% of the Customer's CBL in each Billing Year 10.095 ¢ per kWh applied to all kWh above 90% of the Customer's CBL in each Billing Year Note: Customers previously supplied with Electricity under Rate Schedule 1825 will be subject to the rates in Part B above from the time the Customer commences taking Service under this Rate Schedule. **Monthly Minimum Charge:** $8.642 per kVA of Billing Demand
Definitions	1. Billing Year The Billing Year is the 12 month billing period starting with the first day of the Billing Period which commences nearest to April 1 in each year, and ending on the last day of such 12-month Billing Period.

2. Billing Demand

The Billing Demand will be:

(a) The highest kVA Demand during the High Load Hours (**HLH**) in the Billing Period; or

(b) 75% of the highest Billing Demand for the Customer's Plant in the immediately preceding period of November to February, both months included; or

(c) 50% of the Contract Demand stated in the Electricity Supply Agreement for the Customer's Plant,

whichever is the highest value, provided that for new Customers the Billing Demand for the initial two Billing Periods will be the average of the daily highest kVA Demands for the Customer's Plant.

	3. Customer Baseline Load (**CBL**) The Customer Baseline Load (**CBL**) is the Customer's historic annual energy consumption in kWh as approved by the British Columbia Utilities Commission. The Customer's CBL will initially be determined by BC Hydro, and be subject to revision from time to time, in accordance with the criteria and procedures set forth in BC Hydro's "Customer Baseline Load (**CBL**) Determination Guidelines" (Electric Tariff Supplement No. 74). All CBLs will be subject to final approval of the British Columbia Utilities Commission. 4. High Load Hours (**HLH**) High Load Hours (**HLH**) is the period of hours from 06:00 to 22:00 Monday to Saturday, except for Statutory Holidays (New Year's Day, Family Day, Good Friday, Victoria Day, Canada Day, B.C. Day, Labour Day, Thanksgiving Day, Remembrance Day and Christmas Day). 5. Low Load Hours (**LLH**) Low Load Hours (**LLH**) are all hours other than HLH.
Special Conditions	1. A Customer having two or more operating plants may elect to have a single aggregated CBL determined for all or any combination of its operating plants in accordance with BC Hydro's "Customer Baseline Load (**CBL**) Determination Guidelines" (Electric Tariff Supplement No. 74). Thereafter, BC Hydro will issue a single bill for all operating plants included in the aggregation, and the Energy Charge payable will be determined on the basis of the aggregated CBL. However, the Demand Charge will continue to be determined separately for each operating plant.

	2. If any initial, revised, or aggregate CBL for a Customer has not been determined by BC Hydro and approved by British Columbia Utilities Commission by the time at which the CBL would become effective, BC Hydro may determine the CBL on an interim basis and apply that CBL for the purposes of any billing periods and bills rendered to the Customer until such time as the CBL has been finally determined and approved by the British Columbia Utilities Commission, following which BC Hydro will make any necessary billing adjustments. 3. If a Customer taking Service at the rates in Part B of the Energy Charge rate section above Terminates Service under this Rate Schedule prior to the end of a Billing Year, the Customer's CBL or aggregate CBL will be prorated for the portion of the Billing Year during which the Customer was taking Service, and the prorated CBL or aggregate CBL will be used for the purposes of applying the rates in Part B to all energy consumption during the Billing Year up to the time of Termination. BC Hydro will make any necessary billing adjustments and bill the Customer for the difference (if any) owing.
Taxes	The rates set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Note	The terms and conditions under which Transmission Service is supplied are contained in Electric Tariff Supplement Nos. 5 and 6, or Electric Tariff Supplement Nos. 87 and 88, as applicable.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rates under this Rate Schedule include a rate increase of 1.00% before rounding.

5. TRANSMISSION SERVICE

RATE SCHEDULE 1825 – TRANSMISSION SERVICE – TIME-OF-USE (TOU) RATE

Availability	For Customers who provide notice by February 15 of each year and who at the time of application are eligible to take Service under Rate Schedule 1823 (Stepped Rate) at the Energy Charge rates set out in Part B of the rate section of that Rate Schedule, and who have entered into a TOU (Transmission Service) Agreement by March 15 of that year. Customers will start Service under Rate Schedule 1825 in the first Billing Period after April 1.
Applicable in	Rate Zone I excluding the Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Demand Charge:** $8.642 per kVA of Billing Demand per Billing Period plus **Energy Charge:** 1. Winter HLH Period: 4.507 ¢ per kWh applied to all kWh up to and including 90% of the Customer's Winter HLH Period CBL. 11.265 ¢ per kWh applied to all kWh above 90% of the Customer's Winter HLH Period CBL. 2. Winter LLH Period: 4.507 ¢ per kWh applied to all kWh up to and including 90% of the Customer's Winter LLH Period CBL. 10.210 ¢ per kWh applied to all kWh above 90% of the Customer's Winter LLH Period CBL.

	3. Spring Period: 4.507 ¢ per kWh applied to all kWh up to and including 90% of the Customer's Spring Period CBL. 9.093 ¢ per kWh applied to all kWh above 90% of the Customer's Spring Period CBL. 4. Remaining Period: 4.507 ¢ per kWh applied to all kWh up to and including 90% of the Customer's Remaining Period CBL applicable. 9.971 ¢ per kWh applied to all kWh above 90% of the Customer's Energy CBL applicable in the Billing Period.
Definitions	1. Billing Demand The Demand for billing purposes will be: (a) The highest kVA Demand during the High Load Hours (**HLH**) in the Billing Period; or (b) 75% of the highest Billing Demand for the Customer's Plant in the immediately preceding period of November to February, both months included; or (c) 50% of the Contract Demand stated in the Electricity Supply Agreement for the Customer's Plant, whichever is the highest value.

2. Customer Baseline Load (CBL)

   The Customer Baseline Load (**CBL**) is the Customer's historic consumption (in kWh) as approved by the British Columbia Utilities Commission. For the purposes of this Rate Schedule, the Customer’s CBL will consist of four separate CBLs – one each for the Winter HLH Period, the Winter LLH Period, the Spring Period and the Remaining Period. The Customer’s CBL will initially be determined by BC Hydro, and be subject to revision from time to time, in accordance with the criteria and procedures set forth in BC Hydro's "Customer Baseline Load (**CBL**) Determination Guidelines" (Electric Tariff Supplement No. 74). All CBLs will be subject to final approval of the British Columbia Utilities Commission.

3. High Load Hours (**HLH**)

   High Load Hours (**HLH**) is the period of hours from 06:00 to 22:00 Monday to Saturday, except for Statutory Holidays (New Year’s Day, Family Day, Good Friday, Victoria Day, Canada Day, B.C. Day, Labour Day, Thanksgiving Day, Remembrance Day and Christmas Day).

4. Low Load Hours (**LLH**)

   The Low Load Hours (**LLH**) are all hours other than HLH.

5. Remaining Period

   The Remaining Period is all Billing Periods other than the Winter Period or the Spring Period.

6. Spring Period

   The Spring Period comprises the two Billing Periods starting with the first day of the Billing Period that commences nearest to May 1 each year and ending on the last day of the second Billing Period thereafter.

	7. Winter Period The Winter Period comprises four Billing Periods starting with the first day of the Billing Period that commences nearest to November 1 each year and ending on the last day of the fourth Billing Period thereafter.
Special Conditions	1. Service under this Rate Schedule will be provided only while a TOU (Transmission Service) Agreement with the Customer is in effect. 2. A Customer having two or more operating plants may elect to have a single aggregated CBL determined for all or any combination of its operating plants in accordance with BC Hydro's "Customer Baseline Load (CBL) Determination Guidelines" (Electric Tariff Supplement No. 74). Separate Energy CBL values will be determined for each plant and then aggregated. BC Hydro will issue a single bill for all operating plants included in an aggregation, and the Energy Charge payable will be determined on the basis of the aggregated Energy CBL value. The Demand Charge will continue to be determined separately for each operating plant. 3. If any initial, revised, or aggregate CBL for a Customer has not been determined by BC Hydro and approved by British Columbia Utilities Commission by the time at which the CBL would become effective, BC Hydro may determine the CBL on an interim basis and apply that CBL for the purposes of any billing periods and bills rendered to the Customer until such time as the CBL has been finally determined and approved by the British Columbia Utilities Commission, following which BC Hydro will make any necessary billing adjustments.

	4. In accordance with the TOU (Transmission Service) Agreement, the Customer will have a period of 30 days following approval of the Customer's initial CBL by the British Columbia Utilities Commission within which the Customer may, by written notice to BC Hydro, withdraw from taking Service under this Rate Schedule, and revert to taking Service under Rate Schedule 1823 (Stepped Rate). This right of withdrawal is available only when the Customer first subscribes to take Service under this Rate Schedule, and is applicable only in respect of the initial CBL determination. If the Customer exercises this right of withdrawal Rate Schedule 1823 will apply from the commencement of the then current Billing Year, and BC Hydro will make any necessary billing adjustments accordingly. 5. Customers taking Service under Rate Schedule 1852 (Modified Demand) may not also take Service under this Rate Schedule.
Taxes	The rates set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Note	The terms and conditions under which Transmission Service is supplied are contained in the Electricity Supply Agreement (Electric Tariff Supplement No. 5, or Electric Tariff Supplement No. 87, as applicable) as amended by the Electric Tariff Supplement No. 72 (TOU (Transmission Service) Agreement), and Electric Tariff Supplement No. 6, or Electric Tariff Supplement No. 88, as applicable.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rates under this Rate Schedule include a rate increase of 1.00% before rounding.

5. TRANSMISSION SERVICE

RATE SCHEDULE 1827 – TRANSMISSION SERVICE – RATE FOR EXEMPT CUSTOMERS

Availability	For all purposes. Supply is at 60 kV or higher. Only for City of New Westminster and University of British Columbia and other Customers exempted from Rate Schedule 1823 (Stepped Rate) by the British Columbia Utilities Commission.
Applicable in	Rate Zone I excluding the Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Demand Charge:** \$8.642 per kVA of Billing Demand per Billing Period plus **Energy Charge:** 5.065 ¢ per kWh for all kWh in a Billing Period **Monthly Minimum Charge:** \$8.642 per kVA of Billing Demand
Definitions	1. Billing Demand The Billing Demand will be: (a) The highest kVA Demand during the High Load Hours (**HLH**) in the Billing Period; or (b) 75% of the highest Billing Demand for the Customer's Plant in the immediately preceding period of November to February, both months included; or (c) 50% of the Contract Demand stated in the Electricity Supply Agreement for the Customer's Plant, whichever is the highest value.

	2. High Load Hours (**HLH**) High Load Hours (**HLH**) is the period of hours from 06:00 to 22:00 Monday to Saturday, except for Statutory Holidays (New Year's Day, Family Day, Good Friday, Victoria Day, Canada Day, B.C. Day, Labour Day, Thanksgiving Day, Remembrance Day and Christmas Day). 3. Low Load Hours (**LLH**) Low Load Hours (**LLH**) are all hours other than HLH.
Taxes	The rates set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Note	The terms and conditions under which Transmission Service is supplied are contained in Electric Tariff Supplement Nos. 5 and 6, or Electric Tariff Supplements Nos. 87 and 88, as applicable.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
Rate Increase	Effective April 1, 2021 the rates under this Rate Schedule include a rate increase of 1.00% before rounding.

5. TRANSMISSION SERVICE

RATE SCHEDULE 1852 – TRANSMISSION SERVICE – MODIFIED DEMAND

Availability	To a Customer supplied with Electricity at 60 kV or higher who is taking Service under Rate Schedule 1823 (Stepped Rate) at the time of application, and is a party to a Modified Demand Agreement under Electric Tariff Supplement No. 54 which is in force, and which is in a location, as determined by BC Hydro, that will allow BC Hydro to curtail load to alleviate a potential local or regional transmission constraint, or take advantage of a market opportunity. The annual subscription period for new subscribers is from September 1 to October 31.
Applicable in	Rate Zone I excluding the Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Excess Demand Charge:** $8.642 per kVA of metered kVA Demand in excess of the Maximum Demand Level during Low Load Hours
Definitions	1. Billing Demand The Billing Demand will be: (a) The highest kVA Demand during the High Load Hours (**HLH**) in the Billing Period; or (b) 75% of the highest Billing Demand for the Customer's Plant in the immediately preceding period of November to February, both months included; or (c) 50% of the Contract Demand stated in the Electricity Supply Agreement for the Customer's Plant, whichever is the highest value.

ACCEPTED:______________________________

ORDER NO.______________________________

____
COMMISSION SECRETARY

2. High Load Hours (**HLH**)

   High Load Hours (**HLH**) means the period(s) in a 24-hour day and during those days of a calendar week in which Electricity usage is typically highest in a particular region, as determined by BC Hydro in its discretion based on load characteristics and transmission constraints in that region from time to time, and designated in a Modified Demand Agreement.

3. Low Load Hours (**LLH**)

   Low Load Hours (**LLH**) are all hours other than HLH.

4. LLH CBL Energy

   LLH CBL Energy means the highest monthly energy consumption during the LLH over the last 12 Billing Periods, or an estimate of consumption if insufficient data is available.

5. Maximum Demand Level

   Maximum Demand Level has the meaning set out in the Modified Demand Agreement. For a Customer with more than one designated period of High Load Hours, separate Maximum Demand Levels will be stated for each corresponding period of Low Load Hours. For a Customer with a single designated period of High Load Hours, a single Maximum Demand Level will be stated for all Low Load Hours.

   The highest Maximum Demand Level will not exceed 95% of Contract Demand stated in the Customer's Electricity Supply Agreement, and is subject to local transmission availability.

Special Conditions	1. The terms and conditions under which Transmission Service is supplied are contained in Electric Tariff Supplement Nos. 5 and 6. The provisions of Rate Schedule 1823 (Stepped Rate) and Electric Tariff Supplement Nos. 5 and 6 continue to apply to Customers receiving Service under this Rate Schedule. In the case of a conflict between this Rate Schedule or the Modified Demand Agreement and Rate Schedule 1823 or Electric Tariff Supplement Nos. 5 or 6, the provisions of this Rate Schedule and the Modified Demand Agreement will govern. 2. If for any two Billing Periods the total energy consumed under Rate Schedule 1852, during the LLH, is greater than the LLH CBL Energy by 10% or more, the highest kVA Demand in each such Billing Period during the High Load Hours will be adjusted by the ratio of the average monthly LLH Energy during such two Billing Periods over the LLH CBL Energy. The adjusted highest kVA Demand will apply for a period of 12 months after the second Billing Period included in the adjustment calculation. The LLH CBL Energy will be recalculated using the consumption history of the most recent 12 Billing Periods. 3. The Minimum Reduction under the Modified Demand Agreement will be the greater of 50% of the difference between the Maximum Demand Level and the LLH CBL Demand, and 10 MW. 4. The Maximum Number of Demand Reduction Transactions under the Modified Demand Agreement will be the greater of Maximum Duration multiplied by the Maximum Number of Demand Reduction Transactions, and 48 hours.
Taxes	The rates set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.

5. TRANSMISSION SERVICE

RATE SCHEDULE 1853 – TRANSMISSION SERVICE – IPP STATION SERVICE

Availability	For Customers who are Independent Power Producers (**IPPs**) served at transmission voltage, on an interruptible basis.
Applicable in	Rate Zone I excluding Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Energy Charge:** The sum, over the Billing Period, of the hourly energy consumed multiplied by the entry in the Intercontinental Exchange (**ICE**) Mid-Columbia (Mid-C) Peak, and Mid-C Off-Peak weighted average index price as published by the ICE in the ICE Day Ahead Power Price Report that corresponds to the time when consumption occurred, during that hour
Monthly Minimum Charge	$48.70
Special Conditions	1. BC Hydro agrees to provide Electricity under this Rate Schedule to the extent that it has energy and capacity to do so. 2. BC Hydro may, without notice to the Customer, refuse to supply or terminate the supply of Electricity under this Rate Schedule if at any time BC Hydro does not have sufficient energy or capacity. 3. Prior to taking Electricity under this Rate Schedule, the Customer may be required to obtain approval from BC Hydro. BC Hydro will advise the Customer of the need to obtain approval prior to the taking of Electricity under this Rate Schedule. 4. Electricity taken under this Rate Schedule is to be used solely for maintenance and black-start requirements and will not displace electricity that would normally be generated by the Customer.

5. TRANSMISSION SERVICE

RATE SCHEDULE 1880 – TRANSMISSION SERVICE – STANDBY AND MAINTENANCE SUPPLY

Availability	For Customers supplied with Electricity under Rate Schedule 1823 (Stepped Rate), 1825 (TOU Rate), 1827 (Rate for Exempt Customers), 1828 (Biomass Energy Program) or 1852 (Modified Demand), on an interruptible basis.
Applicable in	Rate Zone I excluding the Districts of Kingsgate-Yahk and Lardeau-Shutty Bench.
Rate	**Administrative Charge:** \$150.00 per Period of Use plus **Energy Charge:** During the Period of Use, 10.095 ¢ per kWh of metered Rate Schedule 1880 energy consumption, determined as set out below
Definitions	1. HLH Reference Demand HLH Reference Demand is the highest kVA Demand in the HLH for the current Billing Period prior to the Period of Use, but excluding any prior Period of Use. If the Period of Use extends over an entire Billing Period, the highest kVA Demand in the HLH from the prior Billing Period will be used in determining the HLH Reference Demand, excluding any Period of Use in the prior Billing Period. For the purpose of determining HLH Reference Demand, the HLH periods are as defined in Rate Schedule 1823, 1825, 1827, 1828 or 1852, whichever is applicable.

ACCEPTED:________________________

ORDER NO.________________________

COMMISSION SECRETARY

	2. Period of Use A period of consecutive hours during which Electricity is taken under this Rate Schedule. The Period of Use is as defined by the Customer when requesting Service from BC Hydro under this Rate Schedule 1880 and may extend into subsequent Billing Periods.
Rate Schedule 1880 Energy Determination	During HLH periods, the kWh consumption on an hourly basis which exceeds the HLH high kWh per hour within the Period of Use or portion thereof where HLH high kWh per hour is the product of HLH Reference Demand multiplied by the Power Factor for the half hour when the HLH Reference Demand occurred. For the purpose of the Rate Schedule 1880 Energy Determination, the HLH periods are as defined in Rate Schedule 1823, 1825, 1827, 1828 or 1852, whichever is applicable.
Special Conditions	1. BC Hydro agrees to provide Electricity under this Rate Schedule to the extent that it has energy and capacity to do so. 2. BC Hydro may, without notice to the Customer, refuse to supply or terminate the supply of Electricity under this Rate Schedule if at any time during the Period of Use BC Hydro does not have sufficient energy or capacity.

3. This Rate Schedule is only for the following purposes:

   To provide Electricity the Customer would otherwise generate during periods when all or part of the Customer's electrical generating plant is curtailed.

   Electricity used for this purpose may be taken on an instantaneous basis when the impact of the instantaneous pickup of loads normally provided by the Customer’s electrical generation units does not occur after BC Hydro has advised the Customer that a period of system constraint or potential system constraint exists.

   During periods of potential system constraints, BC Hydro will require Customers to arm load shedding relays to ensure that the loss of electricity production from a Customer’s electrical generation unit will not result in a demand greater than the Customer’s Maximum kVA Demand on BC Hydro’s system. BC Hydro may require the Customer to provide it with control of these load shedding relays. During periods of potential system constraints, upon a Customer’s request, BC Hydro will endeavour to provide Electricity normally provided by the Customer’s electrical generation unit.

   The Customer is required to advise BC Hydro within 30 minutes of taking Electricity under this Rate Schedule for this purpose. If the Customer fails to advise BC Hydro within 30 minutes, measured Demand and Energy consumption will be billed under Rate Schedule 1823, 1825, 1827, 1828 or 1852, whichever is applicable.

4. Electricity taken under this Rate Schedule will not displace Electricity otherwise to be taken by the Customer under Rate Schedule 1823, 1825, 1827, 1828 or 1852.

   Electricity taken under this Rate Schedule will not displace electricity that would normally be generated by the Customer for the purpose of re-sale.

	5. In addition to the charges specifically set out in this Rate Schedule, the Customer will pay for any additional facilities required to deliver Electricity under this Rate Schedule provided that BC Hydro obtains the prior consent of the Customer for construction of the additional facilities. 6. A Customer may be required to allow BC Hydro to install metering and communication equipment to measure the electricity output of the Customer's self-generation unit. 7. BC Hydro will bill for Electricity taken under Rate Schedule 1880 at the same time it bills for Electricity taken under Rate Schedule 1823, 1825, 1827, 1828 or 1852, whichever is applicable.
Taxes	The rates set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Note	The terms and conditions under which Transmission Service is supplied are contained in Electric Tariff Supplement Nos. 5 and 6, or Electric Tariff Supplement Nos. 87 and 88, as applicable.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.
Rate Increase	Effective April 1, 2021 the Energy Charge under this Rate Schedule includes a rate increase of 1.00% before rounding.

ACCEPTED:________________________

ORDER NO.________________________

5. TRANSMISSION SERVICE

RATE SCHEDULE 1891 – TRANSMISSION SERVICE – SHORE POWER SERVICE

Availability	For the supply of Shore Power to Port Customers for use by Eligible Vessels while docked at the Port Customer's Port Facility, on an interruptible basis. Supply is at 60 kV or higher.
Applicable in	Rate Zone I.
Rate	**Administrative Charge:** $150.00 per month plus **Energy Charge:** 10.095 ¢ per kWh for all kWh in a billing period
Definitions	For purposes of this Rate Schedule, capitalized terms have the meanings given to them in the Shore Power Service Agreement (Electric Tariff Supplement No. 86).
Special Conditions	1. BC Hydro agrees to provide Electricity under this Rate Schedule to the extent that it has energy and capacity to do so. BC Hydro may refuse Service under this Rate Schedule in circumstances where BC Hydro does not have sufficient energy or capacity. For greater certainty, BC Hydro will not be required to construct a System Reinforcement under Electric Tariff Supplement No. 6 to provide Shore Power Service under this Rate Schedule. 2. The terms and conditions under which Shore Power Service is supplied are contained in the Shore Power Service Agreement (Electric Tariff Supplement No. 86). The Port Customer will pay to BC Hydro the charges set out in this Rate Schedule in addition to any charges set out in the Shore Power Service Agreement.

COMMISSION SECRETARY

	3. A Port Customer that provides Port Electricity at a Port Facility under Rate Schedules 1600, 1601, 1610, 1611 (Large General Service) or 1823 (Stepped Rate) is not eligible to take Shore Power Service under this Rate Schedule to provide Port Electricity to that Port Facility, or a Port Facility served by the same BC Hydro delivery facilities. 4. On each occasion, if any, that BC Hydro is required to dispatch power line technicians or other workers to operate the switchgear for each connect and disconnect of Eligible Vessels docked at the Port Customer's Port Facility, BC Hydro will charge, and the Port Customer will pay, the reasonable time and labour costs for this service. The charge will be based on prevailing BC Hydro contracted labour rates and will be separately itemized on the Port Customer's monthly bill.
Taxes	The rates set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.

5. TRANSMISSION SERVICE

RATE SCHEDULE 3808 – TRANSMISSION SERVICE – FORTISBC INC.

Availability	This Rate Schedule is available to FortisBC Inc. (FortisBC) in accordance with the terms and conditions of the Agreement between BC Hydro and FortisBC entered into and deemed effective July 1, 2014 (Power Purchase Agreement). Contract Demand must not exceed 200 MW in any hour.
Applicable in	For Electricity delivered to FortisBC at each Point of Delivery as defined in the Power Purchase Agreement.
Rate	**Demand Charge:** \$8.642 per kW of Billing Demand per Billing Month plus **Energy Charge:** Tranche 1 Energy Price: 5.065 ¢ per kWh Tranche 2 Energy Price: 9.509 ¢ per kWh

ACCEPTED:______________________________

ORDER NO.______________________________

COMMISSION SECRETARY

Definitions	1. Billing Demand The Billing Demand in any Billing Month will be the greatest of: (a) The maximum amount of Electricity (in kW) scheduled under the Power Purchase Agreement, for any hour of the Billing Month; (b) 75% of the maximum amount of Electricity (in kW) scheduled under the Power Purchase Agreement in any hour in the 11 months of the Term immediately prior to the Billing Month (or less than 11 months, if the Effective Date is less than 11 months prior to the month); and (c) 50% of the Contract Demand (in kW) for the Billing Month. If FortisBC has reduced the Contract Demand in accordance with the Power Purchase Agreement, the amount of Electricity specified in item (b) above may not exceed an amount equal to 100% of the Contract Demand. 2. Maximum Tranche 1 Amount The Maximum Tranche 1 Amount for each Contract Year is 1,041 GWh. 3. Scheduled Energy Less Than or Equal to Annual Energy Nomination In any Contract Year, for the amount of the Scheduled Energy taken or deemed to be taken that is less than or equal to the Annual Energy Nomination, FortisBC will pay: (a) The Tranche 1 Energy Price for each kWh of such Scheduled Energy taken or deemed taken that is less than or equal to the Maximum Tranche 1 Amount; and (b) The Tranche 2 Energy Price for each kWh of such Scheduled Energy taken that exceeds the Maximum Tranche 1 Amount.

ACCEPTED:______________________

ORDER NO.______________________

____
COMMISSION SECRETARY

	4. Scheduled Energy Exceeding the Annual Energy Nomination In any Contract Year, for the amount of the Scheduled Energy taken or deemed to be taken that exceeds the Annual Energy Nomination, FortisBC will pay: (a) 150% of the Tranche 1 Energy Price, for each kWh of such Scheduled Energy taken or deemed taken that that exceeds the Annual Energy Nomination, but is less than or equal to the Maximum Tranche 1 Amount; and (b) 115% of the Tranche 2 Energy Price, for each kWh of such Scheduled Energy taken that exceeds the Annual Energy Nomination and also exceeds the Maximum Tranche 1 Amount. 5. Annual Minimum Take In any Contract Year, FortisBC will schedule and take an amount of Electricity equal to at least 75% of the Annual Energy Nomination, and will be responsible for any Annual Shortfall.
Note	The terms and conditions under which Service is supplied to FortisBC are contained in the Power Purchase Agreement.
Taxes	The rates and charges set out in this Rate Schedule are exclusive of goods and services and provincial sales taxes.
Rate Rider	The Deferral Account Rate Rider as set out in Rate Schedule 1901 applies to all charges payable under this Rate Schedule, before taxes and levies.

Rate Increase	The Tranche 1 Energy Price and Demand Charge set out above are subject to the same rate adjustments as Rate Schedule 1827 (Rate for Exempt Customers). Tranche 2 Energy Price is subject to changes as provided for in the Power Purchase Agreement. Effective April 1, 2021 the Tranche 1 Energy Price and the Demand Charge under this Rate Schedule include a rate increase of 1.00% before rounding.

COMMISSION SECRETARY

Schedule 01

Point-To-Point Transmission Service

Availability	For transmission of electricity on a firm and non-firm basis from one or more Point(s) of Receipt (POR) to one or more Point(s) of Delivery (POD).
Rate for Long-Term Firm Service	The Reserved Capacity Charge for the Long-Term Firm Service Rate will be up to a maximum price as set out below except where the POD is a point of interconnection between the Transmission System and the transmission system of FortisBC Inc., in which case the rate shall be zero ($0.00). The Maximum Reserved Capacity Charge is $78,262/MW of reserved capacity per year to be invoiced monthly. Reserved Capacity Billing Demand The Reserved Capacity Billing Demand is determined for each POR(s), POD(s) pair. The Reserved Capacity for each pair of POR(s) and POD(s) will be the maximum non-coincident sum of the designated POR(s) and POD(s) included in the pair.

Schedule 01 – Point-To-Point Transmission Service (continued)

Rate for Short-Term Firm and Non-Firm Service	The posted prices for Short-Term Firm and Non-Firm Service will be less than or equal to a maximum price ($/MWh) as set out below, except where the POD is a point of interconnection between the Transmission System and the transmission system of FortisBC Inc., in which case the rate shall be zero ($0.00). Maximum Price for: 1. Monthly delivery: $6,521.81/MW of Reserved Capacity per month. 2. Weekly delivery: $1,505.03/MW of Reserved Capacity per week. 3. Daily delivery: $214.42/MW of Reserved Capacity per day. 4. Hourly delivery: $8.93/MW of Reserved Capacity per hour. Discount Rate: For discounted paths posted on the Transmission Provider's OASIS, the Transmission Customer shall pay each month for Reserved Capacity Billing Demand the greater of the rates set forth below and the rate offered by the Transmission Customer and accepted by the Transmission Provider up to the maximum rate for Short-Term Firm and Non-Firm Service: 1. Hourly delivery: $3/MW of Reserved Capacity per hour in the Heavy Load Hour period (06:00-22:00, Monday - Saturday, excluding NERC holidays) and $1/MW of Reserved Capacity per hour for the Light Load Hour period (remaining hours and days). 2. Daily delivery: sum of the hourly delivery charge in the 24 hour period in the day.
Reserved Capacity for Short-Term Firm and Non-Firm Services	The Reserved Capacity shall be the maximum of the sum of non-coincident POD(s) Capacity Reservations or sum of non-coincident POR(s) Capacity Reservations.

ACCEPTED:____________________

ORDER NO.____________________

COMMISSION SECRETARY

Schedule 01 – Point-To-Point Transmission Service (continued)

Penalty Charge	In addition to the applicable rate for service and associated charges for Ancillary Services, a penalty charge will be applied to all unauthorized usage at a rate of 125 percent of the maximum hourly delivery charge.
Special Conditions	Discounts: The following conditions apply to discounts for transmission service: 1. any offer of a discount made by BC Hydro must be announced to all Eligible Customers solely by posting on the OASIS, 2 any customer-initiated requests for discounts (including requests for use by one's wholesale merchant or an affiliate's use) must occur solely by posting on the OASIS, 3. once a discount is negotiated, details must be immediately posted on the OASIS, and 4. for any discount agreed upon for service on a path, from POR(s) POD(s), BC Hydro must offer the same discounted transmission service rate for the same time period to all Eligible Customers on all unconstrained transmission paths that go to the same POD(s) on the Transmission System.
Taxes	The Rate and Charges contained herein are exclusive of applicable taxes.
Resales	The rates and rules governing charges and discounts stated above shall not apply to resales of transmission service, compensation for which shall be governed by section 23.1 of the Tariff
Note	The terms and conditions under which Transmission Service is supplied are contained in BC hydro's Open Access Transmission Tariff. Capitalized terms appearing in this Rate Schedule, unless otherwise noted, shall have the meaning ascribed to them therein.

Effective April 1, 2021, this rate schedule is approved.

Schedule 03

Scheduling, System Control, and Dispatch Service

Preamble	This service is required to schedule the movement of power through, out of, within, or into a Control Area. This service can be provided only by the operator of the Control Area in which the transmission facilities used for transmission service are located. Scheduling, System Control and Dispatch Service is to be provided directly by BC Hydro. The Transmission Customer must purchase this service from BC Hydro. The charges for Scheduling, System Control and Dispatch Service are to be based on the rates set forth below.
Availability	In support of Network Integration Transmission Service, Long and Short-Term Firm Point-to-Point Transmission Service, and Non-Firm Point-to-Point Transmission Service.
Rate	$0.152 per MW of Reserved Capacity per hour.
Taxes	The Rate and Charges contained herein are exclusive of applicable taxes.
Note	A description of the methodology for discounting Scheduling, System Control and Dispatch Services provided under this Schedule is contained in Section 3 of the BC Hydro OATT.

Effective April 1, 2021, this rate schedule is approved.

ORDER NUMBER
G-xx-xx

IN THE MATTER OF
the *Utilities Commission Act*, RSBC 1996, Chapter 473

and

British Columbia Hydro and Power Authority (BC Hydro)
Fiscal 2022 Revenue Requirements Application

BEFORE:
D.M. Morton, Panel Chair
T.A. Loski, Commissioner
R. I. Mason, Commissioner

on XXX, 2021

ORDER

WHEREAS:

A. On December 22, 2020, British Columbia Hydro and Power Authority (BC Hydro) filed its Fiscal 2022 Revenue Requirements Application (Application) with the British Columbia Utilities Commission (BCUC) pursuant to sections 58 to 61 and 89 of the *Utilities Commission Act* (UCA), requesting, among other things, an approval of an increase in rates by 1.16 per cent, effective April, 1, 2021;

B. By Order No. G-187-21 dated June 17, 2021, the British Columbia Utilities Commission (Commission) approved the request rate increase of 1.16 per cent, subject to adjustments resulting from various determinations and directives, including Directive 26, which directs BC Hydro "to increase its F[iscal] 2022 forecast revenue by the estimated value of the low carbon fuel credits that it plans to transfer to other parties, if any, during F[iscal] 2022" and "to record in all future R[evenue] R[equirements] A[pplication]s, the forecast revenue based on an estimate of the value of the low carbon fuel credits that it plans to transfer to other parties";

C. On July 16, 2021, BC Hydro filed its compliance filing to Order No. G-187-21 (Compliance Filing), in which BC Hydro applied for the establishment of a new regulatory account – the Low Carbon Fuel Credits Variance Regulatory Account – to capture, on an ongoing basis, the difference between planned and actual revenues from low carbon fuel credits in a given year; and

D. The Commission reviewed BC Hydro's request for the establishment of the Low Carbon Fuel Credits Variance Regulatory Account and grants the establishment of the requested regulatory account.

…/2

NOW THEREFORE, pursuant to sections 58 to 61 of the UCA, the Commission orders as follows:

1. The Low Carbon Fuel Credits Variance Regulatory Account is approved to capture, on an ongoing basis, the difference between forecast and actual miscellaneous revenue from low carbon fuel credits. BC Hydro is to apply interest on the balance of this regulatory account based on BC Hydro's current weighted average cost of debt and to amortize the balance of the account into rates through the Deferral Account Rate Rider.

DATED at the City of Vancouver, in the Province of British Columbia, this (XX) day of (Month Year).

BC Hydro Fiscal 2023 to Fiscal 2025 Revenue Requirements Application

Appendix AA

Report on the Non-Integrated Areas Demand-Side Management Program and Evaluation of DSM Effectiveness

Table of Contents

List of Attachments

1 Introduction

BC Hydro provides this appendix in response to Directive 47 from the BCUC decision on the Fiscal 2020 – Fiscal 2021 Revenue Requirements Application (**Directive 47**) and in response to Directive 19 from the BCUC decision on the Previous Application (**Directive 19**). Directive 47 requires BC Hydro to report on progress with regards to the Non-Integrated Areas (**NIA**) DSM program, including an assessment of whether that program has been effective in reducing barriers for NIA customers in accessing DSM offerings. Directive 19 requires BC Hydro to include BC Hydro's most recent evaluation of its DSM effectiveness.

2 Report on Progress in the NIA (Directive 47)

In compliance with Directive 47, BC Hydro provides its Report on Demand Side Management Activities for Fiscal 2021 (**DSM Activities Report**)[1]. This report includes BC Hydro's progress on the NIA DSM program for the fiscal year ending March 2021 and has been included as Attachment 1 to this appendix.

Section 3 of the DSM Activities Report provides a report of DSM activity in the NIA. In addition, BC Hydro's fiscal 2021 DSM expenditures, electricity savings and cost effectiveness results for the NIA program are shown as a line item within Table 1 and Table 3 through Table 6, along with all other programs.

[1] In compliance with Directive 69 (page 197) of the BCUC Decision G-96-04 on BC Hydro's Fiscal 2005 to Fiscal 2006 Revenue Requirements Application (as amended by subsequent BCUC orders), BC Hydro submits annual DSM Activities Report to the BCUC.

3 BC Hydro's most recent Evaluation of its DSM Effectiveness (Directive 19)

In compliance with Directive 19, BC Hydro provides the DSM Activities Report which provides information on DSM expenditures, electricity savings, and plan performance for the fiscal year ending in March 2021.

In addition, BC Hydro provides the two most recent annual Demand Side Management Milestone Evaluation Summary Reports[2] covering fiscal 2019 and fiscal 2020. They have been included as Attachment 2 and Attachment 3 to this appendix.

[2] In compliance with Directive 66 (page 197) of the Commission Decision G-96-04 on BC Hydro's Fiscal 2005 to Fiscal 2006 Revenue Requirements Application, BC Hydro annually submits the executive summaries of its milestone evaluation reports and full final evaluation reports of all its DSM programs to the BCUC.

Table of Contents

List of Tables

BC Hydro
Power smart

1 Introduction

This BC Hydro annual report to the British Columbia Utilities Commission (**BCUC** or **Commission**) on Demand-Side Management (**DSM**) activities provides information on DSM expenditures, electricity savings, plan performance and mitigation measures for the 2021 fiscal year, which is the twelve months ending March 31, 2021. This report also provides information on Low Carbon Electrification expenditures within the DSM Regulatory Account.

This annual report is filed in compliance with, or to reflect, the following BCUC Directives:

- Directive 69 from the BCUC Decision G-96-04 on BC Hydro's Fiscal 2005 to Fiscal 2006 Revenue Requirements Application (**F05-F06 RRA**);
- Directive 16 from the BCUC Decision G-29-07 on BC Hydro's 2006 Integrated Electricity Plan and Long-Term Acquisition Plan (**2006 IEP/LTAP**);
- Directives 36, 38, and 42 from the BCUC Decision G-91-09 on BC Hydro's 2008 Long-Term Acquisition Plan (**2008 LTAP**);
- Directive 23 from the BCUC Decision G-47-18 on BC Hydro's Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (**F17-F19 RRA**); and
- Directive 47, 49, 50 and 51 from the BCUC Decision G-246-20 on BC Hydro's Fiscal 2020 to Fiscal 2021 Revenue Requirements Application **(F20-F21 RRA).**

Directive 69 of the F05-F06 RRA Decision directed BC Hydro "to provide information to the BCUC for on-going review of Power Smart performance through:

- Executive Summaries of milestone evaluation reports and full final evaluation reports for each program;
- Semi-annual- reports on DSM activities which, amongst others, will include:

BC Hydro
Power smart

- Detailed breakdown of OMA expenses related to support activities carried out within the Power Smart group and in other departments that support the Power Smart organization;
- Detailed description of the functions of portfolio level costs and how these costs are allocated to programs;
- Summaries of the overall performance of Power Smart with reference to program objectives; and
- Variances of fiscal year budgeted and actual deferred capital expenditures and explanation of variances."

Directive 16 of the 2006 IEP/LTAP Decision directed BC Hydro "to continue to file reports on DSM performance as described in Directive 69 of the F05/F06 RRA Decision included in Order No. G-9604 and to file its Semi Annual Demand-Side Management Reports in the same format as the June 2005 Report with the following enhancements:

(i) Provide annual and cumulative totals since program inception;

(ii) Express these values on a per unit basis; and

(iii) Provide the benefit to cost ratios for the three DSM tests."

Directive 36 of the 2008 LTAP Decision directed BC Hydro to switch from semi-annual to annual DSM performance reports. Directive 38 from the same Decision directed BC Hydro to include in these reports:

> "…metrics for each initiative, achievements in relation to milestones, and description of past or planned mitigation measures where warranted. These mitigation measures should include shifting program resources and alternative supply options for each program. Ongoing DSM performance reporting should demonstrate how BC Hydro is continuously pursuing DSM and that specific programs are cost-effective."

Directive 42 of the 2008 LTAP Decision directed BC Hydro to continue to report on a Ratepayer Impact Measure (**RIM**) test values.

Directive 23 of the F17-F19 RRA Decision directs BC Hydro to "include a line item in BC Hydro's Annual Report on DSM Activities to reflect the Non-Integrated Area (**NIA**) activities that are tracked separately."

Directive 47 of the F20-F21 RRA Decision directed BC Hydro, among other things, to report on the progress of the NIA program in future annual DSM reports, and in the fiscal 2023 Revenue Requirements Application, "including an assessment of whether that program has been effective in reducing barriers for Non-Integrated Area customers in accessing DSM offerings and thereby meeting the objective of Directive 23 from the 2017 to 2019 Revenue Requirements Application."

Directive 49 of the F20-F21 RRA Decision directed BC Hydro "to report on the Low Carbon Electrification expenditures within the DSM Regulatory Account annually in its annual DSM report to the BCUC, clearly allocated to the applicable classes defined in section 4(3) (a), (b), (c) or (d) of the GGRR, including a consolidated table with a break down between the Initial LCE and BC Hydro LCE projects and programs."

Directive 50 of the F20-F21 RRA Decision rescinded Directive 61 from Order G-96-04 on BC Hydro's F05-F06 RRA.

Directive 51 of the F20-F21 RRA Decision determined that BC Hydro may make inter-year and inter-program area transfers, as follows:

- BC Hydro may transfer unspent accepted DSM expenditures in a program area to the same program area in the following year of the Test Period, on the condition that BC Hydro provides information regarding unspent amounts as part of its annual DSM reports so that all amounts transferred within a program area are transparently accounted for from one test year to the next; and

- The Panel accepted the DSM expenditure schedule including transfers of up to 25 per cent of DSM expenditures from any one existing program area to any other existing program area.

BC Hydro files its evaluation reports pursuant to Directive 69 of the F05-F06 RRA Decision separately.

This annual report addresses the balance of Directives 69 and 16, as well as Directives 36, 38, and 42 of the 2008 LTAP Decision, Directive 23 of the F17-F19 RRA Decision and Directives 47, 49, 50 and 51 of the F20-F21 RRA.

2 Expenditures and Electricity Savings for Fiscal 2021 as a Result of DSM activities

BC Hydro's DSM expenditures[1] in fiscal 2021 totalled $77 million, while new incremental DSM electricity savings totalled 780 GWh/year. Expenditures were $12 million or 14 per cent below the Fiscal 2021 DSM Plan presented in BC Hydro's F20-F21 RRA. Overall, new incremental electricity savings as shown in Table 1 were 27 GWh/year or 4 per cent above the DSM Plan.

BC Hydro confirms that no unspent accepted DSM expenditures from fiscal 2020 were transferred to fiscal 2021. BC Hydro also confirms that over fiscal 2021, no transfers between program areas were made beyond the allowed levels.

Table 1 presents planned and actual DSM expenditures and new incremental electricity savings in fiscal 2021.

[1] Comprising all DSM-related deferred operating expenditures. DSM operating expenditures are presented in Table 8 of this report.

* Numbers may not add due to rounding.

Notes:

1 Including all DSM-related deferred operating expenditures.

2 Plan figures are from BC Hydro's F20-F21 RRA, Appendix X.

3 Reported savings from codes and standards and residential inclining block and transmission service rate structures are based on planned estimates as well as evaluated results.

Table 2 provides explanations of the variances between planned and actual expenditures and savings shown in Table 1 above:

Table 2 Variance Explanations between Planned and Actual Expenditures and Savings for Fiscal 2021

Rate Structures	
Transmission Service Rate	Expenditures were below plan due to planned rate design activities to explore potential changes to RS 1823 being delayed. Electricity savings were approximately on plan.
DSM Programs	
Residential Sector	
Low Income	Expenditures and savings were below plan due to the COVID-19 pandemic that forced the Energy Conservation Assistance Program (**ECAP**) portion of the program to suspend operations for four months. Participation was slow to recover once in-home visits resumed.
Non-Integrated Areas	Expenditures were approximately on plan. Electricity savings were below plan primarily due to the impact of the COVID-19 pandemic, which prevented on-site visits in some participating communities due to local health and safety protocols. In response, the program re-allocated dollars from incentives to provide more enabling support to Indigenous Nations, which brought program expenditures in approximately on plan.
Retail	Expenditures and savings were above plan due to higher participation in most product categories than planned during Q3 campaign, driven in large part by COVID-19 pandemic influenced demand in retail do-it-yourself home improvements.
Home Renovation Rebate	Expenditures and savings were above plan due to strong participation driven by the increased rebate promotion which was implemented in Q3 to support contractors and customers impacted by the COVID-19 pandemic.
Residential Energy Management Activities	Expenditures were below plan due to planned activities being deferred. Savings were above plan due to higher than planned participation in energy reduction challenges and higher than planned participation in the Energy Visualization Portlet where customers can see their detailed consumption history to determine when they are using electricity and opportunities to conserve.
Commercial Sector	
Leaders in Energy Management – Commercial (**LEM-C**)	Expenditures and electricity savings were approximately on plan.
New Construction	Expenditures were below plan due to a customer project being deferred to fiscal 2022 and resulting adjustments to project incentives. Electricity savings were approximately on plan.

BC Hydro
Power smart

Commercial Energy Management Activities	Expenditures were below plan due to energy manager positions becoming vacant at customers' sites, and the time required for customers to fill the vacancies.
Industrial Sector	
Leaders in Energy Management – Industrial (LEM-I)	Expenditures were below plan due to fewer incentive projects with customers than planned. Electricity savings were above plan due to higher savings from strategic energy management activity and customer-funded projects.
Thermo-Mechanical Pulp	No expenditures or electricity savings were planned. However, historical electricity savings were reduced based on actual performance of a project. The total incentive provided for the project was reduced to reflect the adjusted electricity savings. This resulted in a negative variance in expenditures.
Industrial Energy Management Activities	Expenditures were below plan due to energy manager positions becoming vacant, and the time required for customers to fill the vacancies.
Total Programs	Expenditures were below plan primarily due to fewer Industrial customers advancing incentive projects than planned, a reduction in incentives paid out to a customer in the Thermo-Mechanical Pulping program and Low-Income program operation suspensions due to the COVID-19 pandemic. Electricity savings were above plan primarily due to Industrial strategic energy management and customer-funded projects achieving higher savings than planned.
Supporting Initiatives	
Public Awareness	Expenditures were below plan due to Public Awareness activities being impacted by the COVID-19 pandemic restrictions which limited the opportunities for in-person community outreach and in-person school education programs and related expenses.
Indirect and Portfolio Enabling	Expenditures were approximately on plan.
Codes and Standards	Expenditures and electricity savings were approximately on plan.
Capacity Focused DSM	Expenditures were below plan due to delays in activities resulting from the impact of the COVID-19 pandemic.
Portfolio Total	Expenditures were below plan primarily due to fewer Industrial customers advancing incentive projects than planned, a reduction in the incentive provided to a customer in the Thermo-Mechanical Pulp program and Low-Income program operation suspensions due to the COVID-19 pandemic. Electricity savings were above plan primarily due to Industrial strategic energy management and customer-funded projects achieving higher savings than planned.

3 Non-Integrated Areas Activity

BC Hydro's fiscal 2021 DSM expenditures, electricity savings and cost effectiveness results for the NIA program are shown as a line item within Table 1 and Table 3 through Table 6, along with all other programs.

The barriers that BC Hydro has identified and is trying to address with the NIA program include awareness, acceptability, affordability, availability, and accessibility. The main components of the NIA program include:

- Indigenous Communities Conservation Program, which contains two streams:
  - Stream 1 provides free energy saving products, salary support and installation training for Indigenous Nations to hire local installers to conduct home energy upgrades such as energy efficient lighting, high performance faucets and showerheads, and basic draft proofing and to assess homes for additional energy-saving opportunities.
  - Stream 2 provides training to Indigenous Nations and their contractors to complete advanced home energy upgrades and provides rebates to support the cost of those upgrades (e.g., insulation, windows, doors, ventilation, heat pumps, etc.).

For communities that choose not to participate in the Indigenous Communities Conservation Program and for all other customers within the NIA, the following offers are available:

- Energy Savings Kits: free energy saving products are offered to NIA residential customers that they can install in their own homes;
- Home Renovation Rebates: NIA residential customers are offered bonus rebates on eligible home energy upgrades; and
- Business Energy Savings Incentives: NIA commercial customers, including Indigenous Nations, are eligible for bonus incentives through this program.

In addition to the above activities, BC Hydro has also implemented the following initiatives to help address barriers:

- Creation of a new role at BC Hydro that works directly with Indigenous Nations to support their participation in our programs; and
- Provision of funding for Energy Champion positions for the Indigenous communities, plus associated peer networks and training opportunities for Indigenous Nations.

NIA program activities in fiscal 2021 focused on the continued ramp up of the program as well as identifying ways to try to mitigate the impacts of the COVID-19 pandemic on NIA program delivery. Despite the COVID-19 pandemic, BC Hydro saw continued interest and a 30 per cent increase in program participation over fiscal 2020. In particular, BC Hydro continued provide support to Indigenous Nations to hire local installers and contractors so that home energy upgrades could continue in many communities, with protocols in place to adhere to provincial and local health orders.

For residential customers in the NIA, BC Hydro continued to offer bonus rebates on weatherization upgrades and introduced an increased rebate promotion on heat pumps. In addition, a direct mail campaign in the fall of 2020 encouraged NIA residential customers to order free Energy Savings Kits ahead of the winter heating season. With participation and energy savings below plan, BC Hydro provided more enabling support (e.g., funding energy focused staff positions, community energy planning, etc.) to Indigenous Nations. This support will help to build community capacity to pursue conservation and energy management activities and community goals.

BC Hydro is in the process of developing a performance measurement framework with Indigenous communities for the NIA program, which it expects to use to report on how the program is addressing community goals and barriers.

4 Expenditures to Date

BC Hydro's DSM expenditures for fiscal 2021 totalled $77 million. Table 3 presents DSM expenditures from April 1, 2020 to March 31, 2021.

BC Hydro
Power smart

Table 3 Expenditures for Fiscal 2020 to Fiscal 2021*

BC Hydro Power smart

BC Hydro's DSM electricity savings since the beginning of fiscal 2020 totalled 1,340 GWh/year at March 31, 2021, which equates to 103 per cent of the planned savings of 1,300 GWh/year in the F20-F21 RRA. Table 4 presents actual cumulative savings as a percentage of plan as of the end of fiscal 2021.

Table 4 Cumulative Electricity Savings: Fiscal 2020 to Fiscal 2021

Actual as a Percentage of Plan[1]

Industrial Energy Management Activities	n/a
Industrial Sector Total	108%
Total Programs	**106%**
Codes and Standards	101%
Capacity Focused DSM	n/a
PORTFOLIO TOTAL	**103%**

Notes:

1 Reported savings for codes and standards and rates structures are based on planned estimates as well as evaluated results.

The cumulative portfolio DSM electricity savings from April 1, 2019 through March 31, 2021 have been achieved at an average net levelized utility cost of $23 per MWh. Table 5 presents net levelized utility cost that is calculated by subtracting capacity benefits from gross utility costs and then dividing the resulting net utility costs by electricity savings. A negative net levelized utility cost means that the subtracted capacity benefits exceed gross utility costs.

Table 5 Utility Cost of Electricity Savings: Fiscal 2020 to Fiscal 2021

Total Programs	**8**
Energy Management Activities	n/a
Supporting Initiatives[1]	n/a
Codes & Standards	n/a
Portfolio Total[2]	**23**

Notes:

1 Supporting initiatives costs have not been allocated to programs per Directive 50 of the F20-F21 RRA Decision, which rescinds Directive 61 from Order G-96-04 on BC Hydro's F05-F06 RRA. Directive 61 had directed BC Hydro to add a prorated amount of costs from supporting initiatives to the cost of each DSM program to assess cost-effectiveness.

2. Energy management activities, supporting initiatives costs and codes and standards costs are included at the portfolio level. Capacity focused DSM is not included in cost effectiveness calculations because this initiative is still in the trial and pilot stage and therefore the associated benefits have not yet been quantified.

Table 6 presents benefit cost-ratios of actual DSM electricity savings achieved from April 1, 2019 through March 31, 2021.

Codes & Standards	n/a	n/a	n/a	n/a
Portfolio Total[7]	**2.6**	**2.0**	**0.9**	**1.2**

Notes:

1 To align with BC Hydro's F20-F21 RRA, this report uses a long-run marginal cost (LRMC) of $105 per MWh. As described in BC Hydro's F20-F21 RRA, Chapter 10, this value is based on an outdated assessment of greenfield wind projects, including BC Hydro's cost to integrate and deliver energy to the load centre (Lower Mainland). BC Hydro plans to update the LRMC in the next IRP. Internal decisions on demand-side measures are based on the Utility Cost Test at market price and not on the LRMC.

2 In accordance with the DSM Regulation, the avoided cost of natural gas is valued at BC Hydro's LRMC of acquiring electricity generated from clean or renewable resources in B.C. converted to $/gigajoule (**GJ**) in all time periods. Non-energy benefits in the DSM Regulation are valued at 15 per cent of the energy and capacity benefits of electricity and natural gas, or as quantified by the Utility.

3. While subsection 4(6) of the DSM Regulation precludes the use of the Ratepayer Impact Measure Test in determining cost effectiveness of a demand-side measure, this benefit cost ratio is included in the table to comply with Directive 42 from the BCUC decision on BC Hydro's 2008 LTAP.

4 The Total Resource Cost Test benefit cost-ratios for the Low Income, Non-Integrated Areas and Social Housing Retrofit component of the LEM-C Program include a 40 per cent adder to program benefits, in accordance with the DSM Regulation.

5 Avoided costs in all NIA cost tests are based on NIA generation costs $300 per MWh (F2015$).

6 Supporting initiatives costs have not been allocated to programs per Directive 50 of the F20-F21 RRA Decision.

7 Energy management activities, supporting initiatives costs and codes and standards costs are included in cost effectiveness calculations at the portfolio level. Capacity focused DSM is not included in cost effectiveness calculations because this initiative is still in the trial and pilot stage and therefore the associated benefits have not yet been quantified.

Based on the experience gathered over the past few years through initiative tracking, Table 7 sets out the mitigation measures that have been undertaken or are planned for to address areas where cumulative energy savings are below plan. For some initiatives where cumulative energy savings are on or above plan, the table includes planned actions to ensure performance is maintained.

Table 7 Mitigating Measures to Address Cumulative Energy Savings Below Plan

Rate Structures	
Industrial Transmission	Cumulative electricity savings in fiscal 2021 were on plan.
DSM Programs	
Residential Sector	
Low Income	Cumulative electricity savings in fiscal 2021 were below plan. As public health measures due to the COVID-19 pandemic subside, ECAP promotion and activity are expected to increase.
Non-Integrated Areas	Cumulative electricity savings in fiscal 2021 were below plan. Providing enabling support to Indigenous Nations places them in a stronger position to advance demand-side management projects in their communities in the future. As public health measures subside, DSM projects are expected to increase.
Retail	Cumulative electricity savings in fiscal 2021 were above plan. Program staff will work closely with partners to examine expected participation levels in fiscal 2022 with recent COVID-19 pandemic related retail activities.
Home Renovation Rebate	Cumulative electricity savings in fiscal 2021 were above plan. New tools continue to focus the program towards the highest consuming electrically heated homes and the creation of registered contractor directories helps customers engage contractors with strong program knowledge.

BC Hydro
Power smart

Residential Energy Management Activities	Cumulative electricity savings were above plan. We are continuing to explore new tools to help customers understand their electricity consumption to determine areas of high use and potential savings.
Commercial Sector	
LEM-C	Cumulative electricity savings in fiscal 2021 were approximately on plan. Going forward, the program will continue to work with customers to remove barriers including providing energy advisors to assist small and medium businesses and working with non-profit housing providers to reduce electricity consumption in multi-unit residential buildings.
New Construction	Cumulative electricity savings in fiscal 2021 were above plan. The program is ramping down.
Industrial Sector	
LEM-I	Cumulative electricity savings in fiscal 2021 were approximately on plan. The program will continue to leverage strategic energy management activities.
Thermo-Mechanical Pulp	The Thermo-Mechanical Pulp program was implemented pursuant to Government direction and was subject to specific criteria and timelines. The deadline for project submission has passed and no further projects are planned through this program.
Capacity Focused DSM	There are no capacity savings in fiscal 2021 as these are pilot initiatives.

5 Conservation and Energy Management KBU Operating Expenditures for Fiscal 2021

BC Hydro's Conservation and Energy Management KBU operating expenditures in fiscal 2021 totalled $533,211.[2] Table 8 presents Conservation and Energy Management KBU operating expenditures in fiscal 2021.

Table 8 Conservation and Energy Management KBU Operating Expenditures for Fiscal 2021

Labour	489
Consultants/Contractors/Temp Labour	4
Other	40
Total	**533**

2 DSM operating expenditures are not included in earlier tables.

BC Hydro
Power smart

6 Low Carbon Electrification Expenditures

In accordance with Directive 49 of the F20-F21 RRA Decision, BC Hydro reports on the Low Carbon Electrification expenditures within the DSM Regulatory Account. BC Hydro's Low Carbon Electrification expenditures within the DSM Regulatory Account for fiscal 2021 totalled $4.1 million. Table 9 presents Low Carbon Electrification expenditures allocated to the applicable classes defined in section 4(3) (a), (b), (c) or (d) of the GGRR, including a consolidated table with a break down between the Initial Low Carbon Electrification and BC Hydro Low Carbon Electrification projects and programs.

Table 9 Low Carbon Electrification Expenditures for Fiscal 2020 to Fiscal 2021*

Initial LCE Projects		**Expenditures**		
GGRR Regulation Subsection	Projects	F2020 ($ 000)	F2021 ($ 000)	Total ($ 000)
4(3)(a)	Project 3	$1,418	$158	$1,575
	Project 4	$11,250		$11,250
	Thompson Rivers University		($69)	($69)
4(3)(c)	Translink	$500		$500
Project Total		$13,168	$89	$13,256

BC Hydro LCE Programs		**Expenditures**		
GGRR Regulation Subsection	Programs	F2020[1] ($ 000)	F2021 ($ 000)	Total ($ 000)
4(3)(a)(b)	BC Hydro LCE Program	$3,091	$2,852	$5,943
4(3)(c)	BC Hydro LCE Program	$438		$438
4(3)(d)	BC Hydro LCE Program	$232	$1,184	$1,416
Program Total		$3,761	$4,036	$7,797

Summary of LCE Projects/Programs	**F2020**	**F2021**	**Total**
Initial LCE Projects	$13,168	$89	$13,256
BC Hydro LCE Programs	$3,761	$4,036	$7,797
Total BC Hydro LCE Projects/Programs	$16,929	$4,124	$21,053

* Numbers may not add due to rounding.

Notes:

1 GGRR regulation subsection program totals differ from the F2020 GGRR report due to reclassification of a study within the GGRR subsections. The study was completed and included under the classification 4(3)(a)(b) in the F2020 GGRR report, and then it was subsequently reclassified to 4(3)(c). The completion documentation was submitted by the customer in time for fiscal year end. However, the classification of the file trailed into fiscal 2021, after completion of the F2020 GGRR report. This reclassification does not have a rate or cost recovery impact as the study is maintained as a prescribed undertaking.

January 14, 2020

Mr. Patrick Wruck
Commission Secretary and Manager
Regulatory Support
British Columbia Utilities Commission
Suite 410, 900 Howe Street
Vancouver, BC V6Z 2N3

Dear Mr. Wruck:

RE: British Columbia Utilities Commission (BCUC or Commission)
British Columbia Hydro and Power Authority (BC Hydro)
2004/05 and 2005/06 Revenue Requirements Application
Commission Decision: Order No. G-96-04, October 29, 2004,
Directive 66 (page 197)

BC Hydro writes to submit its F2019 Demand Side Management Milestone Evaluation Summary Report (**the Report**), dated December 2019 in compliance with Directive 66 (page 197) of the BCUC Decision on BC Hydro's 2004/05 to 2005/06 Revenue Requirements Application, dated October 29, 2004. Directive 66 directs BC Hydro to file the executive summaries of its milestone evaluation reports and full final evaluation reports for all its Power Smart programs.

The Report summarizes the impact evaluations completed during F2019 for the following:

1. B.C. Building Code - Commercial Sector: September 2009 – December 2014;
2. Leaders in Energy Management – Commercial Program: F2013-F2017; and
3. Television Market Evaluation: F2015-F2018.

For further information, please contact Geoff Higgins at 604-623-4121 or by email at bchydroregulatorygroup@bchydro.com.

Yours sincerely,

(for) Fred James
Chief Regulatory Officer

List of Tables

1.0 Introduction

This report summarizes the milestone evaluations of demand-side management (**DSM**) initiatives completed by BC Hydro in fiscal year 2019 (**F2019**). It is filed in compliance with Directive 66 of the British Columbia Utilities Commission (**BCUC**) decision on BC Hydro's F05/F06 Revenue Requirements Application (dated October 29, 2004), which "*directs BC Hydro to file the executive summaries of its milestone evaluation reports and full final evaluation reports of all its Power Smart programs*" (page 197).

BC Hydro evaluates its DSM initiatives to improve its estimates of realized DSM electricity savings and to improve their effectiveness and efficiency.

DSM evaluation activities are guided by the following six principles:

- Objectivity and Neutrality: Evaluations are to be objective and neutral.
- Professional Standards: Evaluation work is guided by industry standards and protocols.
- Qualified Practitioners: BC Hydro employs qualified staff and consultants to conduct evaluations.
- Appropriate Coverage: BC Hydro strives to achieve defined coverage levels for its evaluation of DSM initiatives.
- Business Integration: The evaluation function is integrated into BC Hydro's DSM business process of planning, implementation, reporting and evaluation.
- Coordination: BC Hydro evaluation work is coordinated with FortisBC and other DSM partners where feasible.

BC Hydro DSM evaluations are subject to an independent oversight process to ensure that they are neutral and unbiased, of sufficient quality for their intended purposes, and consistent with industry standards and protocols.

1.1 Completed Evaluations

Impact evaluations summarized in this report include the following:

- B.C. Building Code - Commercial Sector: September 2009 – December 2014
- Leaders in Energy Management – Commercial Program: F2013-F2017
- Television Market Evaluation: F2015-F2018

2.0 B.C. Building Code - Commercial Sector: September 2009 – December 2014

2.1 Introduction

This report presents the evaluated gross electricity savings associated with the new provincial building code and the Vancouver Building By-law (**VBBL**) requirements for energy efficiency in commercial buildings adopted in September 2008. The scope of this evaluation includes all new[1] commercial and institutional Part 3 buildings,[2] including multi-unit residential buildings (**MURBs**). Gross energy savings associated with the commercial building code were estimated for the period September 1, 2009 to December 31, 2014 (hereinafter, the evaluation period is referred to as F2010 to F2015).

The BC Building Code is a provincial building regulation that applies to the construction of new residential, commercial, institutional and industrial buildings, as well as alterations and additions to existing buildings. The BC Building Code sets forth the minimum standards and rules by which the construction industry must abide.[3] Prior to September 2008, the BC Building Code did not have energy efficiency requirements for new buildings constructed in the province. In September 2008, the province revised the BC Building Code and adopted ASHRAE 90.1-2004 as the minimum acceptable standard for energy efficiency in commercial buildings. Near the end of 2008, the City of Vancouver adopted a by-law whereby the ASHRAE 90.1-2007 standard had to be met.

BC Hydro provides technical assistance and resources to support the research behind implementing and updating building codes for energy in the province. Support activities include participating in technical code committees; working with government stakeholders in order to help negotiate the advancement in the energy requirements of the building code; and developing strategies and testing new approaches to support and advance future building code updates. BC Hydro also designs and implements initiatives to ready the market for energy efficiency regulations. To support the implementation of the BC Building Code in the commercial sector, BC Hydro implemented the Commercial New Construction (**CNC**) program, which provided funding and training to support the advancement of energy efficiency design and offset the cost of more expensive technologies and design.

This study does not attempt to evaluate the influence of BC Hydro's work on building codes on energy efficiency. Instead, the goal is to estimate electricity savings in BC Hydro's service territory due to a reduction in electricity usage by new commercial building stock since the adoption of the ASHRAE 90.1-2004 standard by the BC Building Code (ASHRAE 90.1-2007 by the VBBL) in September 2008. Therefore, this evaluation will estimate only the gross savings. This is the first evaluation of the energy efficiency component of the commercial building code.

1 Savings from additions or alterations to existing buildings were not included due to limited data.
2 Part 3 buildings refer to buildings over three stories in height or with a floor area of over 600 square meters. Examples include shopping malls, office buildings, apartment buildings, schools and restaurants.
3 BC Office of Housing and Construction Standards, June 2015. *Understanding B.C.'s Building Regulatory System*.

2.2 Approach

The evaluation objectives and research questions are shown below in Table 1, followed by the data sources and methods (Table 2).

Table 1 Evaluation Objectives and Research Questions

Evaluation Objective	Research Questions
1. Characterize the new commercial building stock constructed after the building code requirements were changed in 2008	• What types of commercial buildings were constructed after the introduction of the 2008 provincial building code and Vancouver Building Bylaw (VBBL)? • How many square feet of commercial floor space by building type were constructed during each year of the evaluation period? • What was the regional breakdown of new commercial construction stock in the province for the evaluation period?
2. Estimate electricity usage intensity (EUI) savings	• What was the average annual electricity consumption per square foot by building type pre-code (2005-2008) and post-code (2009-2014)? • What were the gross energy savings per square foot by building type for each year of the evaluation period?
3. Estimate gross energy and peak demand savings	• What were the gross electricity savings by building type and year? • What were the total gross electricity savings by year? • What were the gross peak demand savings by building type and year?

The data sources and analytical methods used to address the objectives are summarized in Table 2, followed by a description for each objective.

Table 2 Evaluation Objectives, Data and Methods

Evaluation Objectives	Data	Method
1. Characterize the new commercial building stock constructed after the building code requirements were changed in 2008	Statistics Canada Building Permits Survey (2005-2015) BC Assessment data (2005-2016) BC Hydro account information	Cross tabulations Trends
2. Estimate EUI savings	BC Hydro billing data (F2014-F2018) Commercial New Construction program data Continuous Optimization program data Canada Green Building Council LEED building lists Weather data	Engineering algorithm Weather normalization modelling Billing data analysis
3. Estimate gross energy and peak demand savings	Results for Objectives 1 & 2 Statistics Canada Building Permits Survey (2009-2015) BC Hydro commercial rate class load shape (Peak Demand Ratio)	Engineering algorithm

Objective 1 used data from three different sources to develop and characterize commercial building stock in the BC Hydro service area. The total number of buildings was obtained from the Statistics Canada Building Permits Survey and information about building characteristics was taken from BC Assessment data and BC Hydro account information. Square footage was estimated using permit cost data collected in the Statistics Canada survey and the Hanscomb 2013 *Yardsticks for Costing*. The analysis of characteristics and trends in the commercial building stock was completed by summarizing trends in constructed buildings over time and generating cross tabulations by building type and region.

Objective 2 required estimation of pre- and post-code EUI for each building type to obtain the EUI savings, a key metric in the calculation of gross savings for commercial stock.

Calculating building EUI required using information from different sources:

- BC Assessment (**BCA**) data were used to identify the building type, year of construction and square footage at the building level;
- BC Hydro billing data were used in the calculation of annual electricity consumption at the building level. The following steps were undertaken to estimate the building normalized annual consumption:
    - removal of participants in other BC Hydro DSM program and LEED-certified buildings;
    - adjustments for construction time, occupancy and fluctuations in business operations based on individual building consumption patterns; and
    - normalizing for variations in weather.
- Information from the BC Hydro and BCA data sources was cross-referenced to compile the data necessary to calculate the normalized annual consumption per square foot (i.e., the building EUI).

In addition, calculating the EUI savings involved several steps:

- Develop the samples of buildings to represent the pre-code period and the post-code period using BCA data.
- Analyze the EUI distributions of the pre- and post-code samples for each building type and determine the median EUI[4] for each sample distribution.
- Calculate the difference between the pre- and post-code median EUIs for each building type.

Objective 3 was addressed by multiplying the EUI energy savings for each building type calculated in Objective 2 by the total square footage by building type for each year from F2010 to F2015, and summing up the results. As noted above, electricity savings are gross estimates, and do not include adjustments for attribution to the supports provided by BC Hydro.

2.3 Results

The results of the evaluation are presented by objective.

Objective 1: Characterize the new commercial building stock

The majority of commercial new construction occurred in the Lower Mainland and on Vancouver Island. During the post-code period, the Lower Mainland accounted for 69 per cent of total new buildings and Vancouver Island accounted for 17 per cent. Taken together these two regions account for a total of 86 per cent of the new commercial buildings in the province and 83 per cent of the total square footage.

Multi-Unit Residential Buildings (**MURBs**) represented the majority (81 per cent) of buildings constructed in the post-code period, with the remaining 19 per cent distributed fairly equally among the other building types. MURBs also accounted for the largest share of the total square footage (58 per cent). Offices, retail, warehouses, and other commercial buildings each

[4] The median was used rather than mean due to the variability in the structures, functions, size and electricity consumption of the buildings in the samples. The median is less sensitive than the average (or mean) to extreme values and outliers, and can be a better indicator of central tendency when the distribution is skewed.

accounted for between 7 per cent to 11 per cent of the total floor area, and the remaining 7 per cent was shared by educational facilities, hospitals, hotels and restaurants.

Square footage by building type fluctuated over time and there was no single consistent pattern across building types. The trend in the square footage for MURBs drives the trend in total floor stock, with a large dip occurring in 2009, followed by continuous growth for the remainder of the period. Square footage also increased in retail buildings after 2009, but began to decline after 2011 until 2013 when it began to increase again. Growth in square footage for new warehouse and office buildings did not pick up as quickly as other building types, declining from 2008 to 2010 with peaks occurring in 2011 and 2012, respectively. The other commercial category showed a similar pattern, although it accounted for less floor area.

Objective 2: Estimate electricity usage intensity savings

EUI savings were calculated as the difference between the median EUI for buildings constructed in the pre-code period and buildings constructed in the post-code period.

Table 3 Pre-Code and Post-Code Gross Energy Savings per Square Foot – Electricity Use Intensity

Building Type	Pre-Code EUI (kWh/ft^2)	Post-Code EUI (kWh/ft^2)	ΔkWh/ft^2	Energy Efficiency Improvement (%)
MURB	6.4	5.8	0.6*	9
Office	14.6	11.5	3.1*	21
Retail	17.9	14.3	3.6*	20
Warehouse	9.8	9.2	0.6	6
Other Commercial	7.7	7.2	0.5	7

* Statistically significant at the 95 per cent confidence level. The remaining differences were not statistically significant at the 80 per cent confidence level.

The EUI savings for MURBs, offices, and retail buildings were statistically significant, while the results for warehouse and other commercial building types were not, due to the small number and diversity of the buildings in these two groups. There was no sample with which to conduct the EUI analysis for education, hospitals, and hotels/restaurants building categories, because the BC Assessment data was poor for these categories. Therefore, the EUI savings for these three building types were based on the engineering modelling analysis used to derive the reported gross savings.

Objective 3: Evaluated gross energy and peak demand savings

The evaluated gross energy savings for each building type in each fiscal year covered by the evaluation period are presented in Table 4. Reported savings were calculated based on a projection of annual growth in commercial floor stock and engineering estimates of EUI savings. Evaluated savings were based on actual floor stock of newly constructed buildings and EUI savings estimated from actual building electricity usage intensity data. Evaluated gross electricity savings ranged from 11 GWh/year to 30 GWh/year from F2010 to F2015, with the most savings occurring in F2013 and the least occurring in F2010. The high savings achieved in F2013 reflects the surge in savings that year for office buildings. Retail buildings had the highest total gross electricity savings (46.4 GWh/year) of all building types, followed by MURBs (29.9 GWh/year) and office (28.9 GWh/year).

Table 4 Summary of Reported and Evaluated Gross Energy and Peak Demand Savings

Calendar Year	Energy Savings (GWh/year)		Peak Demand Savings (MW)	
	Reported	Evaluated Gross	Reported	Evaluated Gross
F2010	10	11	1	2
F2011	18	24	3	4
F2012	16	23	2	4
F2013	17	30	2	5
F2014	17	22	2	4
F2015	18	23	3	4
Total	**96**	**132**	**14**	**21**

The cumulative variance between the reported energy savings and evaluated energy savings was 36 GWh/year. The largest variance occurred in F2013 with a difference of 13 GWh/year between reported and evaluated savings. The evaluated savings for MURBs, offices, and retail buildings were all higher than reported savings for a combined variance of 44.2 GWh/year. For MURBs, the EUI savings were over twice the value assumed in reported savings and the floor stock was 10 per cent higher than was forecast. Offices and retail buildings also had larger than reported EUI savings, although the new floor stock in these categories was only about half the forecasted value. Education buildings were responsible for the largest negative variance at -6.7 GWh/year, mainly due to a smaller floor stock than anticipated in reported savings.

2.4 Findings and Recommendations

Findings

1. The majority of building permits were issued in the Lower Mainland (69 per cent), followed by Vancouver Island (17 per cent). Based on the relative total square footage of these buildings, those constructed in the Lower Mainland were larger than those constructed on Vancouver Island.

2. The increasing trend in building permits that occurred after 2009 was driven by the increasing construction of MURBs, which accounted for the largest percentage of new buildings (81 per cent) during the post-code period. MURBs also accounted for the largest share (58 per cent) of total square footage.

3. Billing data revealed an average lag of approximately one year from permit issuance to construction completion. In addition, MURBs and office buildings had high vacancy rates during the first year after construction completion (i.e., the second year after permit issuance). From the third year onward, these two building types averaged an occupancy rate estimated at approximately 97 per cent annually.

4. The EUI savings estimated for each building type suggested that building performance improved after the code, improving energy efficiency by 9 per cent for MURBs, 21 per cent for office buildings and 20 per cent for retail buildings. Improvements in building performance for the warehouse and other commercial buildings categories were not statistically significant.

5. The evaluated gross energy savings and the corresponding peak demand savings from F2010 to F2015 were 132 GWh/year and 21 MW, respectively. The highest savings

were achieved in F2013, reflecting the spike in building permits for office development in 2012, taking into consideration the 12 months construction period.

6. The evaluated gross electricity savings were 36 GWh/year higher than the reported gross savings of 96 GWh/year. The largest difference occurred for MURBs, where the EUI savings were over twice the value assumed in reported savings and the floor stock was 10 per cent higher than was forecast. Offices and retail buildings also contributed to the positive variance through larger than reported EUI savings, although the new floor stock in these categories was only about half the forecasted value.

Recommendations

The following recommendations flow from the findings of this evaluation. Recommendation #1 is for the BC Hydro Codes and Standards group. Recommendation #2 is for Evaluation.

1. For MURBs and office buildings, consider adding another 12 months of lag time for reported savings to the 12 months already allowed for building construction to allow the building to achieve typical occupancy levels, or somehow account for partial occupancy during that period.
2. If cost-effective, consider using a combined approach in future evaluations of building code to include calibrated engineering simulation analysis for some building types where data is scarce, with the understanding that there will only be billing data for 12 months after building completion or typical occupancy levels.

2.5 Conclusions

The commercial building stock in B.C. became more energy efficient after energy efficiency was included in the 2008 BC Building Code. The greatest energy savings were achieved in retail buildings, followed by offices and MURBs.

3.0 Leaders in Energy Management – Commercial Program F2013-F2017

3.1 Introduction

This report presents the results of an impact evaluation of the BC Hydro Leaders in Energy Management – Commercial (**LEM-C**) program for BC Hydro fiscal years F2013 to F2017 (April 2012 to March 2017).

The LEM-C program targets BC Hydro's commercial segment, which consists of organizations in both the public and private sectors. The target market includes large customer organizations with combined annual electricity consumption greater than 4.0 GWh and small- and medium-sized businesses (**SMBs**) with annual electricity consumption less than 4.0 GWh. LEM-C is a comprehensive program that provides a suite of offers, tools and other assistance intended to help commercial customers implement energy-saving projects while also building energy management activities into their standard business practices over the long term.

During the evaluation period, the custom component of the program provided incentives to large commercial customers to implement energy efficiency projects. Incentives were determined on a per project basis based on its estimated energy savings and capital costs. Savings could also be achieved through program-enabled projects. These are custom projects that did not receive direct capital incentive funding from BC Hydro, but were enabled by other BC Hydro resources and supports, such as energy managers, energy study funding, Key Account Managers (**KAMs**) for large customers[5], and Business Energy Advisors (**BEAs**) for small- and medium-sized customers. Prescriptive incentives (Business Energy Savings Incentives or **BESI**[6]) were available to commercial customers of any size and covered simple, one-for-one replacements of inefficient technologies with energy-efficient ones, most commonly lighting. During the five-year evaluation timeframe, 4,865 energy efficiency and conservation projects implementing 17,365 energy conservation measures were completed at 5,561 unique sites of 1,460 parent organizations.

LEM-C also delivered initiatives designed to change attitudes, behaviours and practices within its large commercial customer organizations. The program undertook a strategic energy management approach designed to assist large customers with managing their energy consumption by planning for and tracking changes in consumption; adopting energy efficiency policies; implementing operational and maintenance changes; completing energy retrofits of existing buildings; changing employee behaviours; and assisting customers to integrate strategic energy management into their ongoing business practices and corporate culture. To support the adoption of strategic energy management, large commercial organizations had access to funding to hire qualified energy managers and conduct energy studies. Maintaining a qualified energy manager workforce was supported through BC Hydro-provided education and training. Funding through the Workplace Conservation Awareness (**WCA**) initiative was also available and aimed to harness employee engagement as a way to save energy and to establish a permanent culture of energy conservation within the organization.

5 Large customers are defined as organizations with electricity consumption of greater than 4 GWh per year.
6 Formerly known as Power Smart Express (**PSX**) until late F2016.

3.2 Approach

The evaluation addressed five objectives each with related research questions, as presented in Table 5.

Table 5 Evaluation Objectives and Research Questions

Evaluation Objective	Research Questions
1. Assess the customer experience with LEM-C program design and delivery	What are participant and non-participant experiences related to program awareness, understanding, and satisfaction for each of the program offers (custom, program enabled, and prescriptive)? Is there a difference between customers with and without a Key Account Manager? What are the main drivers of and barriers to program participation?
2. Assess the extent to which project-enabling activities supported the implementation of energy efficient projects and practices	What types of project-enabling activities were undertaken by the different customer segments? What factors had the greatest association with amount and type of project activity (e.g., energy managers, energy studies, KAM/Alliance/BEA involvement)? Was there a difference across commercial customer segments (e.g., public versus private sectors) and over time? To what extent and in what ways did BEAs influence project activities for small- and medium-sized businesses? To what extent are energy managers and energy studies associated with project activity and savings overall and over time? How much program-provided training and education was accessed by energy managers? How did the training affect the implementation of energy efficient projects and practices? What kinds of program-provided tools and resources were accessed by participants (e.g., SharePoint, webinars, training, others)? How did the tools and resources affect the implementation of energy efficient projects and practices? What kind of influence did customer recognition/appreciation advertising activities have on participating organizations (e.g., number and type of projects, energy savings, behaviour/attitude)?
3. Assess the extent to which strategic energy management practices were integrated into on-going business activities	What types of strategic energy management practices were integrated into business activities? Were there differing degrees of integration across customer groups (e.g., with/without KAM; public versus private sector; organization size or type)? Is there any evidence of activities or energy savings resulting from the expanded energy manager market (e.g., non-BC Hydro funded energy managers)? What are the similarities/differences in strategic energy management practices of participating organizations as compared to similar non-participating organizations?
4. Estimate gross electrical energy and peak demand savings	What were the evaluated gross energy and demand savings by fiscal year, and by custom (incentives, program enabled) and prescriptive (e.g., BESI) offers? What were the gross realization rates[7] by offer, and by end use (to the extent possible)?
5. Estimate net electrical energy and peak demand savings	How much free ridership occurred for the custom and prescriptive offers? How much participant spillover occurred for the custom and prescriptive offers? How much non-participant spillover occurred for the custom and prescriptive offers? What are the evaluated net energy savings and demand savings by fiscal year and by offer?

7 The ratio of initial estimated savings to savings adjusted for data errors and measurement and verification results.

The data sources and analytical methods used to address the objectives are summarized in Table 6.

Table 6 Evaluation Objectives, Data Sources and Methods

Evaluation Objectives	Data	Method
1. Assess the customer experience with LEM-C program design and delivery	• 7 waves of program participant surveys covering F2013 to F2017 (n=686) • 1 wave of a non-participant survey covering F2014 to F2015 (n=349) • Trade allies survey F2015 (n=88)	• Cross tabulations
2. Assess the extent to which project-enabling activities supported the implementation of energy efficient projects and practices	• Program administrative records • Participant survey BEA questions (n=17) • 6 waves of Energy Manager surveys covering F2015 to F2017 (n=7 to n=45 per wave) • Participant interviews (n=10)	• Cross tabulations • Qualitative analysis
3. Assess the extent to which strategic energy management practices were integrated into on-going business activities	• Energy Management Assessment reports • Participant interviews (n=10) • KAM interviews (n=8)	• Descriptive quantitative analysis • Qualitative analysis
4. Estimate gross electrical energy and peak demand savings	• Program tracking data • Project files • Measurement and Verification results (n=999 measures)	• Extrapolation of Measurement and Verification results using stratified ratio estimation • Average peak-to-energy factors
5. Estimate net electrical energy and peak demand savings	• Results from Objective 4 • 7 waves of participant surveys covering F2013 to F2017 (n=686) • 1 wave of non-participant survey covering F2014 to F2015 (n=349)	• Survey-based free ridership and spillover algorithms • BC Hydro Standard Procedure for Cross Effects

3.3 Results

Results for Objective 1: Asses the customer experience with LEM-C program design and delivery

Awareness of the LEM-C offers was highest among custom participants at 93 per cent. Awareness was lower among prescriptive KAM and non-KAM participants at 79 per cent each. For non-participants, awareness of the program among customers eligible to participate in the custom offer was 74 per cent and much lower among customers eligible to participate in only the prescriptive offer at only 36 per cent. In terms of individual program components, among participants, awareness was highest for the role that KAMs play as liaisons for the program and for the prescriptive offer, and lowest for the custom incentive structure and the energy manager offer. Among non-participants, awareness was low for all of the individual program offers.

Overall satisfaction (somewhat plus very satisfied) was very high for all of the LEM-C offers at 95 per cent for custom participants, 88 per cent for prescriptive KAM participants and 92 per cent for prescriptive non-KAM participants. In terms of program experience, services provided by contractors and suppliers/distributors were both rated highly – above 80 per cent rated them as excellent or good – among all participant groups. Installing the energy efficient technology and the quality of the energy efficient technology were also both rated highly by all groups. Knowing how/who to contact was rated particularly highly by custom participants (90 per cent), but lower among both prescriptive KAM participants (68 per cent) and prescriptive non-KAM participants (56 per cent). Areas which rated lowest included direct mail/email about the program (for all offers), length of time to receive project approval (for custom), information about the program on the website (for custom), pre- and post-inspections (for prescriptive KAM), variety of products funded under the program (for prescriptive non-KAM), knowing how/who to contact at BC Hydro (for prescriptive non-KAM) and usability of the online application (for prescriptive non-KAM).

Among all groups, the factor that emerged as the greatest motivator to managing electricity was making operating costs as low as possible. This sentiment was echoed in the participant interviews with saving money noted as the primary motivator. Among the participant groups, the individual program offers were also motivators, as were energy managers and KAMs. Among both participants and non-participants, the largest barriers to managing electricity use were lack of funds for energy efficient retrofits, other operational priorities, and lack of financial incentives. Among non-participants, the main reason for not participating was that they needed more information about the program.

Results for Objective 2: Assess the project-enabling activities

More than half (55 per cent) of the organizations that participated in LEM-C had an energy manager or energy study. Just over one-quarter (27 per cent) had both. Public sector organizations were most likely to have had coverage by either an energy manager or energy study or by both. Interview results revealed that organizations highly value the role of the energy manager and that energy studies have been critical for identifying potential projects and creating a business case for energy management activities.

Analysis of program data showed that most of the expected savings were associated with either an energy manager (70 per cent) or an energy study (65 per cent), and often both (55 per cent). The highest percentage reduction in energy for organizations with energy managers compared to organizations without an energy manager occurred in healthcare, government and advanced education. Municipalities, property management, and retail organizations with energy managers, compared to those without an energy manager, showed the least difference in energy reduction, indicating that enabling activities may have less of an impact in these sectors.

Interviews with representatives of participating organizations and with KAMs indicated that energy managers are critical to facilitating and supporting the implementation of custom and prescriptive projects, as well as facilitating the adoption of strategic energy management practices.

In the interviews, respondents generally highlighted that Key Account Managers were critical to the success of their energy management activities as they facilitated communication between BC Hydro and the respondent’s organization, endorsed the credibility of the energy managers to senior management and assisted with funding applications. Among survey respondents who had used the BEA service, 41 per cent indicated that they would not have completed the project without the assistance of the BEA, while 35 per cent would have completed it on their own and the remaining 24 per cent were unsure. Satisfaction was high among those who used a BEA, with 82 per cent giving it a score of 8, 9 or 10 on a 10-point scale.

BC Hydro provided a comprehensive training plan to support energy managers in achieving conservation goals, including training sessions, on-line webinars as well as Energy Manager Forums. Interviews with Energy managers suggest that the training provided was generally viewed favourably by the energy managers. More experienced energy managers noted that training on BC Hydro’s administrative process requirements became less important with increased experience. Surveys conducted with energy managers revealed their levels of satisfaction with training sessions and the Energy Manager Forum to range between 7.5 to 9.0 on a 10-point scale.

Results for Objective 3: Assess strategic energy management practices

Among the participating organizations interviewed, there was generally a high level of commitment to strategic energy management. Most had been doing strategic energy management for several years and some processes had become embedded in the organization practices. Many reported having year-on-year targets that are reported and updated on an annual basis, and energy planning activities integrated into the capital planning process. Energy studies were a means used to identify potential projects. In contrast, KAMs interviewed indicated that, to their knowledge, non-participating organizations typically did not consider energy efficiency in their capital planning exercises. Instead these organizations took a more tactical approach, relying on funding for discrete projects on an ad hoc basis.

A number of interviewed participants identified operating practices as integral to strategic energy management activities and something that the energy managers had significant ability to influence. It was noted, however, that while the level of awareness related to energy management had increased within organizations, operational staff may not be fully engaged nor committed to energy management.

Most participating organizations conceded that in the absence of the BC Hydro program, the level of strategic energy management activity would diminish.

Energy Management Assessments (**EMAs**) are a diagnostic workshop conducted every two years to track progress in organizational adoption of strategic energy management. Analysis of EMA index scores dating back to F2006 revealed that as many as nine EMA sessions had been completed (one organization), although it was most common for organizations to have engaged in four to six sessions. The overall scores increased from an average of 0.9 to 1.5 after five sessions, moving these organizations as a whole from a tactical approach to energy management (scores in the 0.0 to 1.0 range) to a more strategic approach (scores in the 1.01 to 2.0 range). A few organizations achieved overall scores greater than 2.0, signifying that strategic energy management had been operationally integrated into business practices at the time of the assessment. Scores in the private sector tended to be higher and improved by a greater margin than those in the public sector. Within the private sector, the property management sector had the fastest progression, increasing from an average score of 1.0 to 2.2 after five sessions. Within the public sector, colleges and universities had the fastest progression, increasing from 0.9 to 1.7, after five sessions. Municipalities had the slowest progression, starting at an average score of 0.8 and increasing to 1.3 after five sessions.

Results for Objective 4: Estimate gross electrical energy and peak demand savings

Gross energy savings were determined from three end use samples of projects with M&V and extrapolated to the remaining projects in the population. The sample for realization rate estimation was comprised of projects accounting for 21 per cent of expected energy savings (statistically significant coverage). Once the three samples for realization rate estimation were established, stratified ratio estimation was applied.

LEM-C projects typically involved lighting and could be categorized as Light Emitting Diode (**LED**) lighting, non-LED lighting and other end uses. There was virtually no difference in the realization rate across the three types of end uses. The distribution of energy conservation measures and energy savings for the three end uses, tag-on[8] savings and program enabled (**PE**) projects where savings are assumed to persist for two years or less are shown in the table below.

---

8 Tag-on savings are customer-funded activities that improve energy efficiency, which were recognized and reported by the program during post implementation review of custom lighting projects only. These savings are in addition to estimated spillover savings.

Table 7 Gross Realization Rates and Evaluated Energy Savings and Peak Demand Savings by End Use and Offer

End Use and Offer	Measure Count	Expected Savings (GWh/year)	Gross Realization Rate	Evaluated Gross Energy Savings (GWh/year)	Gross Peak Demand Savings (MW)
LED Lighting	7,695	162	**0.97**	158	25
Non-LED Lighting	7,014	103	**1.00**	103	16
Other End Uses	1,555	93	**0.96**	90	13
Tag-on Savings	n/a	7.3	Not evaluated	7.3	1
PE with ≤ 2 years savings persistence	1,101	42	Not evaluated	42	6
Overall Program	17,365	408	0.98	400	61

Objective 5: Estimate net electricity savings

Net electricity savings are the change in energy consumption and demand that is attributable to the program. They exclude free riders and include spillover. Free ridership was estimated separately for the three types of projects reported by the program: custom, prescriptive KAM and prescriptive non-KAM. The overall level of free ridership was estimated at 17 per cent for the program, ranging from 14 to 22 per cent between program offers. Participant spillover was estimated at 12 per cent and non-participant spillover was estimated at 7 per cent, for a total of 19 per cent. Together they result in a net-to-gross ratio of 102 per cent. Cross effects were calculated as 4 per cent for custom, 4 per cent for prescriptive KAM and 5 per cent for prescriptive non-KAM projects, for a downward adjustment of the evaluated gross energy savings of 13 GWh/year during the evaluation period. Evaluated net energy and peak demand savings[9] are shown in Table 8 and averaged 111 per cent of reported savings, showing that the program performed better than reported.

Table 8 Summary of Energy and Peak Demand Savings

Calendar Year	Net Energy Savings (GWh/year)		Peak Demand Savings (MW)	
	Reported	Evaluated	Reported	Evaluated
F2013	90.3	93.8	13.8	14.3
F2014	65.2	76.0	10.0	11.6
F2015	59.7	64.2	9.1	9.8
F2016	63.9	75.4	9.8	11.5
F2017	76.9	85.9	11.8	13.1

The variance between reported and evaluated net savings is primarily due to the evaluated net-to-gross ratio being higher than what was assumed for reported savings. The results reflect the continuous improvement approach taken by LEM-C program managers whereby the findings from previous impact and process evaluations were used to make adjustments to business planning assumptions, program design and delivery.

9 A conversion factor derived from load shape analysis used in DSM planning was applied. The factor was a weighted average of commercial lighting and other peak-to-energy factors for the period from F2013 to F2017.

3.4 Findings and Recommendations

Findings

Customer Experience with Program Design and Delivery

1. Overall satisfaction (somewhat plus very satisfied) was very high for all of the LEM-C offers at 95 per cent for custom participants, 88 per cent for prescriptive KAM participants and 92 per cent for prescriptive non-KAM participants.
2. Services provided by contractors and suppliers/distributors were both rated highly among all participant groups, as were installing the energy efficient technology and the quality of the energy efficient technology. Aspects with the lowest ratings were direct mail/email about the program, length of time to receive project approval (for custom participants), pre- and post-inspections (for prescriptive KAM participants) and variety of products funded under the program (for prescriptive non-KAM participants).
3. Among all groups, the factor that emerged as the greatest motivator to managing electricity use was making operating costs as low as possible. The largest barriers were lack of funds, other operational priorities, and lack of financial incentives.

Project-enabling Activities

4. The majority of projects (68 per cent) and expected savings (79 per cent) of organizations with annual consumption of 4 GWh per year and greater had an energy manager and/or had completed an energy study. Public sector organizations were most likely to have had coverage by either an energy manager or energy study or both, particularly healthcare, advanced education and school districts. Private sector companies had lower levels of coverage.
5. Overall, organizations with BC Hydro-funded energy managers were found to have completed more than twice the number of projects compared to organizations without an energy manager. To assess the effectiveness of energy managers and account for differences in consumption, energy savings relative to annual consumption in F2017 were examined. The results revealed greater proportional savings for organizations with an energy manager (11 per cent) than those without (8 per cent).
6. All energy managers were required to participate in training relevant to their respective sectors, which they generally viewed favourably. The energy managers interviewed noted that the training was most useful in the first years of participation, but became less relevant to their needs over time. The same was true for the various tools and templates provided by the program. Energy managers highly valued the Energy Manager Forum for knowledge transfer and sharing of ideas among their peers.
7. Business Energy Advisors conducted visits to approximately 500 commercial sites of which about 100 went on to complete projects with associated savings totaling approximately 4 GWh/year. Survey respondents identified energy saving opportunities (88 per cent) and being introduced to available incentives from BC Hydro (71 per cent) as the most valuable aspects of the BEA service.

Integration of Strategic Energy Management Practices

8. Overall, average EMA scores increased over time, with most organizations moving from a tactical approach (scores in the 0.0 to 1.0 range) to a more strategic approach (scores in the 1.01 to 2.0 range). A few organizations achieved assessment scores above 2.0, signifying that energy management had been operationally integrated into corporate

practices. None of the organizations had moved to a continuous improvement approach (i.e., scores above 3.0 range) where strategy energy management would be highly integrated into the corporate culture. Private sector organizations tended to score higher and improved by a greater margin than public sector organizations.

9. Organizations with an energy manager tended to be further ahead in integrating strategic energy management practices within the corporate planning process than those without one. Representatives of participating organizations noted that, if left without an energy manager, the level of strategic energy management would drop off. Organizational barriers to fully integrating strategic energy management included lack of senior management support and low engagement of operations staff.

10. Non-participating organizations did not typically set targets or incorporate energy efficiency into their corporate planning or policies. The exception was large institutions and national private sector organizations that already have a 'green' culture in place, and these typically have professional staff to implement strategic planning and policies.

Gross Electrical Energy Savings

11. The program gross realization rate calculated using the M&V results was 0.98, indicating that the energy conservation measures largely performed as expected. The realization rates by end use were 0.97, 1.0 and 0.96 for LED lighting, non-LED lighting and other end-uses, respectively.

12. Expected energy savings averaged 10 per cent of site energy consumption across all participants during the five-year evaluation period.

Net Electrical Energy Savings

13. The net-to-gross ratio excluding cross effects was 102 per cent based on an overall level of free ridership of 17 per cent, participant spillover of 12 per cent, and non-participant spillover of 7 per cent. Cross effects were 3.4 per cent.

14. Evaluated net savings during the evaluation period from F2013 to F2017 averaged 111 per cent of reported savings.

Recommendations

The following three recommendations are for the BC Hydro LEM-C program managers based on the findings of this evaluation.

1. Review and adjust project-enabling supports, such as training and knowledge sharing to reflect the changing needs of more experienced energy managers and mature organizations with regards to strategic energy management.

2. Develop a better understanding of building operators' responsibilities, capabilities and training needs in order to better support their role in strategic energy management.

3. Improve consistency of linking energy manager, energy study and other enabling activities at the organization level to individual sites and projects in the program administrative database.

3.5 Conclusions

The BC Hydro's LEM-C program achieved 11 per cent more savings during fiscal years F2013 to F2017 than was expected. Energy managers and energy studies lead to enhanced strategic energy management practice and energy savings in participating organizations. The program also achieved high levels of customer awareness and satisfaction.

4.0 Television Market Evaluation F2015-F2018

4.1 Introduction

This is a market evaluation that examines changes in the market for new televisions in B.C. in the context of 2013 and 2015 provincial regulations for TV energy efficiency. The evaluation estimates the electricity savings in BC Hydro's service territory due to changes in the efficiency of TVs sold in B.C. from F2015 to F2018, which includes the influence of provincial TV regulations operating in the context of external drivers and the evolving global TV market. Trends in B.C.'s TV market are examined over a longer period, from the fourth quarter of F2010 to the end of F2018. The evaluation does not attempt to determine the share of savings directly attributable to changes in regulation or other specific actions.

The market for TVs is a global one that evolves over time in response to competition among manufacturers, technology developments and consumer preferences, government policies like energy efficiency standards and regulations, and utility energy conservation programs. The energy efficiency of TVs sold in B.C. is a product of this evolution and the underlying drivers. Some of the drivers that influence the efficiency of TVs sold throughout North America are external to B.C., such as Energy Star standards that influence TV manufacturers and energy efficiency regulations in Canada, California and other states in the U.S. Other drivers of market change are internal to B.C., such as BC Hydro's demand side management programs and the B.C. TV regulation.

BC Hydro demand side management programs targeting the TV market were available from F2009 to F2014, which is prior to the evaluation period.

The B.C. TV regulations establish maximum limits for TV power draw. The first B.C. energy efficiency regulation for TVs took effect in January 2012 for power draw in on mode only, followed by limits for power draw in standby and off modes.

4.2 Approach

Shown on the below are the evaluation objectives and research questions, followed by the data sources and methods.

Table 9 Evaluation Objectives and Research Questions

Evaluation Objective	Research Questions
1. TV market demand-side assessment	What are the trends in TV ownership among residential customers? What are the trends in TV usage among residential customers? What are the principal factors contributing to consumers' TV purchase decisions? How important is energy efficiency of TVs for customers? Has the level of importance changed over the years?
2. TV market supply-side assessment	What were annual sales of TVs in B.C. from F2011 to F2018? What were the trends in the characteristics (e.g., new technologies, screen size) of new TVs from F2011 to F2018? What were the trends in the energy efficiency of TVs sold from F2011 to F2018? What was the level of compliance with the regulations among TVs sold from F2011 to F2018?
3. Gross electricity savings	What were the overall electricity and peak demand savings due to changes in the B.C. TV market from F2015 to F2018?

Table 10 Evaluation Objectives, Data and Methods

Evaluation Objectives	Data	Method
1. TV market demand-side assessment	• Residential End Use Surveys (up to 2017) • 2016 Consumer Electronics Survey • Retailer interviews (n=2) • Regulator interviews (n=2)	• Frequencies; cross tabulations • Trend analysis • Qualitative analysis
2. TV market supply-side assessment	• Quarterly TV sales data for B.C. (F2010 - F2018) • Annual Electronics Floor Stock Study (2010 to 2017) • Online product information • Regulator interviews (n=2) • Retailer interviews (n=2)	• Trends analysis • Descriptive statistics • Frequencies; cross tabulations • Qualitative analysis
3. Gross electricity savings	• Quarterly TV sales data for B.C. (F2010 to F2018) • 2010 Residential Monitoring Study (48 homes) • 2015 Consumer Electronics Metering Study (53 homes)	• Engineering algorithms

Objective 1 entailed a quantitative analysis of survey results to examine trends in the TV stock installed in BC Hydro customers' homes and factors involved in TV purchasing decisions. Qualitative information obtained through retailer interviews supplemented the survey results regarding trends in factors influencing TV purchases.

Objective 2 was addressed through several steps.

- Estimate TV sales in the BC Hydro service territory by quarter for the period January 2010 through March 2018.
- Determine power draw by model for all TVs sold from F2015 to F2018.

- Apply hours of use estimates from two metering studies of non-random samples of homes.
- Estimate electricity consumption per unit and per square inch by model for all TVs sold.
- Estimate average unit electricity consumption for the entire market.
- Conduct qualitative analysis of interviews with retailers and regulator representatives to explore the regulatory environment and current trends in the TV market.

Objective 3 was addressed using engineering algorithms that compared the market average energy consumption of TVs sold in the base period (defined as January to March 2010), to the market average energy consumption of TVs sold in each year from F2015 to F2018. Electricity savings were adjusted for cross effects and the proportion of the residential population in B.C. that is served by BC Hydro. As noted above, electricity savings are gross estimates, and do not include adjustments for attribution to the B.C. TV regulation or other influences.

4.3 Results

The results of the evaluation are presented by objective.

Objective 1: Demand-side Assessment

As of 2017, the majority of households in the BC Hydro service area (95 per cent) had at least one TV that was being used at least occasionally, with the average household using two sets. Reflecting the rapidly changing TV market, the type of TV installed in BC Hydro customers' homes has changed substantially over the past ten years. The most noteworthy change has been the replacement of the previously standard CRT TV by LCD TVs, and now by LED TVs. The rapid decline of the CRT TV is particularly evident, plummeting from 98 per cent of households in 2001 to 10 per cent of households in 2017. This decline was accompanied by a rapid increase in LCD and LED models, going from 8 per cent of households in 2006 to 85 per cent in 2017.

In the Consumer Electronics survey, customers who had recently purchased a TV (n=38) were asked to identify the most important factors in making their TV purchase decisions. Price emerged to be the most important factor, with 59 per cent of respondents selecting price as one of the top three factors, followed by size (34 per cent) and picture quality (29 per cent). Energy efficiency was indicated as one of the top three factors by 14 per cent of respondents—less important than other features, but more important than brand and manufacturer's warranty. Caution should be used interpreting these results due to the small sample size.

Interviewees representing retailer and regulator perspectives suggested that the importance of energy efficiency in TVs to consumers' purchase decisions has changed over time as technology has progressed and TVs have become more energy efficient. Energy efficiency of the older, mostly obsolete CRT models that dominated the market until around 2003 was thought to matter more to consumers than the efficiency of the newer types of TVs now available, and picture quality has become increasingly important.

Objective 2: Supply-side Assessment

Total annual TV sales peaked in F2012 at 530,336 units.[10] After that, there was a declining trend in the number of TVs sold until F2017 which saw an increase of 10 per cent over F2016. The number of TVs sold in F2017 and F2018 appeared to stabilize around 355,000.

It is well recognized that TV technology has advanced rapidly over the past five to ten years. The functionality of TVs has advanced with application-loaded Smart TVs becoming the norm and connectivity to the internet becoming increasingly important.

Results of the annual floor stock study reveal that Organic LED (**OLED**) and Ultra High Definition (**UHD**) TVs have a greater showroom presence than in previous years. From 2014 to 2017, the percentage of LED-HD TVs displayed in retailer showrooms fell from 85 per cent to 52 per cent, while UHD models increased from 18 per cent in 2015 to 44 per cent in 2017. Recent advances in the LED technologies, such as OLED, QLED (Quantum Dot LED) or UHD[11], provide higher image quality on larger screens sizes and have higher power draw.

As explained by the interview participants, advances in TV display technology have generally led to gains in energy efficiency over the years. Consumption per square inch of screen decreased four-fold from the end of F2010 to the end of F2014, levelling off in F2016 to around 120 W per year per square inch. However, although the new technologies are more energy efficient than the old CRT technology, TV power draw increases with screen size. The TV sales data for B.C. shows that TVs with smaller sized screens (i.e., 40 inches or less) are being replaced with larger sized screens. At the end of F2010, 8 per cent of TVs sold had a screen size of greater than 50 inches as compared to 35 per cent of sales at the end of F2018.

Overall, there has been a general decline since F2014 in the proportion of TVs sold in B.C. that are Energy Star rated. The reason for this trend cannot be ascertained by the evidence used in this evaluation. However, during the interviews, retailer and regulator representatives indicated that the test procedures for measuring the energy efficiency of TVs are not well-suited to some of the new technologies or functionalities, such as network connectivity, making it difficult to apply energy efficiency standards in the same manner as has been done historically.

As noted earlier, from F2011 to F2018, there were three versions of the TV regulation for energy efficiency in B.C. The previous evaluation of the TV market conducted a detailed examination of compliance with the province's 2013 TV regulation. In general it was found that the share of TVs that met or exceeded the efficiency level specified by the 2013 regulation increased over the period from F2010 to F2014. By the first quarter of 2012, immediately following the regulation taking effect, compliance had reached 92 per cent climbing to 97 per cent by the fourth quarter of 2014. The current evaluation period encompasses the change to the regulation implemented in 2015, which dropped the limit on power draw in on mode. The high rate of compliance to the regulation continued through to the end of F2018, reflecting the fact that most TVs complied with the limit on power draw in standby and off modes that remained in the regulation. Analysis revealed a steady decline in the percentage of TVs sold that met the previous limit on power draw in on mode.

10 Note that BC Hydro serves approximately 1.7 million residential accounts. Sales levels of 0.5 million per year imply that most BC Hydro residential customers had purchased at least one new TV between F2011 and F2014. The higher sales in F2011 and F2012 are most likely related to the switch from analog to digital broadcasting that began in 2010 and possibly the desirability of the new LCD/LED technology that was entering the market.

11 Note that Ultra High Definition models are also based on LED technology, while LED refers to standard High Definition models.

Objective 3: Gross Electricity Savings

The reported and evaluated gross electricity energy and peak demand savings are presented in Table 11.

Table 11 Summary of Energy and Peak Demand Savings

Fiscal Year	Gross Energy Savings (GWh/year)		Peak Demand Savings (MW)	
	Reported	**Evaluated**	**Reported**	**Evaluated**
F2015	64	50	15	12
F2016	65	45	15	11
F2017	69	42	16	10
F2018	64	33	15	8

Evaluated savings were 93 GWh/year less than the reported savings for the four year evaluation period. The evaluated gross savings were consistently lower than the reported savings, and the gap increased every year. In F2015 evaluated savings were 14 GWh/year lower than the reported savings for that year, followed by a gap of 20 GWh/year in F2016, 28 GWh/year in F2017 and 31 GWh/year in F2018.[12]

The main factors contributing to the variance between reported and evaluated savings are hours of use and annual sales figures. Reported savings were estimated based on 5.6 hours/day while evaluated savings used 5.0 hours/day based on more recent data. Projected TV sales used for reported savings were consistently higher than actual sales, by 11 per cent to 32 per cent depending on the year. By adjusting the assumptions used to calculate reported savings, it was estimated that, together, these two factors account for approximately 72 per cent of the variance.

The remaining 28 per cent of the variance can be attributed to several recent changes to TV characteristics, in particular the increase in screen size over the four year period and the introduction of slightly less energy efficient technology, both of which appear to have had the greatest impact in F2018. Note that increasing screen size has a negative influence on estimated savings because the baseline was taken as the market average consumption of models sold in F2010, which were on average smaller in size. A baseline that would have accounted for the steady trend of increasing screen size would produce a different result and larger savings.

Standby mode consumption was low (most were less than 0.5 watts per unit) and consistent across the evaluation years, and therefore, contributed only marginally to the variance.

[12] Differences from the above table are due to rounding.

4.4 Findings and Recommendations

Findings

Below are the main evaluation findings.

Demand Side Assessment

1. The type of TV installed in BC Hydro customers' homes has changed dramatically over the past ten years, reflecting the rapid changes in TV technologies. The most noteworthy change has been the move away from standard CRT TVs to LCD TVs and then to LED TVs.
2. Survey results for recent purchasers of new TVs revealed the top three drivers of TV purchase decisions to be, in order of importance: price, screen size, and picture quality. Energy efficiency was rated as a top consideration by only 14 per cent of survey respondents. These results were confirmed in interviews with TV retailers and regulators.

Supply Side Assessment

3. Overall, new TV sales have declined since 2012 and sales appear to have plateaued in F2017 and F2018.
4. The new TV market continues to change rapidly with the introduction of new technologies such as Smart TVs and Ultra High Definition.
5. New TV technologies are more efficient than the old CRTs, but larger screen sizes and improved picture quality require greater power. Therefore, although power draw per square inch has declined dramatically since 2010, the overall power draw of a television unit began to increase after 2015 as screen sizes got bigger and TV technology changed.
6. Since the beginning of F2015, there has been a decline in the proportion of new TVs sold that are Energy Star certified, from over 80 per cent to less than 50 per cent.
7. Retailers and regulators interviewed noted that energy efficiency of TVs is more complicated to measure because of new technologies, additional functionality and increase in screen size, and the tests need to be revised.
8. Compliance with the TV regulation has been over 90 per cent since the B.C. regulation took effect in 2012. Since 2015, when the on mode power limit was removed from the regulation, compliance has been almost 100 per cent. However, average power draw in on mode has begun to increase. From the start of 2016 to the end of 2018, the percentage of TVs sold with on mode power draw higher than the standard set forth in the previous regulation increased from 5 per cent to 25 per cent.

Gross Savings

9. Gross evaluated savings in the new TV market were 50, 45, 42, and 33 GWh/year, respectively, for each year from F2015 to F2018. In contrast, the reported savings for each year over the same period ranged from 64 GWh/year to 69 GWh/year.
10. The evaluated gross savings were consistently lower than the reported savings, and the gap increased in each year. In F2015 evaluated savings were 22 per cent lower than the reported savings for that year, followed by a gap of 31 per cent in F2016, 39 per cent in F2017 and 48 per cent in F2018. There were two main factors that contributed to the

variance. Reported savings were estimated based on 5.6 hours/day while evaluated savings used 5.0 hours/day based on more recent data. Projected TV sales used for reported savings were consistently higher than actual sales, by 11 per cent to 32 per cent depending on the year. Together, these two factors account for approximately 72 per cent of the variance. The remaining 28 per cent of the variance can be attributed to several recent changes to TV characteristics, in particular the increase in screen size over the four year period and the introduction of slightly less energy efficient technology, both of which appear to have had the greatest impact in F2018.

Recommendations

The following recommendations flow from the findings of this evaluation. Recommendations #1 and #2 are for the BC Hydro Codes and Standards group. Recommendation #3 is for Evaluation.

1. Given the rapid changes in TV technologies and features, review the assumptions and calculation inputs used in the energy savings forecast for the TV market on a regular basis.
2. Explore how standard test methods can be changed to better align with new TV technologies and uses.
3. Consider undertaking survey and/or residential monitoring or metering studies to examine and better understand current TV-usage behaviours and hours of use among BC Hydro customers.

4.5 Conclusions

The new TV market continues to change rapidly and new technologies are resulting in homes using larger screen sizes that provide high quality picture and additional features that are important to consumers. Energy efficiency has begun to decline in the on power mode, but efficiency in the off and standby power modes remains high. The changes in the TV market resulted in evaluated savings being lower than reported savings in the F2015 to F2018 period.

Glossary

Baseline: A baseline is the initial condition occurring when a DSM activity begins. It may be a market share for equipment, a current standard, or a current average behaviour.

Cross Effects: Cross effects (also known as interactive effects) refer to the effect that some energy conservation measures (**ECMs**) have on other electricity end uses beyond what the ECM itself produces. An obvious example is building lighting. As more efficient lighting is installed, less heat is generated by the lighting system. This means that less heat must be removed from the building by the air conditioning system during the cooling season, but more heat needs to be supplied by the heating system during the heating season.

Demand Side Management (DSM): The definition of Demand Side Management is the same as the definition of "demand-side measures" set out in section 1 of the *Clean Energy Act*, which is "a rate, measure, action or program undertaken; (a) to conserve energy or promote energy efficiency, (b) to reduce the energy demand a public utility must serve, or (c) to shift the use of energy to periods of lower demand, but does not include (d) a rate, measure, action or program the main purpose of which is to encourage a switch from the use of one kind of energy to another such that the switch would increase greenhouse gas emissions in British Columbia, or (e) any rate, measure, action or program prescribed".

End Use: The final application or final use to which energy is applied. Recognition of the fact that electric energy is of no value to a user without first being transformed by a piece of equipment into a service of economic value. For example, office lighting is an end use, whereas electricity sold to the office tenant is of no value without the equipment (light fixtures, wiring, etc.) needed to convert the electricity into visible light. End use is often used interchangeably with energy service.

ENERGY STAR®: ENERGY STAR® is the mark of high-efficiency products in Canada that meet strict technical specifications for energy performance—tested and certified. These products save energy without compromising performance in any way. Typically, an ENERGY STAR® certified product is in the top 15 to 30 per cent of its class for energy performance.

Expected Savings: Estimate of gross energy savings based on customer initially reported savings, engineering review and site inspection. These estimates represent the unverified savings.

Free Riders: Free riders are program participants who would have taken the DSM action, even in the absence of the DSM program. They are a part of the reference case. These actions are not attributable to the program.

Gigawatt Hour (GWh): One billion watt-hours; one million kilowatt hours.

Gross Savings: The change in energy consumption and/or associated demand that results directly from program-related action taken by the participants in the demand side management program irrespective of why they participated.

Market Transformation: Market Transformation refers to a permanent change in the structure or functioning of markets, including more energy-efficient behaviour among customers and higher market penetration of energy-efficient products, as a result of DSM programs that reduce barriers to energy efficiency. These market changes are likely to persist in the absence of continued program activity.

Net savings: The change in energy consumption and/or associated demand that is attributable to the utility DSM program. The change in consumption or associated demand may include the effects of free riders and spillover.

Net-to-gross ratio: A factor representing net demand side management program savings divided by gross program savings that is applied to gross program impacts to convert them into net program load impacts. The factor is made up of a variety of factors that create differences between gross and net savings, commonly including free riders and spillover. Other adjustments may include rebound, cross effects and M&V results.

Peak Demand - Demand refers to the amount of electricity that is consumed at any instant in time, measured in multiples of watts. Peak demand savings are the reduction in amount of electricity that is consumed at system peak demand, which for BC Hydro occurs on a winter weekday between approximately 5 p.m. and 7 p.m.

Persistence: Refers to how long the energy savings are expected to be attributable to the demand side management activity.

Realization Rate: The ratio of initial estimates of savings to savings adjusted for data errors and M&V results. Does not reflect program attribution or influence on the savings achieved.

Reported Savings: Estimate of energy savings being recorded in the program tracking database. Reported savings are based on best information available from technical review of the initial engineering estimate, post implementation review of documentation and/or inspection, or M&V results, as well as, a forecast net-to-gross ratio applied.

Spillover: Refers to program participants and non-participants whose energy savings measures occur through actions that are not part of a program, but which were influenced by the program (also called free drivers or tag-ons). Participant spillover is the additional energy savings that occur when a program participant independently installs energy efficiency measures or applies energy savings practices after having participated in the efficiency program, as a result of the program's influence. Non-participant spillover refers to energy savings that occur when a program non-participant installs energy efficiency measures or applies energy savings practices as a result of a program's influence. Spillover is expressed as a fraction of the increase of energy savings due to spillover to the gross energy savings of the program participant. Spillover may not be permanent and may not continue in the absence of continued program activity.

Mr. Patrick Wruck
Commission Secretary and Manager
Regulatory Support
British Columbia Utilities Commission
Suite 410, 900 Howe Street
Vancouver, BC V6Z 2N3

Dear Mr. Wruck:

**RE: British Columbia Utilities Commission (BCUC or Commission)
British Columbia Hydro and Power Authority (BC Hydro)
2004/05 and 2005/06 Revenue Requirements Application
BCUC Decision: Order No. G-96-04, October 29, 2004,
Directive 66 (page 197)**

In compliance with Directive 66 of the BCUC Decision on BC Hydro's 2004/05 to 2005/06 Revenue Requirements Application, dated October 29, 2004, BC Hydro writes to submit its F2020 Demand Side Management Milestone Evaluation Summary Report dated December 2020.

Directive 66 directs BC Hydro to file the executive summaries of its milestone evaluation reports and full final evaluation reports for all its DSM programs.

The F2020 Demand Side Management Milestone Evaluation Summary Report summarizes the impact evaluations completed during F2020 for the following:

1. Commercial New Construction Program: F2012-F2016 (Final Full Evaluation Report is included in Attachment 1);
2. Leaders in Energy Management Industrial Transmission Program: F2015-F2017; and
3. Load Displacement Initiatives Impact Evaluation: F2021-F2018 (Final Full Evaluation Report included in Attachment 2).

For further information, please contact Chris Sandve at 604-974-4641 or by email at bchydroregulatorygroup@bchydro.com.

Yours sincerely,

Fred James
Chief Regulatory Officer

Table of Contents

1.0 Introduction

This report summarizes the milestone evaluations of demand-side management (**DSM**) initiatives completed by BC Hydro in fiscal year 2020 (**F2020**). It is filed in compliance with Directive 66 of the British Columbia Utilities Commission (**BCUC**) decision on BC Hydro's F05/F06 Revenue Requirements Application (dated October 29, 2004), which "*directs BC Hydro to file the executive summaries of its milestone evaluation reports and full final evaluation reports of all its Power Smart programs*" (page 197).

BC Hydro evaluates its DSM initiatives to improve its estimates of realized DSM electricity savings and to improve their effectiveness and efficiency.

DSM evaluation activities are guided by the following six principles:

- Objectivity and Neutrality: Evaluations are to be objective and neutral.
- Professional Standards: Evaluation work is guided by industry standards and protocols.
- Qualified Practitioners: BC Hydro employs qualified staff and consultants to conduct evaluations.
- Appropriate Coverage: BC Hydro strives to achieve defined coverage levels for its evaluation of DSM initiatives.
- Business Integration: The evaluation function is integrated into BC Hydro's DSM business process of planning, implementation, reporting and evaluation.
- Coordination: BC Hydro evaluation work is coordinated with FortisBC and other DSM partners where feasible.

BC Hydro DSM evaluations are subject to an independent oversight process to ensure that they are neutral and unbiased, of sufficient quality for their intended purposes, and consistent with industry standards and protocols.

1.1 Completed Evaluations

Impact evaluations summarized in this report include the following:

- Commercial New Construction Program: F2012-F2016
- Leaders in Energy Management Industrial Transmission Program: F2015-F2017
- Power Smart Partners – Load Displacement Initiatives Impact Evaluation: F2012-F2018

2.0 Commercial New Construction Program: F2012-F2016

2.1 Introduction

This report presents an impact evaluation of the BC Hydro Commercial New Construction (**CNC**) program for BC Hydro fiscal years 2012 to 2016 (April 2011 to March 2016). The CNC program was targeted at developers and the building design community who play a role in building and expanding commercial buildings in BC Hydro's service territory. Market actors included developers, building owners, architects, engineers, energy modellers and consultants.

The program's key objective is to obtain electricity energy savings by supporting the design and implementation of cost-effective energy conservation measures beyond applicable building code requirements. There are associated capacity savings (MW) with this program that are derived from the energy savings resulting from the program's energy-focused DSM activities. These savings are not a result of capacity-focused DSM. The CNC program provides direct savings for BC Hydro by supporting the following:

- Energy Efficient Design: identify energy savings by promoting and funding the design of energy efficient buildings (i.e., more energy efficient than the minimum building code legislation requires);
- Energy Efficient Construction: acquire energy savings by promoting and funding the construction of energy efficient buildings and offer training and education on the efficient operation of new buildings; and
- Training and Recognition: enable transformation of the market by training a team of industry professionals to act as energy conservation "ambassadors" (i.e., advocates) on all new construction projects that they work on in the future. In addition, to publicly recognize energy efficient design teams and projects and create a market where consumers highly desire energy efficient buildings.

The program had four offerings:

1. Whole Building Design
    - Targeted at buildings over 50,000 square feet
    - Energy Modelling/Computer simulation of the whole building energy use
2. System Design
    - Targeted at improving the energy efficiency of selected building systems in buildings typically over 50,000 square feet
    - Energy use analysis of a specific system (e.g., lighting, refrigeration, HVAC)
3. Energy Efficient Lighting Design
    - Targeted at buildings typically over 10,000 square feet; and
    - Energy use analysis for lighting - reduction of light power density requirement from building code through design and controls

4. Program Enabled
   - Projects in which the customer engaged with BC Hydro, undertook a funded Energy Study and through this engagement the building design/equipment was influenced leading to energy savings
   - These measures did not receive a program incentive due to not meeting BC Hydro cost effectiveness ratios or due to failing to comply with program incentive offer timing and process

The CNC program is winding down, with all remaining applications scheduled to be completed in F2022. BC Hydro will continue to support the transformation of the commercial new construction market through codes and standards activities that support the B.C. Energy Step Code.

2.2 Approach

The evaluation objectives and research questions are shown below in Table 2.1, followed by the data sources and methods (Table 2.2).

Table 2.1. Evaluation Objectives and Research Questions

Evaluation Objective	Research Questions
1. Assess the participant experience	• What is the level of participant awareness of the various CNC program components? • How do participants rate their program experience and overall satisfaction? • How influential is the CNC program on participant decisions around energy efficiency?
2. Assess practices and opinions related to market transformation	• What are the most common types of design studies being conducted in view of helping to make new construction projects perform better than code? (e.g., whole building energy modelling, a refrigeration system design study, and/or a lighting design study) • What are the most common measures being implemented to help make new construction projects perform better than code? • To what extent do market actors believe the commercial new construction market in the province has improved over the last 10-15 years? • How much electricity do market actors believe new construction projects are saving relative to the energy efficiency requirements in the B.C. Building Code?
3. Assess the influence of the program on the adoption of energy efficiency measures beyond building code requirements	• To what extent has the CNC program developed support for design and construction of more energy efficient buildings (beyond code requirements) among commercial new construction market actors (designers, builders, mechanical engineers, architects etc.)? • To what extent and through which activities is the CNC program influencing building design practices and the new construction market beyond incented projects?
4. Estimate gross energy and peak demand savings	• What are the gross and peak demand savings?
5. Estimate net energy and peak demand savings	• What are the net energy and peak demand savings for the overall CNC program? • What are the free ridership, participant spillover and non-participant spillover rates?

The data sources and analytical methods used to address the objectives are summarized in Table 2.2, followed by a description for each objective.

Table 2.2. Evaluation Objectives, Data and Methods

Evaluation Objective	Data	Methods
1. Assess the participant experience	• Participant Survey (n=57)	• Cross tabulations
2. Assess practices and opinions related to market transformation	• Market Actor Survey (n=13-30)	• Cross tabulations
3. Assess the influence of the program on the adoption of energy efficiency measures beyond building code requirements	• Market Actor Survey (n=13-30)	• Cross tabulations
4. Estimate gross energy and peak demand savings	• Program tracking data • Measurement and verification (n=12)	• International Performance Measurement and Verification Protocol (IPMVP) Option A, B and D • Ratio estimation • Peak demand savings based on peak-to-energy factor
5. Estimate net energy and peak demand savings	• Statistics Canada data on commercial new construction activity, F2012-F2016 • Participating building area (square metres) • Conservation Potential Review (**CPR**) Energy Use Intensity (**EUI**) inputs • Results from Objective 4 • Participant survey (n=51) • Market actor survey (n=13-30)	• Survey based free ridership and participant spillover algorithms • Market Actor Survey based non-participant spillover algorithm

2.3 Results

The results of the evaluation are presented by each evaluation objective, below.

Results for Objective 1: Assess the participant experience

Among program participants, 79 per cent reported being aware of the CNC program offer by name. Of the individual program components, awareness, understanding and rating score was highest for the role that key account managers play as liaisons between the CNC program and participants.

Overall satisfaction was high for the CNC program at 80 per cent, comprised of 41 per cent stating they were very satisfied and 39 per cent stating they were somewhat satisfied. When asked the likelihood of recommending the program to others, 95 per cent indicated that they definitely (53 per cent) or probably (42 per cent) would, and 49 per cent reported that they had in fact already done so.

A total of 80 per cent of participants indicated that the CNC program was very (33 per cent) or somewhat (47 per cent) influential on the decision to implement the energy efficient measures at their site. Looking more broadly at conservation motivators, 60 per cent of participants indicated that the CNC program was a 'major factor' in the organization's effort to manage electricity use over the past year. In terms of barriers to managing electricity use, lack of funds for energy efficient retrofits/projects was noted as a 'major barrier' by 33 per cent of participants, followed by other operational priorities (29 per cent) and lack of financial incentives for conservation programs and energy efficiency (26 per cent).

Results for Objective 2: Assess practices and opinions related to market transformation

With regards to buildings that did not participate in the CNC program, but that market actors reported were performing better than the energy efficiency requirements of the B.C. Building Code, the most common type of design study conducted to help these buildings perform better than code was whole building design. On average, approximately two-thirds of respondents confirmed that at least some floor area of their 'better than code, non-participating projects' had come through this study type. This was followed by lighting design studies, with about 44 per cent of respondents, on average, confirming at least some floor area had come through this study type.

Again, with regards to buildings that did not participate in the CNC program but that were performing better than code, by far the most common measure being implemented to help make these buildings perform better than code was highly efficient lighting, with 83 per cent of respondents reporting that the measure was at least sometimes implemented in their 'better than code, non-participating projects. This was followed by HVAC measures at 64 per cent.

Market actors, including electrical engineers, mechanical engineers, energy modellers, architects and project managers, were asked how much they thought energy efficiency had improved in the entire commercial new construction market in B.C. over the past 10 to 15 years. All respondents thought that there had been some improvement over the past 10 to 15 years – although not necessarily beyond code – with the majority (55 per cent) reporting a 20 per cent improvement. Additionally, all thought that both their own buildings and those constructed by other firms were performing better than code specifically in regards to electricity savings. Savings were reported in the 1 per cent to 30 per cent range, with about half of respondents perceiving that their own buildings had 20 per cent to 30 per cent electricity savings relative to code, compared to only about one-third feeling the same way about buildings constructed by others.

Results for Objective 3: Assess the influence of the program on the adoption of energy efficiency measures beyond building code requirements

A total of 91 per cent of respondents had experience with at least one of the energy efficiency resources or touchpoints provided by the program. The most common were "discussions about projects with BC Hydro staff" (70 per cent) and "reviewing case studies/resource literature" (64 per cent). This was followed by 60 per cent who had "attended a program workshop or training session" and 40 per cent who had "reviewed the Building Envelope Thermal Guide". The least used resource was the "Enhanced Thermal Performance Spreadsheet", with only 21 per cent of respondents indicating they had reviewed it.

Market actors were asked to consider all of their various touchpoints with the program and the influence that these had on their design decisions to have non-participating projects perform better than the building code. A total of 60 per cent indicated that these program touchpoints were 'very' or 'somewhat' influential on their decisions to do so.

In order to understand program influence relative to other factors in the broader new construction context, market actors were asked to credit various factors for making non-program projects perform better than the B.C. Building Code, such that the factors summed to 100 per cent. On average, BC Hydro 'drivers' were given a net of 24 per cent of the credit for making projects perform better than code. It follows that non-BC Hydro drivers were given 76 per cent of the credit for buildings performing better than code.

Another approach to assessing program influence was to query market actors on how much of the improvement in the energy use over time – although not necessarily beyond code – could be attributed to BC Hydro's CNC program. About half (49 per cent) felt it was in the 20 to 30 per cent range, with the most common answer at 20 per cent.

Results for Objective 4: Estimate gross energy and peak demand savings

The evaluated gross savings in fiscal year covered by the evaluation period are presented in Table 23. Evaluated gross electricity savings ranged from 9.2 GWh/year to 24.2 GWh/year from F2012 to F2016, with the most savings occurring in F2014 and the least occurring in F2012.

Table 2.3. Summary of Evaluated Gross and Net Energy and Peak Demand Savings

Year	Evaluated Gross Energy Savings (GWh/year)	Evaluated Gross Peak Demand Savings (MW)	Calculated Net-to-Gross Ratio	Evaluated Net Energy Savings (GWh/year)	Evaluated Net Peak Demand Savings (MW)
F2012	9.2	1.3	0.91	8.4	1.2
F2013	19.9	2.8	0.96	19.2	2.8
F2014	24.4	3.5	0.93	22.7	3.2
F2015	18.8	2.7	0.95	17.9	2.6
F2016	20.6	3.0	0.99	20.4	2.9
CNC (F12-F16)	**92.9**	**13.3**	**0.95**	**88.6**	**12.7**

Results for Objective 5: Estimate net energy and peak demand savings

The evaluated net savings in fiscal year covered by the evaluation period are presented in Table 2.4. Evaluated net electricity savings ranged from 8.4 GWh/year to 22.7 GWh/year from F2012 to F2016, with the most savings occurring in F2014 and the least occurring in F2012.

Table 2.4. Summary of Net Energy and Peak Demand Savings

	Net Energy Savings (GWh/year)		Net Peak Demand Savings (MW)	
Fiscal Year	**Reported**	**Evaluated**	**Reported**	**Evaluated**
F2012	8.1	8.4	1.1	1.2
F2013	15.3	19.2	2.2	2.8
F2014	20.7	22.7	3.0	3.2
F2015	14.0	17.9	2.0	2.6
F2016	15.3	20.4	2.2	2.9
CNC (F12-F16)	**73.4**	**88.6**	**10.5**	**12.7**

The cumulative variance between the reported net energy savings and evaluated energy savings was 15.2 GWh/year. The largest variance occurred in F2016 with a difference of 5.1 GWh between reported and evaluated savings.

Overall, the program achieved 121 per cent of reported savings during fiscal years F2012 to F2016, showing the program performed better than reported. The variance between reported and evaluated net savings is primarily due to the impact of non-participant spillover which was estimated in the evaluation.

2.4 Findings and Recommendations

Findings

Participant Experience

1. Overall satisfaction was high for the CNC program at 80 per cent, comprised of 41 per cent stating they were very satisfied and 39 per cent stating they were somewhat satisfied.

2. The highest scores related to aspects of service/communications from BC Hydro, as well as service provided by contractors. Mid-range scores typically related to aspects of the program offer (variety of products and level of incentives) and the overall application procedures. The lowest scores were for length of time to receive the incentive, length of time for the project/process to be completed and direct mail/email about the program (which was not relied on heavily by this program).

3. Participants reported that the program had been influential on their decision to implement the energy-efficient measures, with 33 per cent indicating that it had been very influential and 47 per cent indicating it had been somewhat influential.

Market Transformation

4. All market actors thought that there had been some improvement in the entire commercial new construction market in B.C. over the past 10 to 15 years – although not necessarily beyond code – with the majority reporting a 20 per cent improvement in terms of energy use over time.

5. The most common types of design study conducted to help new construction projects perform better than code were whole building design and lighting design. The most common measures implemented to help projects perform better than code were lighting and HVAC.

Influence on Adoption of Energy Efficiency Measures Beyond Building Code Requirements

6. On average, BC Hydro 'drivers' were given a net of 24 per cent of the credit for making projects perform better than code, with the largest credit given to previous learnings and experience with the CNC program. The remaining 76 per cent of credit was given to non-BC Hydro drivers, with the largest given to general industry innovation/good practices and to clients directing the projects to be built as such.

Gross Electrical Energy Savings

7. The evaluated gross energy savings were 93 GWh/year.

8. The program gross realization rate calculated using the inspected and verified results, including cross effects, was 1.06, indicating that the energy conservation measures largely performed better than expected. The realization rates by program offer were 1.17, 1.04, 0.89 and 0.89 for whole building design, system design, lighting design and program enabled projects, respectively.

9. Expected energy savings averaged 18 per cent of site energy consumption across all participants during the five-year evaluation period.

Net Electrical Energy Savings

10. The evaluated net energy savings were 89 GWh/year.

11. The net-to-gross ratio was 95 per cent based on free ridership of 20 per cent, participant spillover of 1 per cent and non-participant spillover of 14 per cent.

12. Evaluated net savings during the evaluation period from F2012 to F2016 averaged 121 per cent of reported savings.

Recommendations

The following two recommendations are for future new construction initiatives:

1. Support and enabling activities for whole building energy modelling and integrated system approach to estimate a project's energy savings should continue and include the Building Envelope Thermal Bridging Guide and the Enhanced Thermal Performance Spreadsheet.

2. Future Market Actor surveys could be done more frequently so that respondents are better able to recall the projects they are being surveyed about.

2.5 Conclusions

BC Hydro's Commercial New Construction Program achieved high participant satisfaction. Evaluated net savings were 89 GWh/year, which is 121 per cent of reported savings. Evidence suggests that the program has supported the market in complying with and exceeding the energy efficiency requirements of the B.C. Building Code.

3.0 Leaders in Energy Management Industrial Transmission Program: F2015-F2017

3.1 Introduction

This report presents the results of an impact evaluation of the BC Hydro Leaders in Energy Management – Industrial Transmission (**LEM-T**) program for fiscal years F2015 to F2017 (April 2014 to March 2017).

The LEM-T program captures energy savings at large industrial facilities through energy efficiency retrofits, operational and maintenance changes, and behavioural changes. LEM-T program participants are large industrial customers receiving service at transmission voltages (> 60 kV) who belong to a variety of sectors, including pulp and paper, wood products, mining, oil and gas, chemical, cement and manufacturing.

The LEM-T program was built on a foundation of strategic energy management by providing training, energy managers, energy studies, audits, and other resources to enable large industrial customers to implement facility changes and benefit from the Transmission Service Rate (**TSR**) or leverage capital incentives. The main program components covered by this evaluation are described below.

- **Strategic Energy Management**: LEM-T provides funding to industrial transmission customers for a specially trained Industrial Energy Manager to embed strategic energy management (**SEM**) practices into their organizations. The energy managers conduct energy assessments to help customers gain energy insights, build executive support for energy efficiency and define the energy opportunity and value proposition for their company. They also have access to additional funding and resources to implement employee awareness initiatives and enhanced energy monitoring and targeting systems. In F2017, additional deemed savings for selected SEM participants were claimed for the first time. Prior to that, the program promoted and supported the implementation of SEM activities as a program influence factor but no additional savings were claimed for them.
- **Energy Studies**: LEM-T offers funding to identify energy-saving opportunities through plant-wide audits and end use assessments and to quantify opportunities and build the business case for implementing energy improvement projects through feasibility studies.
- **Custom Project Incentives:** Custom project incentives are financial incentives provided to large industrial customers to implement energy efficiency projects. These projects typically involved "hard-wired" changes to electrical equipment.
- **Self-serve Incentive Program (SIP):** The self-serve incentive component of LEM-T is designed to allow large industrial customers to apply for incentives for improvements to compressed air and lighting systems. The online application makes it quick and easy to apply.
- **Program Enabled (PE) Projects:** Program enabled projects are custom projects that did not receive direct capital incentive funding from BC Hydro, but were enabled by other BC Hydro resources and supports, such as energy managers and energy studies. Customers can claim savings from these projects by providing the appropriate documentation and project details.
- **New Plant Design:** The New Plant Design initiative offers industry expertise to provide an energy base line and energy-efficiency design support for new or expanding facilities. These projects are combined with custom project incentives or program enabled projects to encourage efficient designs that surpass industry standards.

3.2 Approach

The evaluation objectives and research questions are shown in the table below, followed by another table summarizing the data sources and methods for each objective.

Table 3.1. Evaluation Objectives and Research Questions

Evaluation Objectives	Research Questions
1. Examine participant and non-participant experience with the program	What was participant and non-participant awareness and understanding of the various program offers? What was participant satisfaction with the various program offers?
2. Assess outcomes influenced by SEM activities among BC Hydro's large industrial customers	What have been the trends and outcomes associated with strategic energy management over time (e.g., changes in sustainability management, capability, commitment, expectations, application of knowledge)? Were energy managers associated with increased project activities? What was the coverage of energy savings of facilities with energy managers compared to those without? To what extent did SEM lead to additional savings beyond project-based activities? Were the savings achieved in the form of a reduction in energy consumption or reduced energy use intensity? What have been the main barriers to and drivers of adopting and integrating strategic energy management into industrial organizations?
3. Evaluate deemed energy savings of SEM participants	What were the gross energy and peak demand savings from SEM participants with deemed savings? What were the net energy and peak demand savings from SEM participants with deemed savings?
4. Estimate gross electrical energy and peak demand savings due to the incentive offers and program enabled projects (excluding deemed savings of SEM participants)	What were the most common energy conservation measures by end use and customer site type among custom and prescriptive incentive projects, and program enabled projects? What were the evaluated gross energy and peak demand savings realized by custom and prescriptive incentive projects, and program enabled projects?
5. Estimate net electrical energy and peak demand savings due to the incentive offers and program enabled projects (including deemed savings of SEM participants)	How much free ridership occurred for custom and prescriptive incentive projects, and program enabled projects? How much participant and non-participant spillover occurred for the program overall? What were the evaluated net energy and peak demand savings for the combined effect of the LEM-T program and the TSR for custom and prescriptive incentive projects, and program enabled projects?

The following table summarized the data sources and methods used to address each evaluation objective and associated research question.

Table 3.2. Evaluation Objectives, Data and Methods

	Evaluation Objective	Data	Method
1.	Examine participant and non-participant experience with the program	• 2015, 2016, 2017 Participant surveys (n=59) • 2015, 2018 Non-participant survey (n=16)	• Cross tabulations; frequencies
2.	Assess outcomes influenced by SEM activities among BC Hydro's large industrial customers	• Program administrative data • Project files (including energy manager reports, Energy, Monitoring and Targeting (**EMT**) reports, etc.) • Interviews: Energy managers; corporate sponsors / representatives (n=9)	• Cross tabulations; frequencies • Portfolio or sample level modeling • Qualitative analysis
3.	Evaluate deemed energy savings of SEM participants	• Account billing data and TSR records (n=60) • Program administrative data	• Quasi-experimental design comparing SEM participants and non-participants
4.	Estimate gross electrical energy and peak demand savings due to the incentive offers and program enabled projects (excluding deemed savings of SEM participants)	• Project tracking data • Measurement and verification results • Account billing data and TSR records (n=60) • Project files & energy study reports	• Measurement and verification results based on the application of International Performance Measurement and Verification Protocol • File reviews and engineering desk review for projects without Measurement & Verification • Development of realization rates using stratified ratio estimation • Extrapolation of case study findings
5.	Estimate net electrical energy and peak demand savings due to the incentive offers and program enabled projects (including deemed savings of SEM participants)	• Results of Objective 4 • File review and case study results (n=14) • 2015, 2016, 2017 Participant surveys (n=59) • 2015, 2018 Non-participant surveys (n=16)	• Estimation of free ridership by triangulating results of participant surveys and case study reviews • Estimation of spillover for participants and non-participants from survey results and decision tree

3.3 Results

The results of the evaluation are presented by each evaluation objective, below.

Results for Objective 1: Examine participant and non-participant experience with the program

Overall awareness of BC Hydro's conservation programs for industrial customers was high among custom participants at 96 per cent and among SIP participants at 95 per cent. Among non-participants, overall awareness was lower at 75 per cent. In terms of individual program components, awareness, understanding and overall ratings were highest for the role that Key Account Managers play as liaisons for the program, energy studies, and the incentive structures.

Overall satisfaction with the program was very high with 100 per cent of both custom and SIP respondents reporting that they were very or somewhat satisfied. This sentiment was very strong with 71 per cent of custom participants and 78 per cent of SIP participants reporting to be 'very satisfied'. Likewise, 100 per cent of both groups reported that they definitely or probably would recommend the program to others and in fact, 56 per cent of custom participants and 65 per cent of SIP participants reported that they had already done so.

In terms of program experience, 'service provided by BC Hydro personnel' and 'knowing how/who to contact at BC Hydro' were rated very favourably by both custom and SIP participants. Among custom participants, the ‘variety of products funded under the program’ and service provided by both suppliers/distributors and by contractors received strong ratings. Among SIP participants, the ‘level of incentives’ and ‘service provided by suppliers/distributors’ were rated highly. Aspects with the lowest rating scores for custom participants included those related to ‘length of time to receive incentive’ and ‘length of time to receive project approval’ as well as for ‘overall application procedures’. For SIP, the aspects with the lowest scores were ‘length of time to receive project approval’ and ‘length of time for the project to be completed’ as well as ‘clarity of communications from BC Hydro about the project’.

Results for Objective 2: Assess outcomes influenced by SEM activities among BC Hydro’s large industrial customers

Based on the interviews with Energy Managers and corporate sponsors, cost reduction was named as the main driver for adopting and integrating SEM into their respective organizations. Cost was also raised as one of the main barriers in implementing SEM, in addition to competition with other initiatives and overloaded resources.

Since the adoption of SEM, interviewees reported that corporate commitment and expectations regarding energy consumption have resulted in a number of positive developments, including more involvement and buy-in from senior management, more reporting and awareness of energy use, and more discussion about energy management throughout all levels of staff. Additionally, SEM principles were reported to be integrated into capital projects more often and some interviewees felt that there had been cultural shifts in their organizations in terms of conservation-mindedness. Most of the Energy Managers interviewed felt that in the absence of BC Hydro, SEM would not be implemented at their company.

On average, sites with Energy Managers completed over four times the number of projects per site relative to those without energy managers (4.6 projects per site compared to 1). Also, sites with an energy manager completed larger projects and achieved 1.7 times more energy savings per project. Overall, sites with Energy Managers achieved a 3.7 per cent reduction of site energy consumption through capital projects, compared to 0.9 per cent for sites without Energy Managers. Sites with Energy Managers and with active strategic energy management had over 5 per cent energy savings from capital projects implemented between F2015 and F2017.

Results for Objective 3: Evaluate deemed energy savings of SEM participants

Expected savings claimed by the program for this component were based on a deemed value of 2 per cent of site energy consumption for sites that met a pre-qualifying threshold of SEM practices. The average site gross realization was estimated at 0.8 and the net to gross ratio at 0.9. The evaluated net energy savings from strategic energy management in F2017 ranged from a lower estimate of 0.7 per cent of site energy consumption (16 GWh/year) to an upper estimate of 2.0 per cent (43 GWh/year), with an average of 1.4 per cent for 30 GWh per year energy and 3.5 MW of peak demand savings. The following table summarizes the evaluated net SEM energy savings.

Table 3.3. Net Realization Rates and Lower and Upper Estimates of SEM Energy Savings

	Average Estimate	Lower Estimate	Upper Estimate
Expected energy savings (GWh/year)	43.4		
Net realization rate	0.7	0.4	1.0
Per cent savings of site energy consumption in F2017	1.4%	0.7%	2.0%
Evaluated net energy savings (GWh/year)	30	16	43
Peak demand savings (MW)	3.5	1.9	5.0

Results for Objective 4: Estimate gross electrical energy and peak demand savings due to the incentive offers and program enabled projects (excluding deemed savings of SEM participants)

The overall LEM-T program realization rate for the period F2015-F2017 was estimated as the ratio of evaluated to expected gross savings for all measures included in the evaluation analysis, but not including savings from strategic energy management. The gross realization rates of the two incentive program offers ranged from 0.90 to 0.96. The overall realization rate for capital projects was calculated at 94 per cent. This means that, on average, measures in the realization rate sample achieved 94 per cent of their expected savings. The following table provides the expected and evaluated gross energy and peak demand savings by fiscal year for capital projects.

Table 3.4. Expected and Evaluated Gross Energy and Peak Demand Savings from Capital Projects by Fiscal Year

Period	Number of Projects	Number of Measures	Expected Gross Energy Savings (GWh/year)	Calculated Realization Rate	Evaluated Gross Energy Savings (GWh/year)	Evaluated Gross Peak Demand Savings (MW)
F2015	115	175	145.2	0.98	142.2	16.6
F2016	123	197	102.7	0.90	92.6	10.8
F2017	107	142	145.8	0. 92	133.5	15.6
LEM-T (F15-F17)	**345**	**514**	**393.7**	**0.94**	**368.3**	**43.1**

Results for Objective 5: Estimate net electrical energy and peak demand savings due to the incentive offers and program enabled projects (including deemed savings of SEM participants)

Capital Projects

The overall level of free ridership was estimated at 20 per cent for the program, ranging from 5 to 52 per cent between program offers. Participant spillover was estimated at 11 per cent and non-participant spillover was estimated at 2 per cent, for a total estimated spillover effect of 13 per cent.[1] Together they result in a net-to-gross ratio from capital projects of 93 per cent as shown in Table 3.6. Results are summarized in the table below, where free ridership, spillover and the net-to-gross ratio are presented by offer.

[1] Spillover of SEM participants was estimated at zero per cent as it is included in the estimate of energy savings from strategic energy management.

Table 3.5. Free Ridership, Spillover, and Net-to-Gross Ratios by Program Offer

Program Offer	Incentive Custom	Incentive SIP	Program Enabled - Retrofit	Program Enabled - New Plant Design
Evaluated Gross Energy Savings (GWh/year)	94.6	21.9	149.8	101.9
Free Ridership (**FR**)	6%	5%	10%	52%
Spillover (**SO**)	13%	13%	13%	13%
Net-to-Gross Ratio (1 – FR + SO)	**107%**	**108%**	**103%**	**61%**
Evaluated Net Energy Savings (GWh/year)	101.3	23.7	154.3	62.2

Evaluated net energy savings from capital projects in each fiscal year were calculated using the evaluated gross energy savings of each project multiplied by the net-to-gross ratio of its program offer. These results are summarized in the following table.

Table 3.6. Evaluated Gross and Net Energy and Peak Demand Savings from Capital Projects

Year	Evaluated Gross Energy Savings (GWh/year)	Evaluated Gross Peak Demand Savings (MW)	Calculated Net-to-Gross Ratio	Evaluated Net Energy Savings (GWh/year)	Evaluated Net Peak Demand Savings (MW)
F2015	142.2	16.6	0.85	121.4	14.2
F2016	92.6	10.8	0.88	81.1	9.5
F2017	133.5	15.6	1.04	138.9	16.2
LEM-T (F15-F17)	**368.3**	**43.1**	**0.93**	**341.4**	**39.9**

Total Program Reported and Evaluated Net Savings

Reported and evaluated net energy and peak demand savings for LEM-T are shown below. Reported savings included the results of the best available estimate from either M&V, post-implementation review, and expected savings, as well as the deemed savings estimate for strategic energy management, and were adjusted by a forecast net-to-gross ratio of 0.908.

Table 3.7. Summary of Energy and Peak Demand Savings

	Net Energy Savings (GWh/year)		Net Peak Demand Savings (MW)	
Fiscal Year	Reported	Evaluated	Reported	Evaluated
F2015	134.2	121.4	15.7	14.2
F2016	91.3	81.1	10.7	9.5
F2017	163.0	169.4	19.1	19.8
LEM-T (F15-F17)	**388.5**	**371.9**	**45.5**	**43.5**

3.4 Findings and Recommendations

Findings

Below are the main evaluation findings.

Participant and Non-Participant Experience

1. Approximately two-thirds of all industrial transmission sites participated in the LEM-T program during the three-year evaluation period (F2015-F2017). Highest participation came from the pulp and paper, mining and wood products industry sectors.
2. Self-reported awareness and understanding of the various program components was high among participants, with the exception of the New Plant Design offer. Awareness and understanding among non-participants were expectedly lower, particularly for the incentive offers.
3. Overall satisfaction was very high with 100 per cent of both custom and SIP survey respondents reporting that they were very or somewhat satisfied with the program.
4. Among both custom and SIP participants, service provided by BC Hydro personnel and knowing how/who to contact at BC Hydro were the highest rated aspects of customer experience. Among custom participants, the variety of products funded under the program was also rated highly, as was the level of incentives among SIP participants. The lowest rated elements for both program offers were generally related to length of time aspects (length of time to receive project approval, length of time to receive incentive and length of time for the project to be completed).

Outcomes Influenced by Strategic Energy Management (SEM) Activities

5. The main motivator for organizations to participating in SEM was energy cost reduction. Costs were also cited as a main barrier to implementing SEM, in addition to competition with other corporate initiatives and overloaded resources.
6. Companies adopting SEM reported a number of positive developments in energy management, including more involvement and buy-in from senior management, increased reporting and awareness of energy use, SEM principles being integrated into capital projects, and cultural shifts in terms of conservation-mindedness. In the absence of BC Hydro support, most organizations felt that SEM would not have been implemented, resulting in sites having higher energy bills, being less successful at energy management and having less employee engagement around energy use.
7. Energy Managers played an important role in program participation. Energy Managers covered 83 per cent of projects among program participants. On average, sites with Energy Managers completed over four times as many projects than sites without Energy Managers.
8. Overall, from F2015 to F2017, sites with Energy Managers achieved a 3.7 per cent reduction of site energy consumption through capital projects, compared to only 0.9 per cent for sites without Energy Managers. Sites with Energy Managers and with active strategic energy management had the highest per cent reduction in site energy consumption, at over 5.5 per cent, when looking at the combined impact of capital projects and SEM.

Deemed energy savings for SEM participants

9. Evaluated net energy savings from strategic energy management were incremental to energy savings from capital projects and estimated in the range of 0.7 per cent to 2 per cent (average of 1.4 per cent) of energy consumption of participants with one year persistence. Energy savings from strategic energy management were weighted by site energy consumption.

Gross Electrical Energy Savings from Capital Projects

10. The realization rate among gross energy savings was 94 per cent, indicating that the energy conservation measures largely performed as expected. The most common reason why measures did not perform as expected was changes in operating conditions identified during post-implementation review.

11. Evaluated gross energy savings per year averaged 4.3 per cent of site energy consumption across all participants between F2015 and F2017, and capital project savings per site ranged from less than 0.1 per cent to over 16 per cent.

12. By including additional data sources in the evaluation review, such as TSR records and customer post-implementation data, the coverage of the gross realization rate sample was doubled from what it would have been using measurement and verification (**M&V**) results alone. However, the results of evaluation reviews are considered less rigorous than those of M&V analysis conducted in accordance with the IPMVP.

Net Electrical Energy Savings

13. The overall level of free ridership was estimated at 20 per cent for the program, ranging from 5 to 52 per cent between program offers. Participant spillover was estimated at 11 per cent and non-participant spillover was estimated at 2 per cent for a total of 13 per cent. Together they result in a net-to-gross ratio of 93 per cent.
14. Free ridership for program enabled new plant design projects was the highest at 52 per cent because case studies found that four of the six projects considered the existing older technology for the equivalent service alternative, although industry standard practice for new equipment had improved in energy efficiency, and there was potential for substantial non-energy benefits as a business driver.
15. Evaluated net energy savings for LEM-T were 121.4 GWh/year in F2015, 81.1 GWh/year in F2016, and 169.4 in F2017 which averaged 96 per cent of reported savings.
16. The average weighted persistence of all capital measures (i.e., the length of time that the savings are reported by the program) was 11.5 years during the evaluation period. When including savings from SEM participants, the average weighted persistence of all savings reported in LEM-T was 10.6 years.

Recommendations

Recommendations #1 and #2 are for program management:

1. In order to better estimate energy savings and document program influence in program enabled new plant design projects, consider the market baseline option of the process technology and include the relevant energy study or energy savings estimation in the project file prior to equipment purchase and project implementation.
2. In consultation with the evaluation department, consider ways to improve the evaluability of the strategic energy management initiative through documentation of the energy conservation measures leading to SEM savings with initial energy savings estimates.

Recommendations # 3 and #4 are for the evaluation team:

3. Work with the program to improve the evaluability of the strategic energy management initiative by developing standardized methods to monitor the progress of program participants for benchmarking impact of SEM activities and determining SEM energy savings.
4. Continue working with industry associations to explore energy savings methods to include natural conservation, market forces and business drivers, and persistence of SEM savings.

3.5 Conclusions

BC Hydro's Leaders in Energy Management – Transmission program achieved 96 per cent of reported savings during fiscal years F2015 to F2017. The program also achieved high levels of customer awareness and satisfaction. Strategic energy management contributed to significantly higher levels of program activity and additional energy savings among participants.

4.0 Power Smart Partners – Load Displacement Initiatives Impact Evaluation: F2012-F2018

4.1 Introduction

This report presents the results of an impact evaluation covering the eight load displacement projects implemented during the period from F2012 to F2016. Since the program has ended and no new projects were implemented in F2017 and F2018 and operational data was available for all the projects, the evaluation period covers F2012 to F2018.[2] The projects were funded through the Power Smart Partners-Transmission (PSP-T) Integrated Power Offer (IPO) or Load Displacement (LD) program offers and were not included in the scope of any previous impact evaluations.

Load displacement projects are customer-based generation projects that self-supply part of the customer's site electrical load. For these projects, industrial, commercial and institutional customers received BC Hydro funding and program support to generate their own electricity for self-supply and offset their electricity purchases from BC Hydro. All customer-based generation projects over 50 kW were reviewed through the Integrated Customer Solutions (ICS) process. The load displacement project enabling activities were specifically designed to operate under the ICS framework and remove technical and financial barriers specific to self-generation projects. Load displacement projects were treated as having reduced customer energy purchases similar to energy conservation project initiatives for industrial transmission customers.

4.2 Approach

The evaluation objectives and research questions are summarized in the following table.

Table 4.4 Evaluation Objectives and Research Questions

Evaluation Objective	Research Questions
1. Estimate gross electricity generation and peak demand impacts.	What were the evaluated gross electricity generation and demand impacts realized by load displacement projects aggregated by fiscal year and, to the extent possible, disaggregated by relevant factors*?
2. Estimate net electricity generation and peak demand impacts.	What were the relative magnitude of parasitic loads[3] and their energy use as related to the load displacement projects?
	What were the evaluated net electricity generation and demand impacts realized by load displacement projects aggregated by fiscal year and, to the extent possible, disaggregated by relevant factors?
	To what extent did parallel energy procurement initiatives[4] impact the net electricity generation of the load displacement projects?

* Relevant factors may include technology type, primary energy source, seasonal operating mode and operating strategy with other on-site process heat requirements that impact the net electricity generation.

2 The Load Displacement initiative was no longer available after F2017.

3 Parasitic load is the electrical energy that is required for the operation of the load displacement project.

4 Other energy procurement initiatives include electricity purchase agreements, contracted generation baseline loads, and tariff treatments.

The objectives, data sources and methods used for this evaluation are shown in Table 4.2.

Table 4.1. Evaluation Objectives, Data and Method

	Evaluation Objectives	Data	Method
1.	Estimate gross electricity generation and peak demand impacts.	• Project files • Self-generation eMetering • Customer process requirements • Billing records and Customer Baseline Load (CBL) Statements[5]	• Annual measurement and verification results and evaluation review • Self-generation load shapes, capacity factors and peak-to-energy factors • Engineering calculations
2.	Estimate net electricity generation and peak demand impacts.	• Load displacement feasibility studies • Reported savings • Project files	• Engineering estimates of parasitic loads • Annual measurement and verification results and evaluation review

Electricity self-generation impacts were evaluated over the period from F2012 to F2018 based on hourly interval data through annual measurement and verification or annual reconciliation of the site's total generation energy.

Objective 1: Estimate Gross Electricity Generation and Peak Demand Impacts

Evaluated gross electricity generation is the energy generated due to the program and estimated from the annual measurement and verification (M&V) results and billing records by fiscal year. Four of the eight projects underwent an annual measurement and verification process for the estimation of gross and net electricity generation. These four projects with M&V are load displacement projects where a new generator was installed. They are grouped in this evaluation under 'New Power Generation' and M&V results were used as the basis of the gross generation energy for evaluation review. The other four load displacement projects were due to refurbishment and upgrading of existing steam turbo-generators which resulted in incremental generation to already existing generation. These are grouped in this evaluation under 'Rebuilt Turbo Generator'. The annual gross incremental generation energy from the rebuilt units was verified by BC Hydro based on revenue metering data for each fiscal year and provided in the customer's billing records. For these projects, the customer's billing records were used as the basis of the gross generation energy for evaluation review.

The gross peak demand impact by the load displacement projects was estimated using the peak-to-energy factor of the total self-generation system at each site. These were evaluated based on hourly interval data during steady-state operations in winter by dividing the average generation power during peak periods by the load displacement project's annual generation energy.

Objective 2: Estimate Net Electricity Generation and Peak Demand Impacts

The net electricity generation is the difference between the energy delivered by the generator and the parasitic energy requirements. The evaluated parasitic energy was estimated based on recent actual performance as the most likely indicator of future performance of the load displacement project.

The parasitic energy estimate for the four New Power Generation projects with M&V was verified by the M&V group using engineering calculations and spot measurements when available. No M&V results were available for the four Rebuilt Turbo Generator projects and a deemed estimate of the incremental parasitic energy was applied based on the default assumption of 3 per cent of incremental gross generation energy[6] of the load displacement project.

---

[5] CBL Statements are issued annually by BC Hydro for each customer on stepped rate schedule (RS1823B) that includes any adjustment made to a customer's energy bill for the purpose of Customer Baseline Load (CBL) administration.

[6] U.S. Department of Energy (2017). *Uniform Methods Project, Chapter 23: Combined Heat and Power Evaluation Protocol.*

The evaluated net generation peak demand impact of the program was estimated using the same peak-to-energy factors determined for Objective 1, applied to the project-based M&V estimates for parasitic energy and metered load shapes of the generation energy. This assumed that the load shape of the parasitic energy is the same as the load shape of the generation energy.

It was not an objective of this evaluation to attribute changes in generation energy to the load displacement initiatives, which would take into consideration free ridership and spillover. In this evaluation, the term 'net generation impact' refers to the gross generation energy less parasitic energy and does not imply attribution to any intervening initiative. These load displacement projects were assumed to have no free ridership and non-existent spillover, for a net-to-gross ratio of one, for two reasons. First, all self-generation projects had to apply to BC Hydro for generator inter-connection and go through the integrated customer solutions process for review and evaluation. All of the eight load displacement projects in this evaluation were then directed to the load displacement capital incentive offer by BC Hydro and each project had its own business case developed with BC Hydro executive approval of the incentive amount. As a result of this process, BC Hydro does not expect that there was any free ridership with regard to the capital incentive. Second, all generation energy is metered and customers were required to service their self-generation contracts in a prescribed order which was verified by BC Hydro for billing purposes. As a result, any spillover of unreported generation energy is not considered to be possible.

4.3 Results

Results for Objective 1: Estimate Gross Electricity Generation and Peak Demand Impacts

Table 4.3 shows the number of load displacement projects implemented by fiscal year, as well as the cumulative rated capacity, the evaluated gross generation energy, and the evaluated gross peak demand impact. Results are given as cumulative due to the variation of project results with annual review through measurement and verification.

The peak-to-energy factor was evaluated for each project from hourly interval data based on the average power generated between December and February. Peak-to-energy factors are usually determined using winter weekday evening loads, to correspond with the BC Hydro system peak, but the variations of generated power between winter days of the week (weekday versus weekend) and winter hours of the day (evenings versus other hours of the day) were found to be negligible. The average evaluated peak-to-energy factor was found to be 0.126 MW per GWh, almost 8 per cent higher than the industrial transmission rate class average of 0.117 MW per GWh which is typically applied to energy conservation measures. This higher peak-to-energy factor resulted in a higher estimate of peak demand impact for load displacement projects.

A number of other factors were examined to assess the performance of load displacement projects in terms of system availability and capacity utilization. Detailed results discussed in the report indicate that all load displacement projects had excess capacity to potentially increase generation power and energy.

Table 4.3 Evaluated Cumulative Gross Generation Energy and Peak Demand Impact

Fiscal Year	Number of New Projects	Load Displacement Project Type	Cumulative Rated Capacity (MW)	Cumulative Evaluated Gross Generation Energy (GWh/year)	Cumulative Evaluated Gross Peak Demand Impact (MW)
F2012	2	2x Rebuilt Turbo Generator	26	167	21
F2013	1	1x New Power Generation	28	181	23
F2014	0	-	28	181	23
F2015	2	1x Rebuilt Turbo Generator 1x New Power Generation	31	204	25
F2016	3	1x Rebuilt Turbo Generator 2x New Power Generation	41	263	33
F2017	0	-	41	263	33
F2018	0	-	41	263	33

Objective 2: Estimate Net Generation Energy and Peak Demand Impacts

Table 4.4 summarizes key results by project type and shows the evaluated net generation energy after adjustment for parasitic energy.

Table 4.4. Net Generation Results by Project Type

	Group 1 Rebuilt Turbo Generator	Group 2 New Power Generation
Number of Projects	4	4
Rated Capacity (MW)	32.1	8.9
Evaluated Gross Generation Energy	204	59
Evaluated Net Generation Energy (GWh/year)	198	55
Parasitic Energy Factor	3%	6.5%
Peak-to-Energy Factor (MW/GWh)	0.129	0.117
Realization Rate[7]	91%	98%
Load displacement to facility energy ratio[8]	18%	14%
LD energy to total self-generation energy	25%	100%

Table 4.5 shows a summary of reported and evaluated net generation energy and peak demand by fiscal year. Year over year reporting of load displacement generation energy improved as the operation of the systems reached steady-state. However, there was a time lag because measurement and verification results or billing reconciliation for a given reporting year only became available after fiscal year-end and were then used as the best available estimate for the next year. Considering this time lag in reporting of variations in performance between fiscal years, the evaluated net generation energy was estimated on average to have achieved 96 per cent of the reported generation energy. The variance is primarily due to inconsistency in reporting of Rebuilt Turbo Generator projects, using their expected generation energy instead of the actual generation energy, and the lack of accounting of parasitic energy in reported savings for these projects. If the reported generation energy were adjusted for actual generation energy and estimated parasitic energy, the overall variance between reported and evaluated net generation energy of all eight load displacement projects would be reduced to less than one per cent.

---

7 Realization rate is the ratio of evaluated net energy generation to the expected generation energy, which is the contracted generation energy of the incentive agreement.

8 The load displacement to facility energy ratio indicates the proportion of site energy consumption that was displaced by the load displacement project on an annual basis.

9 The load displacement to total self-generation ratio indicates the proportion of total self-generation energy at the site that was contributed by the load displacement project on an annual basis.

Table 4.5. Summary of Net Generation Energy and Peak Demand Impact

Fiscal Year	Net Generation Energy (GWh/year)		Net Peak Demand Impact (MW)	
	Reported	Evaluated	Reported	Evaluated
F2012	254	162	30	20
F2013	254	176	30	22
F2014	195	176	23	22
F2015	215	196	25	25
F2016	271	253	32	32
F2017	260	253	30	32
F2018	262	253	31	32

4.4 Findings and Recommendations

Findings

1. Eight load displacement projects were evaluated for a total of 263 GWh per year in gross generation energy and 253 GWh per year in net generation energy. This resulted in 33 MW of gross peak demand impact and 32 MW of net peak demand impact.
2. Seven of the eight load displacement projects ranged from 1 MW to 5 MW in size and one exceeded 25 MW in rated capacity. Seven of the load displacement projects were considered combined heat and power and used biomass and bioenergy as the primary energy source.
3. The four Rebuilt Turbo Generator projects were found to have average availability, capacity and utilization factors of 94 per cent, 78 per cent and 72 per cent respectively. The other four projects were of the New Power Generation type and were found to have average availability, capacity and utilization factors of 91 per cent, 84 per cent and 76 per cent respectively.
4. The load displacement project realization ranged from 75 per cent to 107 per cent, with a weighted average project realization rate of 91 per cent for Rebuilt Turbo Generator and 98 per cent for New Power Generation type projects. The overall program realization rate was 92 per cent.
5. All projects undergo annual verification of the generation energy using hourly interval data. Rebuilt Turbo Generator load displacement projects had verification of actual gross generation energy recorded by BC Hydro, whereas New Power Generation projects underwent annual measurement and verification activities, recording both gross and net generation energy. The reported generation energy is adjusted yearly based on this annual review for all New Power Generation type projects but not for Rebuilt Turbo Generator type projects.
6. The generation energy provided in the customer's annual CBL Statements was found to be the best available estimate for projects without annual measurement and verification. These generation energy records explain most of the variance between reported and evaluated gross generation energy for Rebuilt Turbo Generator type load displacement projects.
7. The peak-to-energy factor was found to be 8 per cent higher than the industrial rate class average because six of the eight projects generated more power during BC Hydro's system

winter peak as a result of higher availability factors in winter months. Generator shutdowns and annual maintenance periods, which decreased overall availability, were observed to typically occur in the spring and summer months. Two projects had peak-to-energy factor lower than the industrial rate class average because of higher process heat requirements in winter.

8. Parasitic energy is the difference between gross and net generation energy and was evaluated at 3 per cent for Rebuilt Turbo Generator projects and 6.5 per cent for New Power Generation projects. New Power Generation projects have more auxiliary energy requirements than incremental generation projects from Rebuilt Turbo Generators. The parasitic energy explains most of the difference between reported and evaluated net generation energy.
9. The average weighted persistence of load displacement projects was estimated to be 16 years and ranging from 10 years to 20 years. The BC Hydro Persistence Standard indicates 20 years persistence for New Power Generation type projects and 15 years persistence for Rebuilt Turbo Generator projects. Any changes to generation energy and persistence are captured in the annual M&V and engineering review process.
10. The evaluation found evidence of continuous improvement of the utilization factor of three New Power Generation load displacement projects through the annual review and the M&V process. Project underperformance was observed due to restriction in condensing capacity, fuel supply, and electrical metering issues that were identified and corrected during the first three years of operating the load displacement projects.

Recommendations

The following recommendations are for the BC Hydro Load Displacement initiative managers based on the findings of this evaluation.

1. Continue to conduct annual review and measurement and verification of all load displacement projects for reporting of actual net generation energy per fiscal year.
2. The program should use the generation energy from customer's annual CBL Statements as the best available estimate when annual measurement and verification results are not available. These apply to Rebuilt Turbo Generator type projects at large industrial customer sites with transmission service that are on the stepped rate (RS 1823B).
3. The program should apply a 3 per cent reduction to the gross generation energy for projects without an engineering estimate of parasitic energy, i.e., load displacement projects of Rebuilt Turbo Generator type.

4.5 Conclusions

BC Hydro's load displacement initiatives achieved 92 per cent of expected generation energy during fiscal years F2012 to F2018. The New Power Generation projects achieved 98 per cent due to continuous improvement of project performance, whereas the Rebuilt Turbo Generator projects achieved 91 per cent due to overestimated utilization factor and underestimated parasitic energy. The evaluated net generation energy of both types of load displacement projects was found to produce an equivalent reduction in site energy purchases.

5.0 Glossary

ANCOVA: is a general linear model which blends analysis of variance (**ANOVA**) and regression to test the main and interaction effects of categorical variables on a continuous dependant variable, controlling for the effects of selected other continuous variables, which co-vary with the dependant.

Baseline: A baseline is the initial condition occurring when a DSM activity begins. It may be a market share for equipment, a current standard, or a current average behaviour.

Cross Effects: Cross effects (also known as interactive effects) refer to the effect that some energy conservation measures (**ECMs**) have on other electricity end uses beyond what the ECM itself produces. An obvious example is building lighting. As more efficient lighting is installed, less heat is generated by the lighting system. This means that less heat must be removed from the building by the air conditioning system during the cooling season, but more heat needs to be supplied by the heating system during the heating season.

Demand Side Management (DSM): The definition of Demand Side Management is the same as the definition of "demand-side measures" set out in section 1 of the Clean Energy Act, which is "a rate, measure, action or program undertaken; (a) to conserve energy or promote energy efficiency, (b) to reduce the energy demand a public utility must serve, or (c) to shift the use of energy to periods of lower demand, but does not include (d) a rate, measure, action or program the main purpose of which is to encourage a switch from the use of one kind of energy to another such that the switch would increase greenhouse gas emissions in British Columbia, or (e) any rate, measure, action or program prescribed".

End Use: The final application or final use to which energy is applied. Recognition of the fact that electric energy is of no value to a user without first being transformed by a piece of equipment into a service of economic value. For example, office lighting is an end use, whereas electricity sold to the office tenant is of no value without the equipment (light fixtures, wiring, etc.) needed to convert the electricity into visible light. End use is often used interchangeably with energy service.

Expected Savings: Estimate of gross energy savings based on customer initially reported savings, engineering review and site inspection. These estimates represent the unverified savings.

Evaluated Savings: Savings estimates reported after the energy efficiency activities have been implemented and an impact evaluation has been completed.

Free Riders: Free riders are program participants who would have taken the demand-side management (**DSM**) action, even in the absence of the DSM program. They are a part of the reference case. These actions are not attributable to the program.

Gigawatt Hour (GWh): One billion watt-hours; one million kilowatt hours.

Gross Savings: The change in energy consumption and/or associated demand that results directly from program-related action taken by the participants in the demand side management program irrespective of why they participated.

Market Transformation: Market Transformation refers to a permanent change in the structure or functioning of markets, including more energy-efficient behaviour among customers and higher market penetration of energy-efficient products, as a result of demand-side management (**DSM**) programs that reduce barriers to energy efficiency. These market changes are likely to persist in the absence of continued program activity.

Net savings: The change in energy consumption and/or associated demand that is attributable to the utility DSM program. The change in consumption or associated demand may include the effects of free riders and spillover.

Net-to-gross ratio: A factor representing net demand side management program savings divided by gross program savings that is applied to gross program impacts to convert them into net program load impacts. The factor is made up of a variety of factors that create differences between gross and net savings, commonly including free riders and spillover. Other adjustments may include rebound, cross effects and M&V results.

Peak Demand: Demand refers to the amount of electricity that is consumed at any instant in time, measured in multiples of watts. Peak demand savings are the reduction in amount of electricity that is consumed at system peak demand, which for BC Hydro occurs on a winter weekday between approximately 5 p.m. and 7 p.m.

Persistence: Refers to how long the energy savings are expected to be attributable to the demand side management activity.

Quasi-experiment: In a quasi-experimental design, there is no random assignment, but treatment and comparison group members are matched on some relevant characteristic(s) and selected on a probabilistic basis.

Realization Rate: The ratio of initial estimates of savings to savings adjusted for data errors and M&V results. Does not reflect program attribution or influence on the savings achieved.

Reported Savings: Estimate of energy savings being recorded in the program tracking database. Reported savings are based on best information available from technical review of the initial engineering estimate, post implementation review of documentation and/or inspection, or M&V results, as well as, a forecast net-to-gross ratio applied.

Spillover: Refers to program participants and non-participants whose energy savings measures occur through actions that are not part of a program, but which were influenced by the program (also called free drivers or tag-ons). Participant spillover is the additional energy savings that occur when a program participant independently installs energy efficiency measures or applies energy savings practices after having participated in the efficiency program, as a result of the program’s influence. Non-participant spillover refers to energy savings that occur when a program non-participant installs energy efficiency measures or applies energy savings practices as a result of a program’s influence. Spillover is expressed as a fraction of the increase of energy savings due to spillover to the gross energy savings of the program participant. Spillover may not be permanent and may not continue in the absence of continued program activity.

Impact Evaluation of the Commercial New Construction (CNC) Program: F2012-F2016

January 23, 2020

Prepared by:

BC Hydro Conservation and Energy Management Evaluation

TABLE OF CONTENTS

This page left blank

Executive Summary

Introduction

This report presents an impact evaluation of the BC Hydro Commercial New Construction program for BC Hydro fiscal years F2012 to F2016 (April 2011 to March 2016). The CNC Program was targeted at developers and the building design community who play a role in building and expanding commercial buildings in BC Hydro's service territory. Market actors included developers, building owners, architects, engineers, energy modellers and consultants.

The program's key objective is to obtain electricity energy savings by supporting the design and implementation of cost effective energy conservation measures beyond applicable building code requirements. There are associated capacity savings (MW) with this program that are derived from the energy savings resulting from the program's energy-focused DSM activities, not a result of capacity-focused DSM. The CNC Program provides direct savings for BC Hydro by supporting the following:

- Energy Efficient Design: identify energy savings by promoting and funding the design of energy efficient buildings (i.e., more energy efficient than the minimum building code legislation requires);
- Energy Efficient Construction: acquire energy savings by promoting and funding the construction of energy efficient buildings and offer training and education on the efficient operation of new buildings; and
- Training and Recognition: enable transformation of the market by training a team of industry professionals to act as energy conservation "ambassadors" (i.e., advocates) on all new construction projects that they work on in the future. In addition, to publicly recognize energy efficient design teams and projects and create a market where consumers highly desire energy efficient buildings.

The program had 4 offerings:

1. Whole Building Design: targeted at buildings over 50,000 square feet;
    a. Energy Modelling/Computer simulation of the whole building energy use
2. System Design: targeted at improving the energy efficiency of selected building systems in buildings typically over 50,000 square feet;
    b. Energy use analysis of a specific system (e.g., lighting, refrigeration, HVAC)
3. Energy Efficient Lighting Design: targeted at buildings typically over 10,000 square feet; and
    c. Energy use analysis for lighting. Reduction of light power density requirement from building code through design and controls
4. Program Enabled.
    d. Projects in which the customer engaged with BC Hydro, undertook a funded Energy Study and through this engagement the building design/equipment was influenced leading to energy savings. These measures did not receive a program incentive due to not meeting BC Hydro cost effectiveness ratios or due to failing to comply with program incentive offer timing and process.

The Commercial New Construction program is winding down, with all remaining applications scheduled to be completed in F2022. BC Hydro will continue to support the transformation of the commercial new construction market through codes and standards activities that support the B.C. Energy Step Code.

Approach

The evaluation addressed five objectives each with related research questions, as presented in Table ES. 1.

Table ES.1. Evaluation Objectives and Research Questions

Evaluation Objective	Research Questions
1. Assess the participant experience	• What is the level of participant awareness of the various CNC program components? • How do participants rate their program experience and overall satisfaction? • How influential is the CNC program on participant decisions around energy efficiency?
2. Assess practices and opinions related to market transformation	• What are the most common types of design studies being conducted in view of helping to make new construction projects perform better than code? (e.g., whole building energy modelling, a refrigeration system design study, and/or a lighting design study) • What are the most common measures being implemented to help make new construction projects perform better than code? • To what extent do market actors believe the commercial new construction market in the province has improved over the last 10-15 years? • How much electricity do market actors believe new construction projects are saving relative to the energy efficiency requirements in the B.C. Building Code?
3. Assess the influence of the program on the adoption of energy efficiency measures beyond building code requirements	• To what extent has the CNC program developed support for design and construction of more energy efficient buildings (beyond code requirements) among commercial new construction market actors (designers, builders, mechanical engineers, architects etc.)? • To what extent and through which activities is the CNC program influencing building design practices and the new construction market beyond incented projects?
4. Estimate gross energy and peak demand savings	• What are the gross and peak demand savings?
5. Estimate net energy and peak demand savings	• What are the net energy and peak demand savings for the overall CNC program? • What are the free ridership, participant spillover and non-participant spillover rates?

The data sources and analytical methods used to address the objectives are summarized in Table ES.2.

Table ES.2. Evaluation Objectives, Data and Methods

Evaluation Objective	Data	Methods
1. Assess the participant experience	• Participant Survey (n=57)	• Cross tabulations
2. Assess practices and opinions related to market transformation	• Market Actor Survey (n=13-30)	• Cross tabulations
3. Assess the influence of the program on the adoption of energy efficiency measures beyond building code requirements	• Market Actor Survey (n=13-30)	• Cross tabulations
4. Estimate gross energy and peak demand savings	• Program tracking data • Measurement and verification (n=12)	• IPMVP Option A, B and D • Ratio estimation • Peak demand savings based on peak-to-energy factor
5. Estimate net energy and peak demand savings	• Statistics Canada data on commercial new construction activity, F2012-F2016 • Participating building area (square metres) • Conservation Potential Review (CPR) Energy Use Intensity (EUI) inputs • Results from Objective 4 • Participant survey (n=51) • Market actor survey (n=13-30)	• Survey based free ridership and participant spillover algorithms • Market Actor Survey based non-participant spillover algorithm

Results

The results of the evaluation are presented by objective.

Results for Objective 1: Assess the participant experience

Among program participants, 79 percent reported being aware of the CNC offer by name. Of the individual program components, awareness, understanding and rating score was highest for the role that key account managers play as liaisons between CNC and participants.

Overall satisfaction was high for CNC at 80 percent, comprised of 41 percent stating they were very satisfied and 39 percent stating they were somewhat satisfied. When asked the likelihood of recommending the program to others, 95 percent indicated that they definitely (53%) or probably (42%) would, and 49 percent reported that they had in fact already done so.

A total of 80 percent of participants indicated that CNC was very (33%) or somewhat (47%) influential on the decision to implement the energy efficient measures at this site. Looking more broadly at conservation motivators, 60 percent of participants indicated that the CNC program was a 'major factor' in the organization's effort to manage electricity use over the past year. In terms of barriers to managing electricity use, lack of funds for energy efficient retrofits/projects was noted as a 'major barrier' by 33 percent of participants, followed by there being other operational priorities (29%) and lack of financial incentives for conservation programs and energy efficiency (26%).

Results for Objective 2: Assess practices and opinions related to market transformation

With regards to buildings that did not participate in the CNC program, but that market actors reported were performing better than the energy efficiency requirements of the B.C. Building Code, the most common type of design study conducted to help these buildings perform better than code was whole building design, with on average approximately two-thirds of respondents confirming that at least some floor area of their 'better than code, non-participating projects' had come through this study type. This was followed by lighting design studies, with about 44 percent of respondents, on average, confirming at least some floor area had come through this study type.

Again, with regards to buildings that did not participate in the CNC program but that were performing better than code, by far the most common measure being implemented to help make these buildings perform better than code was highly efficient lighting, with 83 percent of respondents reporting that the measure was at least sometimes implemented in their 'better than code, non-participating projects. This was followed by HVAC measures at 64 percent.

Market actors, including electrical engineers, mechanical engineers, energy modellers, architects and project managers, were asked how much they thought energy efficiency had improved in the entire commercial new construction market in B.C. over the past 10 to 15 years. All had thought that there had been some improvement over the past 10 to 15 years – although not necessarily beyond code – with the majority (55%) reporting a 20 percent improvement. Additionally, all thought that both their own buildings and those constructed by other firms were performing better than code specifically in regards to electricity savings. Savings were reported in the 1 percent to 30 percent range, with about half of respondents perceiving that their own buildings had 20 percent to 30 percent electricity savings relative to code, compared to only about one-third feeling the same way about buildings constructed by others.

Results for Objective 3: Assess the influence of the program on the adoption of energy efficiency measures beyond building code requirements

A total of 91 percent of respondents had experience with at least one of the energy efficiency resources or touchpoints provided by the program. The most common were *discussions about projects with BC Hydro staff* (70%) and *reviewing case studies/resource literature* (64%). This was followed by 60 percent who had *attended a program workshop or training session* and 40 percent who had re*viewed the Building Envelope Thermal Guide*. The least commonly used resource was the *Enhanced Thermal Performance Spreadsheet*, with only 21 percent of respondents indicating they had reviewed it.

Market actors were asked to consider all of their various touchpoints with the program and the influence that these had on their design decisions to have non-participating projects perform better than the building code. A total of 60 percent indicated that these program touchpoints were 'very' or 'somewhat' influential on their decisions to do so.

In order to understand program influence relative to other factors in the broader new construction context, market actors were asked to credit various factors for making non-program projects perform better than the B.C. Building Code, such that the factors summed to 100 percent. On average, BC Hydro 'drivers' were given a net of 24 percent of the credit for making projects perform better than code. It follows that non-BC Hydro drivers were given 76 percent of the credit for buildings performing better than code.

Another approach to assessing program influence was to query market actors on how much of the improvement in the energy use over time – although not necessarily beyond code – could be attributed to BC Hydro's Commercial New Construction program. About half (49%) felt it was in the 20 to 30 percent range, with the most common answer at 20 percent.

Results for Objective 4: Estimate gross energy and peak savings

The evaluated gross savings in fiscal year covered by the evaluation period are presented in Table ES.3. Evaluated gross electricity savings ranged from 9.2 GWh/yr to 24.2 GWh/yr from F2012 to F2016, with the most savings occurring in F2014 and the least occurring in F2012.

Table ES.3. Summary of Evaluated Gross and Net Energy and Peak Demand Savings

Year	Evaluated Gross Energy Savings (GWh/yr)	Evaluated Gross Peak Demand Savings (MW)	Calculated Net-to-Gross Ratio	Evaluated Net Energy Savings (GWh/yr)	Evaluated Net Peak Demand Savings (MW)
F2012	9.2	1.3	0.91	8.4	1.2
F2013	19.9	2.8	0.96	19.2	2.8
F2014	24.4	3.5	0.93	22.7	3.2
F2015	18.8	2.7	0.95	17.9	2.6
F2016	20.6	3.0	0.99	20.4	2.9
CNC (F12-F16)	**92.9**	**13.3**	**0.95**	**88.6**	**12.7**

Results for Objective 5: Estimate net energy and peak savings

The evaluated net savings in fiscal year covered by the evaluation period are presented in Table ES.4. Evaluated net electricity savings ranged from 8.4 GWh/yr to 22.7 GWh/yr from F2012 to F2016, with the most savings occurring in F2014 and the least occurring in F2012.

Table ES.4. Summary of Net Energy and Peak Demand Savings

	Net Energy Savings (GWh/yr)		Net Peak Demand Savings (MW)	
Fiscal Year	Reported	Evaluated	Reported	Evaluated
F2012	8.1	8.4	1.1	1.2
F2013	15.3	19.2	2.2	2.8
F2014	20.7	22.7	3.0	3.2
F2015	14.0	17.9	2.0	2.6
F2016	15.3	20.4	2.2	2.9
CNC (F12-F16)	**73.4**	**88.6**	**10.5**	**12.7**

The cumulative variance between the reported net energy savings and evaluated energy savings was 15.2 GWh/yr. The largest variance occurred in F2016 with a difference of 5.10 GWh between reported and evaluated savings.

Overall, the program achieved 121 percent of reported savings during fiscal years F2012 to F2016, showing the program performed better than reported. The variance between reported and evaluated net savings is primarily due to the impact of non-participant spillover which was estimated in the evaluation.

Findings and Recommendations

Findings

Participant Experience

1. Overall satisfaction was high for CNC at 80 percent, comprised of 41 percent stating they were very satisfied and 39 percent stating they were somewhat satisfied.

2. In terms of program experience, the highest scores related to aspects around service/communications from BC Hydro, as well as service provided by contractors. Mid-range scores typically related to aspects around the program offer (variety of products and level of incentives) and the overall application procedures. The lowest scores were for length of time to receive the incentive, length of time for the project/process to be completed and direct mail/email about the program (which was not relied on heavily by this program).

3. Participants reported that the program had been influential on their decision to implement the energy-efficient measures, with 33 percent indicating that it had been very influential and 47 percent indicating it had been somewhat influential.

Market Transformation

4. All market actors thought that there had been some improvement in the entire commercial new construction market in B.C. over the past 10 to 15 years – although not necessarily beyond code – with the majority reporting a 20 percent improvement in terms of energy use over time.

5. The most common types of design study conducted to help new construction projects perform better than code were whole building design and lighting design. The most common measures implemented to help projects perform better than code were lighting and HVAC.

Influence on Adoption of Energy Efficiency Measures Beyond Building Code Requirements

6. On average, BC Hydro 'drivers' were given a net of 24 percent of the credit for making projects perform better than code, with the largest credit given to previous learnings and experience with the CNC program. The remaining 76 percent of credit was given to non-BC Hydro drivers, with the largest given to general industry innovation/good practices and to clients directing the projects to be built as such.

Gross Electrical Energy Savings

7. The evaluated gross energy savings were 93 GWh/yr.

8. The program gross realization rate calculated using the inspected and verified results including cross effects was 1.06, indicating that the energy conservation measures largely performed better than expected. The realization rates by program offer were 1.17, 1.04, 0.89 and 0.89 for whole building design, system design, lighting design and program enabled projects, respectively.

9. Expected energy savings averaged 18 percent of site energy consumption across all participants during the five-year evaluation period.

Net Electrical Energy Savings

10. The evaluated net energy savings were 89 GWh/yr.
11. The net-to-gross ratio was 95 percent based on free ridership of 20 percent, participant spillover of 1 percent and non-participant spillover of 14 percent.
12. Evaluated net savings during the evaluation period from F2012 to F2016 averaged 121 percent of reported savings.

Recommendations

The following two recommendations are for future new construction initiatives:

1. Support and enabling activities for whole building energy modelling and integrated system approach to estimate a project's energy savings should continue and include the Building Envelope Thermal Bridging Guide and the Enhanced Thermal Performance Spreadsheet.
2. Future Market Actor surveys could be done more frequently so that respondents are better able to recall the projects they are being surveyed about.

Conclusions

BC Hydro's Commercial New Construction Program achieved high participant satisfaction. Evaluated net savings were 89 GWh/yr, which is 121 percent of reported savings. Evidence suggests that the program has supported the market in complying with and exceeding the energy efficiency requirements of the B.C. Building Code.

1.0 Introduction

Evaluation Scope

This impact evaluation presents the evaluated net electricity savings of the BC Hydro Commercial New Construction (CNC) program for fiscal years F2012 to F2016 (April 2011 to March 2016).

Due to the time it takes for construction, and occupancy of buildings, a fairly long delay was required before Measurement and Verification (M&V) of a representative sample of buildings that went through the CNC program could be completed. This is why the evaluation period goes back so far and stops at F2016. Additionally, this will mark the final evaluation of the CNC program as all active applications are scheduled to be completed in F2022 and no new applications are being accepted. Therefore, the remaining years of the program (F17-F22) will not be evaluated.

Organization of the Report

The organization of this report is as follows. Section 1 covers the evaluation scope, the organization of the report and the initiative description. Section 2 discusses the approach to the evaluation, including evaluation objectives, methodology review, data sources, and methods. Section 3 provides the results organized by evaluation objective. Section 4 provides findings and recommendations. Section 5 provides conclusions. Additional supporting material is contained in the appendices.

Initiative Description

The CNC Program was targeted at developers and the building design community who play a role in building and expanding commercial buildings in BC Hydro's service territory. Market actors included developers, building owners, architects, engineers, energy modellers and consultants. The key objectives of the CNC program were as follows:

1. Energy Efficient Design: Identify energy savings by promoting and funding the design of energy efficient buildings (i.e., more energy efficient than the building code legislation requires).
2. Energy Efficient Construction: Acquire energy savings by promoting the construction of energy efficient buildings and continued efficient operation.
3. Training and Recognition: Enable transformation of the market by training a team of industry professionals to act as energy conservation "ambassadors" (i.e., advocates) on all new construction projects that they work on in the future. In addition, publicly recognize energy efficient design teams and projects and create a market where consumers desire energy efficient buildings.
4. Advance Building Codes: Support the transformation of the new building market to higher sustained levels of energy efficiency and improved building code compliance. The program's activities help drive developer acceptance to a level where they are accepting of the next phase of more stringent building codes and standards introduced by government.

As noted in the fourth key objective above, the program was designed to support increases in the energy efficiency requirements in building codes. The term "code" or "building code" in this report refers specifically to the energy efficiency requirements of the B.C. Building Code or the Vancouver Building By-law. Although identified as part of the objective, any savings realized by meeting code requirements are not attributed to the program.

The program had 4 offerings:

1. Whole Building Design: Targeted at buildings over 50,000 square feet.
2. System Design: Targeted at improving the energy efficiency of selected buildings systems typically over 50,000 square feet.
3. Energy Efficient Lighting Design: Targeted at buildings typically over 10,000 square feet.
4. Program Enabled:
    - Projects in which the customer engaged with BC Hydro and undertook a funded Energy Study through which the building design/equipment was influenced, leading to energy savings. The savings for this offer were from customer-funded energy conservation measures. These measures are not incented due to not meeting BC Hydro cost effectiveness ratios or due to failing to comply with program incentive offer timing and process.

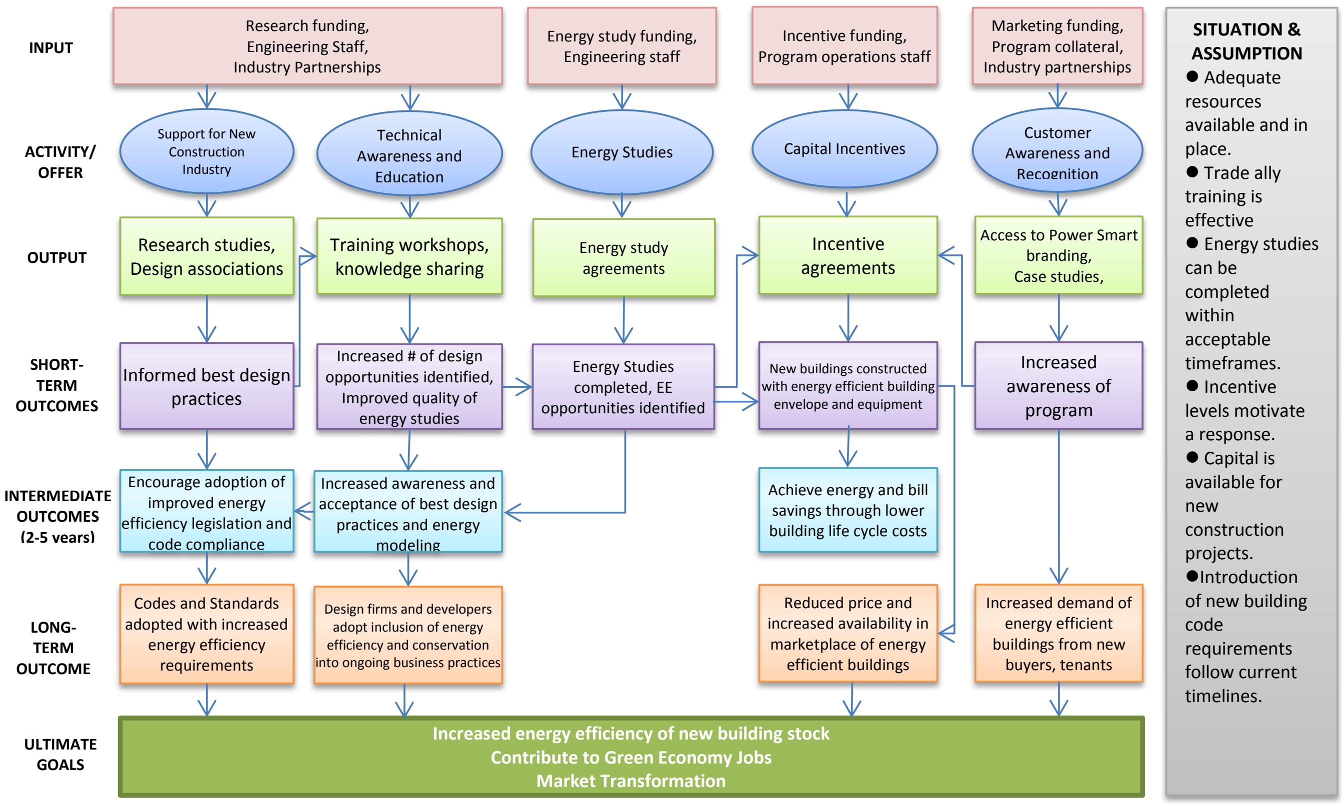
Table 1.1 Program Offers

	Whole Building Design ("Leaders')	System Design (Identified Too Late, Immature Mindshare)	Energy Efficient Lighting Design
Overview	Computer simulation of the whole building energy use	Energy use analysis of a specific system (e.g. lighting, refrigeration, HVAC)	Energy use analysis for lighting. Reduction of light power density requirement from building code though design and controls.
Target Market	• > 50,000 ft^2 ~> 50,000 kWh savings • Buildings with complicated systems • Engineered buildings • Market Leaders • Engaged developers in EE • Part 3 building code • Includes major renovations or major leasehold improvements	• >50,000 kWh savings • Buildings with complicated systems • Market Leaders & Followers • Engaged developers • Part 3 building code	• > 10,000 kWh savings • ~> 10,000 ft2
Building Types	• Office • Institutional • Multi unit residential building (MURB) • Commercial • Large retail	• Office • Institutional • MURB • Commercial • Large retail • Recreation • Supermarket	• Office • Institutional • MURB • Commercial • Large retail • Recreation • Supermarket
Applicable Components	• All electrical energy conservation measures, including building envelope	• All electrical conservation systems: o Lighting o HVAC o Refrigeration	• Lighting • Lighting controls
Incentive	• Fund Energy Study (100%) • Tiered Capital Incentive based on kWh saving	• Fixed Incentive based on kWh Saving • Select study funding (cap at $10k) on complex systems	• Fund lighting calculator (up to $1K) • Fixed Incentive based on kWh Saving

As noted above, the Commercial New Construction program is winding down, with all remaining applications scheduled to be completed in F2022. BC Hydro will continue to support the transformation of the commercial new construction market through codes and standards activities that support the B.C. Energy Step Code.

The program logic model depicts the main inputs, activities and outputs associated with program design and delivery as well as their connection to and the interconnections between the expected short, medium and longer-term outcomes. The logic model for CNC can be found below.

Figure 1.1. Logic Model



2.0 Approach

Evaluation Objectives

The evaluation addressed five objectives and their related research questions as presented in Table 2.1.

Table 2.1. Evaluation Objectives and Research Questions

Evaluation Objective	Research Questions
1. Assess the participant experience	• What is the level of participant awareness of the various CNC program components? • How do participants rate their program experience and overall satisfaction? • How influential is the CNC program on participant decisions around energy efficiency?
2. Assess practices and opinions related to market transformation	• What are the most common types of design studies being conducted in view of helping to make new construction projects perform better than code? (e.g., whole building energy modelling, a refrigeration system design study, and/or a lighting design study) • What are the most common measures being implemented to help make new construction projects perform better than code? • To what extent do market actors believe the commercial new construction market in the province has improved over the last 10-15 years? • How much electricity do market actors believe new construction projects are saving relative to the energy efficiency requirements in the B.C. Building Code?
3. Assess the influence of the program on the adoption of energy efficiency measures beyond building code requirements	• To what extent has the CNC program developed support for design and construction of more energy efficient buildings (beyond code requirements) among commercial new construction market actors (designers, builders, mechanical engineers, architects etc.)? • To what extent and through which activities is the CNC program influencing building design practices and the new construction market beyond incented projects?
4. Estimate gross energy and peak demand savings	• What are the gross and peak demand savings?
5. Estimate net energy and peak demand savings	• What are the net energy and peak demand savings for the overall CNC program? • What are the free ridership, participant spillover and non-participant spillover rates?

Methodology Review

A methodology review covering evaluation protocols and standards, as well as completed evaluations was undertaken to assess common methods used for evaluations of commercial new construction programs. Evaluations were identified through a search of various industry associations and energy program organizations, such as the U.S. Department of Energy, the California Measurement Advisory Council (CALMAC), the U.S. Department of Energy's Uniform Methods Project (UMP), the International Energy Program Evaluation Conference (IEPEC), the American Council for an Energy Efficient Economy (ACEEE), and the Northwest Energy Efficiency Alliance (NEEA). Past BC Hydro evaluations were also reviewed. Recommended evaluation methods are summarized below, along with common methods used in other evaluations.

In general, the recommended approach to estimating evaluated gross energy savings for new construction is to conduct M&V of a sample of projects, and extrapolate findings to the population of all projects. M&V methods included calibrated whole building modelling as well as sub-metering of individual energy end uses and systems, guided by the International Performance Measurement and Verification Protocol (IPMVP). The U.S. Department of Energy's Uniform Methods Project includes several protocols for determining energy efficiency savings for a variety of commercial and industrial end-uses and equipment measures including a protocol for new construction[1].

A literature review of evaluations from BC Hydro and other jurisdictions was conducted to inform this evaluation. The purpose of the literature review was to understand the scope, and evaluation methods employed in recent evaluations of new commercial construction programs. Studies were identified for potential inclusion in the literature review through a search of energy efficiency association websites as well as an internet search. To be included in this literature review, the study had to meet the following criteria: (1) the scope and objectives of the study had to be clear and well defined; and (2) the methods used to evaluate net and gross energy savings had to be clearly identified and transparent.

All of the studies examined focussed on verifying installation of equipment receiving an incentive, estimating gross savings for a sample of projects using suitable M&V methods, and aggregating individual project savings to estimate total gross savings. Most studies estimated a net-to-gross ratio using information from participant and trade ally surveys, typically multiple questions with an algorithm used to aggregate responses. The methods used to estimate gross savings were generally consistent with the IPMVP. Comparison and control groups were not employed in any of the evaluations reviewed.

The Uniform Methods Project protocol for evaluating net savings requires that, at a minimum, a free ridership adjustment is applied to evaluated gross savings[2]. The protocol also indicates that gross savings can be adjusted for spillover (participant and non-participant), but this is discretionary. An acceptable method outlined in the protocol for estimating free ridership and spillover is to use survey responses of program participants regarding the decisions they would have made in the absence of the program and how much the program influenced their decision to undertake specific energy savings activities. Free ridership estimates for programs that involved projects with complex, lengthy, multi-party decision making are increasingly derived using multiple lines of evidence. These lines of evidence commonly include participant survey data supplemented by information from sources such as program files, vendor surveys, or case studies. Using multiple lines of evidence to estimate free ridership in these complex situations has been the approach taken in BC Hydro's recent evaluations of its large industrial and new plant design programs due to small sample sizes and the complexity of decision-making around projects. Less common in other impact evaluations was the inclusion of an adjustment for spillover savings for participants and, particularly, for non-participants. Similar to the estimation of free ridership, the most common approach to estimating spillover was to use surveys of decision makers. Spillover was estimated this way for BC Hydro's most recent impact evaluations of BC Hydro's commercial and industrial programs[3].

Methodology

The data sources and methods used to address each evaluation objective are summarized in Table 2.2.

Table 2.2. Evaluation Objectives, Data and Method

Evaluation Objectives	Data	Method
1. Assess the participant experience	• Participant Survey (n=57 respondents)	• Cross tabulations
2. Assess practices and opinions related to market transformation	• Market Actor Survey (n=13-30)	• Cross tabulations
3. Assess the influence of the program on the adoption of energy efficiency measures beyond building code requirements	• Market Actor Survey (n=13-30)	• Cross tabulations
4. Estimate gross energy and peak demand savings	• Program tracking data • M&V (n=12)	• IPMVP Options A, B and D • Probability Proportional to Size (PPS) ratio estimation • Peak demand savings based on peak-to-energy factor
5. Estimate net energy and peak demand savings	• Statistics Canada data on commercial new construction activity, F2012-F2016 • Participating building floor area (sq. metres) • CPR, EUI inputs • Results from Objective 4 • Participant survey (n=51 projects) • Market actor survey (n=13-30)	• Survey based free ridership and participant spillover algorithms • Market Actor Survey based non-participant spillover algorithm

Data and Methods for Objective 1: Assess Participant Experience

The main source for addressing Objective 1 was an online survey of program participants, conducted in multiple waves. The first wave of the participant survey was fielded in May 2013 (covering projects completed in F2012), followed by a second wave in July/August 2014 (covering projects completed in F2013 and F2014). After that, the participant survey was conducted every six months on an ongoing basis in May and November (covering projects completed within the past 6 months). Details on the survey method are included in Appendix C.1 and questionnaire is included in Appendix F.

A total of 57 surveys were completed by F2012-F2016 program participants, representing an overall response rate of 41 percent and covering 20 percent of all square footage that came through the program. Although the returned sample was generally representative of the population based on known population parameters, the data were statistically weighted to further align it with the known population (by square footage and industry sub-sector for cross tabulations and by project savings for free ridership). Note that of the 57 survey respondents, only 51 were able to fully answer the free rider section. These 51 projects represented 17 percent of total projects completed and 18 percent of energy savings reported by the program during the evaluation period. The survey sample and population sizes by program offer are summarized in Table 2.3 on the following page.

Table 2.3. Participant Sample Size and Population

	Eligible Population	Surveys Sent	Responses Received	Response Rate	Margin of Error at the 95% Confidence Level
CNC Participants	284 sites	140	57	41%	+/- 11.6%

Data and Methods for Objective 2: Assess Practices and Opinions Related to Market Transformation

Objective 2 was addressed through results of a Market Actors Survey. This survey was administered in March 2018, aiming to solicit the views of professionals in British Columbia's commercial new construction industry who had decision making roles regarding the extent that their past projects would be energy efficient.

If not a key decision maker, candidates for this research were also screened based on the requirement to have held positions whereby they regularly provided inputs, alternate options and/or their opinions on the extent that their past new construction projects – those that became occupied between 2012 and 2016 – would be energy efficient.

The survey was conducted online due to the fact that a self-administered approach afforded these professionals the flexibility to complete it at their leisure and the time to formulate and express well-considered responses to the number of comprehensive questions being asked of them.

Potential candidates for this research were sourced via two parallel and complementary methods – one direct and one indirect. First, survey invitations were directly emailed to approximately 300 industry professionals for which business contact information (i.e., email addresses) was ascertained from internal databases and publicly available lists. Second, an invitation to participate in this research was indirectly made by embedding the communications into various industry association e-newsletters and online bulletin boards.

Ultimately, the final sample was comprised of 30 such professionals, primarily electrical engineers, mechanical engineers, energy modellers, architects and project managers. An accompanying response rate and margin of error is not presented due to the nature of the methodology and the fact that the total population size of eligible professionals is not specifically known with any certainty.

See Appendix C for more details in regards to this survey and Appendix E for the survey instrument.

Data and Methods for Objective 3: Assess the Influence of the Program on the Adoption of Energy Efficiency Measures Beyond Building Code Requirements

Objective 3 was addressed with the Market Actors Survey discussed above. Specifically, the survey asked industry professionals about drivers for making projects perform better than the energy efficiency requirements in the B.C. Building Code and BC Hydro influence.

Data and Methods for Objective 4: Estimate Gross Energy and Peak Demand Savings

In order to address Objective 4 and understand the estimation of evaluated gross savings, it is useful to understand the steps in the BC Hydro project cycle through which energy savings were initially estimated, then reviewed and verified for the different program components. The approach to estimate the evaluated gross energy savings include the following four steps and highlights the three components of the gross realization rate:

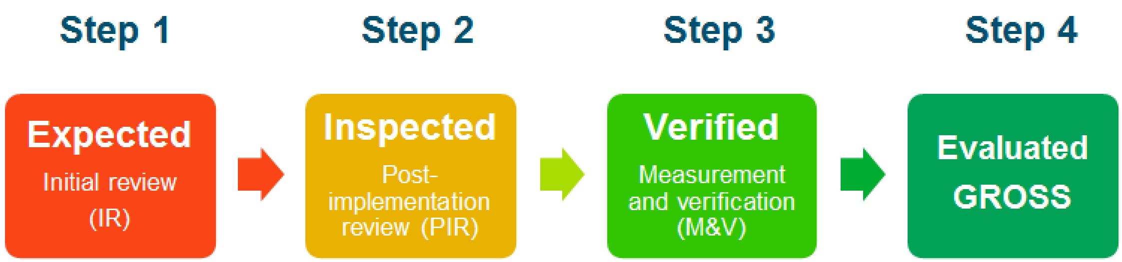
Step 1: Expected savings and initial engineering review.

Step 2: Inspected savings and component of realization rate for projects without post-implementation review.

Step 3: Verified savings and component of realization rate for projects without M&V.

Step 4: Evaluated savings and component of realization rate for cross effects where applicable.

Figure 2.1. Estimating Energy Savings Steps



In mathematical form, the gross evaluated savings were calculated by program offer according to the following equation.

Equation 1

$$Gross\ Evaluated\ Savings_j = Expected_i \times \left(\frac{Inspected}{Expected}\right)_j \times \left(\frac{Verified}{Inspected}\right)_j \times (1 - Cross\ Effects_j)$$

where $Expected_i$ is the expected savings for all projects (i) and the ratios were estimated from a sample of projects within each program offer (j)

Step 1: Expected Savings by Initial Review (IR)

All projects in the evaluation scope had an engineering review conducted by BC Hydro staff which was considered the expected energy savings for each measure in the project. In general, the initial engineering estimate of a project's energy savings was based on a technical application of engineering principles to forecast assumptions of hours of use and energy performance data. For the Whole Building Design and System Design offers, this estimate was documented in an energy study and resulted from whole building energy modelling or integrated system based energy calculation during design and construction. For the Lighting Design offer, the initial engineering estimate was based on a custom prescriptive approach and calculated by measure in the program lighting calculator tool using the applicable energy code as the baseline. For program enabled projects, the initial energy savings estimate was also based on an engineering estimate of a project's predicted energy savings before project implementation. Table 2.4 on the next page lists the count of projects, the count of measures and the expected savings by program offer.

Table 2.4. Expected Energy Savings by Program Offer

Program Offer	Approach	Count of Projects	Count of Measures	Expected Savings (GWh/yr)
Whole Building Design	Whole building energy modelling	95	665	53.4
Lighting Design	BC Hydro Lighting Calculator Tool	169	300	29.2
System Design	System based energy calculation	13	25	2.9
Program Enabled	Energy modelling or system calculation	7	35	1.8
Overall CNC F12-F16		**284**	**1,025**	**87.3**

Step 2: Inspected Savings by Post-implementation Review (PIR)

Energy savings estimates for most of the projects were refined through a post-implementation review (PIR). The purpose of the review is to confirm equipment installation and operation through various means such as examining customer-submitted project records and photos or physical site inspections. Not all projects in the Lighting Design offer were selected for post-implementation site inspections, especially if these projects were smaller in size and involved technologies with well-established engineering estimates.

Tag-on savings are energy savings that are generated above and beyond a project's original contract scope, for example when additional products are installed by the customer compared to what was outlined in the agreement. Tag-on savings do not impact incentives, but are recognized and reported by the program during post implementation review of lighting projects only. Tag-on energy savings were identified during post-implementation review on 11 projects for a total of 1,335 MWh per year.

Energy savings of projects without PIR were estimated based on the ratio of PIR over IR savings using ratio estimation method. The following table provides an overview of the coverage and method for estimation of these results.

Table 2.5. Coverage and Method of Post-implementation Review Savings by Program Offer

Program Offer	Coverage of Number of Projects with PIR	Coverage of Energy Savings with PIR	Method for estimation of (PIR/IR) ratio
Whole Building Design	100%	100%	Calculated
Lighting Design	89%	71%	Ratio estimation
System Design	100%	100%	Calculated
Program Enabled	100%	100%	Calculated

Step 3: Verified Savings by M&V

A subset of Whole Building Design and System Design projects was subject to M&V to validate the energy savings of the implemented measures. M&V was undertaken in accordance with the International Performance Measurement and Verification Protocol (IPMVP) for whole building design projects and inspired by IPMVP principles for system design projects. M&V involved energy modelling and simulation of variables that have a significant impact on energy consumption combined with post-implementation energy metering. To conduct this impact evaluation, a sample of twelve projects was selected for M&V. The sampling method used stratified sampling by savings magnitude and program offer for an overall target confidence of 80 percent and relative precision of 20 percent.

The fundamental equation for estimating energy savings is given by the following equation.

Equation 2: M&V Savings Estimation

$$\text{kWh Savings} = (\text{kWh}_{baseline} - \text{kWh}_{energy\ efficient}) \pm \text{Routine Adjustments} \pm \text{Non-Routine Adjustments}$$

where:

$\text{kWh}_{baseline}$ is the estimated baseline energy consumption of the system as determined by the energy study and/or engineering review completed as a condition of program participation

$\text{KWh}_{energy\ efficient}$ is the M&V estimate of consumption of the installed energy efficient system. This estimate is based on data collected using power meters, current transformer meters, or hours of use loggers, as well as verification of equipment counts through site visit.

Routine Adjustments are for any energy-governing factors, expected to change routinely during the reporting period, such as weather or schedule of operation.

Non-Routine Adjustments are for those energy-governing factors which are not usually expected to change, such as: the facility size, the design and operation of installed equipment, the number of weekly production shifts, or the type of occupants. These static factors must be monitored for change throughout the reporting period.

The approach to M&V differed between projects that went through the program's system design and whole building design offers.

System Design

Three projects that had participated in the system design offer underwent M&V using principles of IPMVP Option A and D[4]. Each project consisted of one or more conservation measures in energy efficient refrigeration systems at a unique building site. The M&V approach involved continuous measurements on a sample of components of the refrigeration system for a duration of three months, followed by engineering analysis to estimate the electricity savings from the energy conservation measures.

Whole Building Design

Nine building parcels that had participated in the whole building design offer underwent M&V using Option D of the IPMVP. The Cadmus Group and RDH Building Engineering Ltd. (RDH) were retained by BC Hydro to undertake this work. Under this approach, an "as-built" whole building energy simulation model was

[4] A combination of the concept of measure isolation (Option A) and calibrated simulation (Option D) was considered an acceptable approach as the engineering principles of the measures and systems are well established and control for the interactive effects within the system boundary through computer simulation.

developed based on the actual construction, systems, and operation of the building. The model was then calibrated such that it aligned with metered energy consumption data for the building. Once an acceptable calibration was achieved, a baseline model was developed by removing the energy conservation measures (ECMs) that went beyond building code requirements from the calibrated as-built model. Savings were determined by subtracting energy consumption for the calibrated as-built model from the calibrated baseline model. This M&V methodology is broken down into the following steps.

1. Data Collection: Information on the building is collected, including the design, as-built, and operating conditions, as well as metered utility energy consumption data (electricity and thermal energy). A site visit is conducted to meet with the building manager and review operational conditions.
2. Whole Building Energy Modelling: An energy simulation model of the building is developed based on the as-built and as-operated conditions determined through the data collection task. The model is calibrated to align with utility-metered energy consumption data by adjusting inputs that are not known with a high degree of certainty, such as plug loads. Modelling uncertainty[5] was determined using ASHRAE Guideline 141 for calibrating to monthly utility bills. Once an acceptable calibration has been obtained, a baseline or reference model is developed by removing energy conservation measures from the calibrated model.
3. Analyze results. Energy savings were determined by comparing the calibrated model to the baseline model and provide whole facility savings only. Energy savings of individual measures cannot be extrapolated due to the interactive effects.

Option D M&V controls for the effect of parallel DSM initiatives by using the measure level savings as an input to the analysis. The measure level savings were developed based on the engineering analysis of measures implemented through the CNC program, and only include savings that go beyond building code requirements. Option D M&V will produce savings estimates that include electricity cross effects, to the extent that they exist.

M&V Sample Coverage

The final M&V sample was assessed to compare it to the population of projects without M&V. The overall program M&V coverage was 7 percent in terms of electric energy savings, and it was estimated at 5 percent in terms of affected floor area. In order to extrapolate the M&V results to the population of projects that did not undergo M&V, projects were stratified according to the magnitude of their savings. The sample was drawn using the probability proportional to size method and the M&V results analyzed using ratio estimation by savings size in order to obtain the most reliable program realization rate estimate[6]. Results of sampling, confidence and precision are discussed in section 3.6.

[5] The Coefficient of Variation of the Root Mean Square Error (CVRMSE) must be less than 15%, while the Normalized Mean Bias Error (NMBE) must be less than 5%.

[6] The target for sampling error and ratio estimation is a confidence level of 80% or better with a relative precision of 20% or better.

The seven program enabled projects were a mix of whole building design and system design projects that were not included in the M&V sampling and therefore not evaluated using ratio estimation.

Table 2.6. Coverage and Method of M&V Savings by Program Offer

Program Offer	Coverage of Number of Projects with M&V	Coverage of Energy Savings with M&V	Method for estimation of (MV/PIR) ratio
Whole Building Design	9%	11%	Ratio estimation
Lighting Design	0%	0%	Estimated from LEM-C F13-F17
System Design	23%	18%	Ratio estimation
Program Enabled	0%	0%	Not evaluated

Ratio Estimation

Ratio estimation was used to calculate evaluated gross savings for three components of the program offers: PIR of Lighting Design projects, M&V of Whole Building Design projects, and M&V of System Design projects. Ratio estimation is a statistical method of extrapolating findings from projects with estimated results to projects without estimated results. Project samples of the three program offers were used to provide data inputs for ratio estimation for the components of realization rate. An overview of the steps involved in ratio estimation is provided below. For additional details, see Chapter 13 of the California Evaluation Framework[7]. The steps involved in determining evaluated gross savings using stratified ratio estimation are described below.

First, the realization rate sample for each of the three program offers was stratified to improve the statistical validity of the resulting estimate of evaluated gross savings. Three strata were selected, based on project savings size. These are shown in Table 2.7.

Table 2.7. Stratification of Components of Realization Rate by Project Size and Program Offer

Strata	Lighting Design Inspected Savings	Whole Building Design Verified Savings	System Design Verified Savings
1	< 0.07 GWh/yr	< 0.2 GWh/yr	< 0.1 GWh/yr
2	0.07-0.70 GWh/yr	0.2-0.75 GWh/yr	0.1-0.2 GWh/yr
3	0.70-2.3 GWh/yr	0.75-4.0 GWh/yr	0.2-0.4 GWh/yr

Second, case weights were calculated for each stratum. Case weights, also known as probability weights, are used to reduce bias when working with sample data. Case weights represent the probability that a project was selected into the ratio estimation sample from the population of projects in the strata, as per Equation 3. Higher case weights indicate that relatively few projects were found in the ratio estimation sample. Weightings applied to the savings in each stratum improve the statistical significance of the resulting ratio estimation.

[7] TecMarket Works, et. al., 2004.

Equation 3

$$Weighting\ (w_i) = \frac{N}{n}$$

Where: (N) is the number of measures in the population
(n) is the number of measures in the realization rate sample

Weightings for the ratio estimation samples are shown below.

Table 2.8. Weighting by Strata and Ratio Estimation Sample

	Lighting Design Inspected Ratio (PIR/IR)			Whole Building Design Verified Ratio (M&V/PIR)			System Design Verified Ratio (M&V/PIR)		
Strata	Population Count, N	Sample Count, n	**Weighting (N/n)**	Population Count, N	Sample Count, n	**Weighting (N/n)**	Population Count, N	Sample Count, n	**Weighting (N/n)**
1	89	89	**1.0**	27	2	**13.5**	3	1	**3.0**
2	76	58	**1.3**	48	3	**16.0**	5	1	**5.0**
3	4	4	**1.0**	20	4	**5.0**	5	1	**5.0**

Third, the required ratios were calculated according to Equation 4.

Equation 4

$$Ratio\ Estimate\ (RE)_j\ = \frac{\sum_{i=1}^{n} w_i y_i}{\sum_{i=1}^{n} w_i x_i}$$

Where: The summation is over all projects from the ratio estimation sample for program offer (j)
w_i is the case weighting of the stratum for project (i), derived from Equation 1
y_i is the known PIR or M&V savings for project (i) in the realization rate sample
x_i is the known IR or PIR savings for project (i) in the ratio estimation sample

Fourth, each of the three ratio estimation results was tested for statistical validity. Equation 5 was used to estimate the standard error of the ratio estimate, Equation 6 was used to estimate the error bounds at the 90 percent confidence level, and Equation 7 was used to estimate the relative precision, also at the 90 percent confidence level. The definitions of the terms in Equation 5 are the same as for Equations 3 and 4.

Equation 5

$$Standard\ error\ of\ GRR, se(GRR)_j = \frac{1}{\sum_{i=1}^{n} w_i x_i}\sqrt{\sum_{i=1}^{n} w_i(w_i - 1)(y_i - bx_i)^2}$$

Equation 6

$$Error\ bounds, eb(GRR)_j = \pm 1.645 * se(GRR)$$

Equation 7

$$Relative\ precision_j = \frac{eb(GRR)}{GRR}$$

Step 4: Evaluated Savings and Gross Realization Rates

Finally, the gross realization rate was estimated for each of the four program offers using the three components of realization rate and calculated according to Equation 8.

Equation 8

$$Gross\ Realization\ Rate\ (GRR)_j = \left(\frac{PIR}{IR}\right)_j \times \left(\frac{MV}{PIR}\right)_j \times (1 - CE_j)$$

Where: *Gross realization rate* was calculated for each program offer (j) and
(PIR/IR) is the ratio of post-implementation review savings to the initial review savings;
(MV/PIR) is the ratio of M&V savings to the post-implementation review savings;
and *CE* is the factor for cross effects where applicable.

Cross Effects (CE)

Gross savings for Lighting Design projects were adjusted for cross effects in accordance with BC Hydro's Standard Procedure for Cross Effects[8]. BC Hydro's commercial programs apply cross-effects only to lighting end-uses. Cross effects are estimated by breaking down lighting savings by building type and computing a weighted average HVAC Interactive factor for each building type based on tabulated values of HVAC interactive factors for different HVAC system types, weighted according to the prevalence of each HVAC system type in the commercial sector. Cross effect assumptions were applied only to evaluated gross savings of the lighting design projects.

The following table provides the summary of the applicability and method for cross effects by program offer.

Table 2.9. Applicability and Method for Cross Effects by Program Offer

Program Offer	Applicability of Cross Effects (%-Lighting savings)	Method for estimation of Cross Effects (CE)
Whole Building Design	30%	Included in M&V
Lighting Design	100%	BC Hydro Standard: Cross Effects
System Design	0%	Included in M&V
Program Enabled	28%	Not evaluated

[8] BC Hydro Standard Procedure: Cross Effects, August 2013

The table below summarizes how the parameters of the gross realization rate were determined for each program offer (i.e., calculated directly or through ratio estimation, included in M&V, or estimated from other data sources).

Table 2.10. Components of Gross Realization Rate by Program Offer

Program Offer	Step 1 Expected Savings	Step 2 (PIR/IR)	Step 4 (M&V/PIR)	Step 4 (CE)
Whole Building Design	Program data	Calculated	Ratio Estimation	Included in M&V
Lighting Design	Program data	Ratio estimation	Assumed*	Estimated
System Design	Program data	Calculated	Ratio Estimation	Included in M&V
Program Enabled	Program data	Calculated	Not evaluated	Not evaluated

* Assumed from BC Hydro LEM-Commercial Impact Evaluation F2013-F2017

The last step was to calculate the evaluated gross energy savings of the program from the gross realization rate and expected savings for all projects in each of the four program offers according to the following equation.

Equation 9

$$Evaluated\ Gross\ Savings_j\ \left(\frac{GWh}{yr}\right) = \sum Expected\ Savings_i\ \left(\frac{GWh}{yr}\right) \times GRR_j$$

Where the summation is over all projects (i) in each program offer (j).

Gross Peak Demand Savings

Peak demand savings were estimated by applying an average peak-to-energy factor derived by CEM Strategic Planning from the commercial rate class load shape, as more refined data on peak savings was not available. For the purpose of this evaluation, the average peak-to-energy factor was 0.143 MW per GWh. This approach introduces uncertainty because it relies on the assumption that energy savings have the same annual shape as the associated load shape, but this may not be true for unique projects and sites.

Baselines

The baseline represents the energy that would have been used without implementation of the energy efficiency project. The baseline energy consumption of a new commercial building is, by necessity, theoretical. Baselines were determined through engineering analysis during the building design, using the building code and relevant codes and standards that were in place at the time of building design as input into the selected building energy modeling software to determine the baseline consumption.

Threats to Validity

Projects without M&V results were the main threat to the validity of evaluated gross savings. Evaluated gross savings for whole building design and system design projects without M&V results were estimated using a gross realization rate, as described above. This can create some uncertainty if the realization rate is not representative of the population. M&V results were only available for a small sample of projects. To mitigate this threat to validity, the gross realization rate was segregated in its three components and each component was tested through estimation of its relative precision.

There were no M&V results available for any Lighting Design projects in the program which introduces uncertainty in the component of gross realization rate for this program offer. To mitigate this threat to validity, the (M&V/PIR) results of similar lighting projects from the recent impact evaluation of the BC Hydro commercial program[9] were used.

Peak demand savings were estimated by applying a peak-to-energy factor derived from the commercial rate class load shape. This approach introduces uncertainty because it relies on the assumption that energy savings have the same annual shape as the associated load shape, but this may not be true for unique projects and sites.

Data and Methods for Objective 5: Estimate Net Energy and Peak Demand Savings

Gross savings do not account for factors external to the program that could impact energy savings and may include energy savings that are not attributable to the program. The evaluated net savings are attributable to the program and include adjustments for free-ridership of participants and spillover of participants and non-participants. Net electricity savings were determined through the following equation:

Equation 10

$$Evaluated\ Net\ Savings\ = Evaluated\ Gross\ Savings\ \times\ (1 - Free\ Rider\ Rate + Spillover\ Rate)$$

Free Ridership

Online surveys of program participants were employed to estimate the savings that were attributable to the CNC program using a self-report approach. As mentioned previously, of the 57 survey respondents, only 51 were able to fully answer the free rider section. These 51 projects represented 17 percent of total projects completed and 18 percent of energy savings reported by the program during the evaluation period. To ensure that survey respondents had the appropriate level of decision making authority for the purpose of this study, a number of questions were asked to determine key characteristics of the respondent and of their facility. In order to estimate free ridership, program participants were asked a series of questions about the counterfactual – what the organization would have done at the site in the absence of the program. First, participants were reminded of the energy conservation measures that were undertaken at the site with assistance from the program. Participants were then asked a series of sequential questions about what they would have implemented without enabling activities or incentives from the program. A decision tree was used to assign free rider scores based on responses to these questions (see Appendix C.3). Free ridership results were weighted based on evaluated gross savings and extrapolated to the project population.

Participant Spillover

In order to estimate participant spillover, survey respondents were once again reminded about the projects they had already completed with assistance from the program. They were then asked to indicate the number of end-uses or technologies that they had upgraded on their own and a series of questions about the program's influence on their decision to do so. A decision tree was used to assign spillover scores based on responses to these questions (see Appendix C.3). Responses were then converted to a metric that is comparable with the free rider score by applying typical energy savings associated with the upgraded end-use or technology, adjusting those savings by the influence of the program, and then comparing those savings to total program savings.

[9] BC Hydro (2019) Leaders in Energy Management - Commercial Program Evaluation

Non-Participant Spillover

Non-participant spillover pertaining to the entire five year evaluation period of interest was estimated via a calculation involving both empirical and survey-based inputs.

To begin, the total commercial new construction building stock in British Columbia – projects that first became occupied between 2012 and 2016 – that could have possibly been influenced by BC Hydro's program was ascertained from Statistics Canada permit data together with costing estimates from Hanscomb Quantity Surveyors. Specifically, this estimate of the total building stock is measured in floor area and was computed by aggregating the dollar values of new construction permits issued for the buildings that became occupied during this period, and dividing this total dollar value by Hanscomb's estimate of construction costs given as dollars per square meter.

As shown in row A of Table 2.11, this total floor area is comprised of all new construction projects during this period – including those that may have received program funding (i.e., participants).

Next, the total commercial new construction building stock during this period that did receive program funding was ascertained from program tracking data. This too was summarized in floor area and is shown in row B.

Through the five years of the evaluation, the commercial new construction building stock that did not receive program funding – and was, therefore, eligible for non-participant spillover savings – is shown in row C as the value of A minus the value of B.

Table 2.11 Non-Participant Spillover Methodology

A.	Commercial new construction building stock in BC that could have been influenced by the program F12-F16 (m^2)	A
B.	Commercial new construction building stock that did receive BC Hydro program funding F12-F16 (m^2)	B
C.	Commercial new construction building stock that did <u>not</u> receive BC Hydro program funding F12-F16 (m^2)	C = A – B
D.	Percent of commercial new construction building stock that exceeds code F12-F16 (%)	D
E.	For commercial new construction building stock that exceeds the B.C. Building Code, the average unit electricity savings relative to the code (kWh/m^2)	E
F.	Attribution of electricity savings to BC Hydro's Commercial New Construction Program (%)	F
G.	Non-Participant Spillover F12-F16 (GWh)	$G = \frac{C \times D \times E \times F}{1,000,000}$

The Market Actors Survey was then leveraged for three additional inputs. First, findings from the survey were used to estimate the percentage of commercial new construction floor area in this period that exceeded the B.C. Building Code (row D). Second, findings from the survey – together with end-use intensity data from BC Hydro's 2016 Conservation Potential Review (CPR) – were used to estimate average unit electricity savings for the floor area that exceed the code (row E). Third, findings from the survey were used to estimate the attribution of gross electricity savings from non-participants back to the Commercial New Construction Program (row F).

It follows that non-participant spillover (row G) was estimated as the product of the values in rows C, D, E and F, divided by 1,000,000 to yield gigawatt-hour savings (GWh).

See Appendix C.3 for more details about this estimation of non-participant spillover, particularly in regards to the calculation of the inputs D, E and F.

Threats to Validity

Threats to the validity of the survey-based methods to estimate free ridership, participant spillover and non-participant spillover in this study were tied to three types of potential bias: 1) response bias, 2) recall bias, and 3) non-response bias.

1. Response Bias

Response bias can occur when the structure of the survey, the presentation of information in the survey, the survey questions and/or the response options influence the responses of customers away from accurate or truthful responses. This potential source of bias was mitigated in the Participant Survey and the Market Actors Survey by administering what is believed to be well-structured, well-ordered, unambiguous and non-leading questions together with balanced response scales that covered the potential range of customer opinion.

One particular type of response bias is 'social desirability response bias' whereby respondents provide answers that they believe an interviewer may want to hear and/or answers that they believe are consistent with the preferred outcome of the study. For each of the two surveys, this potential source of bias was mitigated by utilizing self-administered online surveys rather than an interviewer led approach.

2. Recall Bias

Recall bias – in the most typical of scenarios – can occur when respondents' recollection and opinions of events and/or experiences from the past are 'clouded' by the passage of time giving way to potentially inaccurate responses.

For the Participant Survey, this potential source of bias could emerge if respondents do not remember the project in question and the accompanying approval process. However, it was managed first by administering the survey every six months through the evaluation period whereby customers that completed projects were queried about them no more than six months thereafter. Additionally, the survey presented respondents with detailed descriptions of their projects undertaken at their site. If respondents were not aware of the project, they were skipped around the section on free ridership, and were excluded from the free rider calculation.

As the Market Actors Survey was administered just once at the end of this evaluation period, the sample and findings were potentially prone to recall bias as respondents were asked about their projects that became occupied from 2012 through to 2016. This necessarily meant them trying to recollect design decisions that were made two to three years even before construction and subsequent occupation. This potential source of bias was mitigated by the intuitive layout and flow of the survey, presenting questions in a series of small, logical steps to solicit recollections and opinions.

Additionally, because the survey was self-administered, it afforded respondents the flexibility and time to retrieve and review planning files pertaining to their past commercial new construction projects. In fact, there is anecdotal proof that many respondents did just this.

3. Non-Response Bias

Non-response bias can occur when subjects comprising the final survey sample are significantly different in the key exploratory parameters of interest than eligible subjects in the same population who did not complete a survey. These responders may be different than non-responders on these exploratory parameters because their demographic, geographic, attitudinal or behavioural makeup is different. This can render the survey sample not wholly representative of the population.

For the Participant Survey, this potential source of bias may materialize if the survey respondents and their views are significantly different than all others, particularly if they are not qualified in the first place to be commenting on their organization's decision-making criteria. This potential source of bias was mitigated in two ways. First, it was managed by sending the survey to all available program participants and promoting high response rates through survey completion incentives and multiple reminders to complete the survey. Second, it was further managed by screening respondents by job title and decision-making authority. See Appendix C.1 for this information.

For the Market Actors Survey, non-response bias was plausible due in large part to the fact that the sample was comprised of 30 industry professionals of interest – a fraction of the likely hundreds of them working in British Columbia's commercial new construction marketplace. In fact, some of the inputs into the calculation of non-participant spillover were based on the responses of as few as 13 individuals. Their views in regards to the industry and their attribution of the advancement of energy efficiency back to BC Hydro may not be representative of all professionals who were eligible to complete the survey.

However, proving the existence or non-existence of non-response bias in a survey sample requires either 1) a follow-up survey sample of the non-responders or 2) an understanding of the true population distribution of the exploratory parameters of interest. Follow-up surveys with non-responders are very rarely conducted because they often incur additional costs, extend research timelines, and most often come with their own group of non-responders. Having an understanding of the true population distribution of the exploratory parameters before embarking on a survey is generally rare – the absence of this information is the very reason for conducting the survey in the first place.

Alternative Methodologies

An alternative approach explored in the estimation of gross realization rates for the CNC program was to use M&V results at the energy conservation measure level to estimate separate gross realization rates by end use. This approach was abandoned due to the cost of conducting the M&V at the measure level instead of the project level, concerns about the small number of measures with M&V results in each sample, and the difficulty in estimating the cross effects between end uses.

Analysis of load shapes and interval data of buildings together with benchmarking energy use indices for buildings was also considered but many of the buildings were multi or mixed-use and therefore difficult to compare by building type and space function.

3.0 Results

Participant Experience

Program Components. Among program participants, 79 percent reported being aware of the CNC offer by name. Of the individual program components, awareness was highest for the role that key account managers play as liaisons between CNC and participants at 74 percent. Awareness of the basics of the energy study component and the project incentive structure were equal at 63 percent each.

Table 3.1. Awareness of Program and Components

	CNC Participants (n=57)
Overall awareness of CNC offer	**79%**
Key Account Managers' role as liaison between CNC and participants (among those with a KAM; n=45)	74%
Energy study component of CNC	63%
Project incentive structure of CNC	63%

Among those aware of individual program components, the highest level of understanding was for the role that key account managers play as liaisons between the program and participants with 87 percent reporting an excellent or good understanding. Understanding of the energy study component was more moderate at 72 percent, followed by understanding of the project incentive structure at 66 percent.

Table 3.2. Understanding of Program Components (Excellent + Good)

	CNC Participants (n=57)
Key account mangers' role as liaison between CNC and participants (among those with a KAM; n=33)	87%
Energy study component of CNC	72%
Project incentive structure of CNC	66%

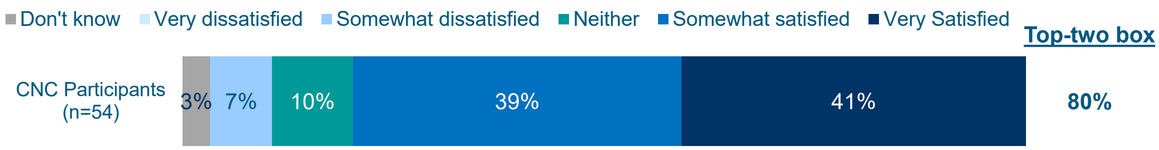
The rating of key account managers in relation to their support of participation in CNC was very high with 100 percent providing an excellent (60%) or good (40%) rating. The overall rating of the project incentive structure was also high with 83 percent providing favourable rating, but with only a small proportion providing an excellent rating (3%) and the balance (80%) providing a good rating. Although the energy study component had a lower combined excellent plus good rating of 72 percent, it had a higher proportion rating it as excellent (20%).

Table 3.3. Rating of Program Components (Excellent + Good)

	CNC Participants (n=57)
Key account managers in relation to their support of participation in CNC (among those with a KAM; n=33)	100%
Project incentive structure of CNC	83%
Energy study component of CNC	72%

Overall Satisfaction. Overall satisfaction was high for CNC at 80 percent, comprised of 41 percent stating they were very satisfied and 39 percent stating they were somewhat satisfied. Results were examined by year, but there were no clear trends over time. When asked the likelihood of recommending the program to others, 95 percent indicated that they definitely (53%) or probably (42%) would, and 49 percent reported that they had in fact already done so.

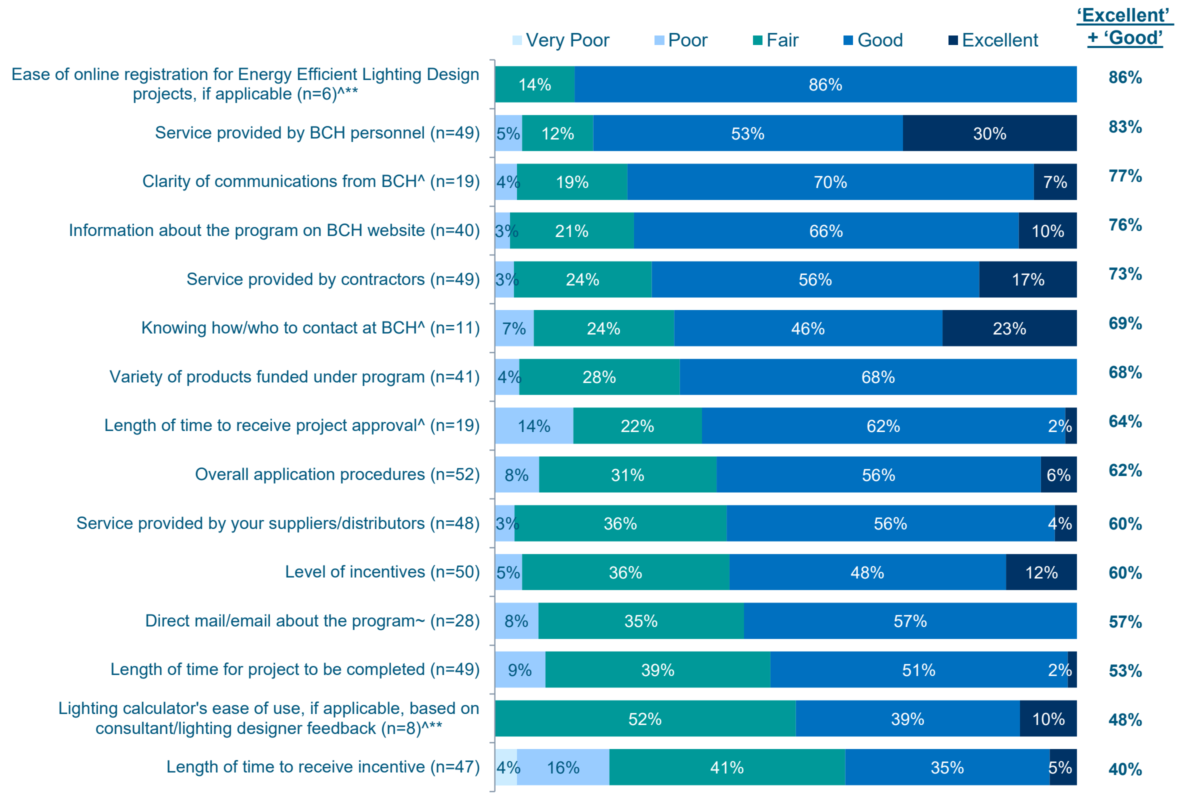
Figure 3.1. Overall Satisfaction



Program Experience. Program participants were asked to provide an overall rating from 'very poor' to 'excellent' on a five-point scale for various aspects of their experience with the program.

- **Service** – While service provided by BC Hydro personnel rated very favourably with 83 percent rating it as excellent or good, service provided by contractors and suppliers/distributors was lower at 73 percent and 60 percent, respectively. Service provided by BC Hydro had the highest excellent score of all individual aspects at 30 percent.
- **Customer Contact** – 'Clarity of communications from BC Hydro' also rated well with 77 percent rating it as excellent or good. Although 'knowing who to contact at BC Hydro' rated lower at 69 percent, it had a higher proportion rating it as excellent (23%).
- **Program Information** – Both 'information about the program on the website' and 'information about program via direct mail/email' had a large proportion of respondents answering 'don't know' to these questions (25% and 43%, respectively), presumably because they had not looked for program information on the website or did not recall receiving any direct mail/email about the program. Among those providing a rating, information on the website was rated favourably at 76 percent, while directly mail/email, which was not relied on heavily by the program, was rated lower at 57 percent.
- **Program Offer** –The 'variety of products funded under the program' and 'level of incentives offered' were rated moderately at 68 percent and 60, respectively.
- **Application Process** – The 'overall application procedures to receive funding' was also rated moderately with 62 percent rating it as either excellent or good.
- **Length of Time** – Aspects related to length of time were among the lowest rated of all aspects, with 'length of time to receive project approval' at 64 percent, 'length of time for project/process to be completed' at 53 percent, and 'length of time to receive incentive' receiving the lowest score of all aspects at 40 percent.
- **Lighting design** – Two new questions about lighting design projects were added to the survey in F2016. Although sample sizes for these questions are small and the results should be interpreted with caution, directionally, the results suggest that 'ease of online registration for Energy Efficient Lighting Design projects' was rated more favourably than the 'lighting calculator's ease of use' (based on feedback they had received from their consultant/lighting designer).

Figure 3.2. Ratings of Program Experience



Note: 'Don't know' responses are excluded and range from 3% to 43%. ^New questions added in F2015 and F2016. ~Wording updated to include 'email' in F2016. **Small sample size.

Influence of CNC on Energy Efficiency Decisions. The influence of the CNC program on participant decisions around energy efficiency can be gleaned from various questions in the participant survey. A direct question asking about program influence on the decision to implement the specific energy efficient measures funded by the program was used in the decision tree for calculating free ridership. For this question, a total of 80 percent of participants indicated that CNC was very (33%) or somewhat (47%) influential on the decision to implement the energy efficient measures at this site (n=51).

To understand changes in customer awareness of energy conservation measures and opportunities, participants were asked about their organization's prior experience with the energy-efficient measure or technology that was installed though the program. While 10 percent had a great deal of experience and 39 percent had a fair amount of experience, similar amounts had only a little (37%) or no experience at all (12%) with the energy-efficient measure (n=51).

Looking more broadly at conservation motivators, 60 percent of participants indicated that the CNC program was a 'major factor' in the organization's effort to manage electricity use over the past year (n=10)[10]. In terms of barriers to managing electricity use, lack of funds for energy efficient retrofits/projects was noted as a 'major barrier' by 33 percent of participants, followed by there being other operational priorities (29%) and lack of financial incentives for conservation programs and energy efficiency (26%) (n=22).

See Appendix D for additional findings from the survey research.

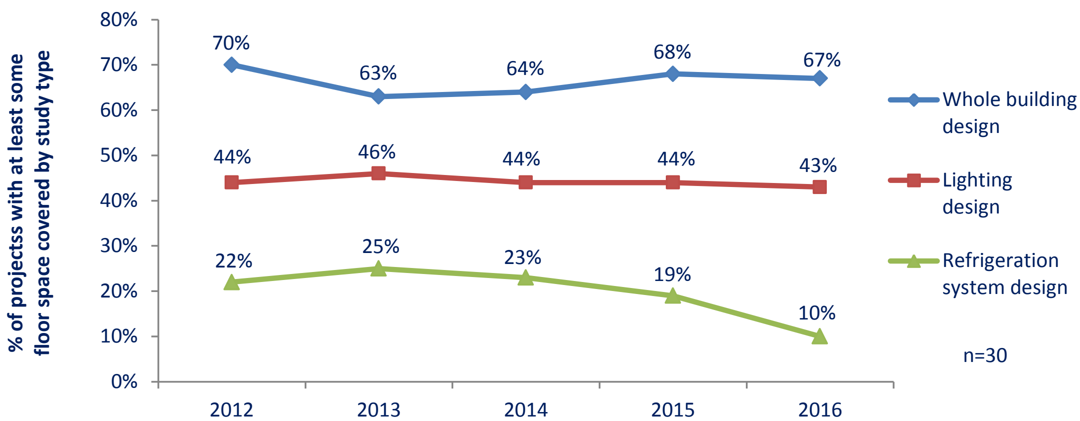
[10] The small sample size is due to a change in the response scale for this question during the evaluation period (from a 5-point influence scale to a 3-point major/minor scale) and due to the motivators/barriers question not being asked each wave due to survey length.

Practices and Opinions Related to Market Transformation

This section assesses the extent and the ways through which the new construction market is performing better than the B.C. Building Code.

With regards to buildings that did not participate in the CNC program, but that market actors reported were performing better than the energy efficiency requirements of the B.C. Building Code , the most common type of design study conducted to help these buildings perform better than code was whole building design, with on average approximately two-thirds of respondents confirming that at least some floor area of their 'better than code, non-participating projects' had come through this study type. This was followed by lighting design studies, with about 44 percent of respondents, on average, confirming at least some floor area had come through this study type. It comes expectedly that refrigeration system design studies were the least common given that not all construction projects would have had this end use.

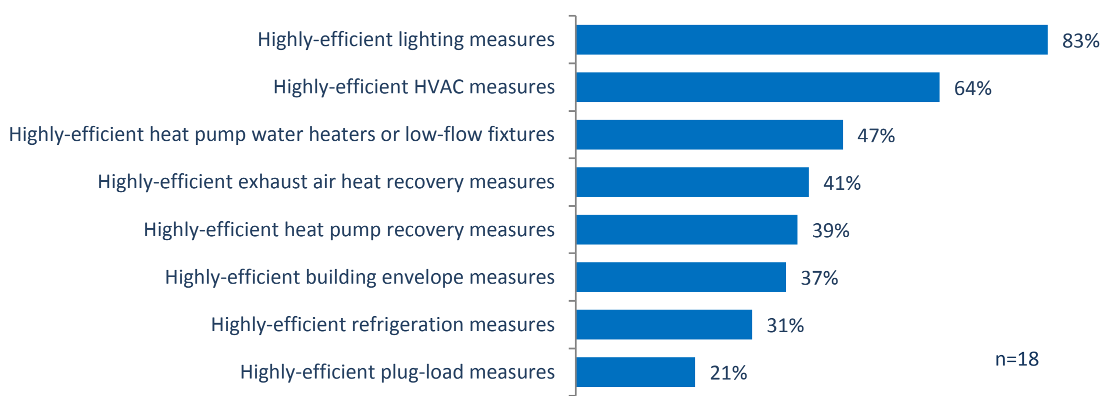
Figure 3.3. Most Common Types of Design Studies (percent of respondents with 'better than code, non-participating projects' that had at least some floor area receive the study type)



Note: because some respondents answered 'don't know' to these questions, results shown are for confirmed studies, and values thus could measure higher.

Again, with regards to buildings that did not participate in the CNC program but that were performing better than code, by far the most common measure being implemented to help make these buildings perform better than code was highly efficient lighting, with 83 percent of respondents reporting that the measure was at least sometimes implemented in their 'better than code, non-participating projects'. This was followed by HVAC measures at 64 percent; all remaining measures were below 50 percent.

Figure 3.4. Measures Implemented in 'Better than Code, Non-Participating Projects' (percent of respondents reporting that the measure was at least sometimes implement in their 'better than code', non-participating projects)



Market actors were asked how much they thought energy efficiency had improved in the entire commercial new construction market in B.C. over the past 10 to 15 years. All had thought that there had been some improvement – although not necessarily beyond code – with the majority (55%) reporting a 20 percent improvement in terms of energy use over time.

Table 3.4. Perceived Improvement in Energy Efficiency in Terms of Energy Use of Entire Commercial New Construction Market in B.C. Over Time (2012 – 2016 compared to 2005 – 2011)

	n=30
0% - no better	0%
1% - 9% better	5%
10% better	15%
20% better	55%
30% better	10%
40% better	10%
50% + better	4%
Don't know	3%

Market actors were also asked how much they thought projects completed by their own organization and by other organizations were performing relative to the energy efficiency requirements of the B.C. Building Code in terms of electricity savings. All thought that both their own buildings and those constructed by other firms were performing better than code, with organizations perceiving their own projects as performing better than those constructed by others. Savings were reported in the 1 percent to 30 percent range, with about half of respondents perceiving that their own buildings had 20 percent to 30 percent electricity savings relative to code, compared to only 36 percent feeling the same way about buildings constructed by others.

Table 3.5. Perceived Electricity Savings of Commercial New Construction Projects Relative to the Energy Efficiency Requirements in the B.C. Building Code (2012 to 2016)

n=23	Own Projects		All Other Projects in B.C.	
0% electricity savings (the projects would be performing to the energy efficiency requirements in the B.C. Building Code)	0%		0%	
1% - 9% electricity savings	18%		26%	
10% electricity savings	13%		13%	
20% electricity savings	35%	**48%**	27%	**36%**
30% electricity savings	13%		9%	
40% electricity savings	0%		0%	
50% + electricity savings	0%		0%	
Don't know	21%		24%	

Influence of the Program on the Adoption of Energy Efficiency Measures Beyond Building Code Requirements

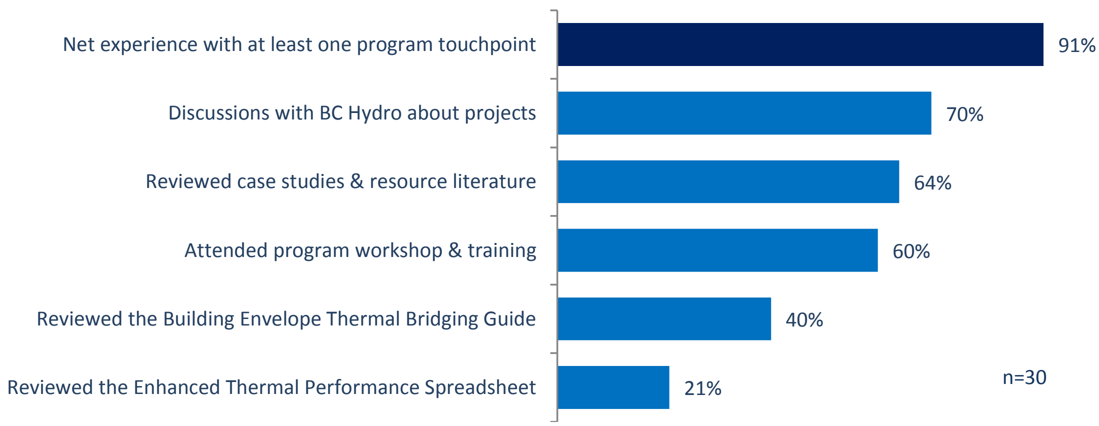
This section assesses the extent to which the CNC program has influenced building design practices and the new construction market beyond incented projects.

The CNC program developed tools to support the industry design and construct more energy efficient buildings (beyond code requirements), including:

- Workshops and training – sometimes in partnership with industry associations – in regards to new building construction;
- Case studies and resource literature in regards to new building construction posted on BC Hydro's website;
- The Building Envelope Thermal Bridging Guide[11] which BC Hydro sponsored and contributed to, and which details how the commercial new construction market can effectively account for the impact of thermal bridging as part of meeting the challenges of reducing energy use in buildings;
- The Enhanced Thermal Performance Spreadsheet[12], which BC Hydro provided technical support and funding for and which is included in BC Hydro's energy modelling guidelines; and
- Discussions with BC Hydro staff about projects aside from the interactions at workshops and other formal events.

A total of 91 percent of respondents had experience with at least one of the energy efficiency resources or touchpoints provided by the program. The most common were *discussions about projects with BC Hydro staff* (70%) and *reviewing case studies/resource literature* (64%). This was followed by 60 percent who had *attended a program workshop or training session* and 40 percent who had re*viewed the Building Envelope Thermal Guide*. The least commonly used resource was the *Enhanced Thermal Performance Spreadsheet*, with only 21 percent of respondents indicating they had reviewed it.

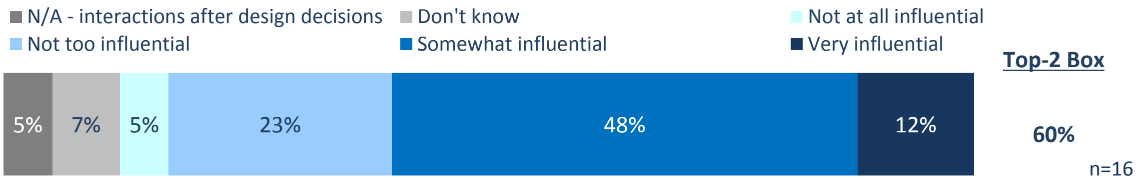
Figure 3.5. Experience with Program Resources (multiple response question)



[11] https://www.bchydro.com/content/dam/BCHydro/customer-portal/documents/power-smart/builders-developers/building-envelope-thermal-bridging-guide-1.1.pdf
[12] https://www.bchydro.com/content/dam/BCHydro/customer-portal/documents/power-smart/builders-developers/betbg-enhanced-spreadsheet.xlsm

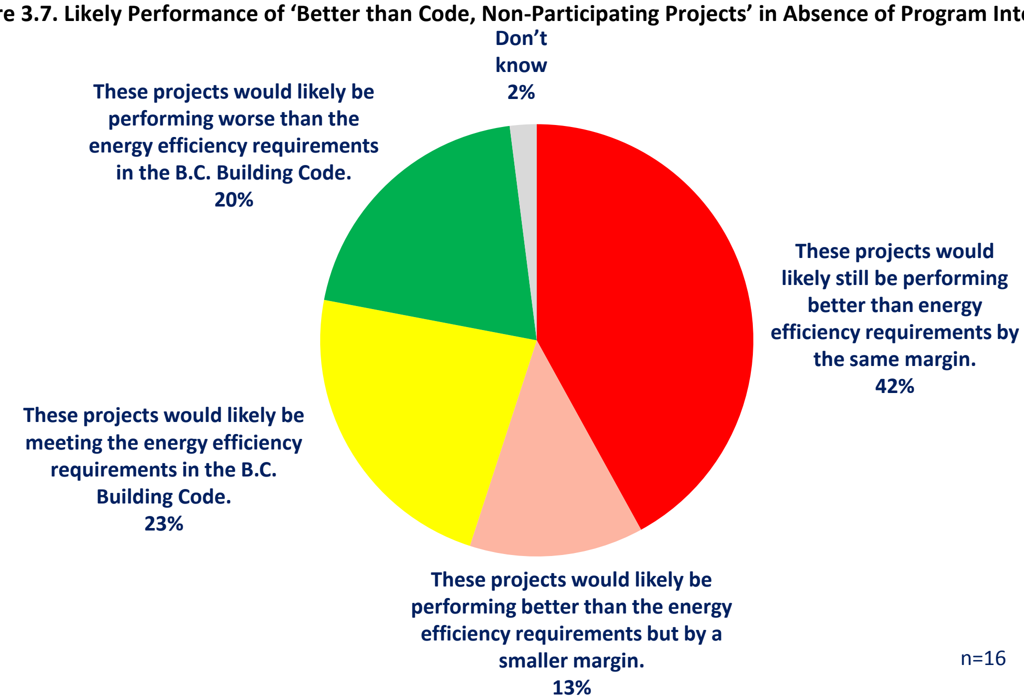
Market actors were asked to consider all of their various touchpoints with the program and the influence they had on their design decisions to have non-participating projects perform better than the building code. A total of 60 percent indicated that these program touchpoints were 'very' or 'somewhat' influential on their decisions to do so, while 28 percent indicated that the program had been 'not too influential' or 'not at all influential'. A further 7 percent did not know, while the remaining 5 percent indicated that the interaction(s) had occurred after the design decisions were made for these projects.

Figure 3.6. Influence of BC Hydro Program Interactions on Decisions to have Non-Participating Projects Perform Better than Requirements in the B.C. Building Code



Market actors were asked to think about influence from another perspective – the likely energy efficiency of their 'better than code, non-participating projects' had they not (nor any of their colleagues) had any interactions with BC Hydro's CNC program and its resources and touchpoints. While 42 percent of respondents indicated that these projects would likely still be performing better than building code energy efficiency requirements and by the same margin, a total of 56 percent indicated that these projects would likely be performing with lower energy efficiency had they not experienced these program touchpoints. This was comprised of 13 percent that felt their projects would still be performing better than the energy efficiency requirements in the B.C. Building Code but by a smaller margin, 23 percent that felt that their projects would have just met the requirements, and 20 percent that felt that their projects would likely be performing worse than the requirements. This is generally consistent with the 60 percent of respondents indicating the program had been somewhat or very influential in Figure 3.6 above.

Figure 3.7. Likely Performance of 'Better than Code, Non-Participating Projects' in Absence of Program Interactions



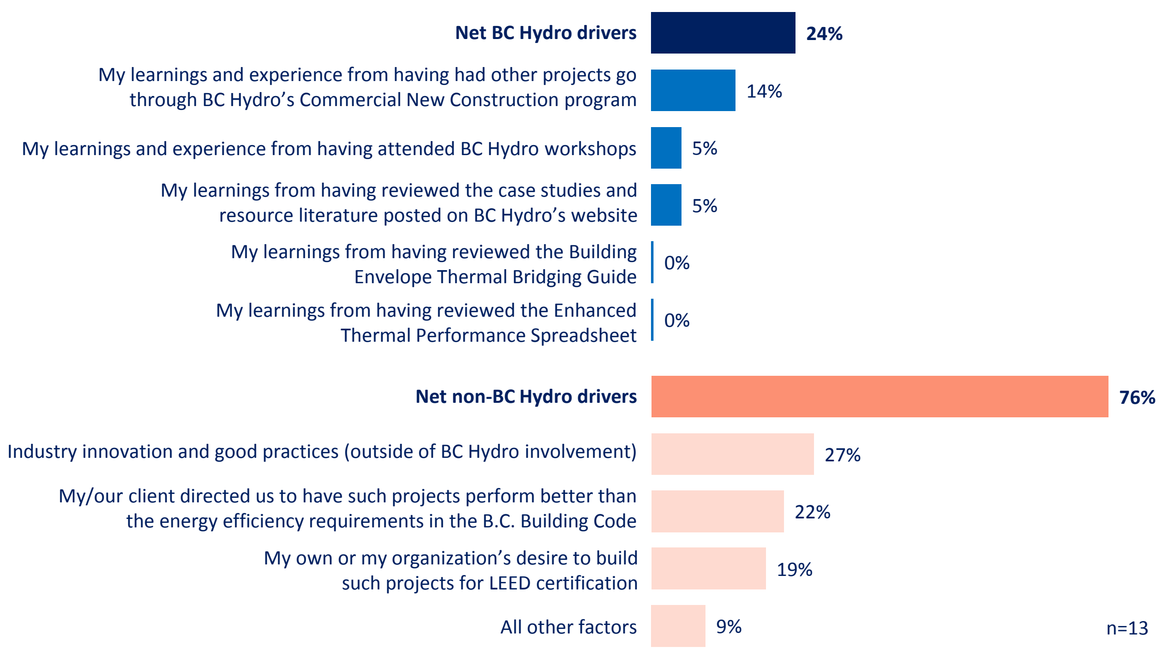
In order to understand program influence relative to other factors in the broader new construction context, market actors were asked to credit various factors for making non-program projects perform better than the B.C. Building Code, such that the factors summed to 100 percent.

Note that after excluding industry professionals who did not report any 'better than code, non-participating projects' during the evaluation period, as well as several more who were unable to provide estimates, a total of 13 respondents in the sample weighed in on this question.

On average, BC Hydro 'drivers' were given a net of 24 percent of the credit for making projects perform better than code. Specifically, previous learnings and experience with the CNC program was given the highest credit at 14 percent, followed by learnings from workshops at 5 percent and learnings from case studies/resources on the website, also at 5 percent. None explicitly gave credit to the Building Envelope Thermal Bridging Guide or to the Enhanced Thermal Performance Spreadsheet despite some respondents reporting having reviewed these resources; however, this may be due to these resources becoming available late in the evaluation period.

It follows that non-BC Hydro drivers were given 76 percent of the credit for buildings performing better than code, with the highest credit given to general industry innovation and good practices (27%) and clients directing the projects to be built as such (22%). There is a possibility that some of these non-BC Hydro factors were – to some extent – influenced by market effects ultimately tied to the Commercial New Construction Program. Should this in fact be the case, the estimate of attribution back to the program could be a conservative one as could be the overall estimate of spillover savings.

Figure 3.8. Drivers for Making Non-Participating Projects Perform Better than the Requirements in the B.C. Building Code



Another approach to assessing program influence was to query market actors on how much of the improvement in the energy use of the entire commercial new construction market in the B.C. (participant and non-participant buildings) over time could be attributed to BC Hydro's Commercial New Construction program. About half (49%) felt it was in the 20 to 30 percent range, with the most common answer at 20 percent. These results are generally consistent with findings from Figure 3.7 above on drivers where 24 percent of credit was given to BC Hydro for savings beyond code.

Table 3.6. Attribution of Savings of the Entire B.C. Commercial New Construction Market to BC Hydro's Commercial New Construction Program – For All Buildings Occupied in 2012-2016 Compared to Those Occupied in 2005 to 2011

	n=25
0% of the improved energy use in the province is attributable to BC Hydro's program	0%
1% - 9%	18%
10%	10%
20%	41%
30%	8%
40%	3%
50% + of the improved energy use in the province is attributable to BC Hydro's program	3%
Don't know	18%

Gross Electrical Energy and Peak Demand Savings

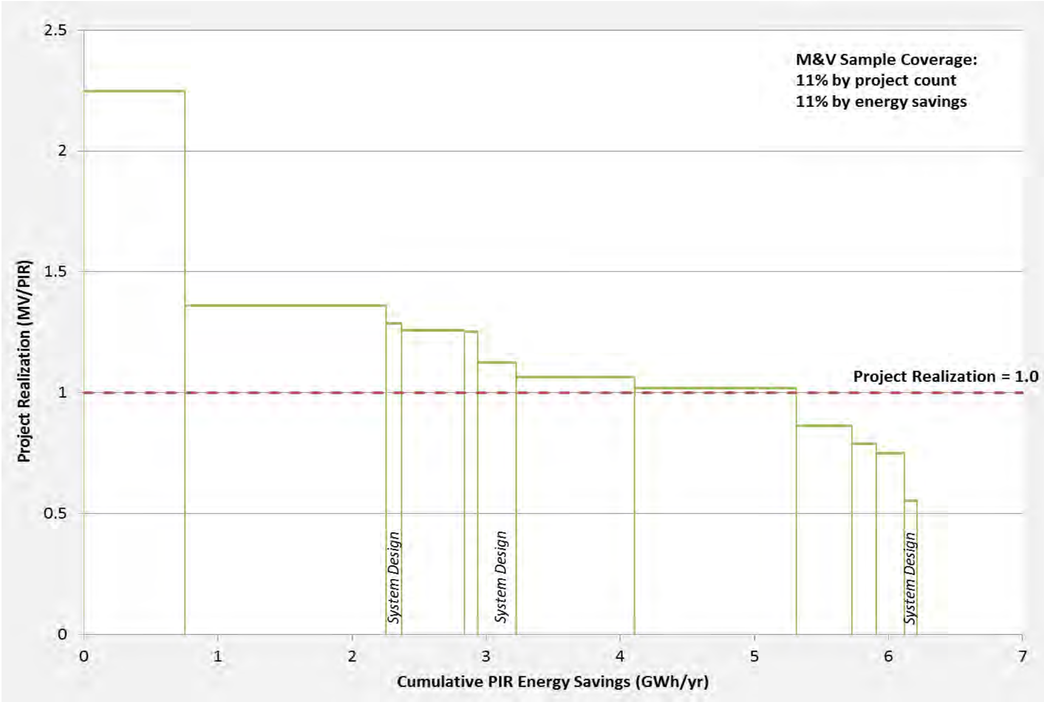
Gross electricity savings are the change in energy consumption that results directly from the program related actions taken by participants in CNC. As detailed in Section 2.3, the evaluated gross energy savings were determined through four steps (and three components of realization rate) for each of the four program offers. The four steps described were expected, inspected, verified and evaluated savings. The general approach for each step and program offer was to use a sample of projects and extrapolate to the remaining projects in the population.

Overall CNC projects involved lighting with 52 percent of the expected savings, HVAC with 37 percent, and the remaining savings distributed among building envelope improvements (5%), hot water and low-flow fixtures (2%), and refrigeration (4%) measures. The twelve projects with M&V results covered whole building design and system design projects with inclusion of interactive effects but without insight into individual measure performance by end use. Therefore, gross realization rates were evaluated by program offer.

The figure below shows the distribution of the twelve projects with M&V. Nine projects were from the Whole Building Design offer and three projects were from the System Design program offer. First, the project realizations were sorted in descending order to graphically illustrate their range and distribution. Each column in the graphs represents a single project, with the height of the column representing the project realization and the width of the column representing the project's inspected energy savings. A project realization of 1.0 indicates that the verified savings were equal to the inspected savings. The results are graphically divided into those with measure realizations above 1.0 (over performing) and below 1.0 (under performing).

The whole building design project with the highest realization rate was found to consume twice the electricity as the original model because of increased internal loads and extended hours of operation. This presented a greater opportunity for the efficient as-built HVAC systems to realize energy savings over the baseline.

Figure 3.9. M&V Results by Project Realization and Savings Size



Evaluated gross savings were analyzed to understand the breakdown by program offer between the components of realization rate. The table below summarizes the results of the components of realization rate and the overall gross realization rate by program offer. This analysis revealed that the component of realization rate for the inspected savings was between 0.89 and 0.99, whereas the component of realization rate for the verified savings was between 0.98 and 1.18. Cross effects were assumed to be embedded in the M&V results for whole building design and system design projects. An additional adjustment for cross effects was necessary for the lighting design offer and estimated at 5 percent cross effect based on the BC Hydro Standard for Cross Effects and found similar to a recent LEM-C evaluation. Of the four program offers, the whole building design offer achieved the highest gross realization rate (1.17), while the program enabled offer and the lighting design offer had the lowest realization rate (0.89).

Table 3.7. Components of Gross Realization Rate by Program Offer

Program Offer	Step 1 Expected Savings (GWh/yr)	Step 2 Factor Inspected (PIR/IR) [A]	Step 3 Factor Verified (MV/PIR) [B]	Step 4 Factor Cross Effects (CE) [C]	Gross Realization Rate [A]x[B]x[C]	Step 4 Evaluated Gross Savings (GWh/yr)
Whole Building Design	**53.4**	0.991 Calculated	1.181 Ratio Estimation	Included in M&V	**1.17**	**62.4**
Lighting Design	**29.2**	0.948 Ratio estimation	0.984 Assumed*	1-0.05 Estimated	**0.89**	**25.9**
System Design	**2.9**	0.948 Calculated	1.096 Ratio Estimation	Included in M&V	**1.04**	**3.0**
Program Enabled	**1.8**	0.887 Calculated	Not evaluated	Not evaluated	**0.89**	**1.6**
Overall CNC (F12-F16)	**87.3**	**0.973**	**1.111**	**0.014**	**1.06**	**92.9**

* Assumed from BC Hydro LEM-Commercial Impact Evaluation F2013-F2017

The following table provides the expected and evaluated gross energy and peak demand savings by fiscal year. Electricity savings are presented as incremental savings achieved within each fiscal year and expressed as an annual rate of savings (also known as run rate savings).

Table 3.8. Expected and Evaluated Gross Energy and Demand Savings All Participants (F2012-F2016)

Period	Number of Projects	Number of Measures	Expected Gross Energy Savings (GWh/yr)	Calculated Realization Rate	Evaluated Gross Energy Savings (GWh/yr)	Evaluated Gross Peak Demand Savings (MW)
F2012	47	134	9.2	1.00	9.2	1.3
F2013	60	226	18.3	1.08	19.9	2.8
F2014	58	186	23.8	1.03	24.4	3.5
F2015	67	272	17.7	1.06	18.8	2.7
F2016	52	207	18.3	1.13	20.6	3.0
CNC (F12-F16)	**284**	**1,025**	**87.3**	**1.06**	**92.9**	**13.3**

As noted above, the overall gross realization rate of the program was 1.06. This realization rate estimate is statistically valid across all projects over the five years evaluated. In order to report evaluated savings by year, as required for business purposes, annual realization rates were also calculated. These annual estimates reflect information on the types of projects reported each year, and their evaluated performance. The annual estimates do not have the statistical validity of the overall estimate, and should be treated as informative rather than conclusive. The use of annual realization rate estimates introduces some uncertainty to the annual evaluated gross savings result. An alternative approach would have been to apply the overall realization rate of 1.06 to each year evaluated. However, this approach was not taken because it would mask the year-over-year variations in participation by program offer.

Net Electrical Energy and Peak Demand Savings

Net electricity savings are the change in energy consumption attributable to the program. Net savings exclude free riders and include spillover.

Free ridership provides an estimate of the proportion of savings that were reported by the CNC program but are not attributable to it. Free ridership in this context may also be referred to as natural conservation due to market forces beyond the influence of BC Hydro.

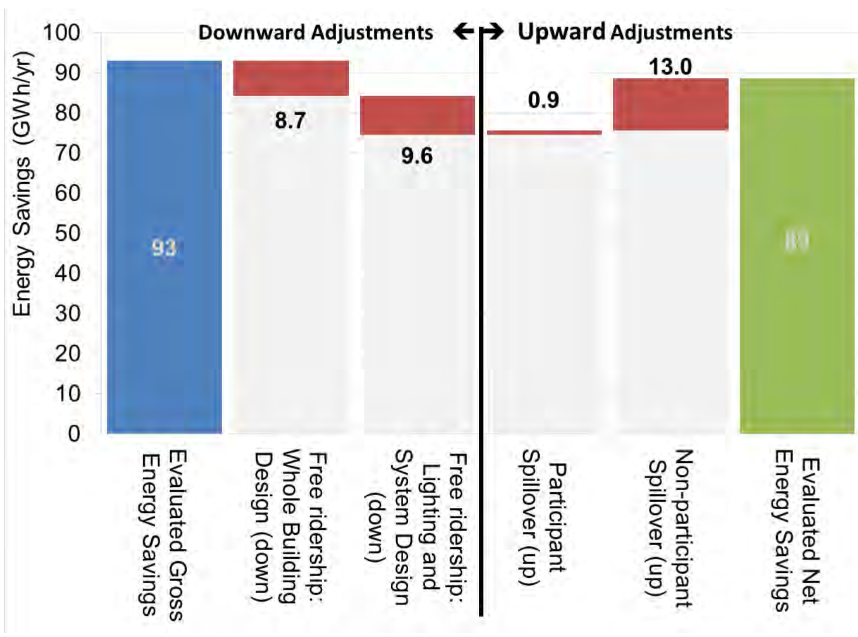
The overall level of free ridership is estimated at 20 percent for the program. Free ridership was estimated at 14 percent for whole building design and 32 percent for lighting and system design projects. Participant spillover was estimated at 1 percent and non-participant spillover was estimated at 14 percent, for a total of 15 percent. Together they result in a net-to-gross ratio of 95 percent.

Table 3.9. Free Ridership, Spillover, and Net-to-Gross Ratio

	CNC
Evaluated Gross Energy Savings (GWh/yr)	93 GWh/yr
Free Ridership (FR)	20%
Spillover (SO)	15%
Participant Spillover	*1%*
Non-Participant Spillover	*14%*
Net-to-Gross Ratio (1 – FR + SO)	**95%**
Evaluated Net Energy Savings (GWh/yr)	89 GWh/yr

The figure below illustrates both the overall effect of downward and upward adjustments to the evaluated gross energy savings from free ridership, and spillover.

Figure 3.10 Net-to-Gross Adjustments to Evaluated Gross Energy Savings



Evaluated net energy savings in each fiscal year were calculated using the evaluated gross energy savings of each project multiplied by the net-to-gross ratio of its program offer. Electricity savings are presented as incremental savings achieved within each fiscal year and expressed as an annual rate of savings. Peak demand savings were calculated using the same peak-to-energy factor as for gross demand savings. The yearly net-to-gross ratio varied slightly due to changes in the mix of projects by program offer and their respective level of energy savings. These results are summarized in the following table.

Table 3.10. Evaluated Gross and Net Energy and Peak Demand Savings

Year	Evaluated Gross Energy Savings (GWh/yr)	Evaluated Gross Peak Demand Savings (MW)	Calculated Net-to-Gross Ratio	Evaluated Net Energy Savings (GWh/yr)	Evaluated Net Peak Demand Savings (MW)
F2012	9.2	1.3	0.91	8.4	1.2
F2013	19.9	2.8	0.96	19.2	2.8
F2014	24.4	3.5	0.93	22.7	3.2
F2015	18.8	2.7	0.95	17.9	2.6
F2016	20.6	3.0	0.99	20.4	2.9
CNC (F12-F16)	**92.9**	**13.3**	**0.95**	**88.6**	**12.7**

Reported and evaluated net energy and peak demand savings for CNC are shown below. Reported savings included the results of post-implementation review and tag-on savings, where available, and were adjusted by a forecast net-to-gross ratio of 0.85. Evaluated net energy savings provide an estimate of evaluated savings that are attributable to CNC. Electricity savings are presented as incremental savings achieved within each fiscal year and expressed as an annual rate of savings (also known as run rate savings). Overall, the program achieved 121 percent of reported savings during fiscal years F2012 to F2016, showing the program performed better than reported. The variance between reported and evaluated net savings is primarily due to the impact of non-participant spillover which was estimated in the evaluation.

Table.3.11. Summary of Net Energy and Peak Demand Savings

Fiscal Year	Net Energy Savings (GWh/yr)		Net Peak Demand Savings (MW)	
	Reported	Evaluated	Reported	Evaluated
F2012	8.1	8.4	1.1	1.2
F2013	15.3	19.2	2.2	2.8
F2014	20.7	22.7	3.0	3.2
F2015	14.0	17.9	2.0	2.6
F2016	15.3	20.4	2.2	2.9
CNC (F12-F16)	**73.4**	**88.6**	**10.5**	**12.7**

Confidence and Precision

Relative precision indicates how much random error exists in an estimate derived through sampling, with lower values aligning with better precision. In impact evaluations of DSM programs and initiatives, BC Hydro targets relative precision of 20 percent or better at a confidence level of 80 percent or better.[13] For small samples, the sample to population size is weighted. If the minimum levels are not achieved, the results are considered to be inconclusive.

In the case of realization rates, relative precision provides a measure of how well the realization rate sample represents the population by savings size. As shown below, the relative precision of the three components of realization rates by program offer is 4 to 15 percent at a 90 percent confidence level, which exceeds BC Hydro's minimum target.

[13] Standard for Impact Evaluation, BC Hydro Power Smart, Conservation and Energy Management , February 2016.

Table 3.12. Confidence and Relative Precision of Gross Realization Rates

Statistical Parameter	Result for Inspected Savings in Lighting Design	Result for Verified Savings in Whole Building Design	Result for Verified Savings in System Design
Gross Realization Rate	0.95	1.18	1.10
Standard Error	0.022	0.011	0.070
Error Bound	0.036	0.182	0.116
Error Ratio	0.282	0.282	0.111
Confidence Level	90%	90%	90%
Relative Precision	**0.038**	**0.154**	**0.106**

See Table 2.3 in the methodology section for the margin of error for participant survey results.

Limitations

Limitations of the work are presented below.

1. The participant survey results for F2012 to F2014 have the potential for recall bias because the surveys were administered up to two years after the decisions that the survey queried. The magnitude and direction of any recall bias is unknown. Since F2015, the participant survey has been conducted every 6 months, mitigating the possibility for recall bias.
2. M&V coverage of whole building design and system design offers was representative by project savings size, and exceeded the target confidence and precision levels. However, the M&V coverage for lighting design projects was zero. The realization rate was assumed to be similar to the one found in the most recent evaluation of lighting projects in the BC Hydro commercial retrofit program, which introduced an unknown level of uncertainty to the evaluated gross savings.
3. Some components of the gross realization rate such as the estimation of M&V and cross effects of program enabled projects were not evaluated and add uncertainty to the results. However, the limited number of program enabled projects and the small relative magnitude of associated energy savings, compared to other program offers, limits the impact on the overall evaluated program results and did not justify further refinement of the energy savings evaluation for this program offer.
4. Demand savings could not be estimated with available data sources because project demand savings are often not reported in the program tracking data. The use of an average peak-to-energy factor based on the commercial rate class load shape for new construction sites adds uncertainty to the estimates of peak demand savings, because it relies on the assumption that the program's energy savings have the same shape as the associated load shape.
5. Due to the high cost of M&V and the lack of willing participants allowing their buildings for additional data collection and to be modelled, the evaluation lacked a representative number of M&V results which introduces uncertainty in the component of gross realization rate that it may not be representative of the population.

4.0 Findings and Recommendations

Findings and recommendations are presented below.

Findings

Participant Experience

1. Overall satisfaction was high for CNC at 80 percent, comprised of 41 percent stating they were very satisfied and 39 percent stating they were somewhat satisfied.

2. In terms of program experience, the highest scores related to aspects around service/communications from BC Hydro, as well as service provided by contractors. Mid-range scores typically related to aspects around the program offer (variety of products and level of incentives) and the overall application procedures. The lowest scores were for length of time to receive the incentive, length of time for the project to be completed and direct mail about the program.

3. Participants reported that the program had been influential on their decision to implement the energy-efficient measures, with 33 percent indicating that it had been very influential and 47 percent indicating it had been somewhat influential.

Market Transformation

4. The most common types of design study conducted to help new construction projects perform better than code were whole building design and lighting design. The most common measures implemented to help projects perform better than code were lighting and HVAC.

5. All market actors thought that there had been some improvement in the entire commercial new construction market in B.C. over the past 10 to 15 years – although not necessarily beyond code – with the majority reporting a 20 percent improvement.

Influence on Adoption of Energy Efficiency Measures Beyond Building Code Requirements

6. On average, BC Hydro 'drivers' were given a net of 24 percent of the credit for making projects perform better than code, with the largest credit given to previous learnings and experience with the CNC program. The remaining 76 percent of credit was given to non-BC Hydro drivers, with the largest given to general industry innovation/good practices and to clients directing the projects to be built as such.

Gross Electrical Energy Savings

7. The evaluated gross energy savings were 93 GWh/yr.

8. The program gross realization rate calculated using the inspected and verified results including cross effects was 1.06, indicating that the energy conservation measures largely performed better than expected. The realization rates by program offer were 1.17, 1.04, 0.89 and 0.89 for whole building design, system design, lighting design and program enabled projects, respectively.

9. Expected energy savings averaged 18 percent of site energy consumption across all participants during the five-year evaluation period.

Net Electrical Energy Savings

10. The evaluated net energy savings were 89 GWh/yr.

11. The net-to-gross ratio was 95 percent based on free ridership of 20 percent, participant spillover of 1 percent and non-participant spillover of 14 percent.

12. Evaluated net savings during the evaluation period from F2012 to F2016 averaged 121 percent of reported savings.

Recommendations

The following two recommendations are for future new construction initiatives:

1. Support and enabling activities for whole building energy modelling and integrated system approach to estimate a project's energy savings should continue and include the Building Envelope Thermal Bridging Guide and the Enhanced Thermal Performance Spreadsheet.

2. Future Market Actor surveys could be done more frequently so that respondents are better able to recall the projects they are being surveyed about.

5.0 Conclusions

BC Hydro's Commercial New Construction Program achieved high participant satisfaction. Evaluated net savings were 89 GWh/yr, which is 121 percent of reported savings. Evidence suggests that the program has supported the market in complying with and exceeding the energy efficiency requirements of the B.C. Building Code.

Evaluation Oversight Committee Sign-Off

BC Hydro's Evaluation Oversight Committee is made up of stakeholders from various parts of the company and is mandated to ensure that BC Hydro's evaluations are objective, unbiased and of sufficient quality.

The Evaluation of the [Report name here including fiscal] meets the following criteria for approval by the Evaluation Oversight Committee:

- The evaluation complied with the defined scope.
- The evaluation methodology is appropriate given the available resources at the time of the evaluation.
- The evaluation results are reasonable given the available data and resources at the time of the evaluation.

Abbreviations and Glossary

Baseline:	A baseline is the initial condition occurring when a DSM activity begins. It may be a market share for equipment, a current standard (e.g., building code), or a current average behavior.
Cross Effects:	Cross effects (also known as interactive effects) refer to the effect that some energy conservation measures (ECMs) have on other electricity end uses beyond what the ECM itself produces. An obvious example is building lighting. As more efficient lighting is installed, less heat is generated by the lighting system. This means that less heat must be removed from the building by the air conditioning system during the cooling season, but more heat needs to be supplied by the heating system during the heating season.
Demand Side Management (DSM):	"a rate, measure, action or program undertaken; (a) to conserve energy or promote energy efficiency, (b) to reduce the energy demand a public utility must serve, or (c) to shift the use of energy to periods of lower demand, but does not include (d) a rate, measure, action or program the main purpose of which is to encourage a switch from the use of one kind of energy to another such that the switch would increase greenhouse gas emissions in British Columbia, or (e) any rate, measure, action or program prescribed". (*Clean Energy Act, s. 1*)
Expected Savings:	Estimate of gross energy savings based on the initial engineering estimates. These estimates represent the unverified savings.
Evaluated Savings:	Savings estimates reported after the energy efficiency activities have been implemented and an impact evaluation has been completed.
Free ridership:	Energy use of a program participant or ratepayer under a conservation rate who would have implemented the program conservation measure or practice in the absence of the program or rate.
Gigawatt Hour (GWh):	One billion watt-hours; one million kilowatt-hours.
Gross Savings:	The change in energy consumption and/or demand that results directly from program-related action taken by the participants in the demand side management program irrespective of why they participated.
Market Transformation:	Market Transformation refers to a permanent change in the structure or functioning of markets, including more energy efficient behaviour among customers and higher market penetration of energy-efficient products, as a result of demand-side management (DSM) programs that reduce barriers to energy efficiency. These market changes are likely to persist in the absence of continued program activity. The reference case is used to establish the level of market transformation over time.
Natural Conservation:	Natural conservation refers to those efficiency improvements that would occur in the absence of any DSM activity. This may be due to equipment efficiencies, behaviors, changes to codes and standards or simply reactions to general rate increases.
Net savings:	The change in energy consumption and/or demand that is attributable to the utility demand side management program. The change in consumption or demand may include the effects of free riders and spillover.

Net-to-Gross Ratio: The combination of free rider and spillover estimates which are then applied to the gross savings to provide an estimate of attributable net savings for the program. Reflects program influence, does not reflect project performance in terms of energy savings estimated or measured.

Peak-to-Energy Factor: Relates to BC Hydro's system peak demand in MW, to annual energy consumption, in GWh based on the load shape of a given sector.

Realization Rate: The ratio of initial estimates of savings to savings adjusted for data errors and M&V results. Realization rate does not reflect program attribution or influence on the savings achieved.

Reported Savings: Estimate of energy savings being recorded in the program tracking database. Reported savings are based on best information available from technical review of the initial engineering estimate, post-implementation review of documentation and/or inspection, or measurement and verification results, as well as a forecast net-to-gross ratio.

Spillover: Refers to program participants and non-participants whose energy savings measures occur through actions that are not part of a program, but which were influenced by the program (also called free drivers or tag-ons). Participant spillover is the additional energy savings that occur when a program participant independently installs energy efficiency measures or applies energy savings practices after having participated in the efficiency program, as a result of the program's influence. Non-participant spillover refers to energy savings that occur when a program non-participant installs energy efficiency measures or applies energy savings practices as a result of a program's influence. Spillover may not be permanent and may not continue in the absence of continued program activity.

Appendix A Results Summary

The purpose of this appendix is to summarize key numerical results from the CNC program evaluation for the period of F2012 to F2016. The following table present the savings summary.

Table A.1. Summary of Net Energy and Peak Demand Savings

	Net Energy Savings (GWh/yr)		Net Peak Demand Savings (MW)	
Fiscal Year	**Reported**	**Evaluated**	**Reported**	**Evaluated**
F2012	8.1	8.4	1.1	1.2
F2013	15.3	19.2	2.2	2.8
F2014	20.7	22.7	3.0	3.2
F2015	14.0	17.9	2.0	2.6
F2016	15.3	20.4	2.2	2.9
CNC (F12-F16)	**73.4**	**88.6**	**10.5**	**12.7**

Table A.2. Key Results of the CNC Program Evaluation F2012-F2016

Estimate	Result
Realization rate (evaluated gross as % of expected savings)	106%
Cross effects (calculated as % of expected savings of Lighting Design offer) To the extent they occurred, cross effects are included in evaluated gross savings for Whole Building Design and System Design program offers.	5%
Net-to-gross ratio (calculated as % of evaluated gross; excluding cross effects)	95%
Free ridership (calculated as % of evaluated gross)	20%
Participant spillover (calculated as % of evaluated gross)	1%
Non-participant spillover (calculated as % of evaluated gross)	14%
Rebound (% of evaluated gross)	Not required[1]
Peak-to-Energy Factor (MW/GWh)	0.143 MW/GWh
Weighted average persistence of program savings	15 years
Variance Factor (evaluated net as % of reported savings)	121%

Re: Evaluation of the Commercial New Construction (CNC) Program: F2012-F2016

Dear Madam or Sir:

This advisory memo summarizes the opinions of the evaluation advisor on the evaluation work performed by the BC Hydro evaluation team for the abovementioned program. It takes into consideration the comments and answers from and exchanges with the evaluation team, which were incorporated into the final version of the evaluation report.

Overall appreciation of the report:

- Excellent quality in general. The report is easy to read and flows well. It clearly demonstrates the important impact of the initiative on the market, as well as the high participant satisfaction and high realization rate achieved.
- The advisor commends the evaluation team for the openness and transparency during the whole review process. Exchanges with the BC Hydro team were excellent. They provided clear and precise answers to all questions and additional information whenever necessary.

1. What is your assessment of the quality of the research design? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluation results?
   - The quality of the research design is excellent and appropriate for a new construction program.
     - The program and how it operates to transform the market is well described;
     - The logic model clearly summarizes the program components, outputs, outcomes (short, intermediate and long-term objectives);
     - The evaluation objectives and research questions are clear.
2. What is your assessment of the quality of the input data? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluation results?

- The advisor notes the significant effort that went into determining the savings of nine sites using Option D (calibrated simulation) of the International Performance Monitoring and Verification Protocol (IPMVP). While the sample is relatively small, this approach is complex and time consuming, which justify limiting the number of sites with calibrated simulation.
- The projects without full measurement and verification (M&V) went through an initial review of the expected savings; then a significant share of participants went through an additional post-implementation review. This is an appropriate approach for this type of program.
- The advisor expressed some concern about the small number of market actors that were interviewed to determine non-participant spillover. However, the report clearly states the limitation associated with this low number of respondents. Moreover, the advisor recognizes that market actor interviews to determine market trends and non-participant probable courses of action are always a difficult endeavour.

3. What is your assessment of the quality of the analytical methods? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluation results?
   - The analytical method was good and appropriate for the type of evaluation conducted. The portion of participants evaluated through M&V are in line with international best practices for program evaluation. The lighting component of the program relies on initial and post-installation reviews and is acceptable since lighting is a less complex measure to evaluate.
   - The spillover calculations have some uncertainty due to the low number of respondents and a relatively complex questionnaire. The threat to validity and these limitations are well identified and discussed in the report.
4. How does the methodology compare to common industry practice for evaluations of similar initiatives?
   - The methodologies are in line with best evaluation practices. The report properly covers the review of literature for similar programs and identifies and applies recommendations from the Uniform Methods Project (UMP).
5. What are your suggestions for future evaluations of this DSM initiative?
   - The advisor is in agreement with the main recommendations for future evaluations included in the report by the BC evaluation team.
6. Do you have any other comments that you would like to make?
   - No, this evaluation effort is well done.

Re: Evaluation of the Commercial New Construction (CNC) Program: F2012-F2016

1. What is your assessment of the quality of the research design? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluation results?
    - The effort is appropriate to the research goals. Good description of both goals and CNC program. Good integration of a variety of information, both primary and secondary, to obtain a good understanding of changes in this varied customer segment and impact of BC Hydro's comprehensive mix of CNC offerings.

2. What is the assessment of the quality of the input data? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluation results?
    - Data is drawn from a comprehensive and appropriate mix of program tracking data, M&V of specific projects, secondary data, and surveys of participants and market actors. Limited number of survey responses at times could affect the validity of results depending on how representative these are of the broader population. Data for M&V of specific projects very good. Data used for free ridership and spillover/market effects limited and more uncertain.

3. What is your assessment of the quality of the analytical methods? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluated results?
    - Market actor surveys provide insights on market changes and impacts to building codes. Methods for estimating gross savings draw from specific projects M&V based on IPMVP and UMP. Free ridership and Spillover (participant and non-participant) use surveys similar to those used in other BC Hydro evaluations and by other jurisdictions. All these methods are sound as long as respondents are a good representation of the broader population.

4. How does the methodology compare to common industry practice for evaluations of similar initiatives?
    - Methods used align well with those used elsewhere to address the evaluation questions. BC Hydro's efforts to estimate non-participant spillover go beyond usual practice and provide a better understanding of the CNC offerings impact.

5. What are your suggestions for future evaluations of this DSM initiative?
    - The CNC program is being phased out by 2022 and no more evaluations are being considered. Lessons from this evaluation that provide useful insights to consider in other similar evaluations include: 1) Study more why non-participants are not engaging with the program; 2) Consider doing

some sensitivity analyses on savings estimates; 3) Conduct ongoing market actor and participant satisfaction surveys soon after participation; 4) Examine more deeply spillover (participant & non-participant) to improve our understanding of how to foster it and also reduce the uncertainty in its savings estimates.

6. Do you have any other comments that you would like to make?
   - Well written, easy to follow report for a quite complex mix of program offerings to a varied customer base, over a long time period. Appreciate the added language in the final report on threats to validity and uncertainty in the results.

Appendix C Approach Details

C.1. Additional Details on the Participant Survey

Surveys were used as the main source of information for evaluation objective 1 (customer experience) and as a key input for objective 5 (net savings). An online survey of program participants and non-participants was employed, with the following main steps listed below.

An online methodology was selected for this survey for a number of reasons: 1) email addresses were available for the full participant population; 2) the online format better allowed for presenting detailed information on projects completed under the program (e.g., service address, types of upgrades completed, etc.) compared to most other methodologies; 3) the length and complexity of the survey was better suited to a format where the respondent could take the time to make well-considered responses and/or obtain information from others involved in the project; and 4) an online methodology was more cost-effective to collect large sample sizes as compared to telephone surveys.

- Draft survey instruments were prepared, reviewed with program stakeholders and revised to include additional questions of interest.
- The participant sample was developed to include all available CNC program participants. The sample excluded any contacts who had been surveyed within the past six months for any other BC Hydro survey (as per BC Hydro policy on customer contacts). The invitation email included text that asked respondents to forward the survey link to an individual who, in that person's opinion, may have more knowledge about their organization's participation in the program.
- The surveys were programmed in an online format and tested for ease of use and proper functionality.
- The participant surveys were fielded in:
    - May 2013 (for projects completed in F2012)
    - July/August 2014 (for projects completed in F2013 to F2014)
    - November 2014 (for projects completed in the first half of F2015)
    - May 2015 (for projects completed in the second half of F2015)
    - November 2015 (for projects completed in the first half of F2016)
    - May 2016 (for projects completed in the second half of F2016)
- Participants received an honorarium of a $50 gift card for completion of their survey. Multiple reminders were sent to increase the response rate.
- Data were cleaned and cross tabulations were prepared for the evaluation period.

To ensure that survey respondents had the appropriate level of decision making authority for the purpose of this study, a number of questions were asked to determine key characteristics of the respondent and of their facility. The tables below provide customer responses about their title/position within the company as well as decision making responsibilities.

Table C.1. Position/Title of Respondent

Position or Title	CNC Participants (n=57)
Project Manager	34%
Developer	16%
General manager	9%
Business owner or co-owner	8%
Energy Manager – hired as part of BC Hydro's PSP/Energy Manager Program	7%
Executive	6%
Energy Manager - unspecified if BCH funded (response option from prior to 2013)	6%
Site or property manager/supervisor	4%
Energy Manager – NOT hired as part of BC Hydro's PSP/Energy Manager Program	3%
Accountant/Bookkeeper	1%
Finance manager	1%
Other	6%
Total	100%

Table C.2. Primary or Joint Decision Maker (% yes)

Responsible for decisions related to…	CNC Participants (n=57)
Energy management	59%
Investments in equipment costing less than $100,000	58%
Investments in equipment costing $100,000+	51%
Capital investments in retrofitting existing sites/facilities or building new sites/facilities	37%
The operation and maintenance of sites/facilities	36%
The maintenance of equipment	31%

C.2. Additional Details on the Market Actors Survey

For many of the same reasons given in regards to the participant survey, the Market Actors Survey was conducted online. In the same way, the Market Actors Survey was designed by Evaluation staff, and reviewed and revised based on stakeholder feedback. Subsequent to that, the survey was programmed in the online format and tested in a first round by internal staff for its desired functionality, and tested in a second round by five external industry contacts to ensure the questions were meaningful, well-understood and unambiguous.

As already explained earlier in this report, industry professionals for this survey were targeted and sourced via two methods. In the first method, survey invitations were directly emailed to approximately 300 industry professionals for which business contact information (i.e., email addresses) was known. In the second method, an invitation to participate in this research was indirectly made by embedding communications into various industry association e-newsletters and online bulletin boards. These associations included:

- International Building Performance Simulation Association;
- Illuminating Engineering Society of BC;
- ASHRAE BC: American Society of Heating, Refrigerating and Air conditioning Engineers; and
- Architectural Institute of British Columbia.

A total of 30 eligible professionals completed the survey. In doing so, they considered and responded to lines of questions about energy efficiency design and decision making in British Columbia's commercial new construction industry in its broadest context, and also in regards to their own projects in a much narrower context. In this regard, they were funneled through an iteration of questions and grids that converged to be specifically about any of their projects that were designed to perform better than the B.C. Building Code, but did not come through BC Hydro's program. As illustrated in the survey document, this approach was conducted for each of the five years – concurrently – 2012 through to 2016. Note that the sample size decreased to 13-15 through some of these questions due to the fact that not all 30 respondents had 'better than code, non-participating projects' in these particular years.

Based on the input of experts who advised on this evaluation, the data was statistically weighted by the role of the industry professional, reflecting the fact that certain professions – their design roles and decisions – have a greater influence than others in the extent that a project is to be energy efficient. Specifically, three groups of respondents – electrical engineers, mechanical engineers, and energy modelers – were each assigned a 30 percent weighting in their opinions on any given question. All other respondents with other occupational roles in the design and decision process were collectively assigned the 10 percent balance of weight.

Table C.3 below details the role of the industry professionals in the survey sample before statistical weighting.

Table C.3. Role of Industry Professional

	Industry Professionals (n=30)
I was often a key decision maker regarding the extent that projects would be energy efficient	40%
I typically was not a key decision maker, but did provide inputs, alternate options and/or my opinions into the decision making process	60%
I typically had little or no role in the decision making process	0%

Percents are unweighted data.

Table C.4 below details the occupational title or role of the industry professionals in the survey sample before statistical weighting.

Table C.4. Position/Title of Industry Professional

	Industry Professionals (n=30)
Mechanical engineer	53%
Electrical engineer	17%
Energy modeller	17%
Project management	17%
Architect	13%
Real estate	7%
Specifications writer	7%
Project developer/development	3%
Other	20%

Percents are unweighted data.
Other is comprised of the following: Building Code / Fire Engineers; Energy Advisor; Facility Management; Mechanical Designer; Set energy performance standards; Turnkey system provider.

C.3: Additional Details on the Free Rider and Spillover Analysis

Free Ridership

The algorithm used to assign free rider scores for the decision maker survey is shown in the free rider decision tree (see below). For each organization, a free rider score was assigned according to the organization's answers to the survey questions shown in the decision tree. Free rider scores vary between 0.0 and 1.0; where a score of 1.0 represents a full free rider, a score of 0.0 represents a full non-free rider, and a score between 0.0 and 1.0 represents a partial free rider. An example of a full free rider would be an incentive project where the organization indicated that it would have completed the project on its own, at the same efficiency level and scale, even without the assistance of the program, and it was not at all influenced by the program, nor required program assistance to have met any financial criteria. An example of a partial free rider would be an incentive project where an organization indicated that it would have completed it on its own but at a lower efficiency level. An example of a full non-free rider would be a project that would not have been completed at all without the assistance of the CNC program. Spillover was estimated using a similar approach.

There were seven self-report parameters used to inform the free rider algorithm. The rationale for the various pathways and deductions that are shown within the free rider decision tree are described below.

a. Action the organization would have taken if the program had not existed (Steps 1 to 5)

- If the organization indicated that it DID NOT KNOW whether it would have completed the project in absence of the program (Step 2), the final free rider score depended on the organization's answer to the 'influence' question (Step 3). The answers to the influence question range from 0.0 to 1.0 with increments of 0.25, and 'don't know' scoring 0.5. These scores help differentiate between responses and permit the assignment of free rider scores (e.g., 'very influential' was assigned a lower free rider score than a 'somewhat influential' response; 0.0 versus 0.25, respectively).
- If the organization indicated that it WOULD NOT HAVE completed the energy efficiency project in absence of the program, it was assigned a final free rider score of 0.0 (Step 4). Organizations were not queried further because 'not completing a project' represented the path of least resistance from a planning perspective. No attempt was made to further 'test' their intentions, nor were they asked about program influence (an assumption was made that they would have answered that the program had been 'very influential').
- If the organization indicated it WOULD have implemented the energy efficient measures, it was assigned an initial free rider score of 1.0 (Step 5). Deductions to this score were then applied to reflect prior plans, efficiency and scale of the project had they completed it on their own (Steps 6 to 13). The algorithm 'chips away' their stated intention and their initial free rider score of 1.0 by considering their responses to these additional questions.

b. Prior plans to install energy efficient measures/technologies before becoming aware of the program (Steps 6 to 8)

- If the organization WOULD have implemented the energy efficient measures and had plans to do so BEFORE becoming aware of the program, no deductions were made to the free rider score in this step (Step 7). This group was not asked the influence question as their plans had been made before any interaction with the program. As such, it was assumed the program would have been 'not at all influential' on their basic plans to carry out some sort of upgrades.
- If the organization WOULD have implemented the energy efficient measure, but had made plans only AFTER the idea was first suggested by a BC Hydro-funded energy consultant, a BC Hydro-funded

Energy Manager or a BC Hydro representative (Step 8), the organization was then asked how influential the program was on the decision to implement the measure.

c. Influence of the program on the decision to install energy efficient measures/technologies (Step 9)

- For those organizations that made plans AFTER suggestion from BC Hydro, influence was taken into account to reflect the possibility of a causal relationship between 2nd or 3rd party 'suggestion' and the decision to implement the energy efficient measures. The rationale for utilizing the 'influence' question at this stage of the algorithm was that a suggestion could take many different forms, ranging anywhere from a simple verbal suggestion during a meeting, to an energy study. Based on professional judgment, points were deducted from the free rider score to reflect the fact that we were no longer 100% sure that the organization would have installed the measure in absence of the program:0.5 for VERY INFLUENTIAL, 0.35 for SOMEWHAT INFLUENTIAL, 0.15 for NOT TOO INFLUENTIAL, 0 for NOT AT ALL INFLUENTIAL and 0.25 for don't know responses The assumption was that the program was at least partially influential on the organization's decision to do so.

d. Financial criteria around site investment (Step 10)

- For incentive projects, if an organization indicated that its energy efficiency project would NOT have met their organization's financial criteria for site investments without assistance from the program, then the free rider score was reduced by an additional 0.5. Although for-profit businesses rely heavily on the financial bottom line, a project can still proceed even if it does not meet an organization's financial criteria due to other non-financial factors such as anticipated change of regulations, safety, market prices, etc. This suggests that a project can still be a partial free rider even if it requires an incentive payment from the program to meet the organization's financial criteria. If the organization believed their financial criteria would have been met, the free rider score was not adjusted. If the organization did not know, the free rider score was reduced by 0.25.

e. Energy efficiency level of new measures/technologies in absence of the program (Step 11)

- If an organization indicated that the energy efficiency of the project would have been AS EFFICIENT or MORE EFFICIENT in absence of the program, no points were deducted.
- A deduction of 1.0 was made if the organization would have completed a LESS ENERGY EFFICIENT project in absence of the program. For CNC, baselines are determined through BC Hydro Conservation & Energy Management Engineering review. In cases where several different options are available to the customer that range in efficiency, Engineering calculates gross energy savings using a baseline of what the customer would have likely done without the influence of the program. In other words, only savings that go beyond common market practice (natural conservation) are claimed by the program. Therefore, a participant who reports that they would have done something less efficient in the absence of the program is a 0 percent free rider on this specific aspect of free ridership (i.e., a 1.0 deduction).
- A deduction of 0.5 was made if the organization DID NOT KNOW what level of energy efficiency the project would have had. This value was used to maintain the average deduction between those organizations which would have implemented a measure with the same or higher efficiency and those organizations which would have implemented a measure with less efficiency.

g. Percent of the project that would have been completed in absence of the program (Step 12)

- A final adjustment to the free rider score was made based on the percentage of the project that would have been completed if no assistance had been provided through the program, e.g., if 40 percent of the project would have been completed in absence of the program, the free rider score was multiplied by 0.4. 'Don't know' response did not receive any adjustments, i.e., they were multiplied by 1.

h. Timing

- Note that while timing of the project was explored in the survey, it was excluded from the algorithm due to the nature of CNC projects. Due to the high cost and long lifespan of the types of projects CNC pertains to, if a particular energy efficient technology is not installed as part of the initial construction, it is unlikely that it would be brought in to replace a less efficient technology in the short to medium term. It would not be financially feasible to replace a recently installed technology with a more energy efficient one – it is either included as part of initial construction or not replaced again until the long term.

- After applying all of the adjustments, an individual free rider score was calculated for each site that responded to the survey. These scores were then weighted by savings and averaged to calculate a grand mean free rider score.

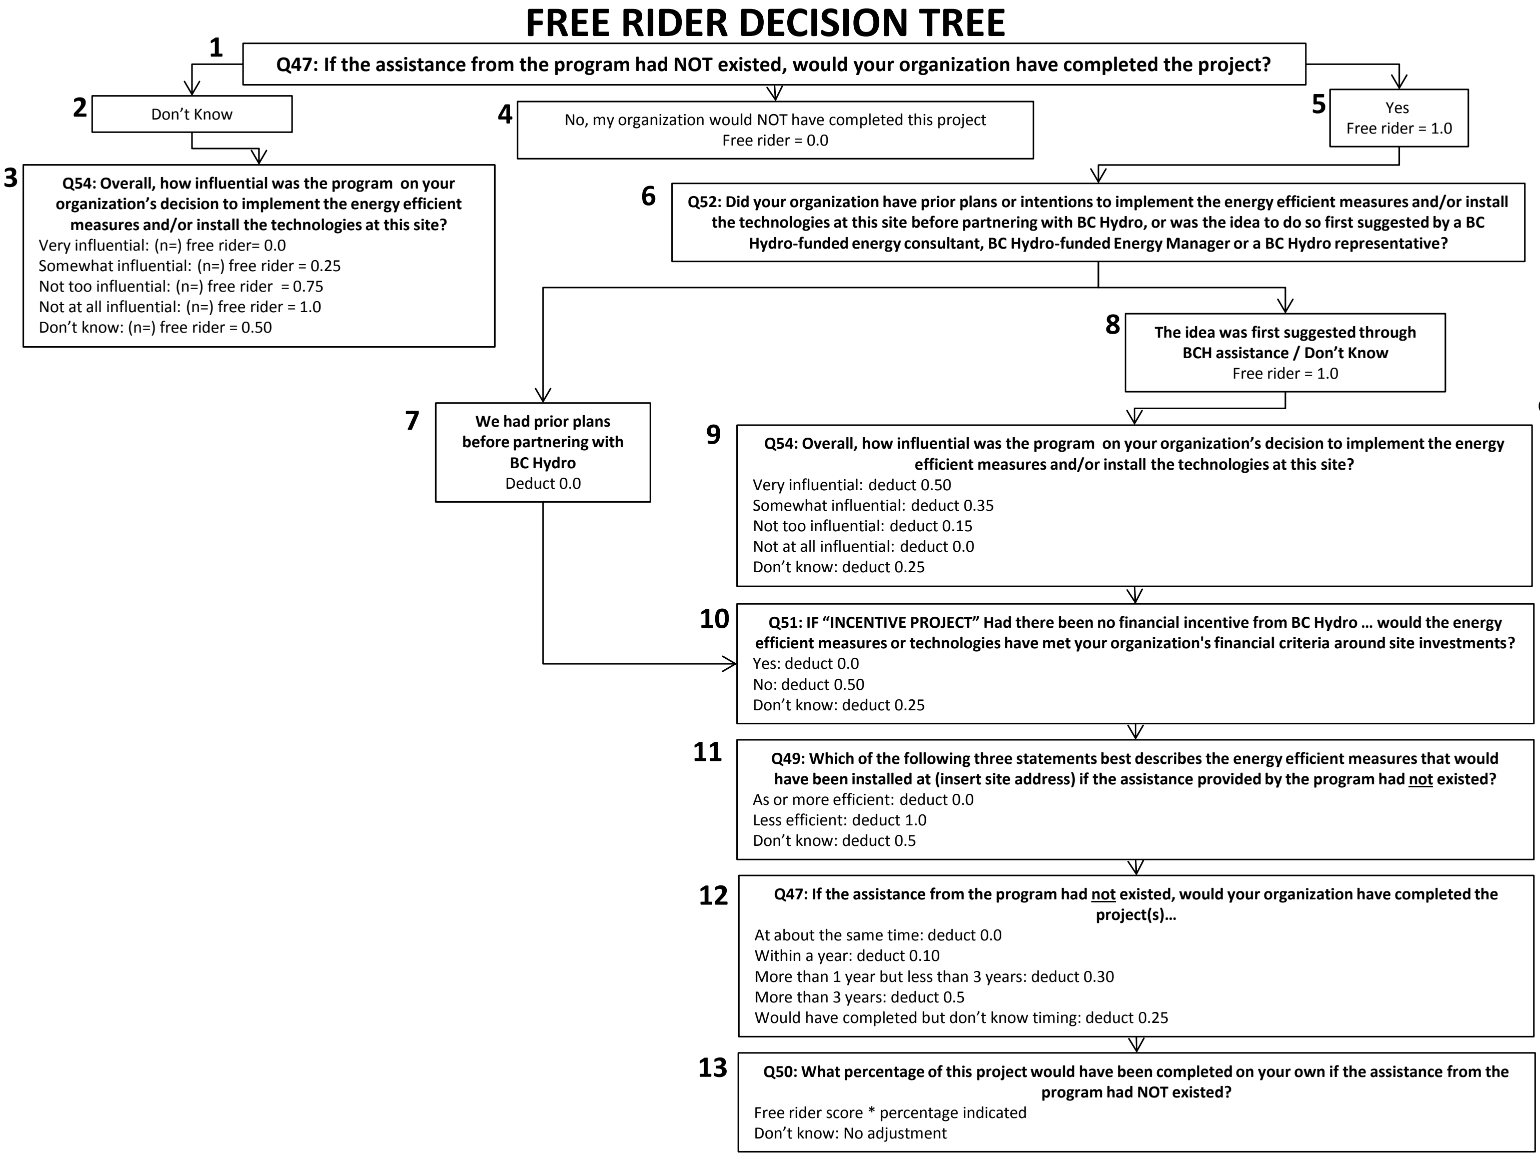

Figure C.1. Free Rider Decision Tree

Participant Spillover

The participant spillover decision tree logic is presented as Figure C.2. The rationale for the various pathways and additions on the spillover decision tree are described below. All organizations were initially assigned a spillover score of 0.0. Spillover points were then *added* – thereby crediting the program with additional savings – depending on responses a series of questions.

a. Additional energy efficient projects completed without assistance from CNC (Steps 1-4)

- Organizations that DID NOT KNOW whether any new energy efficiency projects were undertaken at a specified site were given a final spillover score of 0.0. This is because the program cannot claim additional savings for something that may or may not have been completed (Step 2).
- Organizations that indicated that NO additional energy efficiency projects had been undertaken were given a final spillover score of 0.0. A score of 0.0 indicated that no additional savings could be claimed by the program for this site and they were excluded from further analysis (Step 3).
- Organizations that indicated that additional energy efficiency projects HAD BEEN IMPLEMENTED without assistance from the program were asked to select the ones they installed from a list of common end-uses and technologies (e.g., lighting, cooling systems, heating systems, water heating, etc.). From this point forward, each end-use or technology that was upgraded was analyzed separately in order to assign a spillover score at a retrofit level.

b. Funding from other organizations (Steps 5 to 7)

- Projects that received assistance from a program offered by another organization were assigned a final spillover score of 0.0 (Step 6). While it was possible that the CNC program could have influenced these particular projects, these projects were removed from further analysis as it was not possible to reliably separate the level of influence from the different overlapping programs. This removal resulted in a more conservative spillover estimate.
- If no other funding was received, no credits were added, but the organization continued with additional questions.

c. Action the organization would have taken if the program had not existed (Steps 8 to 11)

- Energy-efficient retrofits or upgrades made without the assistance of another organization were then grouped using the ‘timing’ question. Those projects that would have NOT been completed at all if the organization had not participated in the program were giving a final spillover score of 1.0, fully crediting the program for the spillover savings associated with these projects.
- Those projects that would have gone ahead regardless of program participation continued with questioning regarding prior plans, influence, timing, efficiency and scale of the project. If the organization was unsure about whether the project would have been completed in absence of the program, it was also asked these additional questions – a more conservative approach – rather than being assigned any spillover additions at this point.

d. Prior plans and influence of the program on the decision to install additional energy efficient measures/ technologies (Steps 12 to 15)

- If an organization first had plans to implement the measure PRIOR to its participation in the program, it was not asked the influence question (Step 12). It was assumed that the influence would have been ‘not at all’ since their plans were in place before any interaction with the program.

- If the organization first made plans AFTER its participation in the program, it was asked how influential the program was on its decision to complete these additional projects. The spillover score at this step ranges from 0.0 to 1.0.

e. Timing of installing the additional energy efficiency measures/technologies in absence of the program (Step 16)

- If an organization would have completed the project AT THE SAME TIME or WITHIN A YEAR of when it was actually done, no credits were added to the spillover score. Also, no credits were added if the organization would have completed the project, but was unsure about the timing.
- For those organizations that would have completed the project, a credit of 0.1 was added for MORE THAN ONE YEAR BUT LESS THAN 3 YEARS and 0.3 was added for MORE THAN 3 YEARS. The higher credits for the projects originally planned further in the future reflects bringing those projects – and the associated savings – forward in time by a greater number of years. Similar to the free rider influence question, the credits are heuristics that help differentiate between responses and permit the assignment of spillover scores.

f. Energy efficiency level of the additional measures/technologies in absence of the program (Step 17)

- If the project would have been LESS ENERGY EFFICIENT had the organization not participated in the program, a credit of 0.5 was added to the spillover score.
- However, if the project would have been AS EFFICIENT or MORE EFFICIENT, no credits were added since the program interaction did not result in any additional savings beyond the organization's original plans. No credits were added for 'don't know' responses.

g. Amount or number of additional energy efficient measures/technologies that would have been completed in absence of the program (Step 18)

- If the organization originally intended to implement FEWER energy efficient measures prior to participating in/becoming aware of the program, the program was credited with the additional savings associated with the increased scale of the project through an addition of 0.25 points.
- If the SAME or MORE measures were originally planned, no credits were added to the spillover score.

In order to convert the spillover score into the same metric as the free rider score, a typical savings estimate was applied to each individual end-use that was upgraded, and then those savings were adjusted by the organization's final spillover score for that particular end-use. The adjusted spillover savings for each individual end-use for each organization were summed and then used to calculate an average spillover savings per site (including those sites that reported no spillover activity). This average was then used to extrapolate spillover savings to the entire participant population. Finally, the total spillover savings were expressed as a percentage of the total evaluated gross program savings.

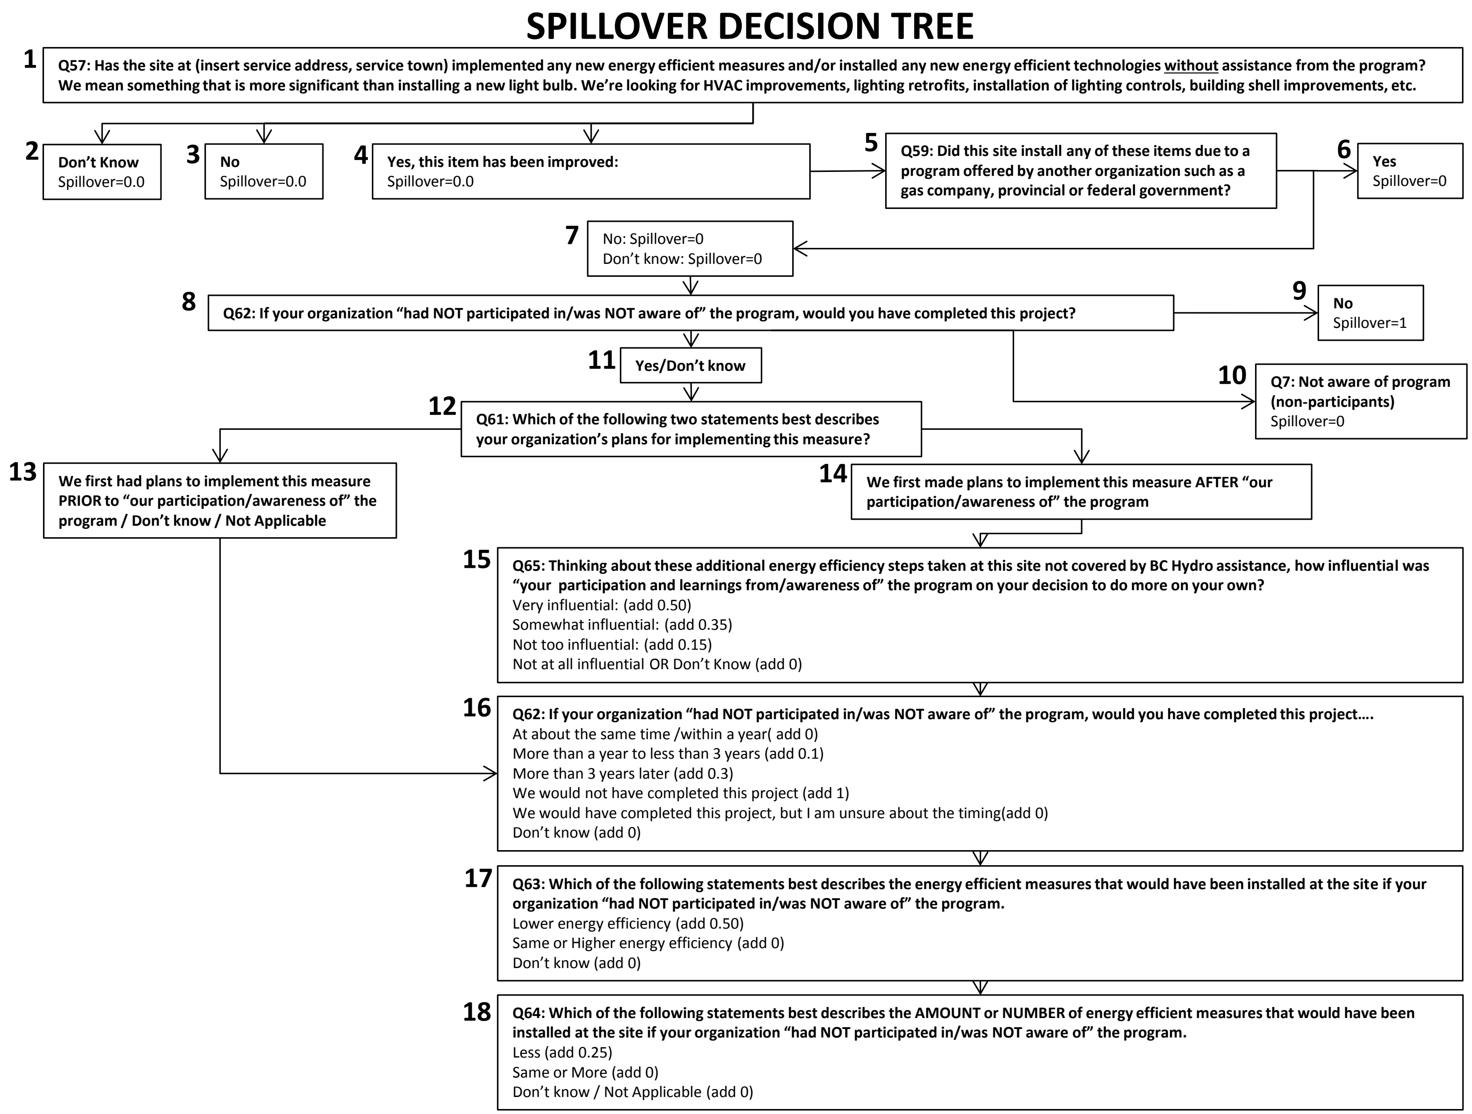

Figure C.2. Participant Spillover Decision Tree

Non-Participant Spillover

As already outlined in Section 2 and presented again in Table C.5 below, non-participant spillover pertaining to the entire five year evaluation period of interest was estimated via a calculation involving five inputs. The calculations of inputs D, E and F are further explained below.

Table C.5

A.	Commercial new construction building stock in B.C. that could have been influenced by the program F12-F16 (m^2)	A
B.	Commercial new construction building stock that did receive BC Hydro program funding F12-F16 (m^2)	B
C.	Commercial new construction building stock that did <u>not</u> receive BC Hydro program funding F12-F16 (m^2)	C = A – B
D.	Percent of commercial new construction building stock that exceeds code F12-F16 (%)	D
E.	For commercial new construction building stock that exceeds the B.C. Building Code, the average unit electricity savings relative to the code (kWh/m^2)	E
F.	Attribution of electricity savings to BC Hydro's Commercial New Construction Program (%)	F
G.	Non-Participant Spillover F12-F16 (GWh)	$G = \frac{C \times D \times E \times F}{1{,}000{,}000}$

Details of Input D: Percent of commercial new construction building stock that exceeds code

Findings from the Market Actors Survey were used to estimate the percent of commercial new construction floor area during the evaluation period that exceeded the B.C. Building Code (row D).

As this estimate was applied to the commercial new construction projects that did not receive program funding in the pursuit of non-participant spillover, it was ultimately based on survey respondents' non-participating projects. However, this estimate of the percent of commercial new construction floor area that exceeded code could only be distilled after respondents were taken through questions about all of their projects – some of which were in fact participating projects. As explained further below, such estimates that were later determined to include participating projects were excluded from further calculations.

Lines of questions in the survey solicited – for each of the five years 2012 through to 2016 – a respondent's total amount of commercial new construction floor area that they worked on and, through further calculation, the total amount of floor area that was designed and built to perform better than the energy efficiency requirement in the B.C. Building Code. The questions pertaining to each year were presented concurrently in a grid format.

For each year, a respondent then disaggregated their 'better than code' floor area – if there was any – into the amount that received program funding and the amount did <u>not</u> receive BC Hydro program funding[14].

[14] An alternate approach would have been to first ask survey respondents to estimate the total amount of their commercial new construction floor area that did not receive program funding, then to estimate the amount of that non-participating floor area that was designed and built to perform better than the B.C. Building Code. However, it was believed that this sequence of questioning and deduction would be less intuitive for most respondents.

For each year in which a respondent did not have any projects at all that received program funding, the percent of their commercial new construction floor area that exceeded the energy efficiency requirement in the B.C. Building Code was calculated as the total amount of their floor area in that year that exceeded the code divided by the total amount of floor area that they had worked on. Conversely, for any year in which a respondent did have at least some of their 'better than code' projects receive program funding, the estimate of the percent 'better than code' – intended to be applied strictly to non-participating projects for that year – was subsequently discarded. This was because for any given year, a respondent's 'better than code' floor area that did not receive program funding could not be disentangled from their 'better than code' floor area that did receive funding.

For each year, an average percent of commercial new construction floor area that exceeded code was then calculated as the average percent among all eligible respondents – weighted by the total built floor area that any one respondent had worked on.

Covering the entire five years of this evaluation period, the grand average of the percent of commercial new construction floor area that exceeded code was then calculated as the average percent from each individual year – weighted by the combined total built floor area for all respondents in each year.

Details of Input E: Average unit electricity savings for new construction building stock that exceeds code

Findings from the survey – together with end-use intensity data from BC Hydro's 2016 Conservation Potential Review (CPR) – were used to estimate average unit electricity savings for the floor area that exceed the B.C. Building Code (row E) over the five year evaluation period.

Survey respondents who reported having had commercial new construction projects over the five years that were designed to perform better than the B.C. Building Code and that did not receive BC Hydro program funding were asked a series of questions about their 'better than code, non-participating' projects.

These respondents were first asked to indicate which one(s) of eight different energy-efficient measures they at least sometimes designed or recommended to be implemented in their 'better than code, non-participating' projects.

Next, for each measure that was at least sometimes implemented, respondents were then asked to 1) estimate the percentage of their 'better than code, non-participating' floor area over the five years that either incorporated or benefitted from the measure, and 2) estimate the percent electricity savings from the measure as compared to a conventional measure that could have been implemented to just meet – not exceed – the energy efficiency requirements in the B.C. Building Code.

This information was then integrated with end-use intensity data from BC Hydro's 2016 Conservation Potential Review (CPR) to yield an estimate of the average unit electricity savings (kWh/m^2) – relative to the building code – for these 'better than code, non-participating' projects.

Details of Input F: Attribution of savings to BC Hydro's Commercial New Construction Program

Findings from the survey were used to estimate the attribution of gross electricity savings from 'better than code, non-participating' commercial new construction projects over the five year evaluation period back to the Commercial New Construction Program (row F).

Survey respondents were asked to reflect upon their new construction projects in B.C. – those that became occupied from 2012 to 2016 – that are performing better than the energy efficiency requirements in the B.C. Building Code and that did not receive BC Hydro program funding.

In doing so, they were asked to assess each of nine different factors in terms of the factors' influence on making these particular projects perform 'better than code'. As detailed on the following page, five of these factors were tied to BC Hydro's Commercial New Construction Program, its complementary offerings and the industry resources for which it played an integral role in developing. Four of the factors were categorized as non-BC Hydro factors.

Specifically, respondents were asked to record the percent share they would credit each of the nine factors for making their 'non-participating' projects perform 'better than code' such that the percent shares summed to 100 percent. Note that for any given respondent, a BC Hydro factor was not shown – via the survey's programming logic – if the respondent previously indicated having had no experience with the factor. In this scenario, the factor was effectively rendered a 0 percent share.

- BC Hydro Factors
  - My learnings and experience from having had other projects go through BC Hydro's Commercial New Construction program;
  - My learnings and experience from having attended BC Hydro workshops;
  - My learnings from having reviewed the case studies and resource literature posted on BC Hydro's website;
  - My learnings from having reviewed the Building Envelope Thermal Bridging Guide; and
  - My learnings from having reviewed the Enhanced Thermal Performance Spreadsheet.
- Non-BC Hydro Factors
  - Industry innovation and good practices (outside of BC Hydro involvement);
  - My own or my organization's desire to build such projects for LEED certification;
  - My/our client directed us to have such projects perform better than the energy efficiency requirements in the B.C. Building Code; and
  - All other factors.

For each respondent, the percent shares they credited to the five BC Hydro factors were added up to a net BC Hydro total – essentially, their attribution of their 'better than code, non-participating' projects during the evaluation period back to the Commercial New Construction Program. The grand average – the final point estimate of attribution (row F) – was then calculated as the equally weighted average among all eligible respondents.

Notably, this line of questioning around attribution was administered near the very end of the survey after respondents were taken through very comprehensive and algorithmic sets of questions about their commercial new construction projects that became occupied during the period of interest. It is believed that the sequencing and build-up of these prior questions set respondents up in a favourable position and mindset to make reliable, informed and unbiased assessments of the factors.

Appendix D Results Details

D.1 Additional Detail for Expected Energy Savings

The number of measures and expected energy savings by program offer and by industry sub-sector and end uses are given in the graphs below.

Figure D.1. Project and Savings Distribution by Program Offer

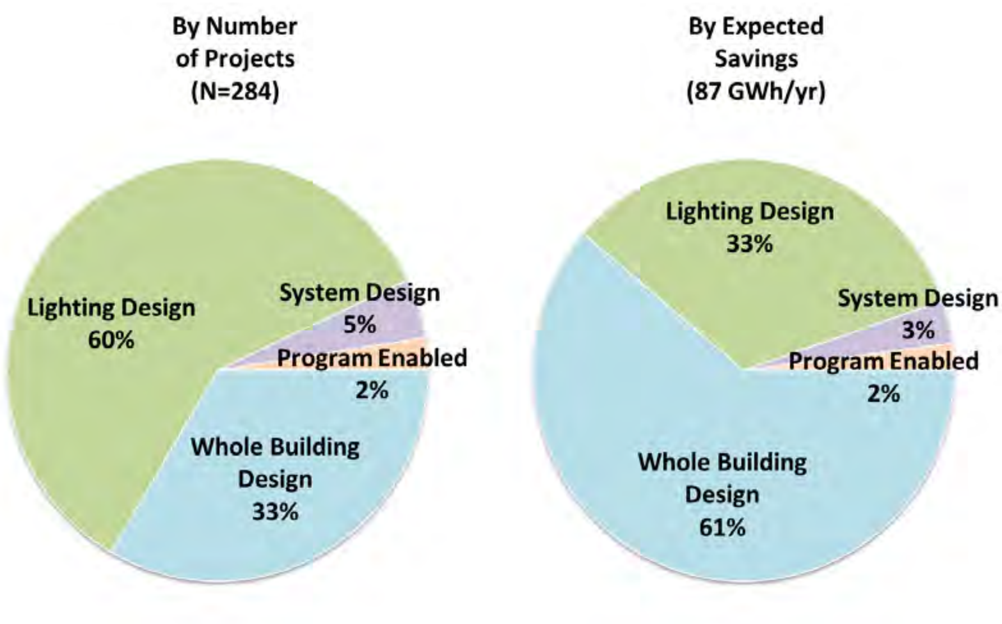

Figure D.2. Savings Distribution by Program Offers and Fiscal Year

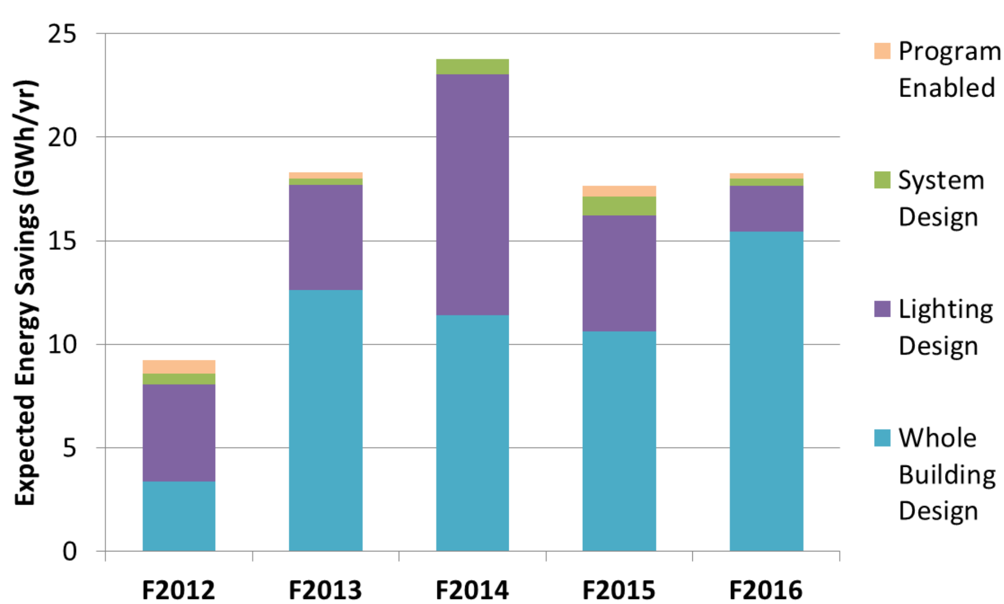

Figure D.3. Project and Savings Distribution by Sector

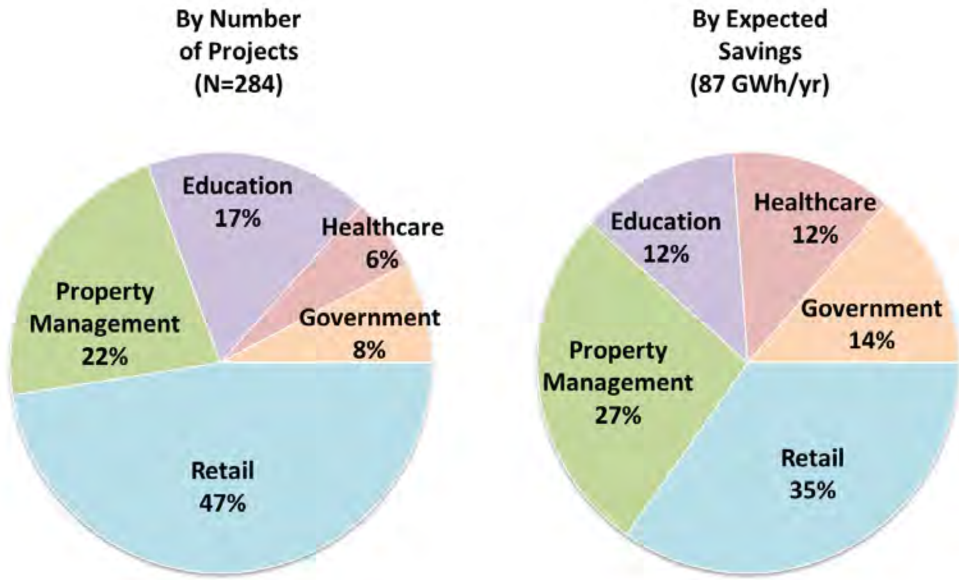

Figure D.4. Savings Distribution by Industry Sub-sector and Fiscal Year

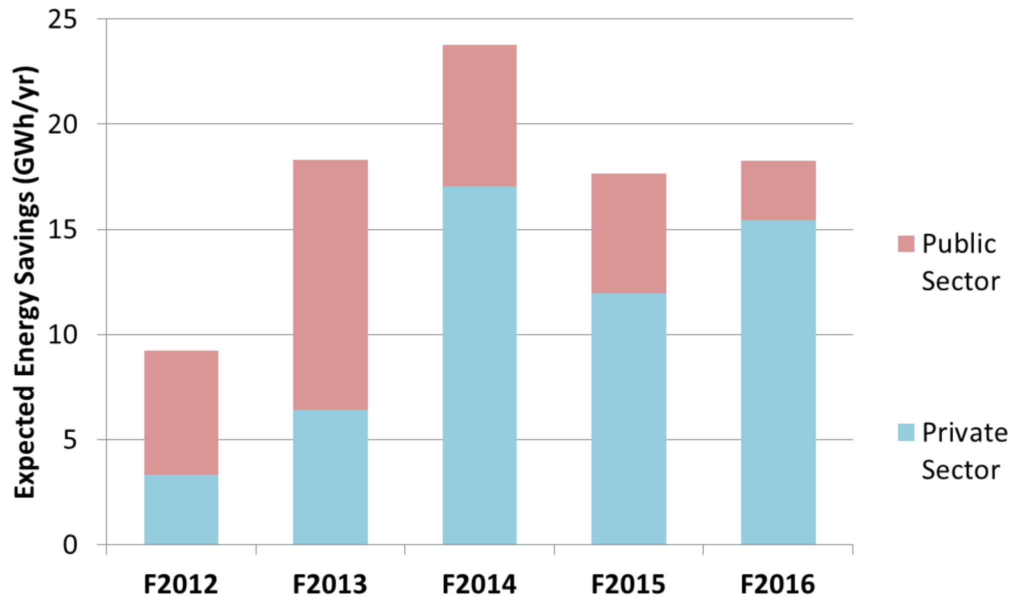

Figure D.5. Measures and Savings Distribution by End Use

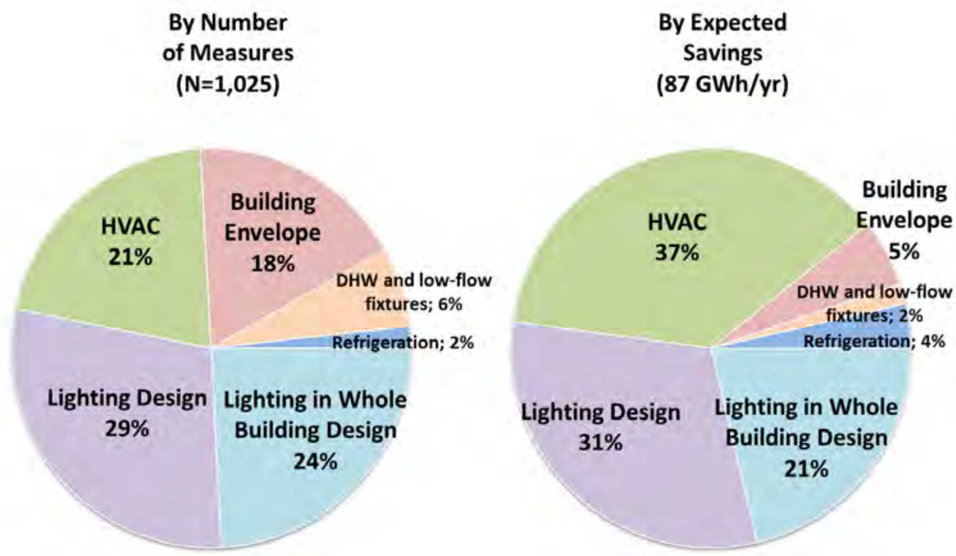
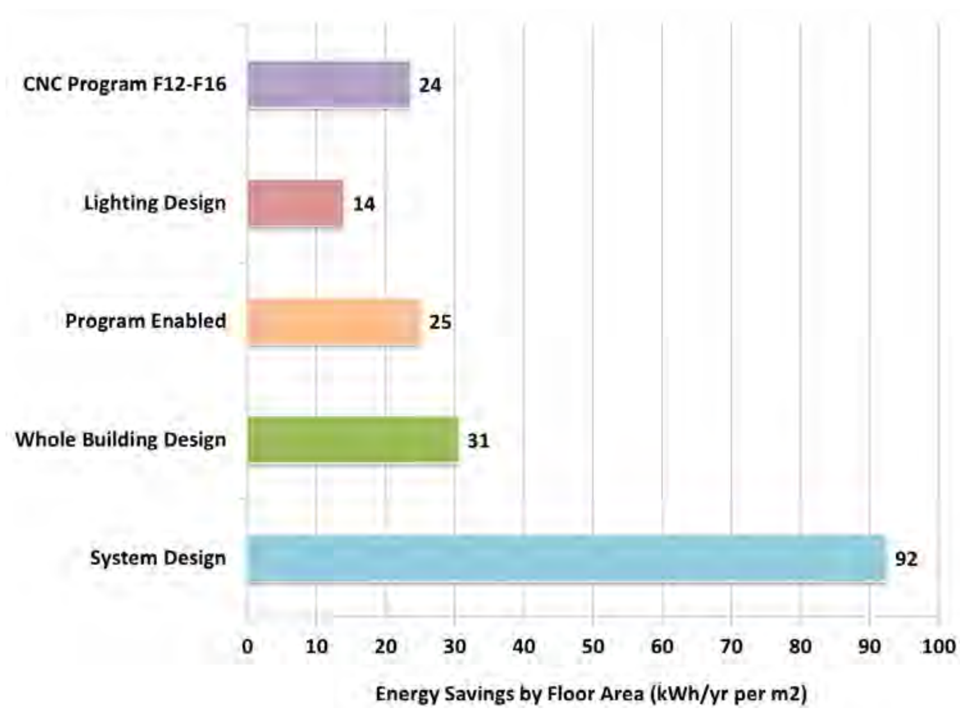


The figure below illustrates the unit energy savings by affected floor area and program offer for the CNC program from F2012 through F2016. The figure shows the increasing unit energy savings from Lighting Design to Whole Building Design to System Design. Overall, the CNC program achieved building energy intensity savings of 24 kWh per year per square meter which is approximately 18 percent of the building's electricity consumption.

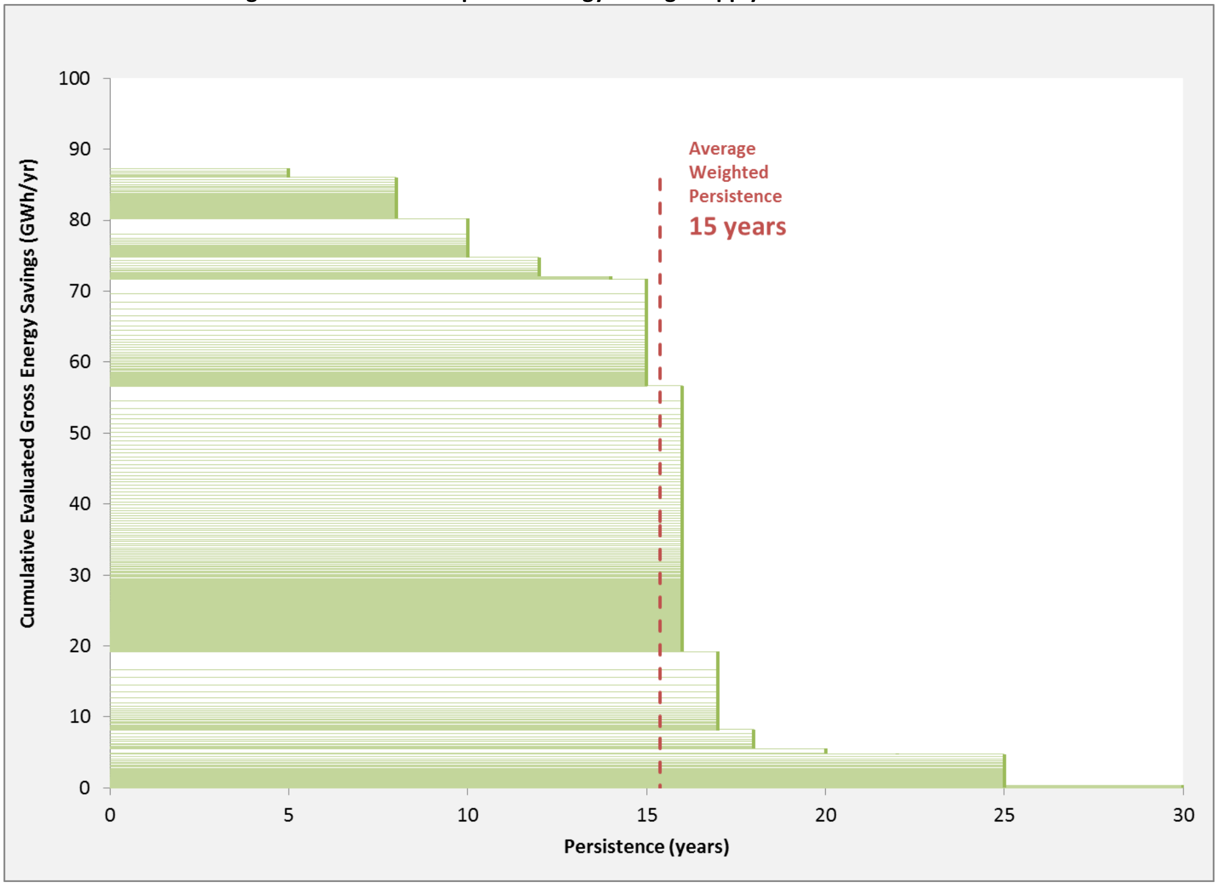
Figure D.6. Energy Savings by Affected Floor Area and Program Offer



D.3 Additional Results for Persistence

The persistence of measures was not evaluated but persistence values were assigned during the technical review of measures in accordance to the BC Hydro Persistence Standard[15]. The graph below illustrates the magnitude of expected energy savings of measures in order of increasing persistence. At the top of the chart are projects of lowest persistence (5 years) and at the bottom projects of highest persistence (30 years). In general, measures with 5 to 8 year persistence are lighting control measures; measures with 8 to 16-year persistence are hard-wired equipment and system measures; and measures with over 16 year persistence are typically upgrades to building envelope, or redesign of air distribution ductwork or water piping networks. The row height indicates the magnitude of savings. The weighted average persistence of energy savings from CNC in the F2012 – F2016 period was calculated to be 15.4 years as indicated by the dotted red vertical line.

Figure D.7. Measure Expected Energy Savings Supply and Persistence Curve



[15] BC Hydro DSM Standard: Effective Measure Life and Persistence – Revision 10, June 2016.

D.1 Additional Results from the Participant Survey

This section presents additional results from the participant survey.

Likelihood of Recommending the Program

Below are the full distributions of the likelihood of recommending the program to others and having already done so.

Figure D.8. Likelihood of Recommending the Program to Others

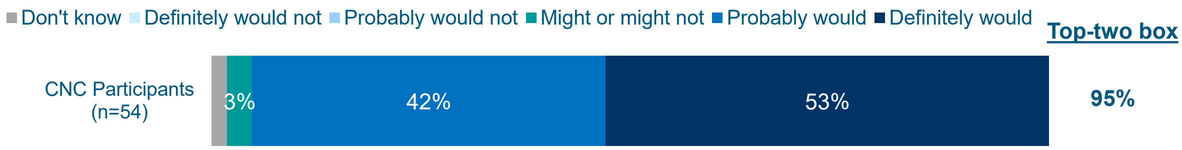


Figure D.9. Have Recommended the Program to Others

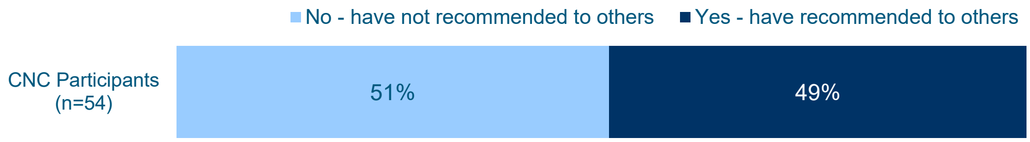
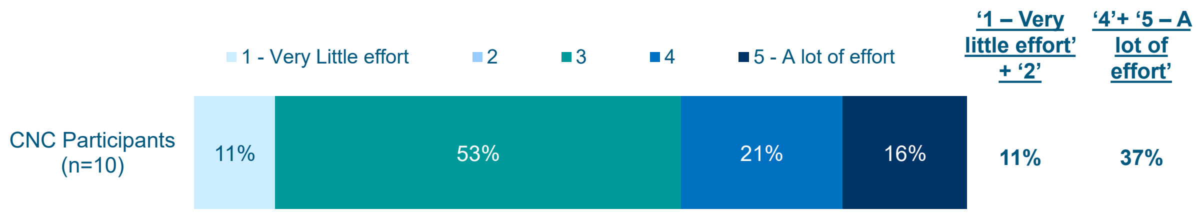


Level of Effort

Participants reported that they had put in moderate levels of effort to participate in CNC, with the bulk of respondents (53%) reporting a level of 3 on a 5-point scale. A further 37 percent reported having to put in a higher level of effort – a level of 4 or 5 on a 5-point scale. Very few (11%) reported having to put in very little effort in order to participate in the program – a score of 1 on the 5-point scale. Note that the sample size for this question is small because it was added to the survey in F2016.

Figure D.10. Level of Effort to Complete Participation in the Program



Suggestions for Improvement

Participants were asked to provide comments or suggestions about the program. In total, 25 percent of those who responded provided comments. Comments related to the process being too slow, the process being too complicated and communication issues emerged as main themes.

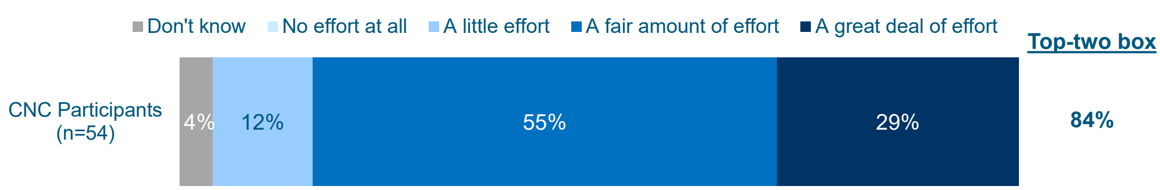
Table D.1. Comments/Suggestions for Improvement

	CNC Participants (n=15)
Process too slow / approvals take too long / speed up process	26%
Process/forms too complicated / create simpler process	24%
Communication issues / better communication with BCH/KAMs	14%
Website issues (hard to navigate, needs better info/tools)	8%
Increase variety of eligible products	4%
Increase incentive amounts	4%
Provide more information / training / seminars about program	3%
Want site visit/energy audit/in-person meeting	3%
Other program related	9%
Other non-program related	4%

Conservation Efforts and Momentum

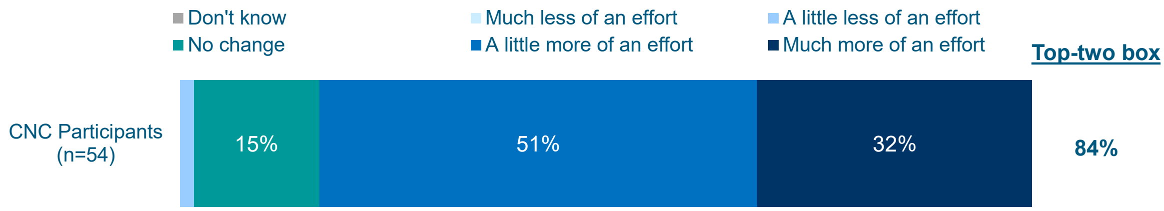
In total, 84 percent of CNC participants reported making either 'a great deal of effort' (29%) or 'a fair amount of effort' (55%) to conserve electricity over the past year. Only a small percentage reported making 'a little effort' (12%) and none reported making 'no effort at all'.

Figure D.11. Efforts to Conserve



Compared to efforts a year ago, 84 percent of participants reported increased levels of conservation effort, with 32 percent indicating that they had made 'much more of an effort' and 51 percent indicating that they had made 'a little more of an effort'. A further 15 percent indicated that there was 'no change', while only 2 percent indicated making less of an effort.

Figure D.12. Conservation Momentum



Energy Management Motivators

Participants were asked to rate various motivators to manage their use of electricity over the past year. 'Key account managers' and the 'CNC program' emerged as major factors. Other top motivators included 'reducing electricity use to make operating costs as low as possible' and an 'energy manager'. Note that the sample sizes for this question are small for two reasons: 1) the scale for this question was changed starting in F2013 (from an influence scale to a major/minor scale) and results from F2012 have thus been excluded and 2) due to the overall length of the survey, this bank of questions is not asked every survey wave.

Table D.2. Motivators to Manage Use of Electricity Over the Past Year

	Major Factor (n=10)
Key Account Manager (among those with a KAM; n=5)	65%
CNC program	60%
Reducing electricity use to make operating costs as low as possible	44%
Energy Manager	44%
Reducing electricity use to benefit the environment – it's just the right thing to do	37%
The incentive to conserve electricity that is built into BC Hydro's rate structure	37%
Overall level of electricity prices	34%
Increased funds within your company for energy-efficient retrofits	32%
Focus on cost cutting measures due to any economic downturn	23%
Federal, Provincial, or Local government initiatives	9%
Employees	9%
Contractors, vendors or customers	9%

Percentages shown are for 'major factor based on a 3-point labelled scale: major factor, minor factor, and not a factor. 'Don't know' responses are included in the calculation of percentages. Scale changed in F2013; responses from F2012 have been excluded.

Energy Management Barriers

Participants were also asked about barriers to manage electricity over the past year. The factors that emerged as the largest barriers were 'lack of funds for energy efficiency retrofits/projects', that there are 'other operational priorities' and 'lack of financial incentives for conservation programs and energy efficiency'.

Table D.3. Barriers to Manage Use of Electricity Over the Past Year

	Major Factor (n=22)
Lack of funds for energy efficient retrofits/projects	33%
There are other operational priorities	29%
Lack of financial incentives for conservation programs and energy efficiency	26%
Interruption to business operations	14%
Lack of staffing/staffing requirements	11%
Can't control employees' behaviour in regards to energy efficiency practice	7%
Takes too much time	3%
Current usage is already near its lowest possible level	3%
Lack of knowledge of where the opportunities for savings might be	0%
All equipment is functioning efficiently as possible	0%
Currently leasing the property and no property changes are permitted	0%

Percentages shown are for 'major barrier' based on a 3-point labelled scale: major barrier, minor barrier, and no barrier.
'Don't know' responses are included in the calculation of percentages.

Program Participation

While the questions below were used primarily as inputs to the free rider algorithm, looking at them individually can provide additional insights into the decision making process for implementing energy efficient upgrades, as well as provide insights on the role that each plays in the free ridership score. Recall, however, that free ridership is calculated using a decision tree with the individual questions receiving scoring based on the response options selected. Note also that the overall free rider score was weighted based on savings. Further details about the free rider algorithm and the scoring for each element are discussed in Appendix C.2.

Project Completion and Timing

As part of the timing question, organizations stated whether or not the energy efficiency project would have gone ahead without assistance from the CNC program. All participants indicated that that the project would have gone ahead in some form even in the absence of the program, comprised both of those who were able to provide an estimate of the timing and those who were unsure of timing. The vast majority would have completed the project at the same time (76%), while the next largest proportion was unsure about timing (16%).

Note that while timing of the project was explored in the survey, it was excluded from the algorithm due to the nature of CNC projects. Due to the high cost and long lifespan of the types of projects CNC pertains to, if a particular energy efficient technology is not installed as part of the initial construction, it is unlikely that it would be brought in to replace a less efficient technology in the short to medium term. It would not be financially feasible to replace a recently installed technology with a more energy efficient one – it is either included as part of initial construction or not replaced again until the long term.

Table D.4. Project Completion and Timing

We would have completed the project…	CNC Participants (n=51)
...at about the same time as actually done so	76%
...within a year of when actually done so	4%
...more than a year but less than 3 years later	0%
...more than 3 years later	0%
My organization would have completed this project, but I am unsure about the timing	16%
My organization would NOT have completed this project	0%
Don't know	4%
Total	100%

Prior Plans

A total of 41 percent of CNC participants reported that the idea to implement the energy efficiency measures was first suggested through BC Hydro assistance, such as a BC Hydro-funded energy consultant, BC Hydro-funded Energy Manager or a BC Hydro representative. A total of 43 percent of participants had the idea to implement the measure prior to suggestion by BC Hydro, while the remaining 16 percent were unsure about prior plans.

Table D.5. Prior Plans

	CNC Participants (n=51)
Yes, the idea was first suggested through BC Hydro assistance	41%
No, the ideas was NOT first suggested through BC Hydro assistance	43%
Don't know	16%
Total	100%

Among those who would have completed the project even if assistance from CNC had not existed.

Energy Efficiency

Participants were asked what level of energy efficiency they would have implemented in absence of the program. A total of 45% would have done so with a lower energy efficiency than actually implemented, while 41% would have installed the same efficiency as actually done so.

Table D.6. Energy Efficiency

We would have completed the measure with…	CNC Participants (n=51)
…a LOWER ENERGY EFFICIENCY than actually installed	45%
…the SAME ENERGY EFFICIENCY as actually installed	41%
…a HIGHER ENERGY EFFICIENCY than actually installed	2%
Not applicable	2%
Don't know	10%
Total	100%

Among those who would have completed the project even if assistance from CNC had not existed.

Financial Criteria

A total of 45 percent of participants indicated that the project would have met their organization's financial criteria around site investments, even without assistance from the program. A similar proportion indicated that it would not have met their financial criteria (43%), while the remainder were either unsure or felt that the financial criteria was not applicable to the project. Lighting design projects were more likely to have met an organization's financial criteria than whole building design projects (56% versus 40%). Note that although for-profit businesses rely heavily on the financial bottom line, projects often still proceed even if they do not meet an organization's financial criteria due to other factors (e.g., anticipated change of regulations, market prices, etc.).

Table D.7. Financial Criteria

	CNC Participants (n=51)
Yes, it would have met our financial criteria	45%
No, it would NOT have met our financial criteria	43%
Not applicable	4%
Don't know	8%
Total	100%

Among those who would have completed the project even if assistance from CNC had not existed.

Scale of Project

About one-quarter of participants who believed they would have completed the project on their own even without assistance from the program would have completed it at the same scale or higher. A further 40 percent would have completed between 50% and 99% of the project on their own, while only 8 percent would have completed less than half of it.

Table D.8. Scale of Project

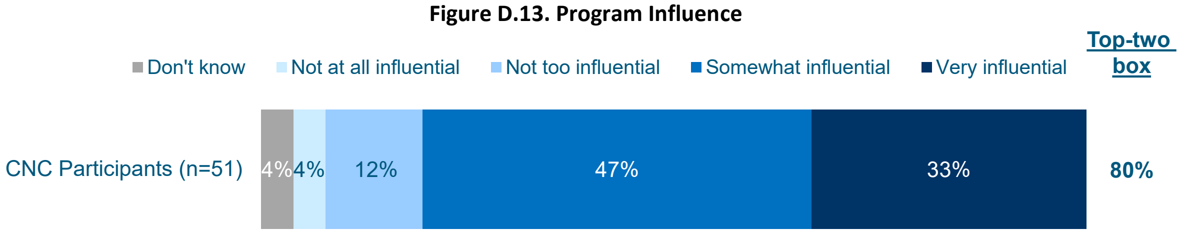
	CNC Participants (n=51)
0%	0%
1% to 24%	2%
25% to 49%	6%
50% to 74%	12%
75% to 99%	28%
100% or greater	28%
Not applicable	4%
Don't know	20%
Total	100%

Among those who would have completed the project even if assistance from CNC had not existed.

Program Influence

Participants were asked how influential the program was on their organization's decision to implement the measures. In total, 80 percent of participants reported that the program was 'very influential' or 'somewhat influential' on their decision to do so. A further 12 percent indicated that the program had been 'not too influential' while 4 percent indicated that it had been 'not at all influential'.

Figure D.13. Program Influence

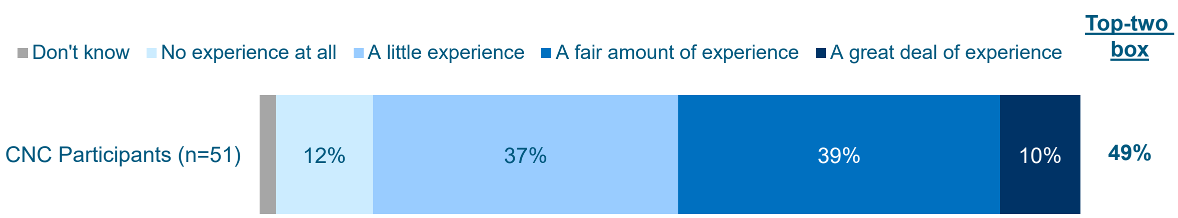


Among those who would have completed the project even if assistance from CNC had not existed.

Prior Experience with Measure/Technology Installed

Prior experience with the measures or technologies installed was fairly evenly distributed, with about half of participants having at least at least a fair amount of experience and half having little to no experience. Note that this question was not used in the free rider algorithm.

Figure D.14. Prior Experience with Measures/Technologies Installed



Appendix E Market Actor Survey – Questionnaire

Commercial New Construction – Market Actor Survey

Welcome to BC Hydro's Commercial New Construction Survey.

As the commercial new construction industry in British Columbia continues in its drive to build and operate higher performing and more energy efficient buildings, it is important to understand 'where it is currently at' in this regard.

While BC Hydro has very deep insights into the building projects that have come through its own Commercial New Construction Program, it has fewer and less reliable insights in regards to the many more projects that have not come through its program.

To this end, BC Hydro is embarking on a study to estimate the extent that new construction projects in the province are energy efficient. We are particularly interested in understanding the buildings or major additions that became occupied from 2012 to 2016 for which you may have had a decision making role regarding the extent that the projects would be energy efficient.

Again, our interest in this study is about the commercial new construction projects in the province that have not received direct BC Hydro funding or support.

The survey will likely take 30 minutes to work through, but we have tried to make your participation as easy as possible by allowing you to log on/off of the survey to complete it at your leisure. The next screen page will show you how.

For privacy reasons, do not self-identify (unless for the purposes of entering the contest) or identify other specific individuals in your written comments. Any comments including self-identification or identification of third parties will be discarded.

Thank you for your participation, your opinions are extremely important to us.

Cohesium Research, an independent research company based in B.C., is assisting us to conduct this survey. Your responses will be held in strict confidence by BC Hydro's Evaluation department and will be compiled with those of other customers for the research and planning purposes as identified above.

If you have any further questions about how to complete your survey, please contact please contact Connie Cheng, Project Manager, Cohesium Research at conniecheng@cohesiumresearch.com. If you have questions about why BC Hydro is conducting this research, please contact Marc Pedersen, Senior Evaluation Specialist at marc.pedersen@bchydro.com.

The personal information gathered through this study, including your opinions, demographic information, and name (if you choose to provide it at the end of the survey for participation in the prize draw) is being collected in furtherance of BC Hydro's electricity conservation mandate under the Clean Energy Act.

About You and Your Work

1. To begin the survey, can you please confirm that at least some of your work over the past 5-10 years has been in regards to the commercial new construction market in British Columbia?

By this we mean work that informs new construction or building additions in the commercial (e.g., offices and retail stores), institutional (e.g., schools & universities, hospitals), and multi-unit residential sectors.

☐[1] Yes

☐[0] No ⇒ SKIP TO Q70

☐[99] Don't know ⇒ SKIP TO Q70

2. Consider the commercial new construction projects you worked on that became occupied between 2012 and 2016.

Which one of the following statements best describes your involvement in the decisions regarding the extent that the projects would be energy efficient?

- **Decisions for such projects very likely occurred some three to five years prior to when they became occupied.**
- **Decisions regarding a project's energy efficiency may pertain to the building's envelope, its heating, cooling and ventilation systems, service water heating, its lighting system and its plug-load system.**

☐[1] I was often a key decision maker in the extent that projects would be energy efficient

☐[2] I typically was not a key decision maker, but did provide inputs, alternate options and/or my opinions into the decision making process

☐[3] I typically had little or no role in the decision making process ⇒ SKIP TO Q70

☐[99] Don't know ⇒ SKIP TO Q70

3. Consider the commercial (Part 3) new construction projects in B.C. for which you had any sort of decision making role regarding the extent that the projects would be energy efficient and only those that became occupied between 2012 and 2016. What segments of the market were the projects a part of?

- **Decisions for such projects very likely occurred some three to five years prior to when they became occupied.**
- **New construction projects include buildings and/or major additions in the commercial, institutional and the multi-unit residential sectors.**

Select all that apply.

☐[1] Hospitals and other health care facilities

☐[2] Grocery stores

☐[3] Mixed-use buildings

☐[4] Multi-unit residential buildings

☐[5] Non-food retail stores

☐[6] Office buildings

☐[7] Restaurants/Fast food

☐[8] Schools

☐[9] Universities

☐[98] Other (please specify): ______________________________

☐[99] Don’t know ⇒ SKIP TO Q70

4. What was your specific role regarding the extent that that the new construction projects in B.C. – those that became occupied between 2012 and 2016 – would be energy efficient?

- **Decisions in such projects very likely occurred some three to five years prior to when they became occupied.**
- **New construction projects include buildings and/or major additions in the commercial, institutional and the multi-unit residential sectors.**

Select all that apply.

☐[1] Architect

☐[2] Electrical engineer

☐[3] Energy modeller

☐[4] Mechanical engineer

☐[5] Project developer/development

☐[6] Project financing

☐[7] Project management

☐[8] Quantity surveyor

☐[9] Real estate

☐[10] Specifications writer

☐[98] Other (please specify): ______________________________

☐[99] Don't know

5. How many years have you had any decision making roles regarding the extent that new construction projects would be energy efficient?

☐[1] Less than 2 years

☐[2] 2 years to less than 5 years

☐[3] 5 years to less than 10 years

☐[4] 10 years to less than 25 years

☐[5] 25 years or more

☐[99] Don't know

6. Intentionally left empty

7. Intentionally left empty

8. Intentionally left empty

9. Intentionally left empty

BC Hydro's Commercial New Construction Program

10. Previously known as BC Hydro's High Performance Buildings program until 2009, the Commercial New Construction program assists in the design and construction of new high performance and energy efficient institutional, commercial, and multi-unit residential buildings in B.C.

The program encourages developers and their design teams to adopt energy-efficient design early in the design process, and provides them with a range of tools and potential financial incentives.

Which of the following statements best reflects your awareness and experience with BC Hydro's Commercial New Construction program?

☐2 I have worked on projects that have come through BC Hydro's Commercial New Construction program and/or the High Performance Buildings program

☐1 I was previously aware of the program, but I don't believe that I have ever worked on any projects that came through it

☐0 I was not previously aware of the program

CONTINUE WITH Q11 IF Q10=2; ELSE SKIP TO Q12

11. Please consider once again the new construction projects in B.C. – that eventually became occupied in 2012 to 2016 – for which you had any sort of decision making role regarding the extent that a project would be energy efficient.

Did any of those projects come through BC Hydro's Commercial New Construction program?

☐1 Yes

☐0 No

☐99 Don't know

12. BC Hydro has offered workshops and training in the past – sometimes in partnership with the APEGBC, IES, AIBC and IBPA – in regards to new building construction.

Have you ever attended one of these workshops or training opportunities?

☐1 Yes

☐0 No

☐99 Don't know

13. BC Hydro's Commercial New Construction program has case studies and resource literature in regards to new building construction posted on its website.

Have you ever reviewed these case studies and resource literature?

- **Building Envelope Thermal Bridging Guide**
- **Accounting for Thermal Bridging at Interface Details**
- **New Construction Energy Modelling Guideline**
- **New Construction Lighting Calculator**
- **Recommended lamp and ballast wattages**
- **City of Vancouver Energy Modelling Guidelines**
- **GeoExchange BC Professional Guidelines**

☐1 Yes

☐0 No

☐99 Don't know

14. Aside from the interactions you may have had with BC Hydro staff at workshops and other formal events, have you ever had other discussions with them about your projects in B.C.?

☐1 Yes

☐0 No

☐99 Don't know

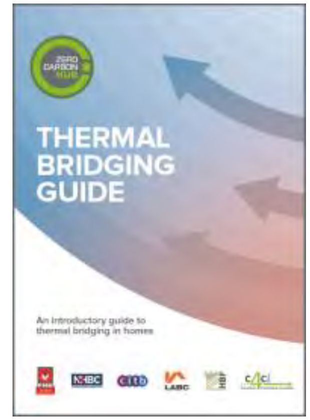
15. BC Hydro was a prime sponsor and contributor of the Building Envelope Thermal Bridging Guide which details how the commercial new construction market can effectively account for the impact of thermal bridging as part of meeting the challenges of reducing energy use in buildings.

Have you ever reviewed the Building Envelope Thermal Bridging Guide?

☐[1] Yes

☐[0] No

☐[99] Don't know



16. BC Hydro provided technical support and funding in developing the Enhanced Thermal Performance Spreadsheet which is included in BC Hydro's energy modelling guidelines.

Have you ever reviewed the Enhanced Thermal Performance Spreadsheet?

☐[1] Yes

☐[0] No

☐[99] Don't know

17. Intentionally left empty

The New Construction Projects You Have Worked On

18. The diagram below illustrates the flow of questions that will be asked of you in the subsequent sections.

1. Total floor area of the projects in B.C. – that became occupied in 2012 through 2016 – you had a decision making role regarding the extent that a project would be energy efficient.

⇩

2. The total floor area of your projects (from 1 above) that is performing better than the energy efficiency requirements in the B.C. Building Code

⇩

3. For your projects that are performing better than the energy efficiency requirements in the B.C. Building Code (from 2 above), the floor area that did and did not come through the program

⇩

4. Building types associated with the 'better than code, non-participating' floor area (from 3 above)

⇩

5. Measures implemented and estimated electricity savings for the 'better than code, non-participating' floor area (from 3 and 4 above)

⇩

6. Influence of factors on your decisions

19.

The remaining portions of this survey are about the new building and major addition construction projects you worked on that became occupied between 2012 and 2016.

20. For each of the five years presented in the table below, please estimate how many new construction projects in B.C. – that eventually became occupied in 2012 to 2016 – for which you had any sort of decision making role regarding the extent that a project would be energy efficient.

Of course, your involvement in such projects very likely occurred some three to five years prior to when they became occupied.

- **New construction projects include buildings and/or major additions in the commercial, institutional and the multi-unit residential sectors.**
- **Your best estimate or recollection is all that is requested.**

	Projects that became occupied in 2012 ⇓	Projects that became occupied in 2013 ⇓	Projects that became occupied in 2014 ⇓	Projects that became occupied in 2015 ⇓	Projects that became occupied in 2016 ⇓

IF DON'T KNOW IN EACH GRID YEAR SHOWN, THEN SKIP TO Q63

22. As shown below, you previously estimated the total floor area of the new construction projects in B.C. – that eventually became occupied in 2012 to 2016 – for which you had any sort of decision making role regarding the extent that a project would be energy efficient.

What percent of the total floor area of those projects would you estimate is performing better – including just slightly better – than the energy efficiency requirements in the B.C. Building Code (ASHRAE 90.1 / NECB 2011)?

- **Your best estimate or recollection is all that is requested.**

34. We are interested in learning about the types of buildings associated with the projects that are performing better than the energy efficiency requirements in the B.C. Building Code and that did not come through BC Hydro's Commercial New Construction program.

Please apportion the floor space of these 'better than code, non-participating' projects by the building types you had said – in the beginning of the survey – that you had worked on.

- **For example, for the 'better than code, non-participating' floor space in 20XX, one may estimate that 80% of it is tied to hospital projects, 20% to mixed use buildings and 20% to office buildings.**

IF Q11=1: SHOW EACH GRID YEAR FOR ONLY WHERE Q23 VALUES =0-9, 98, 99

IF [(Q11=0, 99) OR Q10=0, 1)]: SHOW GRID YEARS FOR ONLY WHERE Q22 VALUES =1-99

	Projects that became occupied in 2012 ⇓	**Projects that became occupied in 2013… show other years in next columns**
Floor area of your 'better than code, non-participating' projects	[CALCULATE AS FLOOR AREA SHOWN IN Q23 x VALUE OF Q24b] ft^2 IF Q22 AND/OR Q23 VALUE=99 (DON'T KNOW) THEN WRITE 'You had said Don't know to this'	[CALCULATE AS FLOOR AREA SHOWN IN Q23 x VALUE OF Q24b] ft^2 IF Q22 AND/OR Q23 VALUE=99 (DON'T KNOW) THEN WRITE 'You had said Don't know to this'

Measures Implemented in 'Your Better than Code, Non-Participating' Projects

39.

The next set of questions is about the measures specific to your construction projects in B.C. that were completed and became occupied between 2012 and 2016, and that are performing better than the energy efficiency requirements in the B.C. Building Code but did not come through BC Hydro's Commercial New Construction program.

40. We would like to learn about the electricity conservation measures that helped your new construction projects in B.C. perform better than the energy efficiency requirements in the B.C. Building Code.

Thinking about the different types of measures for which you personally had a decision making role, what measures did you at least sometimes design or recommend to be implemented in the 'better than code, non-participating' projects?

- **Broadly consider the different types of projects that became occupied between 2012 and 2016.**

Select all that apply.

☐1 Highly-efficient heat pump recovery measures (water to water and air to water heat pumps)
☐2 Highly-efficient heat pump water heaters or low-flow fixtures
☐3 Highly-efficient building envelope measures (roof/wall Insulation, high efficiency glazing)
☐4 Highly-efficient lighting measures (includes controls and/or reduction of lighting power density)
☐5 Highly-efficient HVAC measures
☐6 Highly-efficient exhaust air heat recovery measures
☐7 Highly-efficient plug-load measures
☐8 Highly-efficient refrigeration measures
☐99 Don't know ⇒ SKIP TO Q60

ASK Q41 IF Q40=1 (HEAT PUMP RECOVERY MEASURES); ELSE SKIP TO RULE FOR Q44

41. You previously indicated that some of your projects in B.C. that did not come through BC Hydro's Commercial New Construction program incorporated highly-efficient heat pump recovery measures that helped the projects perform better than the energy efficiency requirements in the B.C. Building Code.

Thinking about all of these 'better than code, non-participating' projects collectively – those that became occupied between 2012 and 2016 – what percentage of their floor area incorporated the highly-efficient heat pump recovery measures?

☐[0] 0% (none of the floor area) ⇒ SKIP TO RULE FOR Q44
☐[2] 10%
☐[2] 20%

Industry innovation and good practices (outside of BC Hydro involvement)	_________
My own or my organization's desire to build such projects for LEED certification	_________
My/our client directed us to have such projects perform better than the energy efficiency requirements in the B.C. Building Code	_________
All other factors	_________
Your Total (SHOW RUNNING TOTAL)	XX%
Target Total	100%

61. Consider your new construction projects in B.C. – that became occupied from 2012 to 2016 – that are performing better than the energy efficiency requirements in the B.C. Building Code and that did not come through BC Hydro's Commercial New Construction program.

Which one of the following statements best describes what the energy efficiency of those non-participating projects would have been had you NOT – nor any of your colleagues…

SHOW AS BULLETS:

SHOW IF A PAST PARTICIPANT [Q10=2]: **had any prior experience with the Commercial New Construction program**

SHOW IF ATTENDED A WORKSHOP [Q12=1]: **ever attended any of BC Hydro's workshops on commercial new construction**

SHOW IF REVIEWED CASE STUDIES [Q13=1]: **ever reviewed any case studies or resource literature on BC Hydro's website**

SHOW IF REVIEWED THERMAL BRIDGING GUIDE [Q15=1]: **ever reviewed the Building Envelope Thermal Bridging Guide**

SHOW IF REVIEWED ENERGY MODELLING GUIDELINES [Q16=1]: **ever reviewed the Enhanced Thermal Performance Spreadsheet**

☐1 These projects would likely still be performing better than the energy efficiency requirements in the B.C. Building Code by the same margin.

☐2 These projects would likely be performing better than the energy efficiency requirements in the B.C. Building Code, but by a smaller margin.

☐3 These projects would likely be meeting the energy efficiency requirements in the B.C. Building Code.

☐4 These projects would likely be performing worse than the energy efficiency requirements in the B.C. Building Code.

☐99 Don't know

☐97 Not applicable – the interaction(s) occurred after the design decisions were made for these projects.

62. Consider each of the following experiences and 'touchpoints' you have had with BC Hydro in regards to commercial new construction:

SHOW AS BULLETS:

SHOW IF A PAST PARTICIPANT [Q10=2]: **your learnings and experience from having worked on 'participating projects' that came through the Commercial New Construction program**

SHOW IF ATTENDED A WORKSHOP [Q12=1]: **your learnings and experience from having attended BC Hydro's workshops on commercial new construction**

SHOW IF REVIEWED CASE STUDIES [Q13=1]: **your learnings and experience from having reviewed case studies or resource literature on BC Hydro's website**

SHOW IF REVIEWED THERMAL BRIDGING GUIDE [Q15=1]: **your learnings and experience from having reviewed the Building Envelope Thermal Bridging Guide**

SHOW IF REVIEWED ENERGY MODELLING GUIDELINES [Q16=1]: **your learnings and experience from having reviewed the Enhanced Thermal Performance Spreadsheet**

Overall, how influential were these experiences and 'touchpoints' on your decisions to have '<u>non</u>-participating projects' that became occupied from 2012 to 2016 – those that did <u>not</u> come through the program – designed to perform better than the energy efficiency requirements in the B.C. Building Code?

☐[1] Very influential

☐[2] Somewhat influential

☐[3] Not too influential

☐[4] Not at all influential

☐[99] Don't know

☐[97] Not applicable – the interaction(s) occurred after the design decisions were made for these projects.

Industry Evolution

63. Compared to buildings that became occupied say 2005 - 2011, to what extent do you believe the entire commercial new construction market in the province has improved in terms of the energy use of the projects that became occupied in 2012 - 2016?

- ☐[0] 0% - no better ⇒ SKIP TO Q65
- ☐[1] 1% - 9% better
- ☐[2] 10% better
- ☐[3] 20% better
- ☐[4] 30% better
- ☐[5] 40% better
- ☐[6] 50% + better ⇒ SKIP TO Q65

64. Thinking about your response to the previous question, how much of the improvement in the commercial new construction energy use in the province – for projects that became occupied in 2012 - 2016 as compared to those that became occupied in 2005 - 2011 – would you attribute to BC Hydro's Commercial New Construction program (previously, the High Performance Buildings program)?

- ☐[0] 0% of the improved energy use is attributable to BC Hydro's program
- ☐[1] 1% - 9%
- ☐[2] 10%
- ☐[3] 20%
- ☐[4] 30%
- ☐[5] 40%
- ☐[6] 50% + of the improved energy use is attributable to BC Hydro's program
- ☐[99] Don't know

65. Think about all of the commercial new construction projects in B.C. from 2012 to 2016 for which you had any sort of decision making role regarding the extent that the projects would be energy efficient – regardless of whether or not they came through BC Hydro's Commercial New Construction program.

How much electricity would you say those projects are saving relative to the energy efficiency requirements in the B.C. Building Code?

- ☐0 0% electricity savings (the projects would be performing to the energy efficiency requirements in the B.C. Building Code)
- ☐1 1% - 9% electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐2 10% electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐3 20% electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐4 30% electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐5 40% electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐6 50% + electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐99 Don't know

66. What's your impression of all other commercial new construction projects in the province from 2012 to 2016? (those you were <u>not</u> involved in)

How much electricity would you say those projects are saving relative to the energy efficiency requirements in the B.C. Building Code?

- ☐0 0% electricity savings (the projects would be performing to the energy efficiency requirements in the B.C. Building Code)
- ☐1 1% - 9% electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐2 10% electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐3 20% electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐4 30% electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐5 40% electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐6 50% + electricity savings better than the energy efficiency requirements in the B.C. Building Code
- ☐99 Don't know

Your Confidence in Your Responses

67. It is very much appreciated that because most of the questions in this survey pertain to your commercial new construction projects that became occupied several years ago, it may have been difficult to remember the projects – in their collectivity – and to have provided various estimates about them.

Overall, how much confidence would you say you have in the accuracy of the various estimates you gave in this survey?

☐[0] 0% confidence
☐[1] 10%
☐[2] 20%
☐[3] 30%
☐[4] 40%
☐[5] 50%
☐[6] 60%
☐[7] 70%
☐[8] 80%
☐[9] 90%
☐[10] 100% confidence ⇒ SKIP TO Q69
☐[99] Don't know

68. Which of the following areas of the survey would you say you are generally confident about in your estimates?

Which of the areas would you say you are <u>not</u> confident about in your estimates?

	Confident	Not Confident	Don't know
The type of buildings that became occupied from 2012 to 2016 for which you played a design decision role.	☐1	☐0	☐99
Your estimates of the floor area of your project in B.C. that became occupied from 2012 to 2016.	☐1	☐0	☐99
Your estimates of the percent of floor area of your projects that are performing better than the energy efficiency requirements in the B.C. Building Code.	☐1	☐0	☐99
Your estimates of the percent of floor area of your 'better than code' projects that came through BC Hydro's Commercial New Construction Program. [SHOW ONLY IF Q11=1]	☐1	☐0	☐99
The various electricity conservation measures you designed or recommended in your 'highly performing, non-participating' projects.	☐1	☐0	☐99
The percent of floor area of your 'highly performing, non-participating' projects that incorporated these conservation measures.	☐1	☐0	☐99
Your estimates of the electricity savings from each of these conservation measures.	☐1	☐0	☐99
Your credit(s) to BC Hydro on their influence on the commercial new construction industry in B.C.	☐1	☐0	☐99

Your Project Names

69. A large number and wide variety of professionals within the commercial new construction industry have been invited to participate in this survey. In an effort to further understand the sample composition of completed surveys, it would be beneficial to learn the names of the 3 largest projects in B.C. that you worked on – those that became occupied from 2012 to 2016.

- **Only list those new construction projects in B.C. – that became occupied from 2012 to 2016 – that are performing better than the energy efficiency requirements in the B.C. Building Code and that did not come through BC Hydro's Commercial New Construction program.**
- **To ensure clarity, also indicate each project's building types (e.g. hospital, grocery store, office building, etc.)**
- **In BC Hydro's reporting, none of your earlier responses in this survey will be linked to the names of the projects that you list below.**

	Project Name ⇓	Project building type ⇓
Project 1		
Project 2		
Project 3

Appendix F Participant Survey – Questionnaire

BC Hydro
Power smart

Commercial New Construction Survey (Wave 5 – May 2016)

INTRODUCTION TEXT

Thank you for taking the time to complete this survey.

Commercial New Construction Program (umbrella program name) Participants: Survey IDs 500,000 – 528,999

Our records indicate that your organization's site located at (insert service address, service town) **participated in BC Hydro's** (insert umbrella program name as per survey ID) **between (DATEflag=1 "October 2015 and March 2016"; DATEflag=2, "April and October 2015"). We are interested in your organization's experience with the program and would appreciate your feedback. If you feel that this survey should be completed by another individual at your organization, please forward the original email invitation to that person. In recognition of your time and effort to complete this survey you will receive a $50 gift certificate upon completing and submitting the survey.**

In consideration of privacy issues, do not self-identify (unless for the purposes of receiving the gift card) or identify other specific individuals in your written comments. Any comments including self-identification or identification of third parties will be discarded.

About You

1. Which of the following best describes your position/title within the organization? Check one only.

- ☐1 Operations or maintenance manager
- ☐2 Operations or maintenance technician/engineer
- ☐3 Plant manager
- ☐4 Business owner or co-owner
- ☐5 Executive
- ☐6 Site or property manager/supervisor
- ☐7 General manager
- ☐8 Energy Manger – hired as part of BC Hydro's Energy Manager program
- ☐9 Energy Manager – NOT hired as part of BC Hydro's Energy Manager program
- ☐10 Finance manager
- ☐11 Purchasing manager
- ☐12 Accountant/Bookkeeper
- ☐13 Developer
- ☐14 Project Manager
- ☐16 Strata council member
- ☐15 Other: please specify __________________

2. For each of the following, please indicate whether you are primarily or jointly responsible for decision making in relation to this particular site, whether someone else at the site is responsible, or whether the decision making is made by a person or team away from the site such as at a corporate office.

		Yes, I am the primary or joint decision maker	No, someone else at this site is the decision maker	No, someone else away from this site is the decision maker	Don't know
a.	Decisions related to investments in equipment costing <u>less than $100,000</u>	☐[1]	☐[2]	☐[3]	☐[999]
b.	Decisions related to investments in equipment costing <u>$100,000 or more</u>	☐[1]	☐[2]	☐[3]	☐[999]
c.	Decisions related to energy management	☐[1]	☐[2]	☐[3]	☐[999]
d.	Decisions related to the maintenance of equipment	☐[1]	☐[2]	☐[3]	☐[999]
e.	Decisions related to capital investments in retrofitting existing sites/facilities or building new sites/facilities	☐[1]	☐[2]	☐[3]	☐[999]
f.	Decisions related to the operation and maintenance of sites/facilities	☐[1]	☐[2]	☐[3]	☐[999]

About this Site

3. Which of the following best describes the ownership of this organization?

- ☐1 Government or public sector (e.g., schools, hospitals, universities, etc.)
- ☐2 Non-governmental organization (e.g,, non-profit, strata council, etc.)
- ☐3 For profit (e.g., publically owned, privately owned, franchise, chain, etc.)
- ☐4 Other: please specify _________________
- ☐999 Don't know/Not sure

4. Please check the one box corresponding to your organization's primary business activity at this particular site. Check one only.

- ☐2 Apartment building or strata property
- ☐3 Arts/entertainment/film
- ☐4 Automotive
- ☐5 Banking/finance/insurance
- ☐6 Business or personal services
- ☐7 Camps/recreation/sports/amusement
- ☐8 College
- ☐9 Communications/media
- ☐10 Construction/home & building contractors
- ☐11 Development/real estate/commercial property management
- ☐12 Food & beverage production or storage
- ☐13 Forest products or wood processing
- ☐14 Government – Local/Provincial/Federal
- ☐15 Hospital (including care facilities)
- ☐16 Hospitality/lodging/tourism
- ☐26 Mixed-use building (e.g., mixed commercial/residential units, etc.)
- ☐28 Retail – non-food
- ☐29 Retail – food stores
- ☐30 Restaurants and food service
- ☐31 Religious organization
- ☐32 School (public or private)
- ☐33 Social services
- ☐35 Transportation
- ☐36 University
- ☐38 Warehousing
- ☐39 Wholesale and Distribution
- ☐40 Other: please specify______________

Awareness of BC Hydro's CNC Program

7b. [For CNC, ask Q29 and Q30 first, then skip back to Q7b] Where did you hear about this program? Select all that apply. [do not randomize]

☐[1] Advertising
☐[2] Direct Mail
☐[3] Email
☐[4] Power of Business Newsletter
☐[5] Current Newsletter
☐[6] Media news story
☐[7] BC Hydro website
☐[8] Other website
☐[9] Facebook or Twitter
☐[10] BC Hydro Key Account Manager
☐[11] BC Hydro Engineering
☐[12] BC Hydro Alliance of Energy Professionals member (formerly Power Smart Alliance)
☐[13] Industry colleagues
☐[14] Work colleagues
☐[15] Friends and family
☐[16] Other, please specify: (*please do not identify individuals by name, title or organization)*
☐[999] Don't know

7c. Please complete the following sentence, 'My business was interested in BC Hydro's (insert umbrella program as per survey ID) because we wanted to …' Select all that apply. [randomize1 to 6]

☐[1] "Green" the business
☐[2] Decrease operating costs
☐[3] Receive incentives
☐[4] Implement energy efficiency technology at the business
☐[5] Improve the lighting at the business
☐[6] Improve the comfort at the business
☐[7] Other reason, please specify: (*please do not identify individuals by name, title or organization)*
☐[999] Don't know

Commercial New Construction Program

29. In the last two years, has your organization completed a major renovation or expansion to an existing facility or built a new facility either at this location or at another location? Check all that apply.

- ☐[1] Yes, we have renovated or expanded an existing facility and/or built a new facility either at this location or at another location in the last two years
- ☐[2] We are currently in the process of renovating or expanding an existing facility and/or building a new facility at this location or at another location
- ☐[3] No
- ☐[999] Don't know

30. BC Hydro's Commercial New Construction Program provides funding and design expertise to eligible customers who are building new facilities, doing a major renovation or expanding existing ones. The program starts with a fully-funded comprehensive energy study which determines a site's energy baseline followed by a range of design options and financial incentives to implement the energy conservation measures and improve its efficiency.

`Prior to this survey, had you heard of BC Hydro's Commercial New Construction Program?

- ☐[1] Yes ⇒ SURVEY IDS 500,000-528,999 SKIP BACK TO Q7b AND Q7c; THEN RETURN TO Q31
- ☐[2] No ⇒ SKIP TO Q40
- ☐[999] Don't know SKIP TO Q40

31. The Commercial New Construction Program pays up to 100% of an energy study which can help customers understand their design options for a new or expanded facility/site and how energy-efficient designs will help them save energy and money over a theoretical baseline.

Prior to receiving this survey, were you aware of the basics of the Energy Study component of the Commercial New Construction Program?

- ☐[1] Yes ⇒ CONTINUE TO Q32
- ☐[2] No ⇒ SKIP TO Q34
- ☐[999] Don't know ⇒ SKIP TO Q34

32. Prior to receiving this survey, how would you rate your understanding of the Energy Study component of the Commercial New Construction Program?

- ☐[1] Excellent
- ☐[2] Good
- ☐[3] Fair
- ☐[4] Poor
- ☐[5] Very Poor
- ☐[999] Don't know

33. Overall, how would you rate the Energy Study component of the Commercial New Construction Program?

☐1 Excellent
☐2 Good
☐3 Fair
☐4 Poor
☐5 Very Poor
☐999 Don't know

34. The Commercial New Construction Program provides financial incentives that reduce the incremental costs (i.e., those costs that exceed the costs for standard, inefficient design options) of energy efficiency measures, or bundle of measures, related to building new facilities or renovating existing ones, up to a maximum of $500,000.

Prior to receiving this survey, were you aware of the basics of the Project Incentive structure of the Commercial New Construction Program?

☐1 Yes ⇒ CONTINUE TO Q35
☐2 No ⇒ SKIP TO Q40
☐999 Don't know ⇒ SKIP TO Q40

35. Prior to receiving this survey, how would you rate your understanding of the Project Incentive structure of the Commercial New Construction Program?

☐1 Excellent
☐2 Good
☐3 Fair
☐4 Poor
☐5 Very Poor
☐999 Don't know

36. Overall, how would you rate the Project Incentive structure of the Commercial New Construction Program?

☐1 Excellent
☐2 Good
☐3 Fair
☐4 Poor
☐5 Very Poor
☐999 Don't know ⇒ ALL SKIP TO Q40

Program Components: Key Account Manager

40. (Only ask if KAMflag=1; otherwise skip to Q44) A Key Account Manager is an organization's point-person inside BC Hydro who is responsible for managing various aspects of the customer relationship. This may include aspects relating to rates, outages, etc., but also those aspects relating to energy efficiency and conservation.

Prior to receiving this survey, were you aware of Key Account Managers?

☐[1] Yes ⇒ CONTINUE TO Q41
☐[2] No ⇒ SKIP TO Q44
☐[999] Don't know ⇒ SKIP TO Q44

41. Prior to receiving this survey, were you aware that the Key Account Manager acts as a liaison between BC Hydro's (insert umbrella program as per survey ID) and its participants?

☐[1] Yes ⇒ CONTINUE TO Q42
☐[2] No ⇒ SKIP TO Q44
☐[999] Don't know ⇒ SKIP TO Q44

42. Prior to receiving this survey, how would you rate your understanding of the role of the Key Account Manager in relation to BC Hydro's (insert umbrella program as per survey ID)?

☐[1] Excellent
☐[2] Good
☐[3] Fair
☐[4] Poor
☐[5] Very Poor
☐[999] Don't know

43. Overall, how would you rate your organization's Key Account Manager in relation to their support of your participation in BC Hydro's (insert umbrella program as per survey ID)?

- ☐1 Excellent
- ☐2 Good
- ☐3 Fair
- ☐4 Poor
- ☐5 Very Poor
- ☐999 Don't know
- ☐998 Not applicable – I have had no experience with a Key Account Manager in regards to the program

Program Component: BC Hydro Alliance of Energy Professionals (ALL SURVEY IDs)

The BC Hydro Alliance of Energy Professionals (formerly Power Smart Alliance) is a network of independent contractors and engineers that can help you select, install and maintain your site's energy related equipment.

44. Were you aware of the BC Hydro Alliance of Energy Professionals (formerly Power Smart Alliance) before this survey?

- ☐1 Yes ⇒ CONTINUE TO Q45
- ☐2 No ⇒ SKIP TO RULE FOR Q45b
- ☐999 Don't know => SKIP TO RULE FOR Q45b

45. Has a BC Hydro Alliance of Energy Professionals partner contacted your organization regarding BC Hydro's (insert program as per survey ID)?

- ☐1 Yes
- ☐2 No
- ☐999 Don't know

Your Site's Participation in BC Hydro's (insert umbrella program as per survey ID)

46. (FOR FIRST PROJECT THAT RESPONDENT IS SEEING) **As first mentioned at the beginning of this survey, BC Hydro records indicate that energy-efficient measures were implemented and/or technologies were installed at** (insert service address; service town) **through your organization's participation in BC Hydro's (insert umbrella program as per survey ID). Below is a project completed with the assistance of the program between** (DATEflag=1, "October 2015 and March 2016"; DATEflag=2, "April and September 2015")**.**

(FOR ANY ADDITONAL PROJECTS) **Here is another project completed with the assistance of BC Hydro's** (insert umbrella program as per survey ID) **at** (insert service address; service town) **between** (DATEflag=1, "October 2015 and March 2016"; DATEflag=2, "April and September 2015").

Were you generally aware of the project listed below?

Type of Assistance:	(insert assistance name)
Brief Project Description:	(insert brief project description)
Incentive amount paid by CNC	(insert incentive amount)

☐[1] Yes, I was generally aware of this project
☐[2] No, I was not aware of this project
☐[999] Don't know

⇒NB: Question repeated for each project completed at the site level up to a maximum of 3 projects (e.g., if 3 separate projects completed at the site level, then questions Q47 to Q54 get repeated as Q47-2 to Q54-2 and Q47-3 to Q54-3 with the descriptions of each project shown)

⇒IF "DON'T KNOW" OR "NO" FOR ALL, THEN SKIP TO Q57. OTHERWISE IF "NO" TO A PROJECT, SKIP TO FOLLOWING PROJECT IF MORE THAN 1 PROJECT.

⇒IF "YES" FOR ANY PROJECT SHOWN THEN CONTINUE THROUGH Q47 TO Q54.

47. For the project listed below…

(ONLY INCLUDE THOSE PROJECTS THAT HAVE BEEN SELECTED 'YES' IN Q46 ABOVE)

Type of Assistance:	(insert assistance name)
Brief Project Description:	(insert brief project description)
Incentive amount paid by CNC	(insert incentive amount)

…if the assistance from BC Hydro's (insert umbrella program name as per survey ID) had not existed, would your organization have completed the project…

☐1 …at about the same time as actually done so
☐2 …within a year of when actually done so
☐3 …more than a year but less than 3 years later
☐4 …more than 3 years later
☐5 My organization would have completed this project, but I am unsure about the timing
☐6 My organization would NOT have completed this project (⇒ CONTINUE TO Q48)
☐999 Don't know

⇒ ANSWERS 1-5 AND 99 SKIP TO Q49.

⇒ Q48 IS ASKED FOR A PROJECT ONLY IF THE CORRESPONDING Q47 IS 6 "MY ORGANIZATION WOULD NOT HAVE COMPLETED THIS PROJECT"

48. Why would your organization NOT have completed this project? (In consideration of privacy issues, please do not reference any individuals' names.) (OPEN END)

☐0 No comments

SKIP TO Q54

49. For the project listed below… (ONLY INCLUDE THOSE PROJECTS THAT HAVE BEEN SELECTED 'YES' IN Q46 ABOVE)

Type of Assistance:	(insert assistance name)
Brief Project Description:	(insert brief project description)
Incentive amount paid by CNC	(insert incentive amount)

…which of the following three statements best describes the energy efficiency of the measure that would have been installed at (insert service address, service town) if the assistance provided by BC Hydro's (insert umbrella program name as per survey ID) had not existed?

- ☐1 We would have completed this measure with a LOWER ENERGY EFFICIENCY than actually installed
- ☐2 We would have completed this measure with the SAME ENERGY EFFICIENCY as actually installed
- ☐3 We would have completed this measure with a HIGHER ENERGY EFFICIENCY than actually installed
- ☐999 Don't know
- ☐998 Not applicable

50. For the project listed below… (ONLY INCLUDE THOSE PROJECTS THAT HAVE BEEN SELECTED 'YES' IN Q46 ABOVE)

Type of Assistance:	(insert assistance name)
Brief Project Description:	(insert brief project description)
Incentive amount paid by CNC	(insert incentive amount)

…what percentage of this project would your organization have completed on its own if the assistance from BC Hydro's (insert umbrella program name as per survey ID) had not existed?

When considering your answer, please keep in mind all the equipment, all the technologies, and/or all of the sites included in this project.

You may either enter a percentage in the field provided, or choose from the list provided:

OR:

☐1 0%	☐2 1% to 24%	☐3 25% to 49%	☐4 50% to 74%	☐5 75% to 99%
☐6 100% or greater	☐999 Don't know			
☐988 Not applicable				

51. For the project listed below… (ONLY INCLUDE THOSE PROJECTS THAT HAVE BEEN SELECTED 'YES' IN Q46 ABOVE)

Type of Assistance:	(insert assistance name)
Brief Project Description:	(insert brief project description)
Incentive amount paid by CNC	(insert incentive amount)

…had there been no financial incentive from BC Hydro (i.e., money paid directly from BC Hydro to your organization – which does not include money for energy audits, studies or Energy Managers – would the energy-efficient measure have met your organization's financial criteria around site investments?

☐[1] Yes, it would have met our financial criteria
☐[2] No, it would NOT have met our financial criteria
☐[999] Don't know
☐[998] Not Applicable

52. For the project listed below… (ONLY INCLUDE THOSE PROJECTS THAT HAVE BEEN SELECTED 'YES' IN Q46 ABOVE)

Type of Assistance:	(insert assistance name)
Brief Project Description:	(insert brief project description)
Incentive amount paid by CNC	(insert incentive amount)

…was the idea to implement the energy efficiency measure first suggested through BC Hydro assistance, such as a BC Hydro-funded energy consultant, BC Hydro-funded Energy Manager or a BC Hydro representative?

☐[1] Yes, the idea was first suggested through BC Hydro assistance.
☐[2] No, the idea was NOT first suggested through BC Hydro assistance
☐[999] Don't know

53. For the project listed below… (ONLY INCLUDE THOSE PROJECTS THAT HAVE BEEN SELECTED 'YES' IN Q46 ABOVE)

Type of Assistance:	(insert assistance name)
Brief Project Description:	(insert brief project description)
Incentive amount paid by CNC	(insert incentive amount)

…how much experience did your organization have with this type of energy-efficient measure that was implemented and/or technology that was installed, previous to your site's participation in BC Hydro's (insert umbrella program as per survey ID)?

☐[1] A great deal of experience

☐[2] A fair amount of experience

☐[3] A little experience

☐[4] No experience at all

☐[999] Don't know

54. For the project listed below… (ONLY INCLUDE THOSE PROJECTS THAT HAVE BEEN SELECTED 'YES' IN Q46 ABOVE)

Type of Assistance:	(insert assistance name)
Brief Project Description:	(insert brief project description)
Incentive amount paid by CNC	(insert incentive amount)

…overall, how influential was BC Hydro's (insert umbrella program as per survey ID) on your organization's decision to implement the energy-efficient measure listed above at this site?

☐[1] Very influential

☐[2] Somewhat influential

☐[3] Not too influential

☐[4] Not at all influential

☐[999] Don't know

Additional Site Investments in Energy Efficiency (ALL SURVEY IDs)

57. Since participating in BC Hydro's (insert umbrella program as per survey ID) for the projects listed below," and no further back than April 2015, has the site at (insert service address, service town) implemented any new energy-efficient measures and/or installed any new energy-efficient technologies without assistance from BC Hydro, or have plans in place to do so within the next two years? We mean something that is more significant than installing a new light bulb. We're looking for HVAC improvements, lighting retrofits, installation of lighting controls, building shell improvements, etc.

- ☐[1] Yes, additional energy efficiency measures have been made and /or will be made at this site without the assistance from BC Hydro ⇒ CONTINUE TO Q58
- ☐[2] No additional significant energy efficiency measures have been made at this site ⇒ SKIP TO Q68
- ☐[999] Don't know / not sure ⇒ SKIP TO Q68

(IF "TYPE OF ASSISTANCE" AND "BRIEF PROJECT DESCRIPTION" ARE POPULATED IN Q46, THEN SHOW FOLLOWING TEXT AND TABLE)

AS A REMINDER …

Please exclude the following projects which your organization completed with BC Hydro's (insert umbrella program as per survey ID)

Type of Assistance	Brief Project Details

⇒ IF 'YES' FOR ALL THEN SKIP TOQ68; IF 'NO' OR 'DON'T KNOW' FOR AT LEAST 1 ITEM THEN CONTINUE TO Q60 (ONLY INCLUDE THOSE ITEMS THAT WERE ANSWERED 'NO' OR 'DON'T KNOW').

60. What percentage of this equipment at this site has been (or will be) affected by this installation? (INSERT ONLY THOSE ITEMS THAT HAVE BEEN CHECKED 'NO' OR 'DON'T KNOW' FROM Q59) For example, if you had a building that was 10 stories tall and a lighting retrofit was completed on 4 floors, you would say 40% of the lighting equipment was affected. Another example is if your site has 4 buildings with heating systems and 1 of the buildings was upgraded, you would say 25% of the heating equipment was affected.

		Percentage of this equipment affected	Don't know
a. New lighting systems, components, or controls	→	____%	☐999
b. New cooling systems, components or controls	→	____%	☐999
c. New heating systems, components or controls	→	____%	☐999
d. New technologies for process cooling	→	____%	☐999
e. New motors or pumps	→	____%	☐999
f. New motor drive systems	→	____%	☐999

66. Thinking about these additional energy efficiency steps taken (or planed) at this site not covered by BC Hydro assistance, would you estimate that these annual electricity savings are greater than or less than the annual electricity savings directly made by participating in the BC Hydro program, or are they about equal?

☐[1]	Annual non-program savings are greater than BC Hydro program savings	⇒ CONTINUE TO Q67
☐[2]	Annual non-program savings are less than BC Hydro program savings	⇒ CONTINUE TO Q67
☐[3]	About equal	⇒ SKIP TO Q68
☐[999]	Don't know	⇒ SKIP TO Q68

67. Approximately how much (IF ANSWER Q66=1 THEN "greater"; IF ANSWER Q66 =2 THEN "less") are these annual non-program savings than the annual BC Hydro program savings? (If ANSWER Q66 =2 also include "e.g., if non-program savings were about a quarter the size of your total program savings, you would write in 25%.")

Please specify: _______% (If ANSWER Q66=1 "**greater than total program savings**"; ANSWER Q66 =2, "**of total program savings**"

☐[999] Don't know

Program Participation: Experience

68. We would like to ask your opinion of several features of BC Hydro's (insert umbrella program as per survey ID). From Excellent to Very Poor, how would you rate the following aspects of the program? (only items A to I and M are randomized, and then the questions about length (J, K and L) be rearranged into the order L, K, J and shown at the bottom of the table

		Excellent	Good	Fair	Poor	Very poor	Don't know/ do not recall	Not applicable
a.	Direct mail information about BC Hydro's (insert umbrella program as per survey ID)	☐1	☐2	☐3	☐4	☐5	☐999	☐998
b.	Information about BC Hydro's (insert umbrella program as per survey ID on the website	☐1	☐2	☐3	☐4	☐5	☐999	☐998
c.	Service provided by BC Hydro personnel	☐1	☐2	☐3	☐4	☐5	☐999	☐998
d.	Service provided by your product supplier(s)/distributor(s)	☐1	☐2	☐3	☐4	☐5	☐999	☐998
e.	Service provided by your contractor(s)/consultant(s) **(for 500,000-528,999 add "**/designer(s)**")**	☐1	☐2	☐3	☐4	☐5	☐999	☐998
f.	Level of incentives offered	☐1	☐2	☐3	☐4	☐5	☐999	☐998
g.	The variety of products funded under the program	☐1	☐2	☐3	☐4	☐5	☐999	☐998
i.	<u>Overall</u> application procedures to receive funding	☐1	☐2	☐3	☐4	☐5	☐999	☐998
m.	Clarity of communications from BC Hydro about your project	☐1	☐2	☐3	☐4	☐5	☐999	☐998
l.	Length of time to receive project approval	☐1	☐2	☐3	☐4	☐5	☐999	☐998
k.	Length of time for the project to be completed	☐1	☐2	☐3	☐4	☐5	☐999	☐998
j.	Length of time to receive the incentive	☐1	☐2	☐3	☐4	☐5	☐999	☐998

68b. Here are some additional aspects of the program. Please rate them from Excellent to Very Poor. [do not randomize]

		Excellent	Good	Fair	Poor	Very poor	Don't know/ do not recall	Not applicable
s.	Knowing how and who to contact at BC Hydro for any project and process questions on the program	☐1	☐2	☐3	☐4	☐5	☐999	☐998
t.	Ease of the online Company Registration for Energy Efficient Lighting Design (EELD) projects	☐1	☐2	☐3	☐4	☐5	☐999	☐998
u.	Consultant/Lighting Designer feedback on the Lighting Calculator's ease of use *(if applicable)*	☐1	☐2	☐3	☐4	☐5	☐999	☐998

68c. On a scale of 1 to 5, with 1 being very little effort and 5 being a lot of effort, please indicate the total effort that was required by your organization to complete your participation in the program?

1 – Very little effort	2	3	4	5 – A lot of effort	Don't know
○	○	○	○	○	○999

69. Overall, how satisfied are you with your experience with BC Hydro's (insert umbrella program as per survey ID)?

- ☐1 Very satisfied
- ☐2 Somewhat satisfied
- ☐3 Neither satisfied or dissatisfied
- ☐4 Somewhat dissatisfied
- ☐5 Very dissatisfied
- ☐999 Don't Know

69b. Thinking about things a little differently, on a scale of 1 to 10, where 1 is not at all satisfied and 10 is extremely satisfied, overall how satisfied are you with BC Hydro's (insert umbrella program as per survey ID)?

1 – Not at all satisfied	2	3	4	5	6	7	8	9	10 – Extremely Satisfied	Don't know
○	○	○	○	○	○	○	○	○	○	○ 999

Follow-Up

70. Based on your experience with BC Hydro's (insert umbrella program as per survey ID), would you recommend the program to organizations similar to your own?

- ☐ 1 Definitely would recommend
- ☐ 2 Probably would recommend
- ☐ 3 Might or might not recommend
- ☐ 4 Probably would <u>not</u> recommend
- ☐ 5 Definitely would <u>not</u> recommend
- ☐ 999 Don't Know

71. Have you recommended BC Hydro's (insert umbrella program as per survey ID) to anyone else?

- ☐ 1 Yes
- ☐ 2 No

72. We would like to know if there are ways to improve BC Hydro's (insert umbrella program as per survey ID). Do you have any suggestions on how the program could be improved? (In consideration of privacy issues, please do not reference any individuals' names.) (OPEN END)

Specify: ____________________

Electricity Management

75. Over the past year, how much of an effort would you say your organization has made to conserve electricity?

- ☐[1] A great deal of effort
- ☐[2] A fair amount of effort
- ☐[3] A little effort
- ☐[4] No effort at all ⇒ ASK Q76, BUT THEN SKIP TO Q78
- ☐[999] Don't know

76. Compared to one year ago, would you say your organization is making more of an effort to conserve electricity, less of an effort, or has there been no change?

- ☐[1] Much more of an effort
- ☐[2] A little more of an effort
- ☐[3] No change
- ☐[4] A little less of an effort
- ☐[5] Much less of an effort
- ☐[999] Don't know

⇒IF Q75=4, THEN SKIP TO Q78, OTHERWISE CONTINUE TO Q77

Energy Management: Motivation

77. In this section, we would like to learn about what motivated your organization to make an effort to manage its use of electricity over the past year.

For each item in the table below, please indicate how much of a factor it has had on your organization's effort to manage its use of electricity over the past year. (RANDOMIZE)

		Major factor	Minor factor	Not a factor	Don't know / Not applicable
a.	Overall level of electricity prices	☐1	☐2	☐3	☐999
b.	The incentive to conserve electricity that is built into BC Hydro's rate structure	☐1	☐2	☐3	☐999
c.	BC Hydro's (INSERT UMBRELLA PROGRAM AS PER SURVEY ID)	☐1	☐2	☐3	☐999
d.	BC Hydro Key Account Manager (Only ask if KAMflag=1)	☐1	☐2	☐3	☐999
e.	Contractors, vendors or customers (e.g., supply chain/marketplace demands)	☐1	☐2	☐3	☐999
f.	Employees	☐1	☐2	☐3	☐999
g.	Energy Manager	☐1	☐2	☐3	☐999
h.	Reducing electricity use to make operating costs as low as possible	☐1	☐2	☐3	☐999
i.	Focus on cost cutting measures due to any economic downturn	☐1	☐2	☐3	☐999
j.	Federal, Provincial, or Local government initiatives	☐1	☐2	☐3	☐999
k.	Increased funds within your company for energy-efficient retrofits	☐1	☐2	☐3	☐999
l.	Reducing electricity use to benefit the environment – it's just the right thing to do	☐1	☐2	☐3	☐999
m.	Other influences: please specify ________________	☐1	☐2	☐3	☐999
n.	Other influences: please specify ________________	☐1	☐2	☐3	☐999

Electricity Management: Barriers

78. In this section, we would like to learn about the barriers your organization may have faced in any effort to manage its use of electricity over the past year. For each item in the table below, please indicate how much of a barrier it has been on your organization's effort to manage its use of electricity over the past year. (RANDOMIZE)

	Major barrier	Minor barrier	No barrier	Don't Know / Not Applicable
a. Lack of funds available for energy-efficient retrofits	☐1	☐2	☐3	☐999
b. Lack of staffing/staffing requirements	☐1	☐2	☐3	☐999
c. Lack of knowledge of where the opportunities for savings might be	☐1	☐2	☐3	☐999
d. Lack of financial incentives for conservation programs and energy efficiency	☐1	☐2	☐3	☐999
e. Can't control employees' behaviour in regards to energy efficiency practice	☐1	☐2	☐3	☐999
f. There are other operational priorities	☐1	☐2	☐3	☐999
g. Takes too much time	☐1	☐2	☐3	☐999
h. Current usage is already near its lowest possible level	☐1	☐2	☐3	☐999
i. Currently leasing the property and no property changes are permitted	☐1	☐2	☐3	☐999
j. All equipment is functioning as efficiently as possible	☐1	☐2	☐3	☐999
m. Interruption to business operations	☐1	☐2	☐3	☐999
k. If applicable: Other barrier (1): specify__________________	☐1	☐2	☐3	☐999
l. If applicable: Other barrier (2): specify__________________	☐1	☐2	☐3	☐999

Comments in Regards to BC Hydro's (insert umbrella program as per survey ID)

79. Do you have any final comments or suggestions in regards to this survey, BC Hydro or its energy conservation programs? (In consideration of privacy issues, please do not reference any individuals' names.) (OPEN-END)

☐[0] No comments

Final Words

80. Are you the original recipient of the survey invitation or was it forwarded along to you by a colleague?

- ☐[1] Original recipient
- ☐[2] The survey was forwarded to me
- ☐[999] Don't know/not sure

81. The key objective of this survey is to collect the necessary information to inform our program evaluation, including how an account's consumption of electricity may vary with the various electrical end-uses associated with it.

To facilitate this, it is important to analyze an account's consumption of electricity for a period dating back to 2010 as a long 'time series' of consumption helps us to better control for year-to-year changes in the weather, the economy, etc.

Rather than asking you to estimate how much electricity this account has consumed over the past couple of years, BC Hydro would like to access this information from your organization's account history and link it to the responses you have given in this survey. We will NOT review any of your organization's bill payment information.

May we please have your organization's permission for BC Hydro to do this?

- ☐[1] Yes
- ☐[2] No

83. If you wish to receive a $50 gift certificate to a home improvement retailer upon completing and submitting the survey, please choose from 1 of 4 retailers and indicate your name, address, city, postal code and phone number below. The information provided below will be stored separately from your survey responses.

POWER SMART PARTNERS –
LOAD DISPLACEMENT INITIATIVES
IMPACT EVALUATION:
F2012-F2018

Final Report

March 31, 2020

Prepared by:

BC Hydro Conservation and Energy Management Evaluation

This page left blank

TABLE OF CONTENTS

This page left blank

Executive Summary

Introduction

This report presents the results of an impact evaluation covering eight load displacement projects implemented during the period from F2012 to F2016. Since the program has ended and no new projects were implemented in F2017 and F2018 and operational data was available for all the projects, the evaluation period covers F2012 to F2018.[1] The projects were funded through the Power Smart Partners-Transmission (PSP-T) Integrated Power Offer (IPO) or Load Displacement (LD) program offers and were not included in the scope of any previous impact evaluations.

Load displacement projects are customer-based generation projects that self-supply part of the customer's site electrical load. For these projects, industrial, commercial and institutional customers received BC Hydro funding and program support to generate their own electricity for self-supply and offset their electricity purchases from BC Hydro. All customer-based generation projects over 50 kW were reviewed through the Integrated Customer Solutions (ICS) process. The load displacement project enabling activities were specifically designed to operate under the ICS framework and remove technical and financial barriers specific to self-generation projects. Load displacement projects were treated as having reduced customer energy purchases similar to energy conservation project initiatives for industrial transmission customers.

Approach

The evaluation objectives and research questions are summarized in the following table.

Table ES.1 Evaluation Objectives and Research Questions

Evaluation Objective	Research Questions
1. Estimate gross electricity generation and peak demand impacts.	What were the evaluated gross electricity generation and demand impacts realized by load displacement projects aggregated by fiscal year and, to the extent possible, disaggregated by relevant factors*?
2. Estimate net electricity generation and peak demand impacts.	What were the relative magnitude of parasitic loads[2] and their energy use as related to the load displacement projects?
	What were the evaluated net electricity generation and demand impacts realized by load displacement projects aggregated by fiscal year and, to the extent possible, disaggregated by relevant factors?
	To what extent did parallel energy procurement initiatives[3] impact the net electricity generation of the load displacement projects?

* Relevant factors may include technology type, primary energy source, seasonal operating mode and operating strategy with other on-site process heat requirements that impact the net electricity generation.

[1] The Load Displacement initiative was no longer available after F2017.

[2] Parasitic load is the electrical energy that is required for the operation of the load displacement project.

[3] Other energy procurement initiatives include electricity purchase agreements, contracted generation baseline loads, and tariff treatments.

The objectives, data sources and methods used for this evaluation are shown in Table ES.2.

Table ES.1. Evaluation Objectives, Data and Method

Evaluation Objectives	Data	Method
1. Estimate gross electricity generation and peak demand impacts.	• Project files • Self-generation eMetering • Customer process requirements • Billing records and Customer Baseline Load (CBL) Statements[4]	• Annual M&V results and evaluation review • Self-generation load shapes, capacity factors and peak-to-energy factors • Engineering calculations
2. Estimate net electricity generation and peak demand impacts.	• Load displacement feasibility studies • Reported savings • Project files	• Engineering estimates of parasitic loads • Annual M&V results and evaluation review

Electricity self-generation impacts were evaluated over the period from F2012 to F2018 based on hourly interval data through annual measurement and verification or annual reconciliation of the site's total generation energy.

Objective 1: Evaluated Gross Electricity Generation and Peak Demand Impacts

Evaluated gross electricity generation is the energy generated due to the program and estimated from the annual M&V results and billing records by fiscal year. Four of the eight projects underwent an annual measurement and verification process for the estimation of gross and net electricity generation. These four projects with M&V are load displacement projects where a new generator was installed. They are grouped in this evaluation under 'New Power Generation' and M&V results were used as the basis of the gross generation energy for evaluation review. The other four load displacement projects were due to refurbishment and upgrading of an existing steam turbine which resulted in incremental generation to already existing generation. These are grouped in this evaluation under 'Rebuilt Turbo Generator'. The annual gross incremental generation energy from the rebuilt units was verified by BC Hydro Contract Management based on revenue metering data for each fiscal year and provided in the customer's billing records. For these projects, the customer's billing records were used as the basis of the gross generation energy for evaluation review.

The gross peak demand impact by the load displacement projects was estimated using the peak-to-energy factor of the total self-generation system at each site. These were evaluated based on hourly interval data during steady-state operations in winter by dividing the average generation power during peak periods by the load displacement project's annual generation energy.

Objective 2: Net Generation Energy and Peak Demand Impacts

The net generation energy is the difference between the energy delivered by the generator and the parasitic energy requirements. The evaluated parasitic energy was estimated based on recent actual performance as the most likely indicator of future performance of the load displacement project.

The parasitic energy estimate for the four New Power Generation projects with M&V was verified by the M&V group using engineering calculations and spot measurements when available. No M&V results were available for the four Rebuilt Turbo Generator projects and a deemed estimate of the incremental parasitic energy was applied based on the default assumption of 3% of incremental gross generation energy[5] of the load displacement project.

[4] CBL Statements are issued annually by BC Hydro for each customer on stepped rate schedule (RS1823B) that includes any adjustment made to a customer's energy bill for the purpose of Customer Baseline Load (CBL) administration.
[5] U.S. Department of Energy (2017). *Uniform Methods Project, Chapter 23: Combined Heat and Power Evaluation Protocol.*

The evaluated net generation peak demand impact of the program was estimated using the same peak-to-energy factors determined for Objective 1, applied to the project-based M&V estimates for parasitic energy and metered load shapes of the generation energy. This assumed that the load shape of the parasitic energy is the same as the load shape of the generation energy.

It was not an objective of this evaluation to attribute changes in generation energy to the load displacement initiatives, which would take into consideration free ridership and spillover. In this evaluation, the term 'net generation impact' refers to the gross generation energy less parasitic energy and does not imply attribution to any intervening initiative. These load displacement projects were assumed to have no free ridership and non-existent spillover, for a net-to-gross ratio of one, for two reasons. First, all self-generation projects had to apply to BC Hydro for generator inter-connection and go through the integrated customer solutions process for review and evaluation. All of the eight load displacement projects in this evaluation were then directed to the load displacement capital incentive offer by BC Hydro and each project had its own business case developed with BC Hydro executive approval of the incentive amount. Hence no free ridership of the capital incentive was anticipated. Second, all generation energy is metered and customers were required to service their self-generation contracts in a prescribed order which was verified by BC Hydro for billing purposes. Hence no spillover of any unreported generation energy was deemed possible.

Results

Objective 1

Table ES.3 shows the number of load displacement projects implemented by fiscal year, as well as the cumulative rated capacity, the evaluated gross generation energy, and the evaluated gross peak demand impact. Results are given as cumulative due to the variation of project results with annual review through measurement and verification.

The peak-to-energy factor was evaluated for each project from hourly interval data based on the average power generated between December and February. Peak-to-energy factors are usually determined using winter weekday evening loads, to correspond with the BC Hydro system peak, but the variations of generated power between winter days of the week (weekday versus weekend) and winter hours of the day (evenings versus other hours of the day) were found to be negligible. The average evaluated peak-to-energy factor was found to be 0.126 MW per GWh, almost 8 percent higher than the industrial transmission rate class average of 0.117 MW per GWh which is typically applied to energy conservation measures. This higher peak-to-energy factor resulted in a higher estimate of peak demand impact for load displacement projects.

A number of other factors were examined to assess the performance of load displacement projects in terms of system availability and capacity utilization. Detailed results discussed in the report indicate that all load displacement projects had excess capacity to potentially increase generation power and energy.

Table ES.3 Evaluated Cumulative Gross Generation Energy and Peak Demand Impact

Fiscal Year	Number of new Projects	Load Displacement Project Type	Cumulative Rated Capacity (MW)	Cumulative Evaluated Gross Generation Energy (GWh/yr)	Cumulative Evaluated Gross Peak Demand Impact (MW)
F2012	2	2x Rebuilt Turbo Generator	26	167	21
F2013	1	1x New Power Generation	28	181	23
F2014	0	-	28	181	23
F2015	2	1x Rebuilt Turbo Generator 1x New Power Generation	31	204	25
F2016	3	1x Rebuilt Turbo Generator 2x New Power Generation	41	263	33
F2017	0	-	41	263	33
F2018	0	-	41	263	33

Objective 2

Table ES.4 summarizes key results by project type and shows the evaluated net generation energy after adjustment for parasitic energy.

Table ES.4. Net Generation Results by Project Type

	Group 1 Rebuilt Turbo Generator	Group 2 New Power Generation
Number of Projects	4	4
Rated Capacity (MW)	32.1	8.9
Evaluated Gross Generation Energy (GWh/yr)	204	59
Evaluated Net Generation Energy (GWh/yr)	198	55
Parasitic Energy Factor	3%	6.5%
Peak-to-Energy Factor (MW/GWh)	0.129	0.117
Realization Rate[6]	91%	98%
Load displacement to facility energy ratio[7]	18%	14%
LD energy to total self-generation energy ratio[8]	25%	100%

[6] Realization rate is the ratio of evaluated net energy generation to the expected generation energy, which is the contracted generation energy of the incentive agreement.

[7] The load displacement to facility energy ratio indicates the proportion of site energy consumption that was displaced by the load displacement project on an annual basis.

[8] The load displacement to total self-generation ratio indicates the proportion of total self-generation energy at the site that was contributed by the load displacement project on an annual basis.

Table ES.5 shows a summary of reported and evaluated net generation energy and peak demand by fiscal year. Year over year reporting of load displacement generation energy improved as the operation of the systems reached steady-state. However, there was a time lag because measurement and verification results or billing reconciliation for a given reporting year only became available after fiscal year-end and were then used as the best available estimate for the next year. Considering this time lag in reporting of variations in performance between fiscal years, the evaluated net generation energy was estimated on average to have achieved 96 percent of the reported generation energy. The variance is primarily due to inconsistency in reporting of Rebuilt Turbo Generator projects, using their expected generation energy instead of the actual generation energy, and the lack of accounting of parasitic energy in reported savings for these projects. If the reported generation energy were adjusted for actual generation energy and estimated parasitic energy, the overall variance between reported and evaluated net generation energy of all eight load displacement projects would be reduced to less than one percent.

Table ES.5. Summary of Net Generation Energy and Peak Demand Impact

Fiscal Year	Net Generation Energy (GWh/yr)		Net Peak Demand Impact (MW)	
	Reported	Evaluated	Reported	Evaluated
F2012	254	162	30	20
F2013	254	176	30	22
F2014	195	176	23	22
F2015	215	196	25	25
F2016	271	253	32	32
F2017	260	253	30	32
F2018	262	253	31	32

Findings and Recommendations

Findings

1. Eight load displacement projects were evaluated for a total of 263 GWh per year in gross generation energy and 253 GWh per year in net generation energy. This resulted in 33 MW of gross peak demand impact and 32 MW of net peak demand impact.
2. Seven of the eight load displacement projects ranged from 1 MW to 5 MW in size and one exceeded 25 MW in rated capacity. Seven of the load displacement projects were considered combined heat and power and used biomass and bioenergy as the primary energy source.
3. The four Rebuilt Turbo Generator projects were found to have average availability, capacity and utilization factors of 94 percent, 78 percent and 72 percent respectively. The other four projects were of the New Power Generation type and were found to have average availability, capacity and utilization factors of 91 percent, 84 percent and 76 percent respectively.
4. The load displacement project realization ranged from 75 percent to 107 percent, with a weighted average project realization rate of 91 percent for Rebuilt Turbo Generator and 98 percent for New Power Generation type projects. The overall program realization rate was 92 percent.
5. All projects undergo annual verification of the generation energy using hourly interval data. Rebuilt Turbo Generator load displacement projects had verification of actual gross generation energy recorded by BC Hydro Contract Management, whereas New Power Generation projects underwent

annual measurement and verification activities, recording both gross and net generation energy. The reported generation energy is adjusted yearly based on this annual review for all New Power Generation type projects but not for Rebuilt Turbo Generator type projects.

6. The generation energy provided in the customer's annual CBL Statements was found to be the best available estimate for projects without annual measurement and verification. These generation energy records explain most of the variance between reported and evaluated gross generation energy for Rebuilt Turbo Generator type load displacement projects.
7. The peak-to-energy factor was found to be 8 percent higher than the industrial rate class average because six of the eight projects generated more power during BC Hydro's system winter peak as a result of higher availability factors in winter months. Generator shutdowns and annual maintenance periods, which decreased overall availability, were observed to typically occur in the spring and summer months. Two projects had peak-to-energy factor lower than the industrial rate class average because of higher process heat requirements in winter.
8. Parasitic energy is the difference between gross and net generation energy and was evaluated at 3 percent for Rebuilt Turbo Generator projects and 6.5 percent for New Power Generation projects. New Power Generation projects have more auxiliary energy requirements than incremental generation projects from Rebuilt Turbo Generators. The parasitic energy explains most of the difference between reported and evaluated net generation energy.
9. The average weighted persistence of load displacement projects was estimated to be 16 years and ranging from 10 years to 20 years. The BC Hydro Persistence Standard indicates 20 years persistence for New Power Generation type projects and 15 years persistence for Rebuilt Turbo Generator projects. Any changes to generation energy and persistence are captured in the annual M&V and engineering review process.
10. The evaluation found evidence of continuous improvement of the utilization factor of three New Power Generation load displacement projects through the annual review and the M&V process. Project underperformance was observed due to restriction in condensing capacity, fuel supply, and electrical metering issues that were identified and corrected during the first three years of operating the load displacement projects.

Recommendations

The following recommendations are for the BC Hydro Load Displacement initiative managers based on the findings of this evaluation.

1. Continue to conduct annual review and measurement and verification of all load displacement projects for reporting of actual net generation energy per fiscal year.
2. The program should use the generation energy from customer's annual CBL Statements as the best available estimate when annual measurement and verification results are not available. These apply to Rebuilt Turbo Generator type projects at large industrial customer sites with transmission service that are on the stepped rate (RS1823B).
3. The program should apply a 3% reduction to the gross generation energy for projects without an engineering estimate of parasitic energy, i.e., load displacement projects of Rebuilt Turbo Generator type.

Conclusions

BC Hydro's load displacement initiatives achieved 92 percent of expected generation energy during fiscal years F2012 to F2018. The New Power Generation projects achieved 98 percent due to continuous improvement of project performance, whereas the Rebuilt Turbo Generator projects achieved 91 percent due to overestimated utilization factor and underestimated parasitic energy. The evaluated net generation energy of both types of load displacement projects was found to produce an equivalent reduction in site energy purchases.

1.0 Introduction

1.1 Evaluation Scope

This report presents the results of an impact evaluation covering eight (8) load displacement projects implemented during the period from F2012 to F2016. Since the program has ended and no new projects were implemented in F2017 and F2018 and operational data was available for all the projects, the evaluation period covers F2012 to F2018. The projects were funded through the Power Smart Partners-Transmission Integrated Power Offer (IPO) or Load Displacement (LD) program offers. These load displacement projects were not included in the scope of any impact evaluations of the BC Hydro Power Smart Partners – Transmission (PSP-T) and Leaders in Energy Management – Transmission (LEM-T) programs.

1.2 Organization of the Report

The report is organized as follows. Section 1 covers the evaluation scope, the organization of the report and the initiative description. Section 2 discusses the approach to the evaluation, including evaluation objectives, methodology review, data sources, and methods. Section 3 provides the results organized by evaluation objective. Section 4 provides findings and recommendations. Section 5 provides conclusions. Additional supporting material is included in the appendices.

1.3 Initiative Description

Load displacement projects are customer-based generation projects that self-supply part of the customer's site electrical load. For these projects, industrial, commercial and institutional customers received BC Hydro funding and program support to generate their own electricity for self-supply and offset their electricity purchases from BC Hydro. All customer-based generation projects over 50 kW were reviewed through the Integrated Customer Solutions (ICS) process. The load displacement project enabling activities were specifically designed to operate under the ICS framework and remove technical and financial barriers specific to self-generation projects. Incentives for load displacement activities were modelled as having reduced customer energy purchases similar to energy conservation project initiatives for industrial transmission customers.

Parallel energy procurement initiatives for customer-based self-generation may include Contracted Generator Baseline (GBL) with an Energy Purchase Agreement (EPA), and the non-contracted GBL to offset energy purchases under the TSR rate structure.

BC Hydro's program records, generator interval data, as well as billing data of the customer's total self-generation energy by BC Hydro Contract Management were annually verified to ensure that there is only single attribution of any customer self-generation energy and no double counting among parallel self-generation initiatives.

Parallel demand side management (DSM) initiatives include previous and current BC Hydro DSM programs, such as LEM-T (formerly known as PSP-T) and LEM-D (formerly known as PSP-D), that allow incremental self-generation projects in their respective program portfolio. These types of self-generation projects were typically incremental generation of less than 1 MW in size and were included in the impact evaluation of their respective DSM program. None of the eight load displacement projects in this evaluation occurred in parallel with incremental self-generation projects through other DSM programs.

2.0 Approach

2.1 Evaluation Objectives

The evaluation objectives and research questions are summarized in the following table.

Table 2.1. Evaluation Objectives and Research Questions

Evaluation Objective	Research Questions
1. Estimate gross electricity generation and peak demand impacts.	What were the evaluated gross electricity generation and demand impacts realized by load displacement projects aggregated by fiscal year and, to the extent possible, disaggregated by relevant factors*?
2. Estimate net electricity generation and peak demand impacts.	What were the relative magnitude of parasitic loads and their energy use as related to the load displacement projects? What were the evaluated net electricity generation and demand impacts realized by load displacement projects aggregated by fiscal year and, to the extent possible, disaggregated by relevant factors[1]? To what extent did parallel energy procurement initiatives impact the net electricity generation of the load displacement projects?

* Relevant factors may include technology type, primary energy source, seasonal operating mode and operating strategy with other on-site process heat requirements that impact the net electricity generation.

In this evaluation and in accordance with industry standard practice for evaluating combined heat and power projects[9], gross electricity generation is defined as the total electricity produced by the generator. Net electricity generation is defined as the gross electricity generated minus parasitic energy, which represents the net impact of the load displacement project to the customer. Parasitic energy is the electrical energy required to operate the load displacement project. The parasitic energy requirements are necessary auxiliary loads such as external generator excitation power, material handling, heating and cooling, lubrication equipment, and other electrical needs required to operate the load displacement project..

2.2 Methodology Review

The main focus of most evaluations is to determine the energy savings impacts of the installed measure. The evaluation of load displacement projects is basically similar to estimating the net electricity impacts from the self-generation system at the customer side of the meter. The Uniform Methods Project (UMP) has developed the basic scope, terminology and methodology for evaluation of combined heat and power systems that are used to meet on-site energy needs. It focuses on systems that are generally sized at less than five megawatts (MW) in rated electrical generating capacity and ensures consistency with other UMP protocols.

While a number of utilities provide incentives for load displacement projects under their custom commercial and industrial program offerings, there are only a few program administrators in North America that offer programs specifically focused on load displacement. These include California's Self Generation Incentive Program, New York State Energy Research and Development Authority's Distributed Generation Combined Heat and Power program, and Manitoba Hydro's Bioenergy Optimization Program.

In most evaluations, results were reported overall but also by technology type and primary energy source. The impact evaluations relied on metering a sample of projects and applying those results to non-metered systems

[9] U.S. Department of Energy (2017). *Uniform Methods Project, Chapter 23: Combined Heat and Power Evaluation Protocol.*

for estimation of gross or net generation. Both California and New York used tele-metering (or web-based metering) to perform systematic and continuous hourly monitoring of system outputs for certain distributed generation systems. These data sources were supplemented by short-term on-site metering and billing reviews, where necessary. The short-term on-site metering typically followed the International Performance Measurement and Verification Protocol (IPMVP®) Option B procedure (retrofit-isolation, all parameter measurement).[10]

2.3 Methodology

In this evaluation, electricity self-generation impacts were evaluated over the period from F2012 to F2018 based on hourly interval data and annual measurement and verification reports when available. The objectives, data sources and methods used for this evaluation are summarized in the table below, and described in more detail following the table.

Table 2.2. Evaluation Objectives, Data and Method

Evaluation Objectives	Data	Method
1. Estimate gross electricity generation and peak demand impacts.	• Project files • Self-generation eMetering • Customer process requirements • Billing records and Customer Baseline Load (CBL) Statements	• Annual M&V results and evaluation review • Self-generation load shapes, capacity factors and peak-to-energy factors • Engineering calculations
2. Estimate net electricity generation and peak demand impacts.	• Load displacement feasibility studies • Reported savings • Project files	• Engineering estimates of parasitic loads • Annual M&V results and evaluation review

Objective 1: Evaluated Gross Electricity Generation and Peak Demand Impacts

Evaluated gross electricity generation is the energy generated due to the program and estimated from the annual M&V results and billing records by fiscal year. Four of the eight projects underwent an annual measurement and verification process for the estimation of gross and net electricity generation. These four projects with M&V are load displacement projects where a new generator was installed, and they are grouped in this evaluation under 'New Power Generation'. The other four load displacement projects at transmission customer sites were due to refurbishment and upgrading of an existing steam turbine with capacity or efficiency improvements which resulted in incremental generation to already existing generation. These are grouped in this evaluation under 'Rebuilt Turbo Generator'. The annual gross incremental generation energy from the rebuilt units was verified by BC Hydro Contract Management for each fiscal year and provided in the customer's billing records, such as the Customer Baseline Load (CBL) Statement, for each fiscal year. Measurement and verification of load displacement projects for Rebuilt Turbo Generators could not be conducted due to interactive effects and rate specific billing formula applied for attribution of the customer's total self-generation energy across parallel initiatives under the terms and conditions of the self-generation agreements. Therefore, the customer's annual CBL Statements were used in the absence of M&V results as the basis of the gross generation energy for evaluation review.

[10] Efficiency Valuation Organization (October, 2016). *Core Concepts. International Performance Measurement and Verification Protocol.*

Baselines were determined on a project by project basis. Load displacement projects can occur at customer locations where self-generation is being implemented with new generators or where incremental generating capacity was added to an existing generating system. In all cases the generation energy was determined annually based on post-implementation measurements only.

Incremental generation from Rebuilt Turbo Generator projects involving optimization of existing self-generation, i.e., turbine upgrades, may have required additional billing adjustments during annual reconciliation because customers with a contracted GBL must service their generation contracts in a prescribed order.

Additional generation energy adjustments can be required during Authorized Plant Outages (APO) or when there were significant changes to the properties and composition of fuel supply and process load requirements. Bioenergy sources can experience much greater deviation from design conditions, which can substantially impact the energy generated through the load displacement program. In these cases, the project's long-term generation energy impact was reviewed and any shortfalls in generation energy were settled financially on an annual basis.

The following table shows the characteristics of the various projects, disaggregated by relevant factors including project type, technology type, primary energy source, seasonal operating mode, and operating strategy with other on-site process heat requirements that impact the net electricity generation.

Table 2.3. Distribution of Projects by Relevant Factors

Type of LD Project	Rebuilt Turbo Generator	New Power Generation	New Power Generation	New Power Generation
Number of Projects	4	2	1	1
Customer Rate Class	Transmission	Transmission	Transmission	Transmission
Industry Sector	Pulp Mills	Wood Products	District Energy	Municipal Water
Primary Energy Source	biomass	biomass	renewable natural gas[11]	clean water flow
Technology Type	steam turbine generator	organic rankine cycle	internal combustion engine	pelton wheel
Combined Heat and Power (CHP)	with heat for process steam	with heat for product drying	with heat for space and water	No CHP
Generation Energy (Data Source)	gross (CBL Statements)	gross and net (M&V Reports)	gross and net (M&V Reports)	gross and net (M&V Reports)
Parasitic Energy	Deemed estimate	Engineering estimate	Engineering estimate	Engineering estimate
Seasonality	Fairly constant power generation	Less power generation in winter	Fairly constant power generation	Highly seasonal power generation

The first step was to collect the project data from the program tracking system and the TSR administrative records for each project and each fiscal year. This included data from the initial engineering review, which provided the expected generation energy based on the incentive agreement of the load displacement projects.

[11] Renewable natural gas is derived from biogas, which is produced from decomposing organic waste from landfills, agricultural waste and wastewater from treatment facilities. In this application it is produced in a different location than the load displacement project.

Records of post implementation review and M&V reported values of energy generated by fiscal year were also collected. For Rebuilt Turbo Generator projects with incremental self-generation, the project related annual generation energy on the customer's CBL Statements was identified as the best available estimate of the project's gross energy generated in each fiscal year. The load displacement energy provided on the CBL Statements was verified by BC Hydro Contract Management under the terms and conditions of all contractual agreements. The Evaluation team did not have access to the contracts nor the details on the attribution of the total actual generation energy.

Due to the variability of historic generation output and verified annual reporting requirements of all load displacement projects, the evaluation estimated the average generation energy and relevant factors for the project's remaining period of persistence (labelled as evaluation review) to provide an estimate of the expected performance of these projects.

The gross peak demand impact by the load displacement projects was estimated using the peak-to-energy factor of the total self-generation system at each site. These were evaluated based on hourly interval data during steady-state operations in winter. The peak-to-energy factor is calculated by dividing the average generation power during BC Hydro's system peak demand (winter weekday evenings) by the load displacement project's annual generation energy, as in the following equation:

Equation 1

$$Peak\text{-}to\text{-}Energy\ Factor\ (\frac{MW}{GWh}) = \frac{Average\ Winter\ Evening\ Gross\ Generation\ Power\ (MW)}{Annual\ Gross\ Generation\ Energy\ (GWh\ per\ year)}$$

Three additional factors were also calculated from hourly interval data to characterise and compare the system performance of each load displacement project: the capacity factor, the availability factor, and the utilization factor. These are described in more details below.

The capacity factor for a New Power Generation system is the actual average running power output of the system divided by the rated installed capacity of the system, as shown in Equation 2. For consistency and comparison, the capacity factor of the Rebuilt Turbo Generator projects with incremental generation capacity, was estimated to be equal to the capacity factor of the total generating system. Because some projects experienced performance issues during initial commissioning, the evaluated capacity factor was estimated based on recent actual performance as the most likely indicator of future performance of the load displacement project.

Equation 2

$$Capacity\ Factor\ (CF) = \frac{Actual\ average\ gross\ power\ generated}{Rated\ installed\ capacity\ of\ generation\ system}$$

The availability factor is the percentage of time the system was actually operating for each fiscal year as given by the equation below. Again, the evaluated availability factor was estimated based on recent actual performance as the most likely indicator of future performance of the load displacement project.

Equation 3

$$Availability\ Factor\ (AF) = \frac{Actual\ hours\ the\ system\ is\ running\ in\ a\ year}{8760\ hours\ per\ year}$$

The utilization factor is the extent to which the load displacement system is actually used. This performance driver depends on the percentage of time the system was operating as well as on the degree to which the system operated at rated capacity when running and was calculated as the product of the capacity factor and the availability of the system as given by equation 4. Similarly, the evaluated utilization factor was estimated to represent the project's most likely indicator of future performance.

Equation 4

$$Utilization\ Factor\ (UF) = CF\ x\ AF = \frac{Actual\ annual\ gross\ energy\ generated\ (kWh/yr)}{Rated\ system\ capacity\ (kW)\ x\ 8760\ (hours/year)}$$

The four factors were estimated individually for each of the projects, and the results were also aggregated to compare the two types of load displacement projects.

Objective 2: Net Generation Energy and Peak Demand Impacts

The net generation energy is the difference between the energy delivered by the generator and the parasitic energy requirements, as calculated using the following equation. The evaluated parasitic energy was estimated based on recent actual performance as the most likely indicator of future performance of the load displacement project.

Equation 5

$$Net\ Generation\ Energy = Gross\ Generation\ Energy - Parasitic\ Energy$$

The parasitic energy estimate for the four New Power Generation projects with M&V was verified by the M&V group using engineering calculations and spot measurements when available. No M&V results were available for the four Rebuilt Turbo Generator projects and a deemed estimate of the incremental parasitic energy was applied based on the default assumption of 3% of incremental gross generation energy[12] of the load displacement project using equation 6.

Equation 6

$$Parasitic\ energy\ of\ incremental\ generation = Gross\ Generation\ Energy\ \times 3\%$$

The evaluated net generation peak demand impacts of the program were estimated using the same peak-to-energy factors determined for Objective 1, applied to the project-based M&V estimates for parasitic energy and metered load shapes of the generation energy. This assumed that the load shape of the parasitic energy is the same as the load shape of the generation energy.

Since the expected generation energy or initial engineering estimates were based on net generation energy, each project's realization is calculated as the ratio of net generation energy to the expected generation energy. The projects were aggregated by type and the realization rate was calculated for the two types of projects. As before, the evaluated project realization was estimated as the most likely indicator of future performance of the load displacement project.

Equation 7

$$Project\ Realization\ Rate = \frac{Evaluated\ Net\ Generation\ Energy}{Expected\ Generation\ Energy}$$

[12] U.S. Department of Energy (2017). *Uniform Methods Project, Chapter 23: Combined Heat and Power Evaluation Protocol.*

Another relevant factor estimated primarily for project comparison and program overview was the ratio of the load displacement generation energy compared to the facility's energy use. The facility energy use was estimated from the annual energy purchases from BC Hydro plus the total self-generation energy at the site.

Equation 8

$$Load\ Displacement\ to\ Facility\ Energy\ Ratio = \frac{Evaluated\ Net\ Generation\ Energy\ (kWh/yr)}{Facility\ Energy\ Use\ (kWh/yr)}$$

$$= \frac{Evaluated\ Net\ Generation\ Energy\ (kWh/yr)}{Energy\ Purchases\ (kWh/yr) + Site\ Generation\ Energy (kWh/yr)}$$

Also the ratio of the project's load displacement generation energy to the total self-generation energy at the site was determined using the following equation:

Equation 9

$$Load\ Displacement\ to\ Total\ Self\text{-}generation\ Energy\ Ratio = \frac{Evaluated\ Gross\ Generation\ Energy}{Total\ Self\text{-}generation\ Energy}$$

It was not an objective of this evaluation to attribute changes in generation energy to the load displacement initiatives, which would take into consideration free ridership and spillover. In this evaluation, the term 'net generation impact' refers to the gross generation energy less parasitic energy and does not imply attribution to any intervening initiative.

These load displacement projects are assumed to have had no free ridership and non-existent spillover, for a net-to-gross ratio of one, for two reasons: First, all self-generation projects had to apply to BC Hydro for generator inter-connection and go through the integrated customer solutions process for review and evaluation. All of the eight load displacement projects in this evaluation were then directed to the load displacement capital incentive offer by BC Hydro and each project had its own business case developed with BC Hydro executive approval of the incentive amount. Hence no free ridership of the capital incentive was anticipated. Second, all generation energy is metered and customers were required to service their self-generation contracts in a prescribed order which was verified by BC Hydro for billing purposes. Hence no spillover of any unreported generation energy was deemed possible.

2.4 Alternative Methodologies

The evaluation scope was limited to estimating the gross and net electricity generation energy and peak demand impact, and because the electricity impact of all projects was assessed based on metered interval data that was verified and reconciled with billing data and tariff treatment. Therefore, no alternative methodology was considered for this evaluation.

Alternative evaluation approaches and methodologies are available and differ in levels of rigor applied in estimating the full impacts of CHP projects. Besides net electricity impacts, other associated CHP performance parameters considered for evaluation may include:

1. Net fuel impact
2. Net electrical efficiency
3. Useful heat recovery rate
4. Overall fuel conversion efficiency
5. Electrical energy offset
6. Fuel offset

Although less frequently considered in CHP evaluations are other issues like degradation in availability and performance due to aging during the project's lifetime, normalization of performance to weather, process loads for CHP systems that serve process loads, relationship between the cost of fuel and electricity, heating and cooling loads served, and overall grid effects. Free ridership and spillover do not typically occur in CHP projects greater than 1 MW, because CHP projects are complex and require detailed engineering estimates and effort in obtaining permits, commissioning, and supporting maintenance and operation. These related performance factors were not used in this evaluation because only eight projects were completed in the evaluation period and the fact that the load displacement initiative was no longer available to customers since F2017.

3.0 Results

3.1 Gross Generation Energy and Peak Demand Impacts

Gross generation energy is the energy generated by customers as a result of participation in the load displacement initiative. As detailed in Section 2.3, gross generation energy was determined from M&V results for the four New Power Generation projects, and from CBL Statements and tariff treatment for the four Rebuilt Turbo Generator projects.

Evaluated results below are given as the best available estimate of overall project performance, considering the annual review and verification of the actual reported energy generated for each load displacement project.

Table 3.1. Gross Generation Results by Project Type

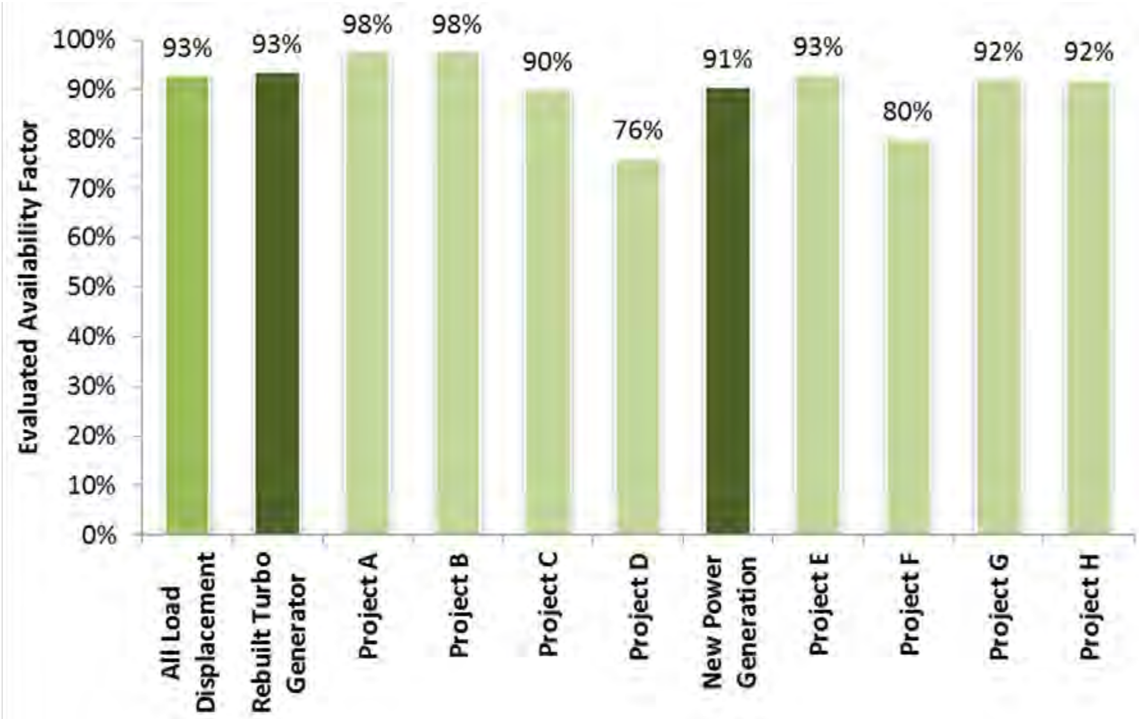
	Group 1 Rebuilt Turbo Generator	Group 2 New Power Generation
Number of Projects	4	4
Rated Capacity (MW)	32.1	8.9
Expected Generation Energy (GWh/yr)	218	56
Evaluated Gross Generation Energy (GWh/yr)	204	59
Availability Factor	93%	91%
Capacity Factor	77%	84%
Utilization Factor	72%	76%
Peak-to-Energy Factor (MW/GWh)	0.129	0.117

The following section describes the evaluated results of the relevant factors by project and project type. Additional details of relevant factors by project type and fiscal year are provided in Appendices C and D.

Availability Factor

The availability factor represents the percentage of time a project is operating within a given fiscal year and generating electricity, and was calculated from hourly interval data. Figure 3.1 shows the evaluated availability factor by project and in aggregate by project type.

Figure 3.1. Availability Factor by Project and Project Type



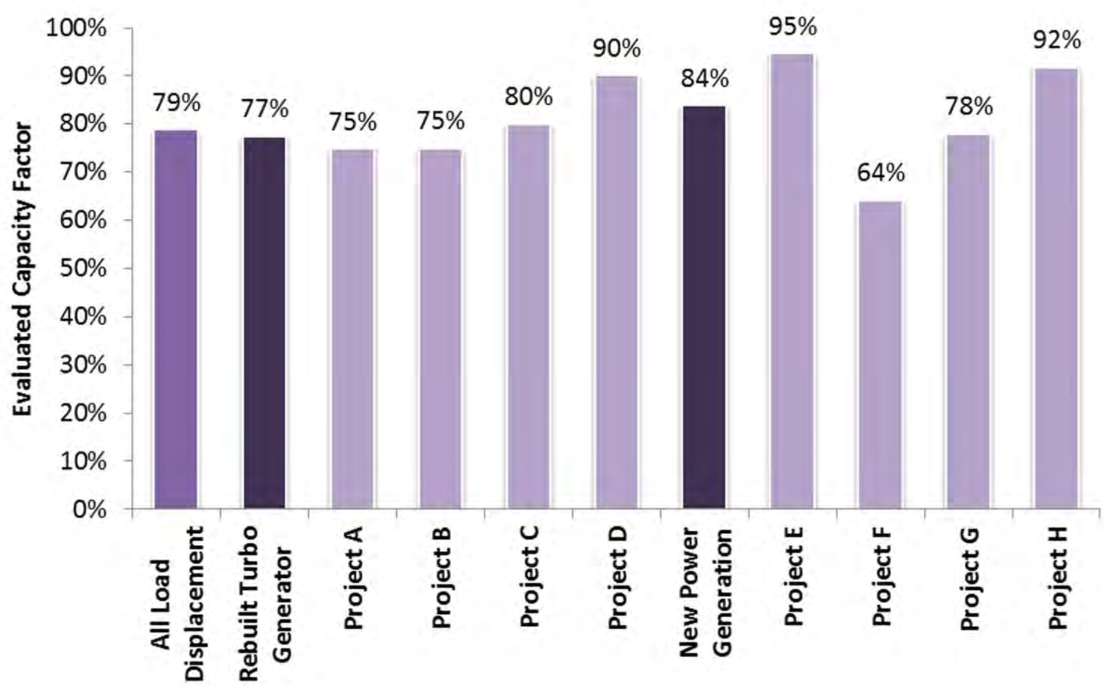
In general, the availability factor by individual projects ranged from 76 percent to 98 percent and Rebuilt Turbo Generator projects had a weighted average of 93 percent, slightly higher than New Power Generation projects which had a weighted average availability factor of 91 percent. These availability factors are as expected of these types of load displacement projects[13], especially with biomass as the primary energy source.

Capacity Factor

The capacity factor relates the average loading of the generator to its rated capacity and was calculated from hourly interval data. The capacity factor of Rebuilt Turbo Generator projects was estimated based on the average generated power and the rated capacity of the total generation system. The results are shown in Figure 3.2 for individual projects and in aggregate by project type. The capacity factor ranged from 64 percent to 95 percent, indicating that all load displacement projects had excess capacity to potentially increase generation power and energy.

[13] Catalog of CHP Technologies, U.S. Environmental Protection Agency Combined Heat and Power Partnership, September 2017.

Figure 3.2. Capacity Factor by Project and Project Type

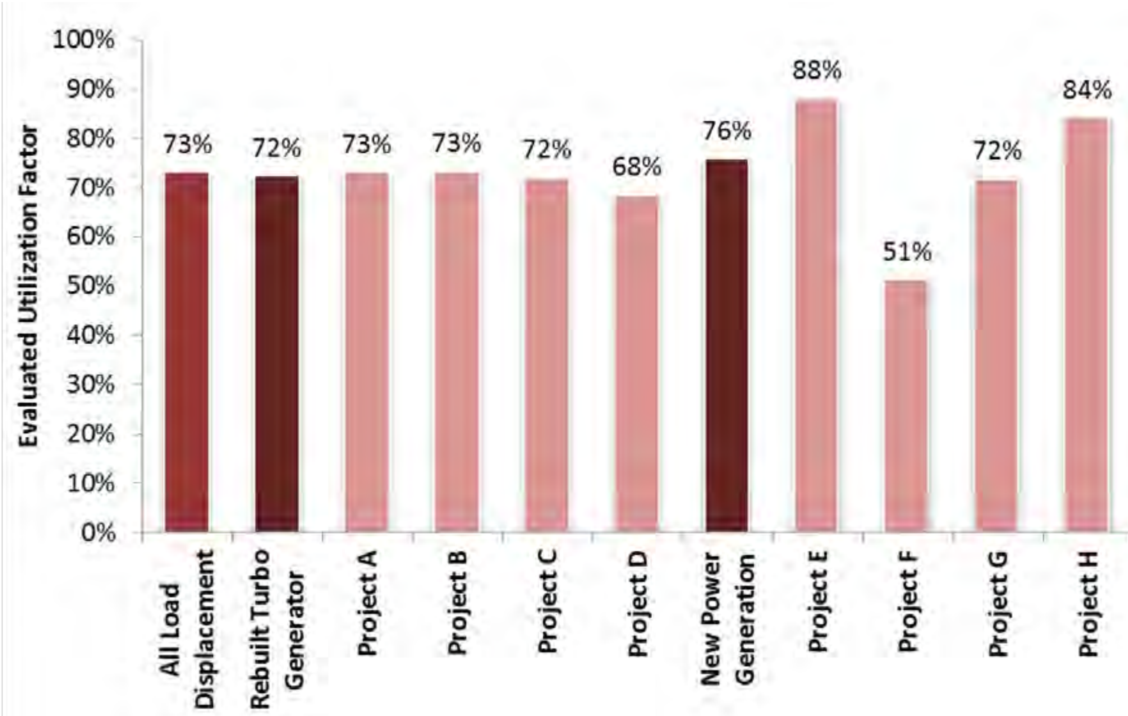


The capacity factor was found to increase over time (see Appendix D) for New Power Generation projects, reaching a weighted average of 84 percent. Likewise for the Rebuilt Turbo Generator projects, the capacity factor was found to average around 77 percent for all years of past operation. The reasons for lower capacity factors were not evaluated but can be due to variations in process heat requirements at mills and to variability in the fuel supply and quality that is common with biomass-based generation.

Utilization Factor

The utilization factor is the overall utilization of the load displacement project and is calculated as the product of the availability factor and the capacity factor. It is shown in Figure 3.3 and individual projects were found to range from 51 percent to 88 percent. On average, New Power Generation projects achieved a utilization factor of 76 percent and Rebuilt Turbo Generator projects 72 percent, for a weighted average utilization factor of 73 percent for all load displacement projects.

Figure 3.3. Utilization Factor by Project and Project Type

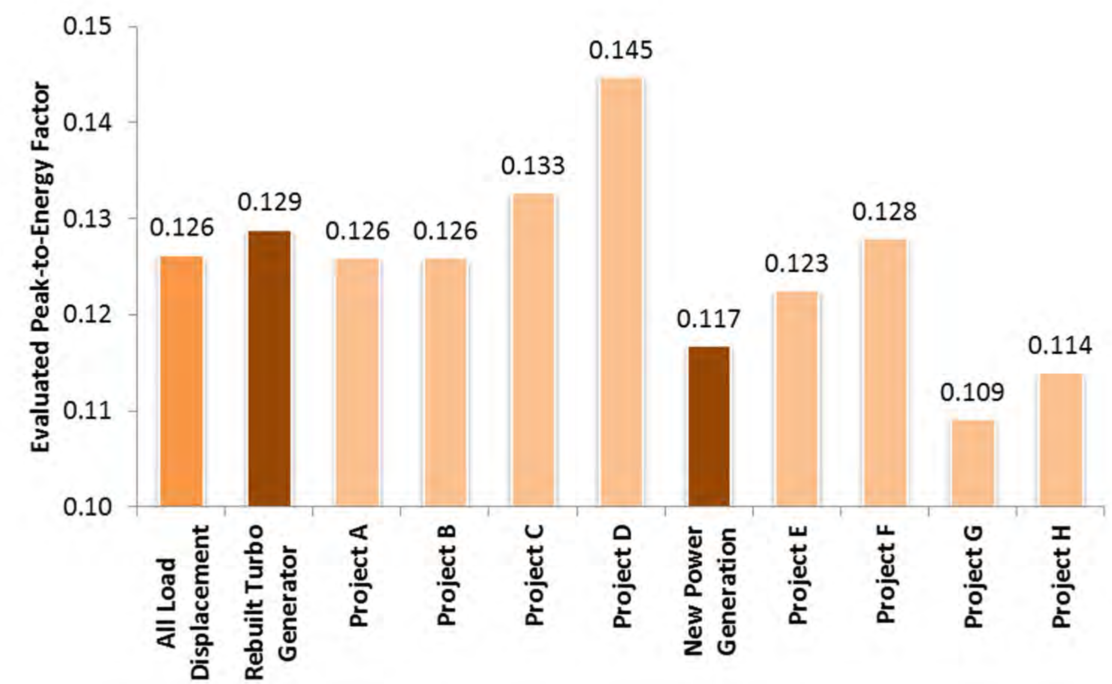


Peak-to-Energy Factor

The peak-to-energy factor was evaluated for each project from hourly interval data based on the average power generated between December and February and is shown in Figure 3.4. Peak-to-energy factors are usually determined using winter weekday evening loads, to correspond with the BC Hydro system peak, but the variations of generated power between winter days of the week (weekday versus weekend) and winter hours of the day (evenings versus other hours of the day) were negligible.

The evaluated peak-to-energy factor was found to be 0.126 MW per GWh, almost 8 percent higher than the industrial transmission rate class average of 0.117 MW per GWh which is typically applied to energy conservation measures. This higher peak-to-energy factor results in a higher estimate of peak demand impact from load displacement projects.

Figure 3.4 Peak-to-Energy Factor by Project and Project Type



Six of the eight projects had an evaluated peak-to-energy factor higher than the industrial rate class average of 0.117 MW per GWh used in the reported savings. Overall, this result indicates that the average power generated in winter is greater than the average power generated during the year. On the other hand, the two projects with lower evaluated peak-to-energy factor had a seasonal winter impact with lower generating power in winter, likely due to higher winter process heat requirements at the facility.

The average peak-to-energy factor for New Power Generation projects was found to be 0.117 MW per GWh, which is close to a flat load. In contrast, the Rebuilt Turbo Generator projects had, on average, a higher peak-to-energy factor of 0.129 MW per GWh.

The number of load displacement projects implemented by fiscal year, as well as the cumulative rated capacity, the evaluated gross generation energy, and the evaluated gross peak demand impact are summarized in the table below. Results are given as cumulative due to the variation of project results with annual review through measurement and verification.

Table 3.2 Evaluated Gross Generation Energy and Peak Demand Impact

Fiscal Year	Number of New Projects	Load Displacement Project Type	Cumulative Rated Capacity (MW)	Cumulative Evaluated Gross Generation Energy (GWh/yr)	Cumulative Evaluated Gross Peak Demand Impact (MW)
F2012	2	2x Rebuilt Turbo Generator	26	167	21
F2013	1	1x New Power Generation	28	181	23
F2014	0	-	28	181	23
F2015	2	1x Rebuilt Turbo Generator 1x New Power Generation	31	204	25
F2016	3	1x Rebuilt Turbo Generator 2x New Power Generation	41	263	33
F2017	0	-	41	263	33
F2018	0	-	41	263	33

The evaluated gross generation energy of the eight load displacement projects, with 41 MW of cumulative generating capacity, 93% availability factor, and 79% capacity factor, displaced gross energy purchases of 263 GWh per year and reduced BC Hydro's system peak demand by 33 MW.

3.2 Net Generation Energy and Peak Demand Impacts

The evaluated net generation energy is the net energy impact from the load displacement program and includes the adjustment for parasitic energy. Since these projects have annual reporting requirements, the generation energy and relevant factors given in the table below are aggregated by project type.

Table 3.3 Net Generation Results by Project Type

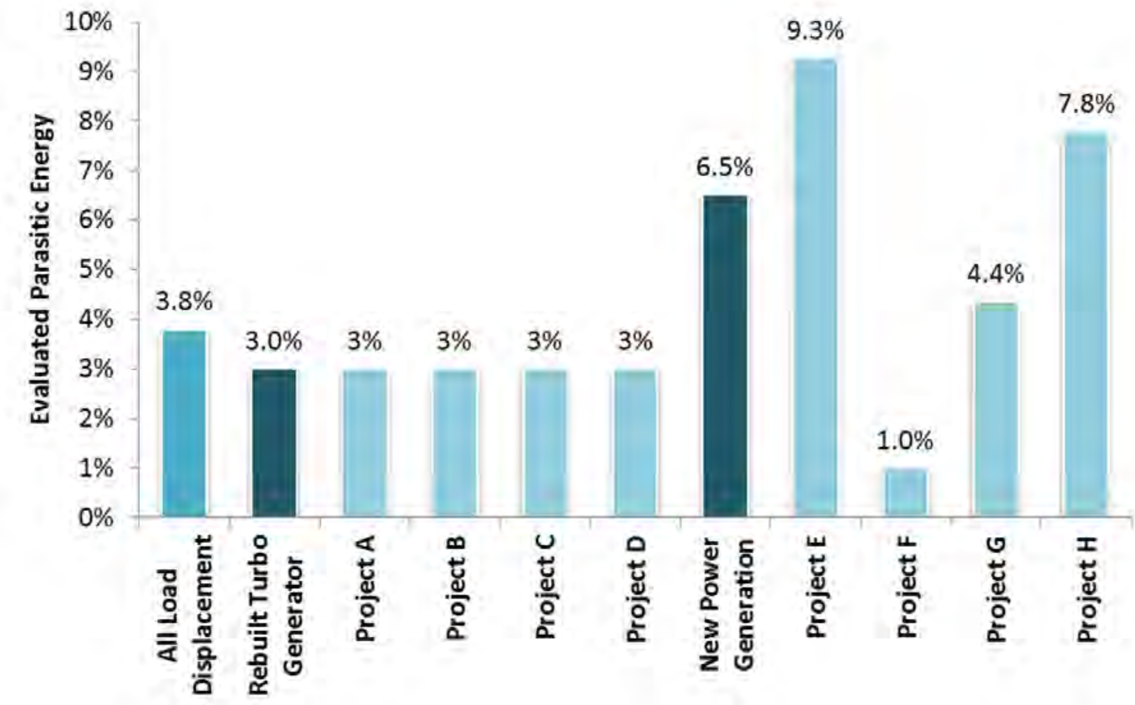
	Group 1 Rebuilt Turbo Generator	Group 2 New Power Generation
Number of Projects	4	4
Rated Capacity (MW)	32.1	8.9
Evaluated Gross Generation Energy (GWh/yr)	204	59
Evaluated Net Generation Energy (GWh/yr)	198	55
Parasitic Energy Factor	3%	6.5%
Peak-to-Energy Factor (MW/GWh)	0.129	0.117
Realization Rate	91%	98%
Load displacement to facility energy ratio*	18%	14%
LD energy to total self-generation energy ratio*	25%	100%

* The results for these two ratios are discussed in Section 3.3

Parasitic Energy Factor

The average weighted parasitic energy was found to be 3.8 percent and is shown by project type in Figure 3.5. The parasitic energy of New Power Generation projects had an engineering estimate with annual review during M&V ranging from 1 percent to over 9 percent of generation energy. However, the parasitic energy factor was not applied to Rebuilt Turbo Generator projects. The evaluation found that the default assumption of 3 percent of gross generation energy was appropriate for Rebuilt Turbo Generator projects.

Figure 3.5 Parasitic Energy Factor by Project and Project Type



Peak-to-Energy Factor

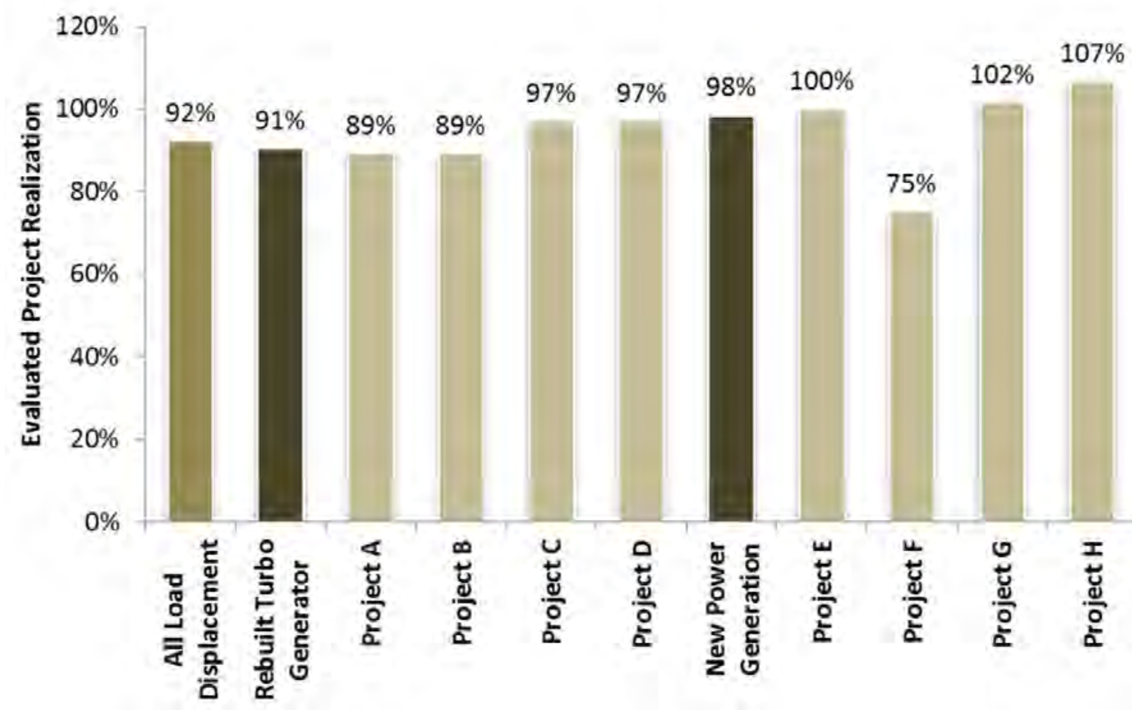
The peak-to-energy factor for net generation energy was assumed to be the same as estimated for gross generation energy which was estimated in Objective 1 for a weighted average of all eight load displacement projects of 0.126 MW per GWh. This assumed that generation energy and parasitic energy have the same load shape.

The peak demand impact of the load displacement projects was significant in magnitude and coincided with the BC Hydro system peak, and yet it was found that these projects potentially have additional capacity to ramp up electricity output. This potential capacity could be utilized as a capacity-focused DSM or demand response resource in the future. The evaluation estimated a theoretical potential to increase the peak-to-energy factor to 0.2 MW per GWh, for an additional 18 MW of peak demand impact for all CHP systems with a load displacement project. The ability to ramp up these combined heat and power systems during peak demand periods is dependent on a number of factors that may require further investigation, including the ability to control the generation rapidly and the ability of the host site to use the captured heat needed to increase the integration of these distributed energy resources onto the grid.

Project Realization

The project realization is the ratio of evaluated net energy generation to the expected generation energy, which is the contracted generation energy of the incentive agreement. Project realization is shown by project and aggregated by project type in the following figure.

Figure 3.6 Project Realization by Project and Project Type



Typical project realization was found to be 92 percent which means load displacement projects produced less than their expected generation energy. This is primarily due to the parasitic energy factor of Rebuilt Turbo Generator projects and the lower than expected aggregate utilization factor. New Power Generation projects also did not achieve their expected generation energy because of one project with lower than expected utilization factor.

The generation energy resulting from these projects is reported each fiscal year and adjusted using the most recent estimate as the best available estimate of net generation energy. In summary, the load displacement initiative included eight projects between F2012 and F2018 and achieved 96 percent of the reported generation energy and 101 percent of the reported peak demand impact. The results by fiscal year are given in the following table.

Table.3.4. Summary of Net Generation Energy and Peak Demand Impact

Fiscal Year	Net Generation Energy (GWh/yr)		Net Peak Demand Impact (MW)	
	Reported	Evaluated	Reported	Evaluated
F2012	254	162	30	20
F2013	254	176	30	22
F2014	195	176	23	22
F2015	215	196	25	25
F2016	271	253	32	32
F2017	260	253	30	32
F2018	262	253	31	32

Year over year reporting of load displacement generation energy improved as the operation of the self-generating systems reached closer to steady-state operation. However, there was a time lag because M&V results for a given reporting year only became available after fiscal year-end and were then used as the best available estimate for the next year. Considering this time lag in reporting variations in performance between fiscal years, the evaluated net generation energy was estimated, on average, to have achieved 96 percent of the reported generation energy. The variance is primarily due to inconsistency in the reporting of Rebuilt Turbo Generator projects, using their expected generation energy instead of the actual generation energy, and the lack of accounting of parasitic energy in reported savings for these projects. If the reported generation energy were adjusted for actual generation energy and estimated parasitic energy, the overall variance between reported and evaluated net generation energy of all eight load displacement projects would be reduced to less than one percent.

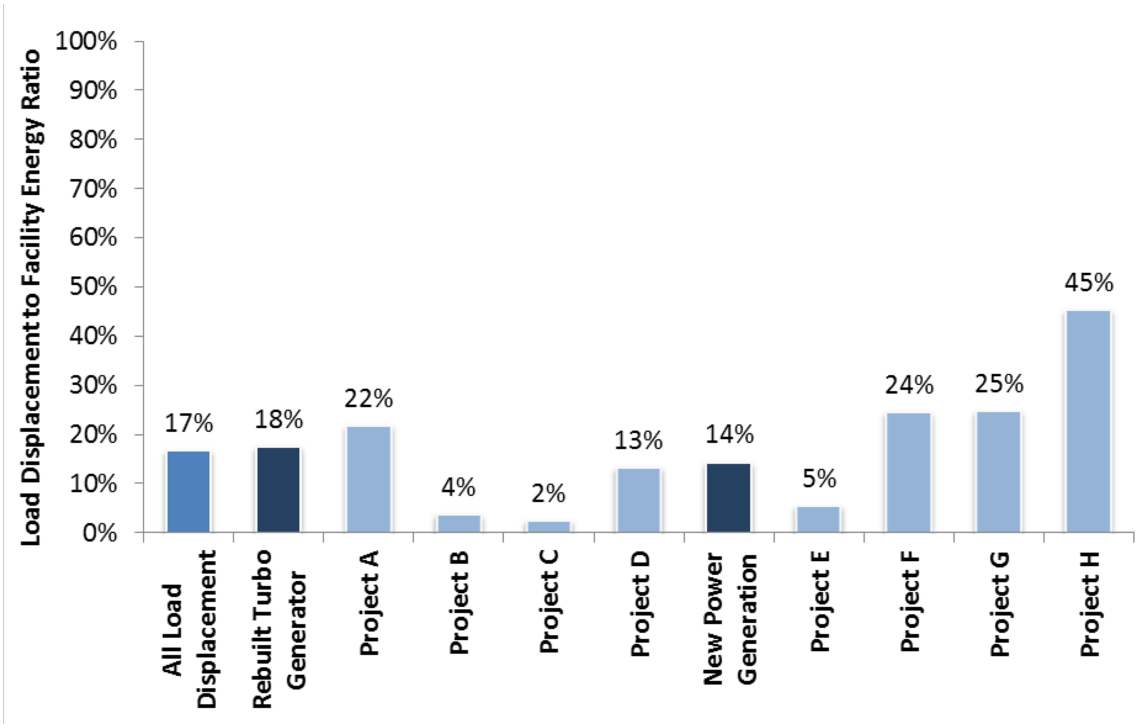
3.3 Results for Other Relevant Factors

The evaluation included other relevant factors as performance metrics for design and development of future load displacement projects. These include the load displacement to facility energy ratio and the load displacement to total self-generation energy ratio. The findings are described below.

Load Displacement to Facility Energy Ratio

The load displacement to facility energy ratio indicates the proportion of annual site energy consumption that was displaced by the load displacement project. The results are shown in the graph below for the eight projects and in aggregate by project type. This ratio ranged from 2 percent to almost 22 percent for Rebuilt Turbo Generator projects, and 5 percent to 45 percent for New Power Generation projects. The weighted average for all load displacement projects was 17 percent.

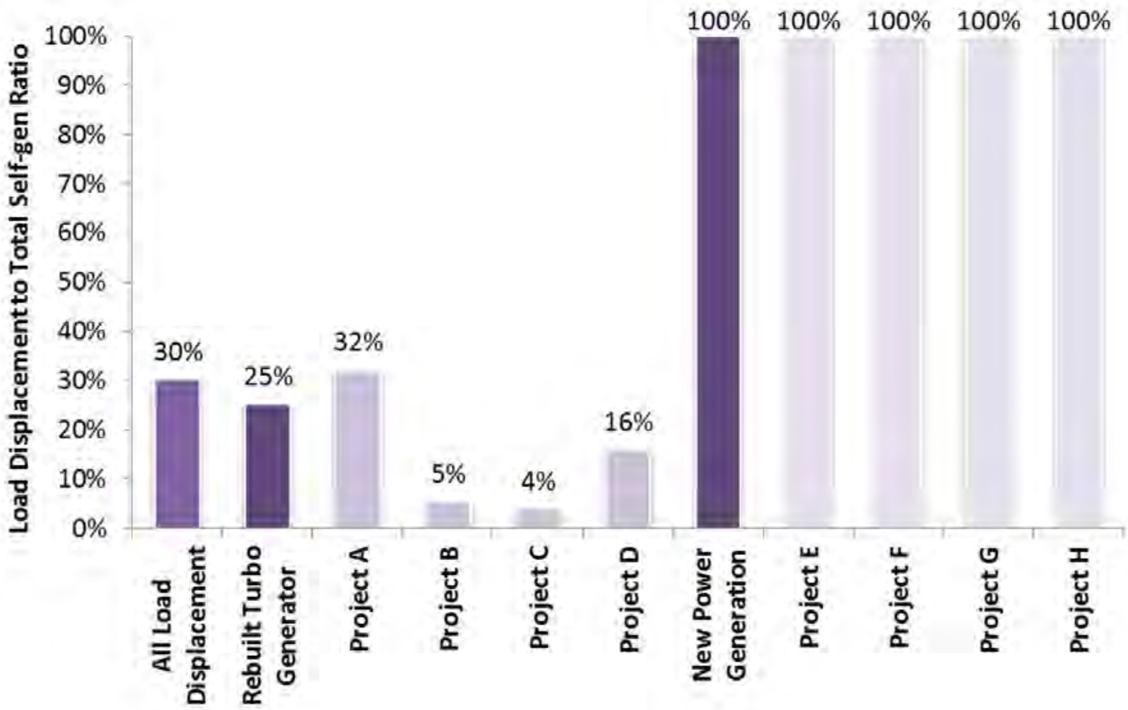
Figure 3.7 Load Displacement to Facility Energy Ratio by Project and Project Type



Load Displacement to Total Self-generation Energy Ratio

Load displacement projects of Rebuilt Turbo Generator type were found to have contributed approximately 25 percent to the total annual self-generation energy. All New Power Generation projects were at sites without previous self-generation and hence resulted in a 100% increase in self-generation at that site. This is illustrated in Figure 3.8.

Figure 3.8 Load Displacement to Total Self-generation Energy by Project and Project Type



Persistence

The average weighted persistence of the eight load displacement projects was found to be 16 years based on the BC Hydro Persistence Standard[14]. The BC Hydro Persistence Standard prescribes persistence and effective measure life of 20 years for New Power Generation and 15 years for Rebuilt Turbo Generator projects, although it includes provisions for adjusting these values based on annual review of generation energy and the terms of load displacement contracts. The evaluation found that project persistence for 3 projects (two Rebuilt Turbo Generator and one New Power Generation project) was adjusted to match the terms of the contract for the project.

3.4 Limitations

The following limitations were recognized in this evaluation.

1. Projects are complex, large, and unique, making it difficult to compare performance between projects. Although each project undergoes custom energy studies and extensive engineering reviews before implementation, the actual project operation and performance can vary over the project persistence, such that the evaluated project performance over the entire persistence period is difficult to predict based on past performance alone. However, this risk is substantially reduced over time and eventually eliminated due to the annual M&V and engineering review process.

[14]BC Hydro DSM Standard: Effective Measure Life and Persistence – Revision 10, June 2016

2. Confidence and precision of the performance characteristics were not statistically tested for their significance because all eight projects were included in the evaluation and no extrapolation was required.
3. Parasitic energy was mostly based on engineering estimates with spot measurements when available. No measurements of parasitic energy of incremental Rebuilt Turbo Generator projects were considered feasible, so that a default assumption of industry standard practice was used. However, this assumed that the parasitic load and energy is directly proportional to the variation in generation energy.
4. Other performance characteristics typical of combined heat and power projects, as well as variability in plant production, may impact the program performance but were not evaluated as there was no program need or requirement.
5. Customer satisfaction and experience was not evaluated because the program has ended and no future load displacement program is under consideration at this time.

4.0 Findings and Recommendations

Findings and recommendations are presented below.

4.1 Findings

1. Eight load displacement projects were evaluated for a total of 263 GWh per year in gross generation energy and 253 GWh per year in net generation energy. This resulted in 33 MW of gross peak demand impact and 32 MW of net peak demand impact.
2. Seven of the eight load displacement projects ranged from 1 MW to 5 MW in size and one exceeded 25 MW in rated capacity. Seven of the load displacement projects were considered CHP and used biomass and bioenergy as the primary energy source.
3. The four Rebuilt Turbo Generator projects were found to have average availability, capacity and utilization factors of 94 percent, 78 percent and 72 percent respectively. The other four projects were of the New Power Generation type and were found to have average availability, capacity and utilization factors of 91 percent, 84 percent and 76 percent respectively.
4. The load displacement project realization ranged from 75 percent to 107 percent, with a weighted average project realization rate of 91 percent for Rebuilt Turbo Generator and 98 percent for New Power Generation type projects. The overall program realization rate was 92 percent.
5. All projects undergo annual verification of the generation energy. Rebuilt Turbo Generator load displacement projects had verification of actual gross generation energy recorded by BC Hydro Contract Management, whereas New Power Generation type projects underwent annual measurement and verification activities, recording both gross and net generation energy recorded. The reported generation energy is adjusted yearly based on this annual review for all New Power Generation type projects but not for Rebuilt Turbo Generator type projects.
6. The generation energy provided in the customer's annual CBL Statements was found to be the best available estimate for projects without annual measurement and verification. These generation energy records explain most of the variance between reported and evaluated gross generation energy for Rebuilt Turbo Generator type load displacement projects.
7. The peak-to-energy factor was found to be 8 percent higher than the industrial rate class average because six of the eight projects generated more power during BC Hydro's system winter peak because of higher availability factors in winter months. Generator shutdowns and annual maintenance periods which decreased overall availability were observed to be typically in the spring and summer months. Two projects had peak-to-energy factor lower than the industrial rate class average because of higher process heat requirements in winter.
8. Parasitic energy is the difference between gross and net generation energy and was evaluated at 3 percent for Rebuilt Turbo Generator projects and 6.5 percent for New Power Generation projects. New Power Generation projects have more auxiliary energy requirements than incremental generation projects from Rebuilt Turbo Generators. The parasitic energy explains most of the difference between reported and evaluated net generation energy.
9. The average weighted persistence of load displacement projects was estimated to be 16 years and ranging from 10 years to 20 years. The BC Hydro Persistence Standard indicates 20 years persistence for New Power Generation type projects and 15 years persistence for Rebuilt Turbo Generator

projects. Any changes to generation energy and persistence are captured in the annual M&V and engineering review process.

10. The evaluation found evidence of continuous improvement of the utilization factor of three New Power Generation load displacement projects through the annual review and M&V process. Project underperformance was observed due to restriction in condensing capacity, fuel supply, and electrical metering issues that were identified and corrected during the first three years of operating the load displacement projects.

4.2 Recommendations

The following recommendations are for the BC Hydro Load Displacement initiative managers based on the findings of this evaluation.

1. Continue to conduct annual review and measurement and verification of all load displacement projects for reporting of actual net generation energy per fiscal year.
2. The program should use the generation energy from customer's annual CBL Statements as the best available estimate when annual measurement and verification results are not available. These apply to Rebuilt Turbo Generator type projects at large industrial customer sites with transmission service and are on the stepped rate (RS1823B).
3. The program should apply a 3% reduction to the gross generation energy for projects without an engineering estimate of parasitic energy, i.e., load displacement projects of Rebuilt Turbo Generator type.

5.0 Conclusions

BC Hydro’s load displacement initiatives achieved 92 percent of expected generation energy during fiscal years F2012 to F2018. The New Power Generation projects achieved 98 percent due to continuous improvement of project performance, whereas the Rebuilt Turbo Generator projects achieved 91 percent due to underestimated utilization factor and parasitic energy. The evaluated net generation energy of both types of load displacement projects was found to produce an equivalent reduction in site energy purchases.

Evaluation Oversight Committee Sign-Off

BC Hydro's Evaluation Oversight Committee is made up of DSM stakeholders from various parts of the company and is mandated to ensure that BC Hydro's DSM evaluations are objective, unbiased and of sufficient quality.

The Evaluation of the *Power Smart Partners - Load Displacement Initiatives Impact Evaluation: F2012-F2018* meets the following criteria for approval by the Evaluation Oversight Committee:

- The evaluation complied with the defined scope.
- The evaluation methodology is appropriate given the available resources at the time of the evaluation.
- The evaluation results are reasonable given the available data and resources at the time of the evaluation.

Abbreviations and Glossary

Customer Baseline Load (CBL): an energy quantity, established in accordance with principles described in the Transmission Service Rate (Tariff Supplement 74) that is intended to be representative of a customer's normal historic annual electricity consumption. An annual CBL Statement is issued by BC Hydro for each customer on stepped rate schedule (RS1823B) that includes all adjustments to a customer's energy bill for the purpose of CBL administration.

Demand Side Management (DSM): The definition of Demand Side Management is the same as the definition of "demand-side measures" set out in section 1 of the Clean Energy Act, which is "a rate, measure, action or program undertaken; (a) to conserve energy or promote energy efficiency, (b) to reduce the energy demand a public utility must serve, or (c) to shift the use of energy to periods of lower demand, but does not include (d) a rate, measure, action or program the main purpose of which is to encourage a switch from the use of one kind of energy to another such that the switch would increase greenhouse gas emissions in British Columbia, or (e) any rate, measure, action or program prescribed".

Electricity Purchase Agreement (EPA): An agreement between BC Hydro and the customer establishing the terms and conditions under which BC Hydro purchases self-generation output produced at the customer's Contracted Generating Unit.

Expected Generation Energy: Estimate of generation energy that is net of parasitic energy and based on the initial engineering estimates. These estimates represent the unverified net electricity impacts of the load displacement project.

Generator Baseline (GBL): The customer's annual, seasonal, monthly or hourly contractual commitment for self-supply from a Contracted Generating Unit that must be satisfied to obtain financial payments.

Gigawatt Hour (GWh): One billion watt-hours; one million kilowatt hours.

Gross Generation Energy: The electrical energy produced by the load displacement project, not all of which is usable to offset the customer's energy purchases.

Load Displacement Agreement (LDA): An agreement between BC Hydro and a customer establishing the terms and conditions under which BC Hydro provides the customer with a financial incentive to make self-generation output for self-supply from a Contracted Generating Unit.

Load Displacement Project: Projects for industrial, commercial and institutional customers that received BC Hydro funding and program support to generate their own electricity for self-supply and offset electricity purchases from BC Hydro.

Net Generation Energy: The generation energy for actual use by the customer. It is estimated by the gross generation energy minus the parasitic energy.

New Power Generation: Type of load displacement project that includes a New Power Generating system of various technologies (internal combustion engine, organic Rankine cycle, combined cycle, boiler steam turbo-generator, combined heat and power, fuel cell, solar).

Parasitic Energy: The electrical energy that is required for the operation of the load displacement project. This is due to a variety of equipment associated with service of the load displacement project, for example, pumps and fans for moving fluids or gases, but not including generator losses.

Peak demand impact: The reduction in demand (MW) that occurs during BC Hydro's system peak hours (from 5 pm-7 pm, Monday through Friday, December through February) as a result of the load displacement project.

Persistence: Refers to how long the generation energy is expected to be attributable to the demand side management activity.

Realization Rate: The ratio of net generation energy adjusted during measurement and verification and evaluation review to the expect generation energy.

Rebuilt Turbo Generator: Type of load displacement project when the turbine casing, turbine blades, turbine shaft, generator windings, etc., are refurbished to improve generation performance, condition and life of the used turbo generator. Usually a lower persistence is given to a Rebuilt Turbo Generator compared to a new turbo generator type projects.

Renewable Natural Gas: Renewable natural gas is derived from biogas, which is produced from decomposing organic waste from landfills, agricultural waste and wastewater from treatment facilities.

Reported Savings: Estimate of net generation energy being recorded in the program tracking database for a given fiscal year. Reported generation energy is based on best information available from technical review of the initial engineering estimate, post-implementation review of documentation and/or inspection, measurement and verification results, or other information sources such as CBL Statements.

Appendix A Results Summary

The purpose of this appendix is to summarize key numerical results from the Load Displacement Initiatives impact evaluation for the period of F2012 to F2018. The following table present the savings summary.

Table A.1. Energy and Demand Savings

	Reported	Evaluated Gross	Evaluated Net
Generation energy (GWh/yr)	271	263	253
Peak demand impact (MW)	32	34	32

The following table presents the key results and findings.

Table A.2. Key Results of Load Displacement Projects for F2012-F2018

Key parameter and relevant factors	Group1: Rebuilt Turbo Generator	Group 2: New Power Generation
Number of projects	4	4
Rated Capacity (MW)	32	9
Expected Generation Energy (GWh/yr)	218	56
Reported Generation Energy (GWh/yr)	218	52
Evaluated Gross Generation Energy (GWh/yr)	204	59
Evaluated Net Generation Energy (GWh/yr)	198	55
Evaluated Net Peak Demand Impact (MW)	25.5	6.5
Parasitic Energy Factor	3%	6.5%
Realization Rate	91%	98%
Peak-to-Energy Factor	0.129	0.117
Availability Factor	93%	91%
Capacity Factor	77%	84%
Utilization Factor	72%	76%
Load Displacement to Facility Energy Ratio	18%	14%
Load Displacement to Total Self-generation Energy Ratio	25%	100%
Free ridership (not evaluated; deemed zero for large LD projects)	0; not evaluated	0; not evaluated
Spillover (not evaluated; deemed zero for large LD projects)	0; not evaluated	0; not evaluated
Average Weighted Persistence (years)	16	19
Variance Factor (evaluated net as % of reported generation energy)	91%	106%
Variance Energy (GWh/yr)	-21	+3
Reason for variance: 1. Average adjustment for actual generation from CBL Statements (GWh/yr) 2. Average adjustment for parasitic energy (GWh/yr)	 -15 GWh/yr -6 GWh/yr	

Appendix B Advisor Memos on Evaluation Report

Advisory Memo on Evaluation Report

March 27, 2020

To: BC Hydro
333 Dunsmuir St.
Vancouver, B.C.
V6B 5R3

From: Pierre Baillargeon
Evaluation Advisor
Vice President Econoler
160 Saint-Paul St., Suite 200
Quebec City, QC GIK 3W1

Re: Load Displacement Program Evaluation

Dear Madam or Sir,

This advisory memo summarizes the opinions of the evaluation advisor on the evaluation work performed by the BC Hydro evaluation team for the abovementioned program. It takes into consideration the initial comments and answers from the evaluation team, which were incorporated into the final version of the evaluation report when appropriate.

Overall appreciation of the report:

- Very good report, with clear and comprehensive explanations of the evaluation steps. The results highlight the key points demonstrating the achievement of the initiative.
- The advisor commends the evaluation team for the openness and transparency during the whole review process. Exchanges with the BC Hydro team were excellent. They provided clear and precise answers to all questions and additional information whenever necessary.

1. What is your assessment of the **quality of the research design**? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluation results?
   - The quality of the research design is excellent, the evaluation objectives and research questions are clear and the report answers those questions.

2. What is your assessment of the **quality of the input data**? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluation results?

- The program evaluation is based on high-quality data. Mainly emetering, customer billing and customer baseline load (CBL).

3. What is your assessment of the **quality of the analytical methods**? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluation results?
   - The analytical method was good and appropriate for the type of evaluation conducted. The new construction component relied on well-known M&V approaches.
   - All equations used for the peak-to-energy factor, capacity factor, availability factor, utilization factor, etc., follow sound engineering principles.
   - The evaluation of a peak-to-energy factor for each site individually provides a better estimate of overall peak effects.
   - The assumption used to estimate parasitic loads (as proportional to generation) was appropriate, considering the small effect of those loads.

4. How does the methodology **compare to common industry practice** for evaluations of similar initiatives?
   - Combining the M&V and billing analysis approaches is generally consistent with best practices to establish load displacement program impacts.

5. What are your **suggestions for future evaluations** of this DSM initiative?
   - The only recommendation is to explore the untapped potential for LD from the implemented projects, which was estimated at approximately 18 MW.

6. Do you have any other comments that you would like to make?
   - No, this evaluation report is very good. Well done.

Advisor Memo on Evaluation Report

March 25, 2020

To: BC Hydro

From: Rafael Friedmann
EOC Evaluation Advisor
Oakland, California

Re: Load Displacement Program Evaluation

1. What is your assessment of the quality of the research design? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluation results?
    - The research design was appropriate for the task at hand.

2. What is your assessment of the quality of the input data? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluation results?
    - Data is adequate and based on a variety of sources, particularly billing and project M&V.

3. What is your assessment of the quality of the analytical methods? If you identify any shortcomings, what is your assessment of their potential risk for the validity of the evaluation results?
    - Methods are straightforward and aligned with the results sought.
    - One project had major commissioning issues that delayed "steady-state" operations and thus, its impact results
    - Persistence based on BCH standards. These are based on engineering estimates; not evaluated due to the long life (16 or more years).

4. How does the methodology compare to common industry practice for evaluations of similar initiatives?
    - Unaware of similar research elsewhere as this is a unique program to my knowledge.

5. What are your suggestions for future evaluations of this DSM initiative?
    - Understand the program is discontinued. If it were to be started again, suggest that more research be done to explore further the apparently significant, untapped opportunities for further Load Displacement
    - Consider tracking persistence if deemed important given the size of some of these projects

6. Do you have any other comments that you would like to make?
    - Well written and comprehensive report

Appendix C Project Details

The following series of figures show the distribution of generation energy of the load displacement projects by project type, technology type, primary energy source, and combined heat and power applications.

Figure C.1. Distribution of Generation Energy by Project Type

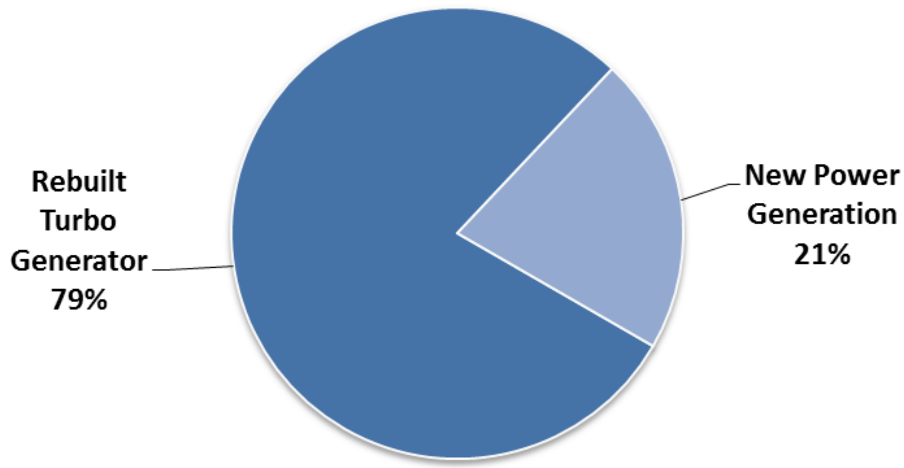

Figure C.2. Distribution of Generation Energy by Primary Energy Source

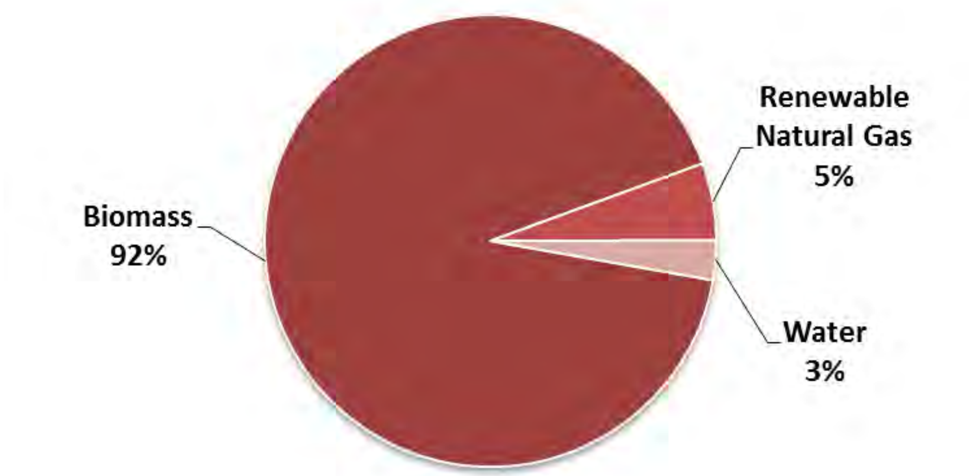

Figure C.3. Distribution of Generation Energy by Technology Type

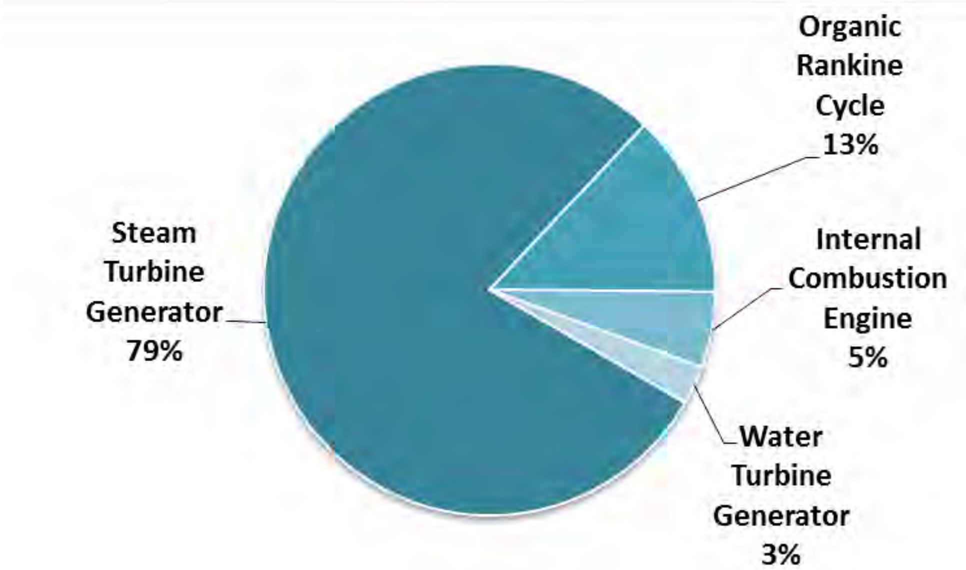

Figure C.4. Distribution of Generation Energy by Combined Heat and Power (CHP) Application

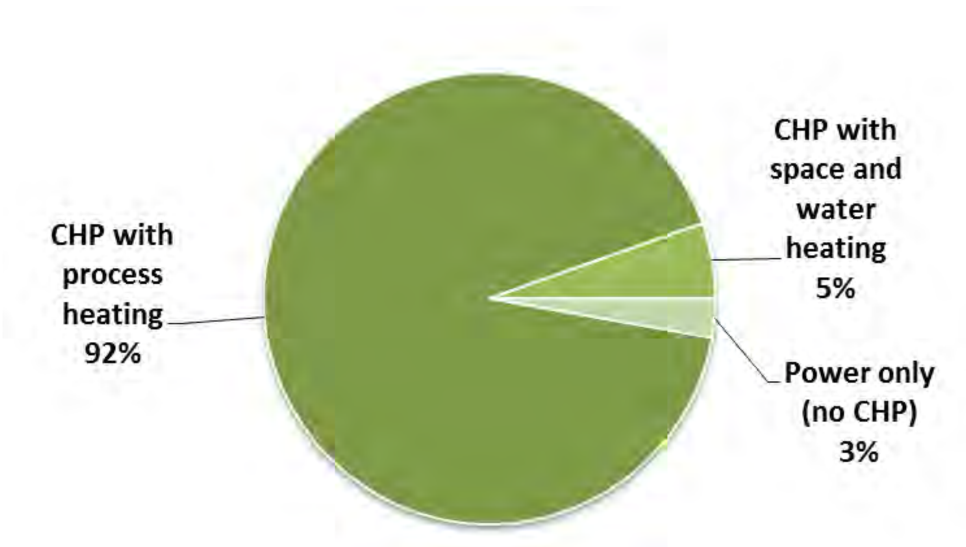

Appendix D Result Details

The following figures illustrate the distribution of relevant factors of the load displacement projects by fiscal year from F2012 through F2018. Since the last load displacement projects in this evaluation period were installed in F2016, the results for F2017 and F2018 are trending the continuing operation and performance of all load displacement projects.

Greenhouse Gas Management Plan

Table of Contents

List of Figures

List of Tables

1 Executive Summary

Climate change is one of the most challenging global issues that we face as a society today. Addressing climate change and supporting the climate actions and targets of government is a priority for BC Hydro. We have developed a Greenhouse Gas (**GHG**) Management Plan that aligns with the Government of B.C.'s CleanBC objectives.

Our GHG Management Plan is forecasting to achieve a reduction in our emissions of 52 per cent by 2025 and 71 per cent by 2030, exceeding the CleanBC targets of 16 per cent and 40 per cent respectively. It connects to and supports key related strategies such as our Environment Strategy, The *United Nations Declaration on the Rights of Indigenous Peoples* (**UNDRIP**), and our Electrification Plan and it is designed with affordability and compliance as key principles.

Our investment in the GHG Management Plan over the fiscal 2022 to fiscal 2030 period will be made through our existing budgets and prioritization processes. Our plan provides clear measures of progress against internally set targets and those that are set in regulation and it demonstrates our commitment to contributing to a healthy environment for the long-term.

2 Our GHG Management Plan Aligns with the Government of B.C.'s Climate Goals and CleanBC

As a Crown Corporation we have an important role in supporting the climate goals of government. BC Hydro's Mandate Letter provided direction to ensure that our organization's operations align to the Government of B.C.'s climate strategy CleanBC, and our Five-Year Strategy reflects our direction to seek reductions in our GHG emissions where feasible and affordable.

Our Electrification Plan is a central support to the Government of B.C.'s climate action plan and will have a broad and significant effect on GHG reductions in our province by supporting our customers to electrify. Our GHG Management Plan is focused on our own operations and further demonstrates our support for actions leading to climate change mitigation.

Under the *Climate Change Accountability Act*, the Government of B.C. has legislated province-wide targets for reducing GHG emissions as follows:

- 16 per cent below 2007 levels by 2025;
- 40 per cent by 2030;
- 60 per cent by 2040; and
- 80 per cent by 2050.

In addition to the overall targets, the Government of B.C. has recently published sectoral targets for Transportation, Oil and Gas, Buildings and Communities and Industry. For our GHG Management Plan we are aligning to the provincial target range for the Industry sector, which has been set at an overall 38 to 43 per cent reduction by 2030.

3 Our GHG Management Plan Aligns with and Supports Related Strategies

Our GHG Management Plan aligns with and supports important BC Hydro and Government of B.C. strategies, including:

- **BC Hydro's Environment Strategy and Principles** – As leaders in managing valuable public resources, our decisions matter. Our environment strategy includes an objective to support climate actions and targets set out by government. Our GHG Management Plan is a key area of focus and one way we are contributing to a healthy environment for the long-term;

- **UNDRIP Implementation** – Reducing diesel use in BC Hydro's Non-Integrated Areas (**NIAs**) and moving to cleaner sources of energy supports our commitment to reconciliation and helps meet objectives under UNDRIP. Many of these communities are interested in reducing diesel use for the associated environmental benefits and/or as a path to energy self-sufficiency. The goals in our Five-Year Strategy support these aims and the UNDRIP principles that underlie community interests;
- **Affordability** – Our plan reflects some GHG reduction actions that are already included in our planned capital and operating budgets. Reducing fossil fuel consumption will directly lower costs related to fuel purchases and will avoid future cost increases from the escalating carbon tax. In addition, this will lead to savings in our annual carbon offset payment which is calculated at \$25/tCO_2e for our fleet and building emissions. Reducing our corporate air travel is associated with significant annual savings in both capital and operating dollars;
- **Electrification Plan** – Demonstrating leadership through selected electrification of our own assets is an integral element of our GHG Management Plan. In addition to taking actions in our own operations, BC Hydro is supporting our customers in shifting from natural gas to electricity. This shift toward clean electricity will help lower overall provincial GHG emissions. These reductions are anticipated to be as great, or greater, than those achieved through our internal actions. Quantifying the reductions facilitated by our customer electrification is included in our Five-Year Strategy; and
- **Clean Electricity and our Integrated Resource Plan (IRP)** – As our province shifts toward a cleaner future, gas-fired thermal generation will be reduced over time. Our draft 2021 IRP assumes a reduced reliance on our thermal generation Independent Power Producers (**IPPs**), and this is reflected in our GHG Management Plan.

4 Treatment of Imports and Exports

Through our trade of clean electricity, we affect GHG emissions beyond our borders. Quantification of GHG emissions related to trade is outside the scope of this GHG Management Plan. Powerex reports GHGs associated with gross scheduled imports of electricity to the provincial government under the *GHG Industrial Reporting and Control Act*.

5 Our GHG Plan was Developed with a Consistent Set of Objectives

Our GHG reduction forecast is inclusive of all categories of GHG emissions related to our buildings, fleet, Sulphur Hexafluoride (**SF_6**) and Carbon Tetrafluoride (**CF_4**) insulating gases and diesel and thermal generation, as well as indirect emissions related to IPPs and corporate air travel. While we do not directly own and operate IPPs, we may influence their operations through our decisions related to their Electricity Purchase Agreements (**EPAs**) with BC Hydro. The same holds true on our use of corporate air travel.

We examined opportunities to reduce emissions in all categories and developed a plan for each category based on these objectives:

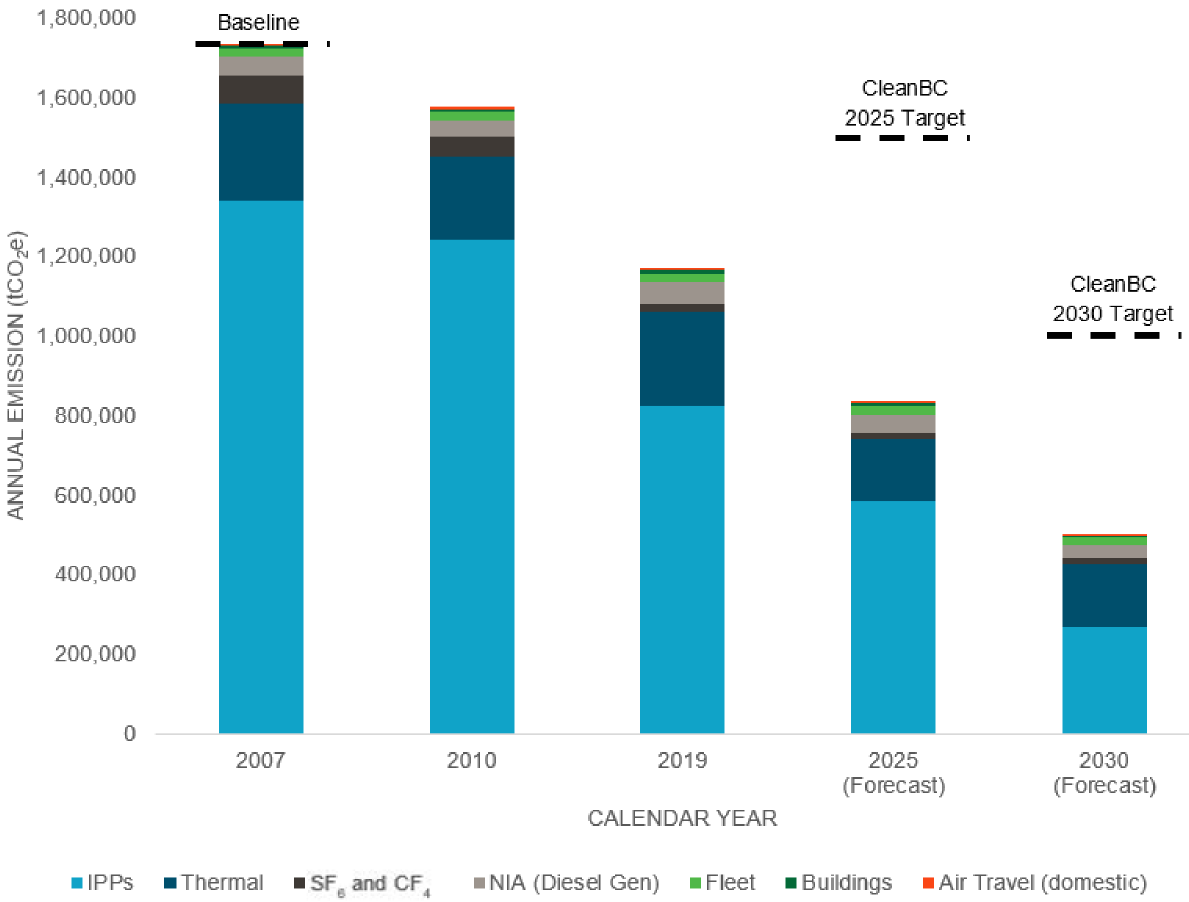
- Focus on compliance and achieving the overall Industry reduction target as set out by the Government of B.C.;
- Comparative return on investment based on the potential GHG reduction weighed against affordability, technical feasibility, market availability and ease of adoption;
- Ensure we maintain a fleet suitable to our organization while pursuing Electric Vehicles (**EVs**) that make sense given our role as a first responder;

- Include existing commitment to develop a plan for reducing diesel generation in NIAs;
- Consider the effect of the escalating Federal carbon tax on our operations; and
- Ensure that the GHG reductions are hard-wired to the extent possible and do not rely on employee behaviors to realize.

6 Our GHG Management Plan Forecasts a Reduction in Emissions of 52 per cent by 2025 and 71 per cent by 2030

The chart and table below show our GHG forecast for 2025 and 2030 against a 2007 baseline. As shown in Figure BB-1, our GHG emissions have decreased since 2007, primarily due to decisions we have made to reduce our thermal operations and reliance on natural gas IPPs. Our forecast assumes a further decrease in our thermal emissions and further decreased reliance on natural gas IPPs. By 2025 we anticipate a 52 per cent reduction from baseline levels versus a 16 per cent target, and in 2030 we anticipate a 71 per cent reduction versus a 40 per cent target. As shown in Table BB-1, GHG reductions will be achieved in all categories, and will be most significant in SF_6 and CF_4, thermal operations, and IPPs.

Figure BB-1 BC Hydro Annual GHG Emissions by Category. Tonnes Equivalent CO_2 (tCO_2e)



Notes:

1. Fleet and buildings baseline is based on calendar year 2010 as calendar year 2007 data is unavailable.
2. Air Travel (domestic) baseline is based on calendar year 2019 as calendar year 2007 data is unavailable.
3. IPPs baseline includes Island Generation, which is operated as a dispatchable facility and hence the hours of operation may significantly vary from year to year

Table BB-1 GHG Forecast by Category

		2019	2025		2030	
GHG Category	Baseline tCO_2e[1,2]	Actual tCO_2e	BC Hydro Forecast tCO_2e	BC Hydro Forecast Reduction (%)	BC Hydro Forecast tCO_2e	BC Hydro Forecast Reduction (%)
Buildings[3]	7,400	10,800	6,300	15	4,600	38
Fleet[3]	22,300	22,100	22,100	1	19,700	12
SF_6 and CF_4	70,400	22,000	15,000	79	15,000	79
NIA (Diesel Gen)[4]	46,300	52,100	44,100	5	30,400[5]	34
Thermal	246,000	235,000	157,000	36	155,000	37
IPPs	1,340,000	826,000	585,000	56	270,000	80
Air Travel (domestic)[5]	2,400	2,400	1,400	42	1,400	42
Totals	**1,735,000**	**1,170,000**	**831,000**	**52**	**496,000**[5]	**71**
Government of B.C. Target (CleanBC)			**1,457,000**	**16**	**1,041,000**	**40**
Amount Plan exceeds target			**-626,000**	**36**	**-544,000**	**31**

Notes:
1. Amounts may not sum due to rounding.
2. Baseline year is 2007.
3. Fleet and buildings baseline is based on calendar year 2010 as calendar year 2007 data is unavailable.
4. NIA forecast is based on a hypothetical group of projects. The forecast may be adjusted (up or down) depending on the outcome of the NIAs – Diesel Reduction Strategy.
5. Air Travel (domestic) baseline is based on calendar year 2019 as calendar year 2007 data is unavailable.

7 Our GHG Reduction Plan Takes Action Across our Organization

The following sections summarize the areas of focus for each GHG category.

7.1 Buildings – Our plan forecasts a GHG reduction from our buildings of 15 per cent by 2025 and 38 per cent by 2030.

The BC Hydro buildings category includes head offices, district offices, NIA line offices, Site C worker accommodation, townsites and leased space. GHG emissions result from the consumption of energy to operate the buildings including heating, cooling, lighting and plug loads. Energy sources include electricity, natural gas, district steam (currently generated by natural gas) and propane.

A base level of GHG reduction in our buildings is part of our ongoing operations and includes planned replacement of end-of-life assets, sale of surplus properties and demolition of buildings that are end of life. Additional measures we are taking to further reduce GHG include adding an Energy Manager resource to support GHG planning for buildings, electrifying new buildings where financially and technically feasible, completing energy efficiency projects in our Edmonds and Dunsmuir office buildings, and purchasing steam produced by electricity, rather than natural gas for our Dunsmuir building when available in approximately 2024/2025. We are not planning to replace assets before end of life or require complete electrification of our existing buildings.

7.2 Fleet – We forecast a consistent level of GHG emissions from our fleet to 2025 and a 12 per cent reduction in our overall fleet emissions by 2030.

BC Hydro’s fleet contains over 3,400 assets that emit GHGs through the combustion of fuel in vehicles equipped with internal combustion engines. GHG reductions in our fleet may be achieved by replacing our internal combustion vehicles with hybrids, or EVs.

We require vehicles with proven reliability and performance when responding to outages and to maintain system reliability, and there are currently no suitable cost-effective EV options in many classes of vehicle. This will limit our adoption of EVs in some classes, particularly heavy vehicles, until suitable options are available. In the light duty class, BC Hydro has been transitioning away from gasoline and diesel vehicles toward electric and/ or hybrid alternatives with lower emissions. BC Hydro’s fleet of passenger vehicles is 60 per cent battery - electric, 6 per cent plug - in hybrid, and 28 per cent hybrid - electric. BC Hydro’s fleet of light duty trucks is 17 per cent hybrid - electric.

A base level of investment in EVs is part of the existing capital plan including replacing a portion of our fleet with hybrid pickups and SUVs through 2025 and replacing sedans with commercially available EVs where viable. We will continue to monitor pilot studies of EV bucket trucks in comparable utilities to learn from their application. After 2025, we will replace a portion of the pickup and SUV fleet with commercially available EVs and pilot medium and heavy-duty EVs that show strong potential for meeting our need for reliability, performance and responsiveness.

7.3 Corporate Air Travel - We are setting a corporate policy to maintain Corporate Air Travel at a level 40 per cent below baseline year.

Prior to 2020 and the COVID pandemic, BC Hydro's air travel emissions typically exceeded 2,100 tonnes of CO_2 per year. In 2020, during the COVID pandemic, air travel emissions were about 75 per cent less than the prior two years.

The organization has successfully adopted video-conferencing and other remote collaboration technology during the pandemic period. We are engaging with parts of the business where air travel has traditionally been highly used and working to develop a policy that will permanently reduce air travel to 40 per cent below our pre-COVID levels.

7.4 SF_6/CF_4 – We plan to maintain our level of emissions at or below the five-year 2019 average, 83 per cent below 2007 levels.

SF_6 and CF_4 are insulating and arc quenching gases used in electrical equipment. They are potent GHGs with high global warming potentials. Governance is in place to limit the amount of new SF_6/CF_4 equipment added to the system. More environmentally friendly alternatives will be selected where these are viable. It is expected we will continue to use these gases in our system for several decades even as we aim to minimize the amount of new SF_6 and CF_4 added to the system.

We have made significant progress reducing SF_6 and CF_4 emissions through targeted equipment repair and replacements over the past two decades. Reducing annual emissions further would require significant additional investment given that the heaviest leakers have been addressed.

7.5 NIA Diesel Generation – Our NIA plan will see GHG emissions lower by 5 per cent by 2025 and 34 per cent by 2030 from 2007 levels

An NIA is a community that is not connected to BC Hydro's integrated system. BC Hydro provides electrical service to 14 NIAs, each of which serves one or more communities and/or First Nations. Electricity in BC Hydro's NIAs is approximately 50 per cent clean or renewable and 50 per cent diesel generation. BC Hydro shares an interest in reducing reliance on diesel in NIAs and is developing a strategy to address NIA community interests in reducing diesel generation. Our NIAs – Diesel Reduction Strategy will pursue new renewable generation opportunities in NIAs by working with governments, clean energy industry partners and with Indigenous Communities to identify and pursue projects that are mutually beneficial and to advance reconciliation. The Diesel Reduction Strategy will also align with CleanBC and result in reduced overall GHG emissions. Details of the plan will be developed over the test period.

7.6 Thermal generation – We forecast a reduction in our emissions from our Thermal generation of 36 per cent by 2025 and continuing at or below that level to 2030

Thermal generation is a significant source of BC Hydro's emissions. Burrard Generating Station was decommissioned in 2010 leaving two thermal plants owned and operated by BC Hydro, Fort Nelson and Prince Rupert. Prince Rupert thermal Generating Station primarily serves a local load and as a back up for the system in the Northwest. Fort Nelson Thermal Generating Station is part of a separate grid tied to Alberta. While serving the local load, our thermal operations are also tied to trade.

We modelled the effect on our Fort Nelson operations from the escalating Federal carbon tax which is set to increase \$15/tCO_2 each year to 2030. The current carbon tax of \$50/tCO_2 is already factored into our decisions to run Fort Nelson for trade purposes. Our modelling indicates the effect of the escalating carbon tax to be about an 8-10 per cent drop in our Fort Nelson emissions per year to 2026. Since the available model only has data to 2026, we chose to flat line the forecast out to 2030, but there is a possibility that we could see further decreases beyond 2026 as the federal carbon tax continues to rise. There are some limits to the modelling; for example, it does not have visibility into the Alberta market conditions for the same period. The intent of the Federal carbon tax is to apply a dis-incentive to non-clean energy sources and according to our modelling it is likely to have that effect on our decisions to operate our thermal for trade.

7.7 IPPs – Our GHG forecast assumes that Electricity Purchase Agreements with two high emitting IPPs will not be renewed when they expire resulting in a significant reduction in emissions from our portfolio

IPPs are considered part of our Indirect Emissions and represent the largest source of emissions in our GHG portfolio. Although we do not own or operate these facilities, we may influence their operations through our decisions related to their EPAs with BC Hydro. Island Generation and McMahon are gas-fired IPP facilities and are the two largest sources of GHG emissions within our integrated system. Although the amount of the emissions will vary significantly from year to year, as a result of Island Generation operating as a dispatchable facility, these two facilities have accounted for up to two-thirds of our total annual GHG emissions.

The EPA with Island Generation expires in fiscal 2023 and the EPA with McMahon expires in fiscal 2030. Not renewing the Island Generation and McMahon EPAs could reduce annual system emissions by roughly 10,000 tonnes of CO_2e and 340,000 tonnes of CO_2e, respectively. BC Hydro's Draft 2021 IRP proposed that these EPAs will not be renewed. The final 2021 IRP will be filed with the British Columbia Utilities Commission in December 2021.

8 Investment in GHG reductions will be made through our existing budgets and prioritization processes

Our base capital budgets include some measures to reduce GHGs in the areas of buildings, fleet and NIAs. We are planning additional capital investment to achieve the forecast reduction in GHGs. In the short-term these investments will be managed opportunistically and treated as ex-plan through our prioritization process and/or funded out of existing budgets. Additional work will occur to advance specific capital investments that will be included in future capital plan updates.

9 We will Adapt our GHG Management Plan as Policy, Direction, and Markets Evolve

Government policy, GHG reduction technologies and market availability and cost of alternatives are areas of dynamic development. We propose a full review of the GHG Management Plan in 2025 which will align with the first targeted milestone in CleanBC and our next revenue requirements application, but interim decisions made by us or by others may require plan adjustments, including:

- Government policy and direction continues to develop, specifically the Comprehensive Review includes consideration of Internal Carbon Costing. If adopted this may affect our plan wherever we are making investment or operational decisions that include an element of GHG. We have not included the application of an Internal Carbon Cost in our forecast;

- The incremental cost and GHG reduction targets related to the NIAs renewable generation plan will be updated once the NIA strategy is fully developed; and
- Reductions in our fleet are dependent on market availability of suitable medium and heavy-duty EVs. If the market develops either faster or slower than we have predicted, we will adjust our plan.

Implementation of our GHG Management Plan is tied to the work we establish in our capital plans and operating budgets. Progress on our committed GHG reduction actions will be monitored quarterly and reported to our Executive Team annually. Our GHG Management Plan aligns with the objectives in the provincial government's CleanBC plan and as a key part of our Climate Change portfolio, it supports our organization in making real and significant GHG emission reductions.

BC Hydro Fiscal 2023 to Fiscal 2025 Revenue Requirements Application

Load Forecast Price Elasticity Report

Two Issues in the Use of Price Elasticities of Electricity Consumption

DIFFERENCES IN ESTIMATES DUE TO REAL VS NOMINAL PRICES AND PRICE INCREASES VS DECREASES

PREPARED BY

Ahmad Faruqui, Ph. D.
Goksin Kavlak, Ph. D.

PREPARED FOR

BC Hydro

AUGUST 16, 2021

Brattle

I. Executive Summary

The Brattle Group was retained by BC Hydro to review two issues related to the estimation of price elasticities. These issues had been raised by the BCUC in a recent order. One of the issues dealt with the differences that might arise in load forecasts if models were estimated with nominal prices versus real prices. The other issue dealt with differences that might arise in load forecast models if price elasticities were allowed to differ between price increases and price decreases.

Brattle economists have been working on the estimation of price elasticities for more than four decades. Dr. Faruqui, who was assisted by Dr. Kavlak, in this review has developed and reviewed demand forecasting models for utilities and regulatory agencies in North America, Asia, Australia and New Zealand.[1]

In the review, we relied on our expert opinion on the estimation of price elasticities, conversations with a few leading utilities, and a literature review. We came to the following conclusions:

- BC Hydro's approach to using price elasticities is broadly consistent with that taken by the surveyed utilities
- We do not think that replacing real prices with nominal prices would make much of a difference in the load forecast during the short and medium terms
- Utilities do not use nominal prices to estimate price elasticities
- Utilities do not differentiate between price elasticities for price increases and decreases
- We do not think it's an easy task to estimate price elasticities that differ between price increases and price decreases
- We were unable to find studies relating to electricity demand that address the two issues raised by the BCUC
- Available studies based on other commodities or products (i.e. non-utility) provide conflicting results - the studies show that there are reasons for asymmetries in demand response to price changes, as well as using real prices versus nominal prices. The conclusions are highly context-dependent and nuanced
- In summary, real prices and the symmetry assumption have been the standard practice for estimating price elasticities in load forecasting models

[1] Dr. Faruqui holds a doctorate in economics from the University of California at Davis. His dissertation was focused on estimating price elasticities for industrial customers in California. He has worked at the California Energy Commission, a state agency, and the Electric Power Research Institute on demand forecasting issues, in addition to working at consulting firms. He has been at Brattle since July 2006. Dr. Kavlak holds a doctorate from the Massachusetts Institute of Technology and was a post-doctoral associate there for three years before joining Brattle. Their biographical details can be found in Appendix A and at www.brattle.com. The Brattle Group is an economic consulting firm. In its electricity practice, Brattle assists electric utilities, deregulated power producers, customers, regulators, and policymakers with planning, ratemaking and litigation support, and with developing (or responding to) new market designs and regulatory frameworks.

II. Introduction

Background

The price elasticity of electricity consumption measures the percentage change in consumption that would occur in response to a one percent change in price. Electricity consumption, measured in kilowatt hours (kWh), is sometimes referred to as demand in the economist's sense of the term. It should not be confused with demand in the engineering sense of the term which is measured in kilowatts (kW).

BC Hydro uses the price elasticity of demand in its load forecast to estimate the changes in electricity consumption that would occur in response to changes in electric rates. A British Columbia Utilities Commission (BCUC) Panel previously reviewed BC Hydro's request to adjust the elasticity assumption from -0.05 to -0.1 and found that the proposed elasticity value was supported by the empirical literature on the subject. It was consistent with what was being used by other utilities. Therefore, the Panel found the elasticity assumption of -0.1 reasonable for the purpose of setting rates within the RRA across all customer sectors. BC Hydro also presented information that changing the price elasticity assumption had a minimal impact on the overall load forecast. BC Hydro showed that the load forecast was very similar under various elasticity assumptions (-0.05, -0.1 and -0.15).

However, the Panel noted customers may respond differently to nominal versus real changes in price. In addition, the Panel also noted that considering BC Hydro had requested a price decrease in fiscal 2021, customers' responsiveness to a price increase versus a price decrease may also differ. As a result, the BCUC requested BC Hydro to provide in the Fiscal 2023- Fiscal 2025 Revenue Requirements Application an analysis of:

- Any difference in elasticity between nominal versus real changes in price in the short-term and
- Any difference in elasticity between a price increase versus a price decrease.

Approach

This memorandum addresses this request in three separate ways: a utility survey, an illustrative numerical analysis, and a literature review. Section II presents a survey of North American utilities to determine current practices in the estimation and use of short-run price elasticities of electricity consumption to see if (a) price elasticities differed between nominal prices and real price and (b) price elasticities were allowed to differ between price increases and price decreases. Section III illustrates the effects of considering real versus nominal prices with a numerical example. Section IV presents a literature review on differences in price elasticity estimates when using nominal versus real prices as well as differences due to a price increase versus a price decrease. Section V summarizes the conclusions of the memorandum.

III. Utility Survey

We reached out to several North American utilities to determine the state of practice in the estimation of short-run price elasticities in electricity demand. Seven utilities responded to our request. In summary, here is what they said.

The surveyed utilities follow a common approach when estimating price elasticities. First, they use real prices in estimating price elasticities. Real prices are nominal prices deflated by a consumer price index to net out the effects of inflation. Survey respondents agreed that in theory the elasticity values might differ if nominal prices were used in their calculation and inflation rates were high. However, they said consumers were likely to respond to changes in real prices rather than nominal prices. In addition, most utilities stated that they did not perform the elasticity estimation themselves; they rather adopted estimates from the literature.

Second, utilities use the same elasticity value for price increases and decreases. Survey responses revealed that most utilities recognized that the elasticities might differ for price increases and decreases. However, they think that using the same values is sufficient and adding asymmetrical values would complicate the models, especially given the small impact of price elasticity on short-run load forecasts.

Extracts from their individual responses are reproduced below.

UTILITY A

We use price elasticities based on real prices as inputs into our long-term end-use models. **We no longer use price as a driver in our short-term econometric models** (monthly usage models for the next 2 to 3 years). In the past, we included price in short-term energy models before my time here (because we're all economists) but it was a chore to make it fit and have the correct sign. **The hypothesis is that customers, particularly residential customers, are more informed about their bills and less informed about and responsive to price per kWh.** And, here in the South, their bills are a whole lot more sensitive to factors such as weather than any change in per unit price. In the longer term, however, both absolute and relative price could impact usage and choice of end-uses, so we do include price elasticities in our long-term end-use models.

To answer your second question, the same price elasticities apply to price increases and decreases. This is an interesting question. We have not conducted or came across any research on the topic.

UTILITY B

We use real price of electricity in our econometric models. This is based on the economic theory that consumers react to real price changes. Whether price elasticity would differ across real versus nominal prices depends on the situation with inflation. During periods of high inflation, the two could differ significantly.

We do not model asymmetric reactions to price increases versus price decreases. **Since price elasticities for most types of consumers are rather small, it's counterproductive to complicate the models, especially in regulatory settings**.

UTILITY C

We don't actively estimate price elasticity. We have a set value of -0.15 that we have used for years. It is a high-level estimate based on older research papers for North American utilities, so not specific to our region. In our SAE model we apply the elasticity to real prices in a "heat use" variable that also incorporates projected HDD and household size, so elasticity has only a modest impact on the overall forecast.

In terms of increases vs decreases, no we don't differentiate. I'm not sure about asymmetry in the elasticity, it's an interesting question and it seems like there are equal opportunities for substitution for both increases (solar) and decreases (EV's and electric heat), but I can see a case where the impact of substitution within various customer segments could be asymmetrical.

We get questions about our elasticity estimate every year when we file our forecast, but have **never had questions about real vs nominal. We've never gotten around to estimating elasticity, it's on our list of "things to do when we have time", and the current estimate seems to be in the ballpark. It's low on the list as I think the exercise will only give us a rough idea anyway,** there are many subgroups within the different classes that will all have distinct elasticities, and as you say we haven't seen any big swings in price so sales variation will be influenced by many other factors. To date nobody has really pushed us on updating our values, and **there are much bigger unknowns on the end-use side of the forecast that are higher priorities for us.**

For our SAE[2] model, we use the U.S. Energy Information Administration (EIA) efficiency data for our region and shares for some of our end use forecasts, and internal estimates for some of the key uses like electric space heating and hot water. We conducted an end use survey in 2019 which we use for our historic shares, and we also have National Resources Canada data but it runs 3 year behind and some of the metrics (particularly space heating) are way off from our internal data so we've been getting away from that.

UTILITY D

If I read your question accurately, it relates to forecasted load information and incorporating into our growth forecast where customer behaviors, emerging technologies or EE, electrification through EV's, etc. all impact price elasticity and how they are factored into that forecast.

From a rate design and cost allocation perspective, we are obligated to use a historical Test Year for ratemaking purposes in our jurisdiction, so we pull actual customer usage during the Test Year and apply adjustments to normalize weather and to annualize the customer count. We generally do not apply adjustments for price elasticity, although in 2017 we did implement rates with an assumption that customer who would save more than 10% would change rates to their most economical rate plan. As you know, we have found that forecast was quite accurate. I know some utilities apply adjustments to their proof of revenue billing determinants or income statement adjustments to their cost of service study to account for customer usage

[2] Statistically adjusted econometric models are called SAE models in the literature

changes or lost revenue associated with changes in behaviors which are likely produced through elasticity studies. As of yet, we have not adopted these into our processes or filings, although we do produce workpapers that show the effects of customer response to our time of use hours. In our most recent case, I included some charts with my rebuttal testimony that show customer response to the on peak hours at 3:00 PM and again at 8:00 PM where consumption drops dramatically at 3:00 and resumes at 8:00 as they respond to our on-peak price signals.

Paraphrased response from another employee from the same utility:

We use real prices because we think customers respond to real prices. In theory, there may be a difference between how they respond to real versus nominal prices but we don't think it matters in practices. It would make a difference if inflation rates were high.

We also don't differentiate between price increases versus price decreases when estimating price elasticities.

UTILITY E

We use real prices in a couple of our residential sales models. Real prices are used to account for the impacts of inflation. **We do expect that elasticities would differ if nominal prices were used instead, as the nominal elasticities would be accounting for both the inflation in the price of electricity as well as the price elasticity of consumption.**

Intuitively we think the elasticities likely would differ for increasing versus decreasing prices. However, we use regression models of monthly sales which provide the average response to price changes during the sample period and we assume that is a sufficient proxy for either increasing or decreasing prices.

UTILITY F

1. We use real pricing. The choice to use real was made before my time, but I think the reasoning was simply to allow the model to see the true growth in pricing over time**. Yes, I**

think there would be some difference in elasticities across real vs nominal, but how significant is hard to say.

2. **We do not differentiate between price increases and decreases, either. A single real price variable has been sufficient for our purposes in capturing the pricing element on load and I'm not sure that splitting it into increase versus decrease would add any more precision.**

UTILITY G

We use real prices in our SAE model. From our experience nominal price tends to exaggerate usage growth.

We don't differentiate between price increases or price decreases when estimating price elasticities. We use a SAE model now to be consistent with other utilities for benchmarking and interpretation purpose. **Another reason we didn't bother with it is that in the long run (year 7 and onward) we hold the real price constant voiding price effect all together.**

IV. Illustrative Regression Analysis

The main goal of this analysis is to show how price elasticity values may differ when real versus nominal prices are used in the estimation process. Here we illustrate this with a hypothetical example by employing a simplified version of the statistical models used to estimate price elasticity of demand.

Price elasticity of demand is estimated by regression analysis, where the dependent variable is 'demand' and independent variables are a set of covariates (e.g. energy prices, population, income, climate) as well as the lagged values of the covariates and the dependent variable. A logarithmic transformation of both the dependent and independent variables in a linear regression model is used to estimate the regression coefficients. With this model, the regression coefficient of an independent variable such as energy price is referred to as 'price elasticity' and interpreted as the percentage change in demand in response to one per cent change in price.

In this example, we set up a multiple regression including two independent variables, electricity price and income per capita. The dependent variable is electricity demand per capita. The regression equation is the following:

$$\log(\text{Demand}) = \alpha + \beta\log(\text{Price}) + \gamma\log(\text{Income per capita}) + \varepsilon$$

The data used for this regression is shown in Table 1. For illustrative purposes, we use hypothetical electricity demand values for a residential customer starting 10,000 kWh per capita in 2000 and decreasing at a rate of -0.4% per year. For prices, we use the nominal average US residential electricity prices during the past two decades.[3] We then obtain the real prices by deflating the nominal prices using the US GDP deflator.[4] We also use the real average the income per capita in the US.[5]

The regression results show that price elasticity estimates differ when real prices versus nominal prices are used (Table 2). The price elasticity (coefficient of price) with real prices is -0.362 and with nominal prices is -0.308. Note that this example does not indicate that nominal prices would always result in higher or lower elasticities; this example is only intended to show that the elasticities would *differ* when the underlying data changes. Also, note that the coefficient of the income variable (income elasticity of demand) changes as well.

TABLE 2: REGRESSION RESULTS FOR NOMINAL VERSUS REAL PRICES

Nominal Price	log(income)	log(NP) Price Elasticity	Intercept
Coefficient	-0.215	**-0.308**	12.198

V. Literature Review

This section presents a review of the academic literature on differences in price elasticity estimates when using nominal versus real prices as well as differences due to a price increase versus a price decrease.

In summary, many academic references show that price elasticity estimation is mostly carried out with real prices. This confirms the utilities' current practice of using price elasticities based on real, inflation-adjusted prices. However, there is a body of behavioral economics literature which states that consumers tend to think in think of money in nominal rather than real terms. This implies that the effects of inflation and price changes might be conflated in determining consumers' behavior.

Secondly, there has been an ongoing debate in the energy economics literature on the subject of "asymmetry" in price elasticities due to price increases versus decreases. Empirical findings on asymmetric response to prices has theoretical foundations in behavioral economics, namely the "loss aversion" concept. The concept of loss aversion suggests that people perceive losses (e.g. price increases) more severely. While several studies found asymmetries with empirical analyses, other studies rebut this finding arguing that the asymmetry is only an artifact of modeling choices. There is also ongoing research in other fields, notably transportation and retail marketing, on the asymmetric demand response to price changes. Retail marketing empirical studies found asymmetries; however, the direction of asymmetry differed among studies. While a group of studies indicated that demand is more responsive to price increases, others found the opposite.

A more detailed summary of relevant academic references is provided below for each question.

References regarding question (i) any difference in elasticity between nominal versus real changes in price in the short-term

Several studies show that estimation of price elasticity is usually performed in real terms, in other words, by using inflation-adjusted values.[6,7,8,9,10] However, behavioral economics literature claims that people tend to make decisions based on nominal prices rather than real

prices. This concept is considered a cognitive bias and referred to as "price illusion" (or money illusion).[11] According to this literature,[12] consumers tend to perceive money in nominal terms because nominal prices are a more natural representation of an economic situation for most people and most economic transactions are framed in nominal terms. In its basic form, price illusion occurs when people take nominal values or changes in nominal values as a proxy for real values or changes in real values, respectively. Price illusion is not only experienced by laypeople; people who are expected to have a better understanding of economic concepts are shown to experience it, too. For example, a research paper[13] finds that investors suffer from price illusion and for this reason firms proactively manage share prices to stay in a relatively constant nominal range to cater to investor demand. The neurological evidence for price illusion has also been demonstrated through medical imaging: A study utilized fMRI (Functional magnetic resonance imaging) to investigate the brain's reward circuitry and found that areas of the brain associated with the processing of anticipatory and experienced rewards, and the valuation of goods, exhibited price illusion.[14] The literature on price illusion implies that energy consumption behavior might, in fact, be influenced by nominal rather than real prices. These findings have not been adopted by energy economics studies; and for the short run elasticity, the effect of real versus nominal prices may not be as important for energy. Because electricity demand is relatively inelastic in the short-run, small changes in price would lead to only small changes in demand therefore would not impact the demand forecast drastically.

References regarding question (ii) any difference in elasticity between a price increase versus a price decrease.

Differences in elasticity between a price increase versus a price decrease ("asymmetries" in price response) have been investigated in energy studies as well as in other fields. Here we summarize relevant articles from both energy and other literatures such as transportation and retail marketing research.

Empirical analyses of asymmetric price elasticities are often linked to theories in behavioral economics, prospect theory in particular.[15] Prospect theory postulates that customers are "loss averse" in prices; in other words, may perceive a price increase as a loss and respond more strongly to a price increase than they do to an equivalent price decrease. Price changes are evaluated relative to an endogenous reference price, which depends on the consumers' price expectations from the recent past. Demand responses are more elastic for price increases than for price decreases and thus firms face a downward-sloping demand curve that is kinked at the consumers' reference price.[16] Empirical evidence for loss aversion has been presented for a variety of products and services such as consumer goods,[17,18] energy use,[19] restaurant visits,[20] and transportation.[21]

In the energy economics literature, there is an ongoing debate on the topic of asymmetry in price elasticities due to price increases versus decreases. A widely-cited study by Gately and Huntington (2002)[19] finds that demand for oil in OECD countries responds much more to increases in oil prices than to decreases, indicating an asymmetry. According to this study, ignoring the asymmetry would have implications for the elasticity estimates and long-term forecast of energy demand. For example, wrongly assuming symmetry will bias downward the estimated income elasticity. In addition, the study also highlights that not only price elasticity but also income elasticity of demand is asymmetric and finds that demand for oil responds more to income increases than decreases. However, this study's focus is on estimating the long-run response of demand to price and income changes; the conclusions may not be as pronounced for the short-run elasticity.

Opposing views have been documented in other studies where researchers claimed that what has been attributed to asymmetry is an artifact of modeling choices. For example, Griffin and

[21] Yaman, F., & Offiaeli, K. Is the Price Elasticity of Demand Asymmetric? Evidence from Public Transport Demand.

Schulman (2005)[22] show that the hypothesis of symmetric price responses cannot be rejected after explicitly controlling for energy saving technical change within the statistical model. According to this study, the effect of energy saving technical change was wrongly attributed to price asymmetry.

Transportation has been an active area of research on the relationship between demand and prices. Yaman and Offiaeli (2017)[21] analyze the price elasticity of demand for public transportation, the London Underground, during a period of time when some of the fares on the network have increased while others have decreased, offering a unique opportunity to observe price elasticities for both cases. The study finds that demand is more sensitive to price increases than to decreases. Other articles study demand for transportation fuels and find statistical evidence for gasoline price and income both can induce asymmetric changes in gasoline demand. For example, Wadud (2017)[23] finds that elasticity with respect to rising prices and falling income is larger than the elasticity with respect to falling prices and rising income respectively, which is consistent with loss aversion in gasoline purchase behavior.

Price elasticity asymmetries have been widely studied by retail marketing research. While a group of empirical studies finds evidence of higher price sensitivity for price increases in line with loss aversion theory, others report opposite results. For instance, Dossche et al.[18] uses data from a large Euro area supermarket chain containing information about prices and quantities sold of about 15,000 items from 2002 through 2005. Consistent with loss aversion, the study finds that the overall price elasticity of demand is higher for price increases than for price decreases. Kalyanaram and Winer (1995)[24] cite several other empirical studies that arrived at the same conclusion and reports asymmetric, heightened responsiveness to price increases as a generalizable observation across retail marketing.

[24] Kalyanaram, G., & Winer, R. S. (1995). Empirical generalizations from reference price research. Marketing science, 14(3_supplement), G161-G169.

On the other hand, several other retail marketing studies find that demand is more sensitive to price decreases than to price increases.[25,26,27,28] The effect of promotions is considered a possible explanation for this phenomenon. Especially in the case of a product with infrequent promotions, customers often respond to a price decrease by stockpiling. Promotions induce the feeling of large gains by outweighing the loss they create in future periods.[26] For instance, Pauwels et al. (2007)[27] finds increased price sensitivity for price decreases because consumers wait for deals. Importantly, this study also notes that before consumers can respond to a price change and contrast the new price with their benchmark, the new price must be perceived as different. A loss must also exceed a certain threshold in order to be perceived, therefore minor price hikes within the threshold are less likely to be noticed. Krishnamurty et al. (1992)[28] contributes to this literature by highlighting the effect of heterogeneity among customers on price elasticity. Loyal customers do not exhibit asymmetric response, while "switchers" might be more sensitive to price increases. Note that these conclusions are derived in the context of retail consumer goods, where switching between substitutes is possible; however, these nuances may not apply directly to energy consumption behavior due to lack of readily available substitutes. Nevertheless, there is an indication of heterogeneous price elasticities for different income groups or countries (e.g. OECD countries vs non-OECD countries) in energy consumption as well.[19]

VI. Conclusion

This memorandum presents a survey of North American utilities to identify current practices in the use and estimation of short-run price elasticities of electricity consumption and to present a review of the academic literature on the topic.

In practice, utilities use real prices and the symmetry assumption in load forecasting. Responses to the utility survey indicate that this practice is sufficient for utilities and adding complexity in the use and estimation of price elasticities would not add value to the load forecast, especially

for the short-run forecast due to the small effect of price elasticity on the load forecast, and may in fact hinder the regulatory process.

In the academic literature, there is ongoing debate on the estimation of price elasticities in different research fields including energy economics, behavioral economics, and marketing. The academic literature presents both theories and empirical evidence concerning the two questions asked by the BCUC Panel.

In summary, there are arguments for and against the existence of asymmetries in demand response to price changes, as well as using real prices versus nominal prices. The conclusions are highly context-dependent and nuanced.

Appendix A: Author Biographies

Dr. Ahmad Faruqui is an internationally recognized authority on the design, evaluation and benchmarking of tariffs. He has analyzed the efficacy of tariffs featuring fixed charges, demand charges, time-varying rates, inclining block structures, and guaranteed bills. He has also designed experiments to model the impact of these tariffs and organized focus groups to study customer acceptance. Besides tariffs, his areas of expertise include demand response, energy efficiency, distributed energy resources, advanced metering infrastructure, plug-in electric vehicles, energy storage, inter-fuel substitution, combined heat and power, microgrids, and demand forecasting. He has worked for nearly 150 clients on 5 continents, including electric and gas utilities, state and federal commissions, governments, independent system operators, trade associations, research institutes, and manufacturers.

Ahmad has testified or appeared before commissions in Alberta (Canada), Arizona, Arkansas, California, Colorado, Connecticut, Delaware, the District of Columbia, FERC, Illinois, Indiana, Kansas, Maryland, Minnesota, Nevada, Ohio, Oklahoma, Ontario (Canada), Pennsylvania, Saudi Arabia, and Texas. He has presented to governments in Australia, Egypt, Ireland, the Philippines, Thailand, New Zealand and the United Kingdom and given seminars on all 6 continents. He has also given lectures at Carnegie Mellon University, Harvard, Northwestern, Stanford, University of California at Berkeley, and University of California at Davis and taught economics at San Jose State, the University of California at Davis, and the University of Karachi.

His research been cited in Business Week, The Economist, Forbes, National Geographic, The New York Times, San Francisco Chronicle, San Jose Mercury News, Wall Street Journal and USA Today. He has appeared on Fox Business News, National Public Radio and Voice of America. He is the author, co-author or editor of 4 books and more than 150 articles, papers and reports on energy matters. He has published in peer-reviewed journals such as Energy Economics, Energy Journal, Energy Efficiency, Energy Policy, Journal of Regulatory Economics and Utilities Policy and trade journals such as The Electricity Journal and the Public Utilities Fortnightly. He is a member of the editorial board of The Electricity Journal. He holds BA and MA degrees from the University of Karachi, both with the highest honors, and an MA in agricultural economics and a PhD in economics from The University of California at Davis, where he was a research fellow.

Dr. Goksin Kavlak is an Associate in The Brattle Group's Boston, MA office. She has extensive experience in modeling the economic implications of alternative energy technology deployment. She has developed methods to evaluate the drivers of technological change in energy systems and authored several high-impact academic articles and reports in this area. Goksin's research has been featured in news outlets such as the New York Times and Financial Times. Goksin's more recent projects include analyzing the electrification potential of buildings and transportation in states with decarbonization goals, rate design for electric vehicle charging, and budget implications of rate increases.

Prior to joining Brattle, Goksin worked at the Massachusetts Institute of Technology as a Postdoctoral Associate, where she led a project team investigating photovoltaics system cost reduction in response to engineering innovations and policies. Goksin earned her Ph.D. degree in Engineering Systems from the Massachusetts Institute of Technology, her M.E.Sc. degree in Environmental Science from Yale University, and her B.S. degree in Industrial Engineering from Bogazici University.

BC Hydro Fiscal 2023 to Fiscal 2025 Revenue Requirements Application

Appendix DD

BC Hydro's Monthly Energy Studies

Table of Contents

List of Figures

List of Tables

1 Introduction

This appendix describes the components and processes that comprise the Monthly Energy Studies, along with the key inputs and outputs of the Monthly Energy Studies.

The Monthly Energy Studies optimize the operational management of generation within BC Hydro's integrated system over the operating time horizon.[1] The Monthly Energy Studies inform operational dispatch decisions and forecast the Cost of Energy for financial reporting purposes. The studies consider a wide range of factors including wholesale electricity trade opportunities, which are necessary and valuable to manage energy deficits and surpluses and increase overall benefits for ratepayers in a hydroelectric system.

BC Hydro's Monthly Energy Studies methodology has not changed from the methodology used in the prior two revenue requirements applications. BC Hydro's objective function in the Energy Studies is to maximize the expected Consolidated Net Revenue from Operations (**CNRO**), which is discussed further in section 1.4 below. BC Hydro is continually improving its modelling capability and the development plan for the models is discussed in section 3 below. The models used in the Monthly Energy Studies are validated and updated on an ongoing basis.

1.1 Monthly Energy Studies Background

The primary objective of a Monthly Energy Study is to forecast, over the operating time horizon, an optimal set of reservoirs and generating station operations and system imports and exports under current forecasts of loads, market prices, inflows, generation unit availability and operational constraints. This modelling also provides:

[1] The operating time horizon is the balance of the current fiscal year plus the next two fiscal years. An additional two years are modeled so that the forecast for the first three years accounts for the impact of any longer-term operational constraints.

- The marginal value of water in BC Hydro's two largest reservoirs (Williston and Kinbasket) that is used to inform operational dispatch decisions; and
- The Cost of Energy for financial reporting.

The Monthly Energy Studies model the use of large storage reservoirs that are used to help manage variability in the annual water supply. They evaluate the wide range of possible inflow scenarios that may occur and consider other relevant factors including uncertainty in domestic load, outages, constraints such as reservoir limits, and market prices. It is important to recognize that while the Monthly Energy Studies and other quantitative tools provide important insights to help guide BC Hydro's decision-making related to the operation of the generating system, they are not the sole basis for those decisions. These decisions do not involve merely implementing the results produced by the Monthly Energy Studies or by any other single quantitative tool used by BC Hydro. Instead, they are reached through extensive discussions and deliberations that occur on an ongoing basis, informed by the model results.

Variation in precipitation and snowmelt results in a wide range of uncertainty in the amount and timing of BC Hydro system inflows: approximately +/- 7,000 GWh per year. Outside temperature and weather may also impact load by +/- 700 GWh per year.

The challenge is to make decisions in the present, given an uncertain future of possible outcomes. The Monthly Energy Studies, and the supporting models that produce the study results, support the decision-making by providing information on the range of possible outcomes from the use of BC Hydro's large reservoirs.

Key inputs of the Monthly Energy Studies are:

- Inflow Forecasts;
- Load Forecasts;

- Market Forward Prices;
- IPP Forecasts;
- Generation Unit Availability Forecasts; and
- Operational Constraints.

These inputs are discussed further in section 2.2 below.

Key outputs of the Monthly Energy Studies are:

- Forecasts of the operation of the generating system and major storage reservoirs;
- Forecasts of price signals to be used as decision support for system hydro and thermal plant operations relative to markets; and
- Forecasts of imports and exports.

1.2 Monthly Energy Studies Models Oversight and Controls

The Energy Studies are produced every month. The results are reviewed weekly by the Generation System Operations (**GSO**) Key Business Unit, discussed with Powerex, compared to other models, and tracked against actuals. The results are reviewed every month by the Executive Vice President of Operations.

BC Hydro maintains the integrity of the Monthly Energy Studies process using a proprietary tool, the Energy Studies Manager. The Energy Studies Manager helps to manage process flow and the thousands of datasets that make up model inputs, outputs and parameters. Each month the progress of the Monthly Energy Study is tracked through the Energy Studies Manager as team members update input data and run models. This tool also archives all the relevant historic and forecast data at each step in the process.

The models, underlying code and documentation are managed using an industry-standard software versioning and revision control system, enabling team members to collaboratively work to improve models, and if necessary, restore historical versions.

All data files are stored in a standard format which is easily manipulated using in-house software libraries and can be quickly inspected using any text editor. Each data file contains its own metadata to define such things as the model or external source that produced the data, the user who ran the model, the date/time stamp when it was run, and units of measurements, and this provides an additional auditing mechanism.

1.3 Energy Studies Modelling Approach

BC Hydro's Monthly Energy Studies consists of i) a data management platform that links data inputs and outputs, and ii) a suite of models. The data management platform and Energy Studies models are developed and maintained by the GSO Key Business Unit within the Operations Business Group.

Five primary characteristics are considered in developing and maintaining these models:

1. **Account for uncertainty:** Modelling BC Hydro's generating system and its interactions with external markets involves incorporating the significant uncertainties in forecast inflows, electricity and gas prices, loads, and operational constraints. These sources of uncertainty are addressed in the Monthly Energy Studies by using modelling techniques that are tailored to explicitly represent these uncertainties in the optimization process and produce a distribution of outcomes in the form of an ensemble forecast;
2. **Optimize the most flexible resources:** The Monthly Energy Studies process seeks to optimize the overall system by focusing on the operation of the largest,

most flexible resources that have the greatest ability to respond to changes in inflows, load, and market prices. The process assumes the smaller plants and less flexible resources are generally operated as they have been previously under equivalent historic inflow conditions;

3. **Maximize Consolidated Net Revenue from Operations (CNRO):** This objective function is described further in section 1.4 below;

4. **Use reservoir marginal values (price signals):** While the system operations are driven largely by inflows and loads, operations at the large storage reservoirs on the Peace and Columbia are also guided by price signals which provide decision support for dispatch of hydro and thermal resources relative to import and export opportunities; and

5. **Produce risk neutral forecasts:** The optimization procedure assumes each of the modeled possible outcomes is equally likely and the mean forecast of these outcomes provides the best operating strategy. In other words, a risk neutral operating strategy is based on an expected outcome and does not bias towards or against favorable or unfavorable outcomes. The models serve load and manage inflows under all these modeled potential scenarios.

As of January 2021, historic weather, inflow, and generation data exists for the period 1972 through 2020. These 49 years provide the basis for the ensemble (a collection or set used to forecast the range of uncertainty. This same set of 49 weather year ensembles is used throughout the Energy Studies process. The use of the same set of historic ensembles ensures that variability in inflows, prices, loads, and resources due to the impacts of weather are well represented in the models.

The variability in the historic record is an order of magnitude larger than the impact of any climate change on the mean forecast over the time horizon of an Energy Study. Nonetheless, since the ensembles always contain the most recent historic observations, effects of climate change are implicitly included to the extent that climate change has influenced observed data.

1.4 System Optimization Objective

The approach to operational decisions to optimize the use of BC Hydro's large reservoirs has served ratepayers well. Further information about BC Hydro's system optimization objective was provided in BC Hydro's compliance filing on the F2020-F2021 RRA to the BCUC dated December 1, 2020.[2]

BC Hydro's system optimization objective is to maximize "expected consolidated net revenue from operations" (**CNRO**). The term CNRO contains three distinct terms: "consolidated", "net revenue" and "from operations". These terms reflect the scope of system optimization rather than how the system is optimized. Specifically:

- **Consolidated** means the consolidated activities related to imports and exports from the BC Hydro system. This includes both imports required to serve load and exports to manage surpluses as well as estimates of imports and offsetting exports by Powerex for trade activities. It does not include Powerex activity that is unrelated to the BC Hydro system;
- **Net Revenue** means the sum of cost and revenue items that are related to operation of the generation system. BC Hydro uses the term net revenue instead of net income because costs that are not related to system dispatch decisions (e.g., finance charges, taxes, depreciation) are excluded from CNRO; and
- **From Operations** refers to the dispatch of the generation system (i.e., deciding what generating units to run when) and the release of water from the facilities (i.e., discharges through turbines or spillways).

[2] Refer to: https://www.bcuc.com/Documents/Proceedings/2021/DOC_61069_2020-12-01-BCH-F2020-21RRA-Compliance-to-G-246-20-Directives-.pdf.

Expected is a statistical term that is short for the "expected value of a variable with a probability distribution".

In other words, the objective function of the Energy Studies models is to compute the CNRO for all potential outcomes in such a way that the average value is maximized. This is also referred to as "risk neutral". Risk neutral is an important economic concept and refers to an approach that is neither risk averse nor risk seeking. It assumes each of the modeled possible outcomes is equally likely and is based on the expected outcome with no bias towards or against any particular outcome.

BC Hydro maximizes expected CNRO over the operating time horizon. This means that BC Hydro seeks to optimize value over time, using the flexibility of multi-year storage.

CNRO is calculated as follows:

- Domestic revenue from accrued sales;
- Plus revenue from System Exports;
- Plus net revenue from Columbia River Treaty related agreements;[3]
- Less cost of IPPs and Long-Term Commitments;
- Less cost of System Imports;
- Less cost of Water Rentals on Generation;[4] and
- Less cost of Natural Gas for Thermal Generation.

CNRO includes items that are impacted by system dispatch and water release decisions, which affect system storage. It also includes items affected by weather

3 Each year, this revenue can be negative or positive. Columbia River Treaty related agreements include the Non-Treaty Storage Agreement and Libby Coordination Agreements.

4 CNRO does not include the cost of water rentals on capacity.

because weather affects system storage and must be considered in system dispatch decisions.

The weather components of CNRO are uncontrollable. For example, domestic revenue is included in CNRO because weather affects load (e.g., customers use more electric heat when temperatures are colder, which increases demand). IPPs and Long-term Commitments are included because weather affects the amount of hydroelectric or wind energy that is generated from these facilities, which BC Hydro is required to take.

While these components are included as part of the CNRO calculation, the Energy Studies only inform decisions regarding the cost of dispatchable energy components.

2 Monthly Energy Studies Description

2.1 Overview of Process

During each study, input forecasts for inflows, loads, forward market prices, IPPs, generation unit availability and operational constraints are collected, and these provide inputs to models that represent the components of the generating system. These in turn feed models that optimize the system to maximize operations-related revenue. Finally, an accounting model implements the 2020 TPA pricing for system imports and exports and necessary reports are produced.

The models, at a minimum, are at a monthly time step; however, many model components execute with a finer granularity (as short as eight hours).

Figure DD-1 below provides an overview of the model inputs and components involved in the Monthly Energy Study process. Figure DD-2 below presents a high-level view of the sequence of operations involved in a Monthly Energy Study.

Figure DD-1 Overview of the Energy Studies Process

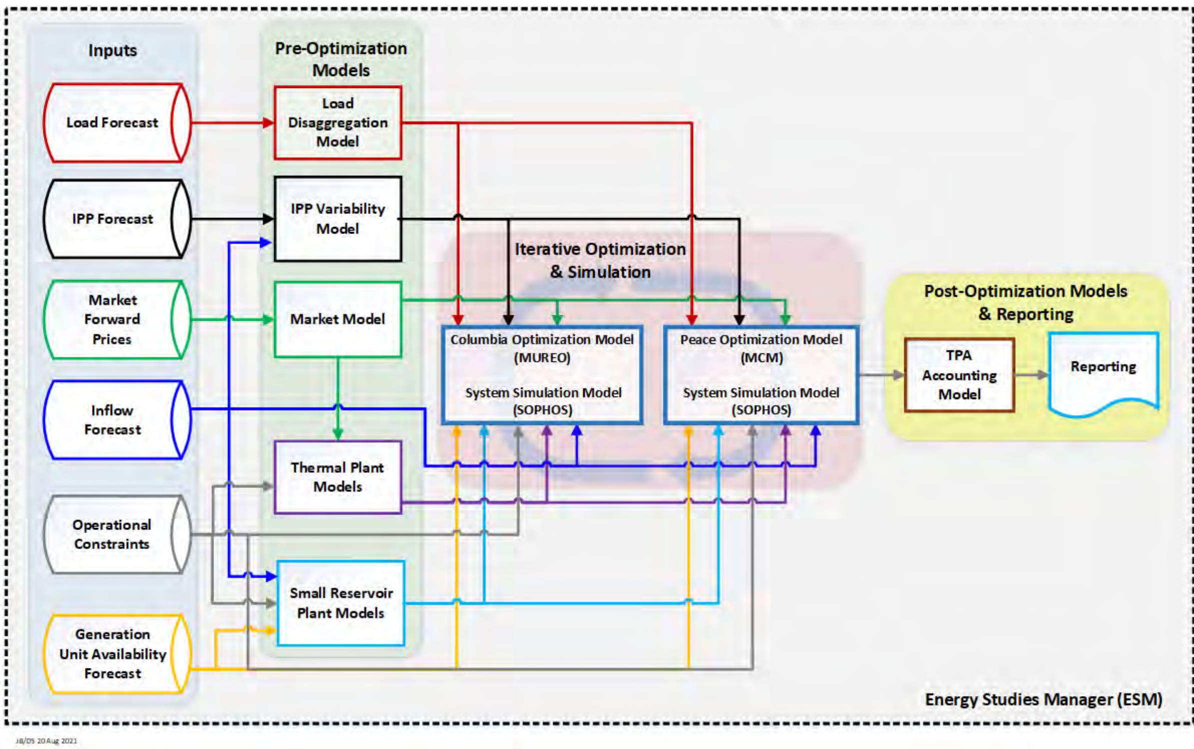

Figure DD-2 Monthly Energy Study Sequence

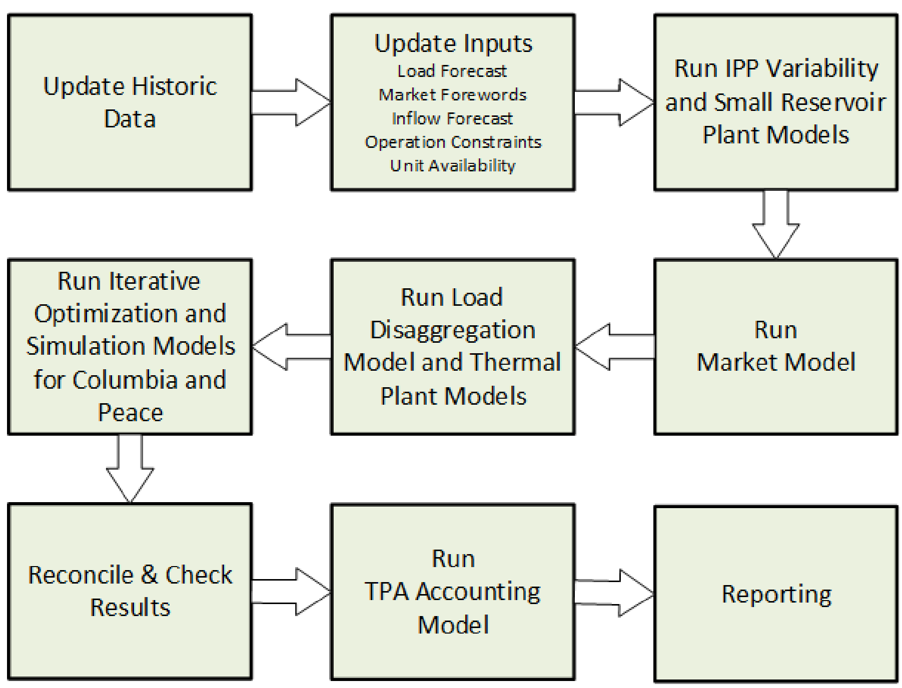

2.2 Inputs and Pre-Optimization Models

This section describes each of the key inputs and the model components that are used to transform the inputs into ensemble data sets that can then be used in the optimization.

2.2.1 Inflow Forecast (Input)

Inflows to each reservoir are the largest determinant of energy production and reservoir operation. Inflows are driven by a combination of rainfall, snowpack and glacier meltwater. Once the annually variable snowpack has melted (usually towards the end of summer), rainfall becomes the primary driver of reservoir inflows.

The inflow forecasts for the study horizon come from two sources. The first year comes from the seasonal inflow forecast and the remaining years come from historical records. Seasonal inflow forecasts are made at the beginning of every month, from January to August, for each of BC Hydro's 25 basins. These forecasts are in ensemble form, with one ensemble member for each historic weather sequence.

As of 2021, historic weather, inflow, and generation data exists for the period 1972 through 2020. These 49 years provide the basis for the ensemble set. The Energy Studies models require five years of inflow data. As a result, a set of five-year parallel sequences (ensembles) are created from the data that preserves any year-over-year correlation, as follows: 1972 to 1976, 1973 to 1977, 1974 to 1978, etc.

Note that to ensure a continuous sequence of five years in all ensembles, the initial year (1972) is assumed to follow the last year. This same set of 49 weather year ensembles is used in all key model inputs. The use of these weather year ensembles ensures that variability in inflows, prices, loads, and resources due to the impacts of weather are well represented in the models.

The inflow forecast is used in the IPP Variability model, the Small Reservoir and Plant Simulation models, and the Columbia and Peace Optimization models.

2.2.2 Load Forecast (Input) and Load Disaggregation Model

The load forecast is produced annually by BC Hydro's Load Forecasting team in the Energy Planning and Analytics Key Business Unit, with more frequent updates as required. This forecast consists of monthly total energy volume from sales to domestic customers plus system losses. Separate forecasts are provided for domestic load, sales to FortisBC under Rate Schedule 3808, delivery obligations to Seattle City Light under the Skagit Valley Treaty, and Fort Nelson area load.

The Energy Studies load variability model takes the load forecast from the Load Forecasting team and turns it into daily heavy load hour (**HLH**) and light load hour (**LLH**) blocks[5] in weather ensemble form (i.e., 49 separate load forecasts that are consistent with the temperatures/precipitation in those ensemble members). This process relies on analysis of the historic impacts of time of day, day of the week, and weather on the domestic load. The resulting ensemble average preserves the total annual energy volumes in the load forecast.

2.2.3 Market Forward Prices (Input) and Energy Studies Market Model

Electricity and gas prices tend to follow an annual cycle with higher prices during the colder winter months and hotter summer months, and lower prices during the spring freshet. At the beginning of each Energy Study, BC Hydro uses a set of forward market price curves for the electricity and gas prices at various North American power hubs as the basis to: 1) develop the market price forecasts generated by the market model used in the Energy Studies; and 2) value the system imports and exports output by the Energy Studies models.

[5] HLH is a 16-hour block from 7 a.m. to 10 p.m.; LLH is an eight-hour block from midnight to 7 a.m. and 10 p.m. to midnight. These correspond to the mid-Columbia market trading blocks, except for Sundays and NERC holidays, which are LLH all day, but are treated as separate blocks in the Energy Studies models.

The Energy Studies market model uses the forward curves for the North American gas market as its starting point. Based on an analysis of historic price data, the model adds variability to these prices in order to capture the expected range of uncertainty while maintaining a mean forecast that aligns with the forward curves. The aim of this process is to forecast a range of potential prices that may occur over the model time horizon.

When using the electricity price forecasts in the Energy Studies models, the modeled prices at the trading hubs are adjusted to factor in transmission costs to and from the BC Hydro system and converted to Canadian dollars where necessary.

2.2.4 IPP Forecast (Input) and IPP Variability Model

A forecast of Electricity Purchase Agreement (**EPA**) deliveries is updated each month by the Independent Power Producers (**IPP**) Portfolio Management team and used in the Energy Studies. For the majority of IPPs, forecast energy production is provided as a monthly estimate which does not account for uncertainty in inflows and energy production.

For many of the larger hydroelectric IPPs in southwest B.C. which have been in production for several years, the IPP Variability Model is used to augment the forecast to reflect uncertainty and daily variability in inflow. The single trace forecast of deliveries for these larger IPPs is replaced by an ensemble forecast that varies by inflow sequence. The mean of the sequences for each of these IPPs preserves the EPA forecast issued by the IPP Portfolio Management team. EPA cost forecasts are predetermined based on the delivery forecast and contract terms, and therefore do not impact the optimization process.

2.2.5 Generation Unit Availability Forecast (Input)

Energy production and plant capacity can be significantly affected by generation units being taken offline for maintenance and capital projects or forced out of service. Unit outages for maintenance and capital projects are accounted for in the Energy Studies. Generation unit availability forecasts are produced for the facilities that are included in the optimization process – facilities on the Peace system (GM Shrum and Peace Canyon generating stations) and Columbia system (Mica, Revelstoke and Arrow Lakes Hydro generating stations). Historic reliability data are used to adjust the availability forecasts to account for the risk of forced outages. The Generation unit Availability Forecast is also used by the Small Reservoir and Plant Simulation models.

2.2.6 Operational Constraints (Input)

Energy Studies models that simulate generating station and reservoir operations require, as an input, information on operating limits for the purpose of satisfying physical and water license requirements. In some cases, these constraints are static and do not change over time (e.g., minimum and maximum elevation limits), while in other cases they can change seasonally (e.g., fisheries flows, flood control elevations).

The Operational Constraints inputs are used in the Small Reservoir and Plant Simulation models, the Thermal Plant models, and the Columbia and Peace Optimization models.

2.2.7 Thermal Plants Model

The Energy Studies also model the operation of Fort Nelson Generating Station and the Island Generation facility, both of which are dispatched for reliability and when economic. Fort Nelson, which is not part of the BC Hydro integrated grid, is run to serve area load as well as meet Alberta market opportunities. The Energy Studies models account for the gas price, plant heat rate, carbon tax and gas transportation costs when forecasting economic dispatch from the thermal plants.

2.2.8 Small Reservoir Plant Models

This section describes the models for other generating facilities that do not get dispatched as part of the optimization models. These models are represented in Figure DD-1 as "Small Reservoir Plant Simulation Models".

2.2.8.1 Small Hydro

BC Hydro's portfolio of generation assets includes many smaller hydroelectric resources that produce energy following a seasonal cycle. Energy production at these smaller plants is modelled in the Energy Studies based on historic energy production, adjusted for outages, upgrades, and other changes in generating capability. The current water supply forecast and outage schedules are also considered.

To align the forecast with the ensembles produced by the other models, historic data for the 1972 to 2020 period is used. In the January through August period of the first study year this forecast is adjusted to account for the current water supply forecast. For the Bridge River facilities, which comprise about 40 per cent of the small hydro energy production, forecast operations for the first 12 to 18 months are used.

2.2.8.2 Kootenay

The Kootenay hydroelectric system consists of a complex arrangement of plants and storage, where the bulk of BC Hydro's flexibility lies in operating Kootenay Canal for power generation. Approximately one-half of the Kootenay Canal inflows come from upstream storage controlled by the U.S. (Libby Dam and Koocanusa Reservoir). The Energy Studies simulate the operation of the upstream storage and models the operation of Kootenay Lake using a linear programing model to maximize the value of energy produced based on the value of energy in the rest of the system.

2.2.8.3 Pend-d'Oreille

The modelled hydroelectric facilities on the Canadian portion of the Pend-d'Oreille River include Seven Mile, Waneta and Waneta Expansion plants. There is very little storage in the Canadian portion of the Pend-d'Oreille, and releases from upstream storage in the U.S. system are regulated. No optimization is performed on this system and a simulation model is run for the Energy Studies in which the Canadian plants generate energy, shaped into HLH and LLH blocks, while passing both local inflows and flows received from the upstream U.S. storage.

2.3 Models of Large Storage Reservoirs and Imports and Exports

BC Hydro's primary source of seasonal and multi-year operational flexibility are the Kinbasket Reservoir on the Columbia River and Williston Reservoir on the Peace River. Taken together, the total storage in these two reservoirs represents approximately 90 per cent of the total storage capability in the entire system. The two basins have their own unique characteristics and constraints; hence, two different models are used.

Due to the large volume of available storage, the plants on the Peace and Columbia can be dispatched to meet domestic load and to take advantage of market conditions. They can run harder (discharge more water) to meet peak domestic load demand or for export during times of high market electricity prices or can be backed down (discharge less water) for imports to take advantage of low market electricity prices.

Energy Studies models for the Peace and Columbia systems are run iteratively with the objective of maximizing CNRO (refer to section 1.4). A future improvement to the modelling will consider implementing the optimization of both basins within a single Three Reservoir (Williston, Kinbasket, and Arrow) model (refer to section 3.2).

2.3.1 Columbia Optimization Model (MUREO)

BC Hydro's primary generating resources on the Columbia River are at the generation stations located at Mica and Revelstoke (Kinbasket and Revelstoke reservoirs, respectively). Water discharged from Kinbasket Reservoir and generated at Mica Generating Station travels through Revelstoke Reservoir and generated at Revelstoke Generating Station into Arrow Lakes Reservoir. Arrow Lakes Reservoir also has a non-BC Hydro owned generating station, Arrow Lakes Hydro. Output from this plant is coordinated with the rest of BC Hydro's generation under the terms of the Keenleyside Entitlement Agreement.

In the Energy Studies, Kinbasket, Revelstoke and Arrow Lakes Reservoirs are modelled in accordance with constraints arising from the Columbia River Treaty related to firm power generation in the U.S. and flood control, as well as supplemental agreements and operating restrictions associated with fish and other non-power uses.

One of the major challenges in modelling the Columbia system involves accounting for the changing storage requirements of the Columbia River Treaty. Changes in snowpack and the timing or volume of inflow forecasts throughout both the Canadian and U.S. portions of the Columbia system can impact the constraints applied during the optimization process. The model considers reservoir elevation, turbine efficiency, generation unit availability and generating capacity of the Mica, Revelstoke, and Arrow Lakes Hydro plants.

The Columbia system is optimized using the Multiple Reservoir Energy Optimizer (**MUREO**) model. It uses a stochastic dynamic programming approach to optimize Columbia River system operations with respect to the uncertainties in inflow, residual load, and electricity price. The marginal value of energy stored in Kinbasket Reservoir is produced by this model.

2.3.2 Peace Optimization Model (MCM)

The Peace system consists of Williston Reservoir and GM Shrum Generating Station, with Dinosaur Reservoir and Peace Canyon Generating Station situated downstream. Site C will be a third dam and generating station on Peace River downstream of Peace Canyon near Fort St. John.

The Peace system is optimized using the Marginal Cost Model (**MCM**). This model also uses stochastic dynamic programming that explicitly considers the likelihood of month-to-month changes in market prices. The marginal value of energy stored in Williston Reservoir is produced by this model.

The MCM optimizes Peace operations in the context of the larger system, and assumes that energy production from GM Shrum and Peace Canyon can be varied to meet both the remaining (or, residual) load not served from other plants in the system, as well as market opportunities for energy export or import. Using energy prices obtained from the market models, the MCM optimizes the net revenue by reducing Peace energy production to permit imports during periods when prices are low and by increasing generation to serve the market during months when prices are high, in both cases ensuring that load is met.

2.3.3 System Simulation (SOPHOS)

The system simulation model SOPHOS takes the discharge releases produced by the Peace and Columbia optimization models to produce forecasts of reservoir elevations, plant discharges and energy production, spills, market imports and exports, and marginal basin prices. This model operates using a daily time step with HLH and LLH blocks and includes more details on outages and constraints than are included in the optimizers due to those models having a coarser sub-monthly time step.

2.4 Post-Processing

After the optimization and simulation modelling is complete, the 2020 TPA accounting model is used to price the system imports and exports and gas generation using the forward price curves. As noted previously, the Energy Studies produce an ensemble of forecasts. The average of these ensembles is used for the Cost of Energy forecast. The forecast cost of total water rental fees is based on the forecast of BC Hydro plant energy production and priced at the applicable water rental rates.

The System Optimization team within GSO, working with the Finance Key Business Unit, prepares and presents the Cost of Energy forecasts.

3 Development of Energy Studies Models

3.1 Development and Continuous Improvement

BC Hydro is continually improving its modelling capability and the models used in the Monthly Energy Studies models are validated and updated on an ongoing basis.[6] BC Hydro provided the following information regarding the cost of energy and the Monthly Energy Studies in BC Hydro's compliance filing to the BCUC dated April 1, 2021:[7]

- A summary of model improvements;
- A plan to update the models in the Energy Studies; and

---

[6] Refer to materials filed in previous proceedings including:
- BC Hydro's response to BCUC IRs 1.55.4 and 2.367.2 in the Fiscal 2011 Revenue Requirements Application;
- Appendix DD of the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application; and
- Subsequent compliance fillings as part of the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application dated December 1, 2020 and April 1, 2021.

[7] Refer to: https://www.bcuc.com/ApplicationView.aspx?ApplicationId=855.

- A plan to have an independent third-party test the Energy Studies Market Model.

3.2 Energy Studies Model Improvements

Changes in BC Hydro system characteristics (e.g., adding a new generating station, unit upgrades), changes in markets (e.g., addition of a carbon tax), advances in modelling techniques, and enhancements in computational power and programming languages, all contribute to the need for continual improvements in models and processes. In addition, the System Optimization team continually compares forecasts with observed data and makes improvements in the models to reduce any bias and improve the representation of the range of expected variation in the forecasts.

Current plans for Energy Studies model improvements are broken up into the following tasks that outline the expected continuous improvements over fiscal 2022 to fiscal 2027. The seven model improvement tasks are:

(a) Increase Automation of the Energy Studies Manager: Efficiency Improvements;

(b) Improve Data Transfer management in the Energy Studies Manager (**ESM**);

(c) Replace the Peace Optimizer Model;

(d) Upgrade the Columbia and Peace Simulation Model (**SOPHOS**);

(e) Update the Load Variability Model;

(f) Develop a Three Reservoir Stochastic Dynamic Programming Model (**SDP**); and

(g) Update the Cloud Computation Interface: Amazon Web Service (**AWS**).

In addition, BC Hydro will:

(a) Update the Short-Term Model: Ultralight;

(b) Provide an external review of the Market Model and report on the results;

(c) Develop a process and implement benchmarking and report on the results; and

(d) Develop a process and implement backtesting and report on the results.

The completion of each task, for the Energy Studies (a) through (g), above, generally addresses some or all of the following objectives:

- Reduce execution time to run the models;
- Reduce the amount of person resources needed to run the models;
- Improve data transcription and transfer between large databases;
- Increase model accuracy;
- Facilitate the ability to run different and parallel scenarios;
- Improve error handling during the Energy Studies Manager process;
- Improve reporting capabilities; and
- Reduce issues associated with aging programming environment or legacy code and documentation.

Directive 4 in the BCUC's Decision on the Previous Application directed BC Hydro to provide an update on the timeline for improvements to the Energy Studies models (referenced in Table 11 of the Decision) and explain any changes to the timeline.[8] In the Decision, the BCUC noted that it was concerned about the length of time it will take to complete the benchmarking and backtesting. BC Hydro has considered the BCUC's feedback and advanced the schedule for backtesting by one year. Under this revised schedule there is less ability for the team to respond to any new issues that may arise. Further compression of the schedule for benchmarking is not feasible

[8] Directive 4; BCUC Decision and Order No. G-187-21, BC Hydro Fiscal 2022 Revenue Requirements Application (June 17, 2021), page 23.

without impacting other scheduled tasks. The table below provides the current timeline for each of the planned improvements.

Table DD-1 Monthly Energy Studies Models Tasks (Update to Table 1 in the April 2021 Compliance Filing)[9]

BC Hydro's ICS Cybersecurity Risk Mitigation Plan

BC Hydro's Industrial Control Systems (ICS) Cybersecurity Risk Mitigation Plan

Cybersecurity in BC Hydro's facilities containing Industrial Control Systems (**ICS**) has so far been focused on those stations where Critical Infrastructure Protection (**CIP**) Mandatory Reliability Standards are applicable. Currently 186 stations are subject to CIP standards for cybersecurity and are classified as high, medium or low depending on their potential to impact the reliability of the Bulk Electricity System (**BES**) across the Western Interconnection System. Additionally, there are another approximately 150 stations that are not subject to CIP standards (referred to as **non-CIP**). Even though a cyber incident at one of these 150 stations wouldn't impact the reliability of the BES, it could potentially lead to a localized power outage and reputational damage to BC Hydro.

The OAG audit found that BC Hydro has insufficient cybersecurity controls in place for ICS that are not covered by CIP Mandatory Reliability Standards. There were three high-level recommendations; to assess the risk over the ICS environment, to maintain an inventory of the ICS systems and devices, and to implement detection and monitoring capability for ICS systems and devices.

In response to the first recommendation, BC Hydro engaged an expert third party service provider to carry out a cybersecurity risk assessment of all ICS, located at approximately 150 stations, that were not in scope of CIP. The assessment identified a number of possible cybersecurity risk mitigation activities. Based on this report, BC Hydro implemented mitigation controls at stations containing ICS and identified as having a high-risk vulnerability to unauthorized access. The remainder of the mitigation recommendations will be considered as part of a multi-year program to address each of the non-CIP stations.

The second and third recommendations from the OAG audit are currently being implemented across our CIP stations in advance of its application to non-CIP stations. More specifically, inventory and configuration management are in place for all high and medium impact stations and are within scope for the current CIP initiative CIP-003-8 (referred to as the **CIP v7** Project) for all low impact sites. Monitoring and detection is in place for high and medium sites and this will be enhanced and extended to the 131 low impact sites during the CIP v7 Project. The recommendation to monitor and detect in real-time is dependent on the network capability of the individual sites and this will be considered as part of the remediation for each station. Once the high, medium and low impact stations have been addressed, BC Hydro will apply the same approach to the non-CIP stations containing ICS.

OAG AUDIT RECOMMENDATIONS

We recommend that BC Hydro

1. Assess cybersecurity risk over its entire ICS environment to ensure appropriate detection and response measures are implemented.
2. Maintain an inventory of hardware and software components, including their configuration, settings for all ICS-related systems and devices, regardless of whether they currently fall under the mandatory standards.
3. Implement detection mechanisms and monitor, in real time, for anomalous activity on ICS-related systems and devices not currently under the mandatory standards.

BC Hydro's multi-year plan is to establish inventory, monitoring and detection mechanisms first across the CIP environment and then the remaining ICS environment where practicable. The practice of mitigating risk to As Low as Reasonably Practicable (**ALARP**) is well-established as a risk management approach. In this case, BC Hydro will implement those recommendations that can be done (e.g., there is connectivity available for remote monitoring) and are reasonable to do (e.g., the risk outweighs the cost). BC Hydro notes that implementing the OAG recommendations for the non-CIP classified stations is outside of the requirements for CIP compliance.

Plan Summary:

- Extend and enhance inventory practices, monitoring and detection technologies and services during the CIP v7 Project for low impact CIP stations;
- Develop a business case, prioritize the non-CIP stations and develop a remediation schedule; and
- Implement inventory, monitoring and detection mechanisms across the non-CIP stations containing ICS where practicable. This is dependent on whether there is connectivity available for remote monitoring and it's reasonable to do so (e.g., the risk outweighs the cost).

PROGRAM PLAN

Scope

The British Columbia Utilities Commission (**BCUC**) has adopted the CIP standards for BC Hydro which specifies requirements for high, medium and low impact facilities as defined by CIP-002. The scope of this program includes approximately 150 stations containing ICS that are not subject to CIP standards

These sites are geographically spread across the province of British Columbia and vary in the number of customers for which they supply power. BC Hydro's Power Systems Planning and Operations teams use a "criticality" categorization for sustaining and responding to reliability issues at these sites based on potential impact to customers. The OAG correctly identified the potential impact of a cybersecurity incident at a non-CIP site to be reliability of service to customers. These sites do not individually have the potential to impact the BES but could impact parts of the local power systems network. It is highly unlikely that an attack originating at one of these sites would be able to access BC Hydro's telecommunications network and impact the rest of BC Hydro's operations. Given the potential impact of a cybersecurity incident is to reliability of service to customers, we will use the "criticality" categorization to prioritize the non-CIP sites for cybersecurity risk mitigation activities.

Approach

BC Hydro's approach is to build on the work being done to meet the CIP requirements and to extend this into the non-CIP sites. BC Hydro completed some immediate remediation activities at non-CIP sites that were identified through the external risk assessment completed in 2019. The remaining recommendations from the OAG audit and the risk assessment will be addressed as part of this program plan.

<u>Develop inventory processes, monitoring and detection architectures and designs during project for CIP v7 low impact sites</u>

The CIP v7 Project will implement many of the controls at BC Hydro's low impact CIP sites that were recommended through the OAG audit. The project will enhance the process and tools for capturing and maintaining an inventory of CIP cyber assets. It will also implement monitoring and detection of activity at the CIP site electronic perimeter for those sites having external routable connectivity. The processes, tools, architecture and designs developed as part of this project will also serve to meet the needs of the non-CIP cyber assets and sites.

<u>Develop business case for non-CIP facilities and include in maintenance program</u>

Following the development and deployment of the CIP requirements for low impact sites, BC Hydro will initiate a prioritized maintenance program to address the non-CIP facilities. BC Hydro will use its current method for categorizing transmission and distribution sites to prioritize the work. A business case will be developed for a continuous improvement work program to assess and remediate sites. The decision to remediate a site will be based on feasibility, cost and risk.

Implement inventory, monitoring and detection mechanisms across the non-CIP ICS environment

As each site is assessed an inventory will be taken and a work package developed to address the remediation recommendations where practicable. There are approximately 150 sites that fall into the non-CIP category. It is expected that this work will take approximately three years based on the number of sites. This timing reflects the use of contractors in addition to BC Hydro's own staff. It is unlikely that this timeline can be accelerated due to resource capacity constraints including BC Hydro management capacity to plan and oversee the work.

To maximize efficient use of resources, assessment and remediation activities will be timed to coincide with regularly scheduled maintenance work where possible.

Schedule

The following schedule is expected for the program.

Fiscal 2022	Fiscal 2023	Fiscal 2024	Fiscal 2025	Fiscal 2026	Fiscal 2027
CIP v7 – LOW impact stations					
		Business case and prioritization	Non-CIP – ICS stations		

The existing CIP v7 Project includes 131 low impact sites (there are 2 others categorized as low impact that are not yet in service) and is expected to take three years to complete. The inventory and design work are expected to be completed in fiscal 2022 with the implementation of controls expected to be complete in the third quarter of fiscal 2024. The implementation is expected to cost approximately $40 million with an additional $4 million per year to sustain. Funding for this work is included in BC Hydro's Fiscal 2023 to Fiscal 2025 Revenue Requirements Application, refer to Appendix I and J (Planning ID: 901592) and Chapter 5, section 5.7.

Implementation of the non-CIP ICS program includes approximately 150 stations and is expected to take a further three years to complete. The program will use the methods, processes and tools developed for CIP v7 and many of the same resources both internal and external to BC Hydro. Business case development and prioritization will start in fiscal 2024 such that the program can begin implementation immediately after completion of the CIP v7 Project. The program will prioritize the non-CIP sites based on BC Hydro's current method for categorizing the criticality of transmission and distribution sites. BC Hydro expects to address the highest priority sites within the first year of the project. BC Hydro's Fiscal 2023 to Fiscal 2025 Revenue Requirements Application includes some capital expenditure funding for this work within Line Asset Planning.

Resources

This program will be initiated by BC Hydro's Asset Planning KBU and will utilize both internal and external maintenance teams to complete the work.

Project Delivery Risks

Risk	Impact	Mitigation
Funding	Funding for the program has not yet been secured and will need to be in place prior to commencing work.	A business case will be developed to secure funding prior to starting the work during the latter stages of the CIP v7 Project. The business case will require approval consistent with BC Hydro's financial policy and may require a submission to the BCUC.

Dam Safety Vulnerability Index and Long-Term Capital Plan

Table of Contents

List of Figures

List of Tables

1 Introduction

BC Hydro provides this appendix in response to Directive 12 from the BCUC's Decision on the Previous Application. Directive 12 directed BC Hydro to file its dam safety vulnerability index for all dams and its aggregate dam safety vulnerability index and a long-term capital plan for ensuring the sustainable safety of all its dams.

Section 2 below provides the requested dam safety vulnerability indices (**Vulnerability Index**), while section 3 provides BC Hydro's dam safety long-term capital plan.

2 Dam Safety Vulnerability Index

This section includes an overview of the Vulnerability Index and how BC Hydro uses it in the safe management of its dams.

2.1 BC Hydro Uses the Dam Safety Vulnerability Index to Characterize All Deficiencies in BC Hydro's Dams

BC Hydro uses the Vulnerability Index to characterize all deficiencies in BC Hydro's dams. BC Hydro's Dam Safety program defines a deficiency to be an inadequacy or uncertainty of concern in the capacity of the dam to meet its performance goals in accordance with established norms of dam safety practices, as described in various guidelines and bulletins published by the Canadian Dam Association, the International Commission on Large Dams, and other similar organizations and authorities. The "dam" in this context is defined as all physical features and structures necessary to retain the reservoir and ensure the controlled passage of all flows through, around and beyond the actual constructed barrier.

BC Hydro's dams have been, and are, built on the basis of good industry practice existing at the time of their construction. Post construction, BC Hydro subjects its dams to regular and continuing surveillance and monitoring to identify deficiencies in design, construction or performance that may compromise the overall integrity of the dam and its ancillary systems and their ability to safely retain and convey water. As our dams age and as scientific knowledge advances, deficiencies can arise in three ways:

- Firstly, deficiencies arise through wear and tear, as explained in Chapter 6, section 6.4.1.4 of this application, and are identified through regular inspections and condition assessments;
- Secondly, deleterious conditions in dams develop over time and are identified by our surveillance activities and verified through engineering investigations. Examples are excessive seepage through embankment dams or abutments with potential for internal erosion, or excessive uplift pressures that can destabilize concrete dams; and
- Finally, deficiencies can arise as good practice evolves and expectations become more stringent. For example, with the evolution of seismic design standards over the past several decades, dams that were designed or upgraded to meet previous expectations for earthquake load resistance may not meet current seismic design expectations and consequently be identified as having a deficiency under seismic loading.

BC Hydro follows international and Canadian best practices in dam safety management to identify and characterize deficiencies associated with its dams. In so doing, BC Hydro uses a standards-based characterization of the degree of concern that exists with respect to the integrity of the dam, expressed in terms of a Vulnerability Index. As discussed in section 2.4 below, the Vulnerability Index characterizes the degree to which the observed or expected performance of a feature of the dam deviates from what is required or minimally desired by current good practice and the frequency at which the dam will be subjected to conditions that stress the feature accordingly.

2.2 BC Hydro's Current Dam Safety Vulnerability Index Ratings

BC Hydro's Dam Safety Vulnerability Index for all dams and aggregated Dam Safety Vulnerability Index are provided below in Figure FF-1 and Figure FF-2, respectively. Identified deficiencies are broken out into Actual Deficiencies and Potential Deficiencies in Figure FF-2. In Figure FF-1, Actual Deficiencies are further broken out into Actual Normal (**AN**), Actual Unusual (**AU**), and Spillway Reliability Deficiencies, while Potential Normal (**PN**) and Potential Unusual (**PU**) Deficiencies are reported together. These types of deficiencies are described in section 2.3 below. The determination of the Vulnerability Index ratings is described in section 2.4 below.

1 **Figure FF-1 Dam Safety Vulnerability Index Ratings**
2 **for BC Hydro Dams as at June 30, 2021**

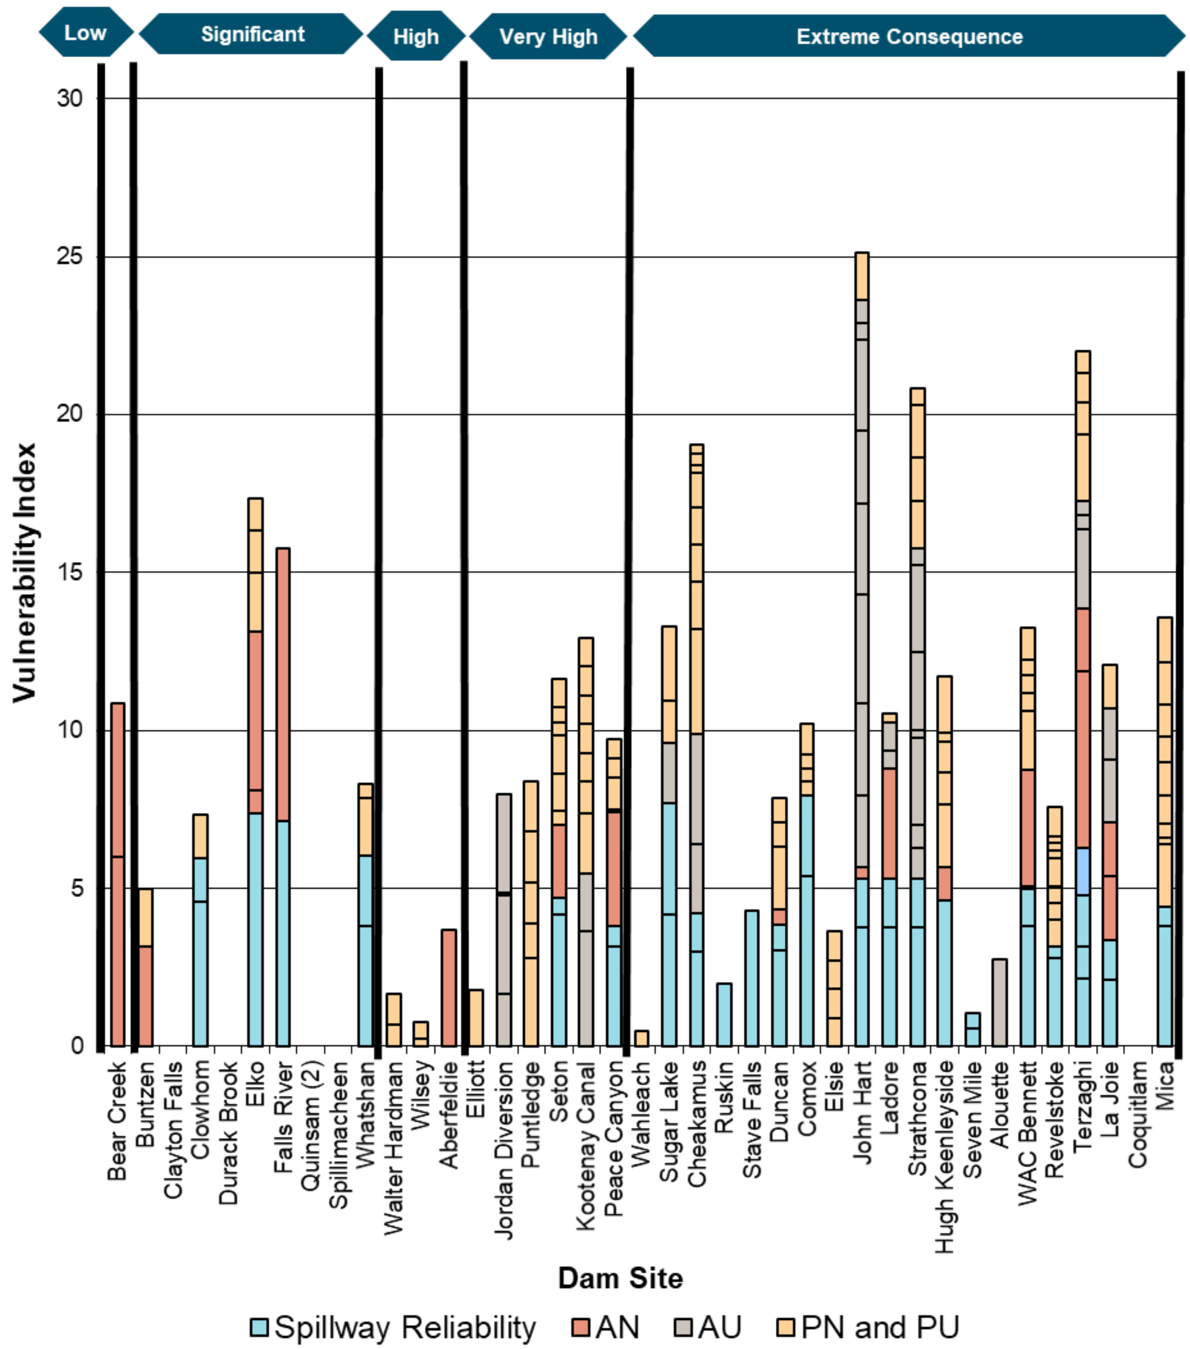

Figure FF-2 Aggregated Dam Safety Vulnerability Index Ratings as at June 30, 2021

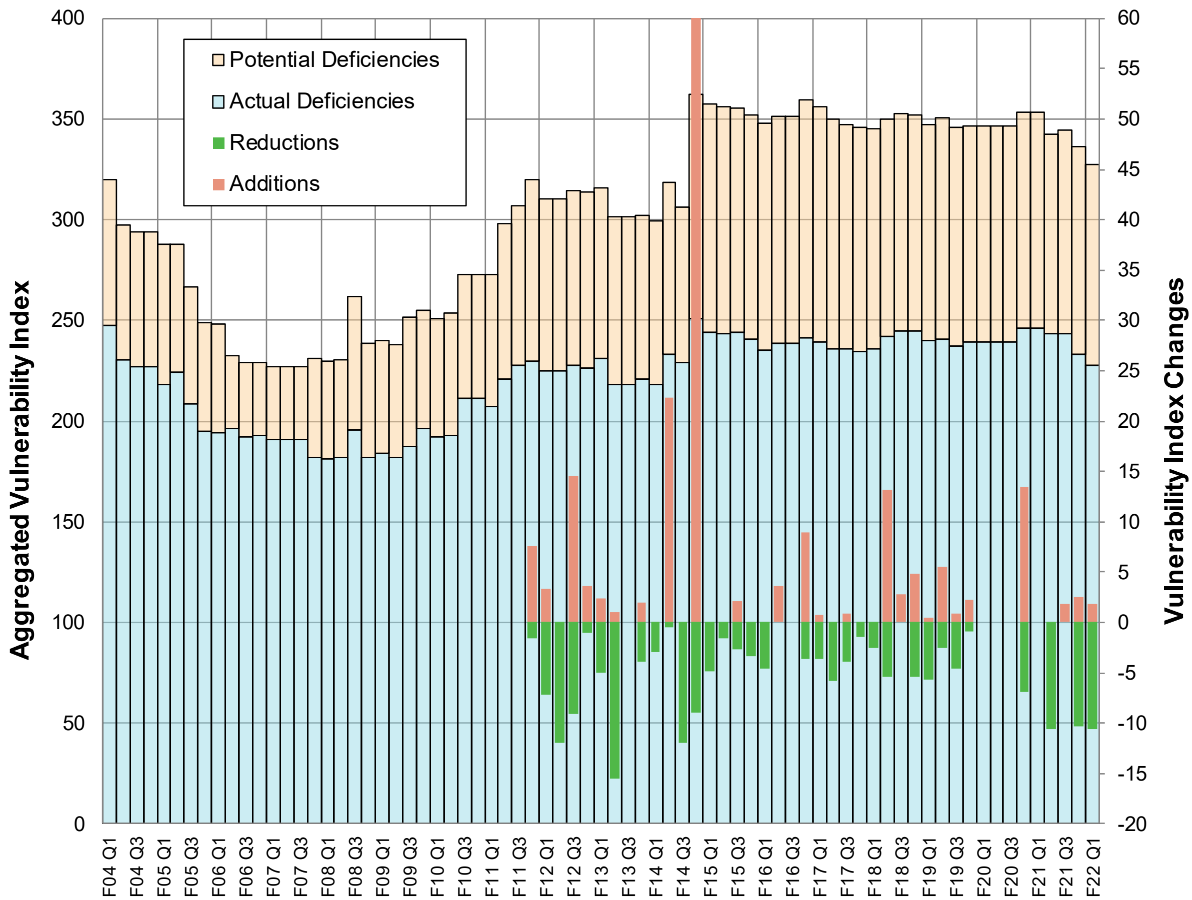


2.3 Types of Deficiencies in the Dam Safety Vulnerability Index

As plotted in Figure FF-2 above, deficiencies are differentiated as Actual Deficiencies or Potential Deficiencies:

- Actual Deficiencies are inadequacies in performance that have been confirmed to exist through an appropriate form of analysis or for which the character or magnitude of residual uncertainties are such that dam safety improvements are necessary; and

- Potential Deficiencies are concerns pertaining to inadequacies in performance that have not yet been confirmed as Actual Deficiencies but are expected to be, or that are of such a nature that, unless they can be demonstrated to not exist, dam safety improvements are necessary.

Deficiencies are further differentiated as pertaining to Normal loading conditions, Unusual loading conditions, or Spillway Reliability.

- Normal loading conditions are the loading conditions that are applied to the dam either continuously or that can be reasonably expected to occur over the operating life of the dam. These include loading conditions for natural hazards such as floods and earthquakes with an Annual Exceedance Frequency (**AEF**)[1] of 1/500 or greater.[2] They also include loads that would occur as a result of operator error or the failure of some protective system necessary to deal with normal loads.
- Unusual loading conditions are those due to natural hazards with an AEF of less than 1/500, as well as unforeseeable loading conditions, including those loads not recognized in best design practices.
- Spillway Reliability Deficiencies are those related to the reliable operation of spillway gates and other discharge devices (e.g., valves) required to control reservoir levels and pass required downstream flows in response to high inflows and/or generating unit outages.

---

1 Annual Exceedance Frequency is the annualized frequency at which some prescribed event will occur or be exceeded. The greater the value of an event's AEF, the more commonly it occurs. For example, an event with an AEF of 2 would be expected to occur, on average, twice per year; an event with an AEF of 1/500 would be expected to occur, on average, once every 500 years; and an event with an AEF of 1/10,000 would be expected to occur once every 10,000 years.

2 A natural hazard with an AEF of 1/500 would have a 10 per cent probability of occurring or being exceeded over a 50-year period or a 20 per cent probability of occurring or being exceeded over a 100-year period. As dams generally have life spans that are at least as long as 50 to 100 years, loadings from natural hazards with AEF of 1/500 or greater can be reasonably expected to occur over a dam's operating life.

Differentiated in these two ways, deficiencies are fully categorized as being Actual Normal Deficiencies, Actual Unusual Deficiencies, Potential Normal Deficiencies, Potential Unusual Deficiencies, and Spillway Reliability Deficiencies. As previously noted, Spillway Reliability Deficiencies are included as Actual Deficiencies in Figure FF-2.

2.4 Computing the Vulnerability Index Rating for a Deficiency

The Vulnerability Index rating for any given deficiency is determined by multiplying a factor representing the deficiency's Magnitude of the Concern by a factor representing the Frequency of Stressing the Feature:

$$\text{Vulnerability Index} = \text{Magnitude of Concern Factor} \times \text{Frequency of Stressing the Feature Factor}$$

The determination of the Magnitude of the Concern and Frequency of Stressing the Feature are discussed below.

2.4.1 Determining the Magnitude of Concern Factor

In determining the factor for Magnitude of Concern of an Actual Deficiency, each of three performance characteristics is assigned a value on a scale of 0 to 1, as follows:

(a) Magnitude of the Gap: The magnitude of the gap between the actual performance capability of the feature of concern and its required or minimum desired capacity. If the feature has 90 per cent of the required or minimum desired capacity, then the inferred gap is 10 per cent and a value of 0.1 is assigned. If the feature has 10 per cent of the required or desired minimum capacity, then the gap is 90 per cent and a value of 0.9 is assigned;

(b) Criticality of the Feature: The criticality of a feature in the assurance of the safety of a dam is determined by the design of the dam and whether or not the feature is "in series" or "in parallel" in the safe functioning of the dam. For a feature that is in series with no parallel compensating features, the assigned value will be 1 if the feature is essential for safety and 0 if it is not essential for safety. On the other hand, if the feature is part of a parallel subsystem, where there are other compensating features, then the assigned value is determined by the extent to which the individual feature contributes to the overall function of the total capacity of the parallel subsystem. Thus if 70 per cent of the functioning of a parallel subsystem is derived from an individual feature, then a value of 0.7 is assigned to the criticality of that feature; and

(c) Magnitude of Weakness of Interim Risk Controls: The magnitude of weakness of interim risk controls is the ineffectiveness of interim risk controls that have been established to manage risks associated with the deficiency until a permanent solution can be implemented. If no interim risk controls have been established, or it is not possible to establish interim risk controls, then a value of 1 is assigned. If the interim risk controls are as effective as a permanent solution, then a value of 0 is assigned. In all other cases, the value assigned is the same as the Magnitude of the Gap with the interim risk controls in place.

The Magnitude of Concern is the product of the three values described in (a) through (c) described above:

$$\begin{aligned}\text{Magnitude of Concern} \;=\; & \text{Magnitude of the Gap} \times \\ & \text{Criticality of the Feature} \times \\ & \text{Magnitude of Weakness of Interim Risk Controls}\end{aligned}$$

The Magnitude of Concern Factor for an Actual Deficiency is computed by taking the cube root of the computed Magnitude of Concern and multiplying by 10.

$$\text{Magnitude of Concern Factor}|_{\text{Actual Deficiency}} = 10 \times \sqrt[3]{(\text{Magnitude of Concern})}$$

In the case of Potential Deficiencies, the Magnitude of Concern is assigned subjectively in part because the information available concerning the physical nature and extent of the concern is inconclusive, and the Magnitude of Concern Factor is computed by taking the cube root of the assigned Magnitude of Concern and multiplying by 5.

$$\text{Magnitude of Concern Factor}|_{\text{Potential Deficiency}} = 5 \times \sqrt[3]{(\text{Magnitude of Concern})}$$

2.4.2 Determining the Frequency of Stressing the Feature Factor

The Frequency of Stressing the Feature is determined directly from load-frequency analysis and is expressed as an AEF. Very rare loading conditions with AEF's of less than 10^{-4} are assigned an AEF of 10^{-4}. The Frequency of Stressing the Feature Factor is determined from:

$$\text{Frequency of Stressing the Feature Factor } = 1 - [0.1 \times \ln 1/\text{AEF}]$$

2.5 The Vulnerability Index Is Routinely Updated

The Vulnerability Index is a dynamic measure that is routinely updated as part of BC Hydro's Dam Safety Program. BC Hydro's surveillance activities and the Dam Safety Reviews provide the principal means of identifying deficiencies, rating their magnitude and determining the frequency of loading, or stressing. The Vulnerability Index rating is updated when new information pertaining to the deficiency is obtained. Dam Safety investigations and the Dam Safety capital projects provide the primary means for updating the data on the Magnitude of the Concern and the Frequency of Stressing. Upon completion of a Dam Safety investigation or a Dam Safety project, new information is generated and used to update the Magnitude of Concern and/or the Frequency of Stressing to reflect a physical change to the asset or a better understanding of the issue. Thus, the Vulnerability Index rating for a deficiency will change, and is tracked, over time.

2.6 The Vulnerability Index in Portfolio Risk Management

Since Vulnerability Index ratings are assigned to individual dam safety deficiencies for each dam, the sum of the individual Vulnerability Index ratings provides a measure of the safety status of that dam at the time that the Vulnerability Index is assigned, and subsequently when it is updated.

For each dam, the Vulnerability Index ratings associated with all characterized deficiencies are aggregated and charted, as in Figure FF-1 above to provide an overall Vulnerability Index for the dam. Since the Vulnerability Index for a dam is the aggregate of the vulnerabilities of individual components, features and functions, the relative importance of the individual vulnerabilities can be considered in decision-making.

With no factor relating to the consequences of failure, the Vulnerability Index is not a proxy for risk. Risk is estimated by sorting the dams according to their consequence classifications within the Dam Safety Regulation[3], with risk inferred to be greater for vulnerabilities in higher consequence dams as one moves across the classifications from left to right in Figure FF-1.

Just as the Vulnerability Index for a single dam is the aggregate of the vulnerabilities of its individual components, the Vulnerability Index of the fleet of dams is expressed as the aggregate of the vulnerabilities of the individual dams. The Vulnerability Index ratings associated with all characterized deficiencies on all dams are aggregated and charted, as in Figure FF-2 above, to provide an overall Vulnerability Index for the fleet of dams. The aggregate Vulnerability Index is plotted over time to show the relative risk position of BC Hydro's fleet of dams.

[3] B.C. Reg. 40/2016, Water Sustainability Act, Dam Safety Regulation: https://www.bclaws.gov.bc.ca/civix/document/id/complete/statreg/40_2016

As it is the intent of BC Hydro to not allow an overall increase in the dam safety risk profile, the ongoing rate of decrease should offset the future Vulnerability Index increases, and this balance is used to set and monitor the Dam Safety projects in the 10-year capital plan on an ongoing basis.

3 Dam Safety Long-Term Capital Plan

BC Hydro's Dam Safety long-term capital plan is derived from BC Hydro's Fiscal 2022 to Fiscal 2031 Capital Plan (**Capital Plan**), which was approved by the Executive Team and presented to the Capital Projects Committee of BC Hydro's Board of Directors in June 2021.[4] Based on the Capital Plan:

- BC Hydro is expecting an increasing level of investment in Dam Safety over the 10-year period;
- Dam safety risks, strategic investments in assets, and other operational considerations are balanced in capital planning using a staged prioritization approach; and
- BC Hydro is investing extensively in the safety of its dams.

BC Hydro expands on each of these points below.

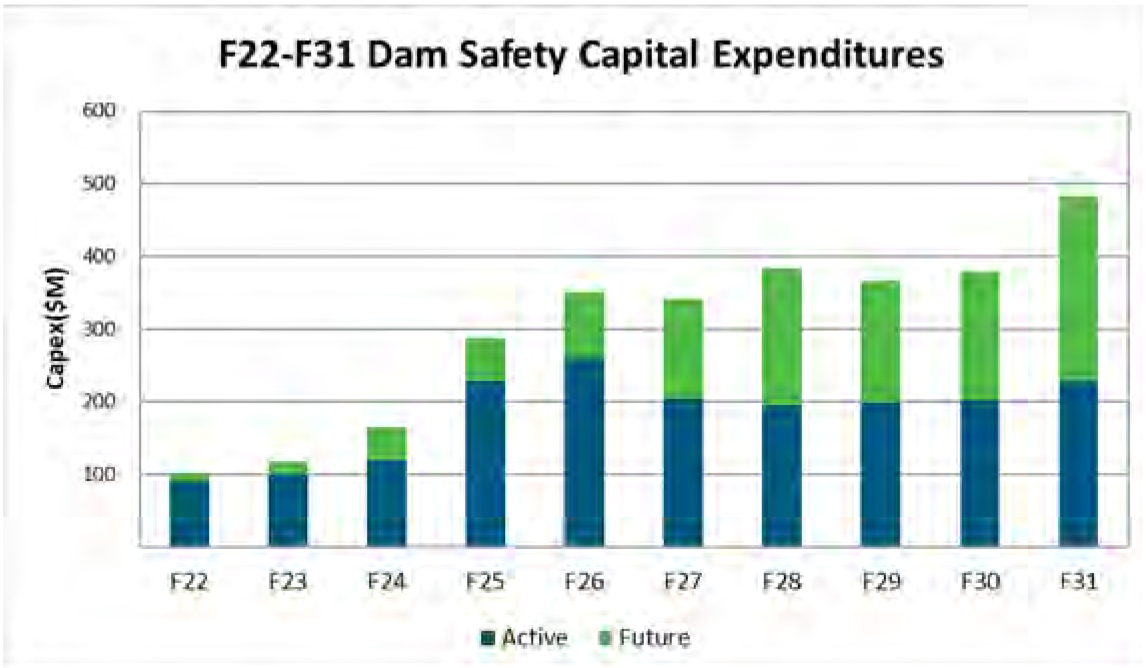
3.1 BC Hydro Is Expecting an Increasing Level of Investment in Dam Safety over the 10-Year Period

As shown in Figure FF-3 below, approximately 60 per cent of the Dam Safety expenditures in the Capital Plan are related to active investments (shown in blue), which are projects that are in the Identification, Definition or Implementation phase of the project delivery lifecycle. The remaining 40 per cent are for future investments (show in green), which are projects that had not been initiated at the time of the Capital Plan. In order to get an overall portfolio perspective, single point forecasts

[4] For more detail on the Capital Plan, see BC Hydro's 10 Year Capital Plan memo in Appendix H.

are required for all projects in all phases of the project lifecycle, including future projects. For future projects, a planning allowance,[5] is used because no formal cost estimate is available.

Figure FF-3 Fiscal 2022 to Fiscal 2031 Dam Safety Forecast Capital Expenditures



The Dam Safety portfolio consists mainly of large multi-year projects and, as a result, is subject to fluctuations in year-over-year spend. A significant portion of the planned Dam Safety expenditures in fiscal 2022 to fiscal 2031 are driven by the detailed design and progression to Implementation phase of a number of large projects, including: John Hart Seismic Upgrade, Strathcona Upgrade Discharge, Ladore Spillway Seismic Upgrade, and La Joie Dam Improvements.

5 Planning allowances are single values (rather than ranges) required to support long-term capital planning. Planning allowances are used when a project is not sufficiently advanced to have a preferred alternative, and there is insufficient information on the scope and schedule to establish a complete total project cost estimate. The planning allowance is prepared based on historic information pertaining to similar projects, and input from subject matter experts.

3.2 Dam Safety Risks, Strategic Investments in Assets, and Other Operational Considerations Are Balanced Using a Staged Prioritization Approach

As described in Chapter 6, section 6.4.1.4 of this application, Dam Safety projects are focused on mitigating safety risks associated with dams and other water conveyance or water retention infrastructure, as well as addressing deterioration and loss of serviceability of those assets. The Dam Safety portfolio includes all water retention and conveyance assets, including those that convey water to generating units, and related ancillary assets that support those functions.

An initial consideration in capital planning is to prioritize risk reduction investments on deficiencies that are associated with high Vulnerability Index ratings and on the right side of Figure FF-1, i.e., associated with Extreme and Very High consequence dams. An example of an investment so prioritized is the recently completed Ruskin Dam and Powerhouse Upgrade project, for which the aggregated Vulnerability Index was more than 20 and is now approximately two (see Figure FF-1). Another example is the trio of projects[6] now underway on the main Campbell River System dams – John Hart, Ladore and Strathcona – which collectively comprise the largest current vulnerability in BC Hydro's fleet of dams.

The Campbell River System projects also exemplify another prime consideration for prioritization: whether there exist effective interim risk controls that can be implemented to manage the risks until the deficiencies can be permanently addressed through an upgrade. In the case of the Campbell River System facilities, and particularly the identified seismic deficiencies at John Hart Dam, no interim risk controls were identified that would allow for other projects to be prioritized above them. In contrast, the seepage and seismic deficiencies at La Joie Dam are being

[6] John Hart Dam Seismic Upgrade project, Ladore Dam Spillway Gates Upgrade project, and Strathcona Dam Discharge Upgrade project.

adequately controlled by having lowered Downton Reservoir behind the dam which has allowed the upgrades to this dam to follow those on the Campbell River system.

Consideration is further given to the prioritization of projects where greater reductions in vulnerabilities can be realized for lesser financial investment, i.e., a conventional cost-to-benefit consideration. This type of analysis was employed in prioritization of risk reduction projects on the Campbell River system and is described in BC Hydro's February 15, 2019 Rebuttal Evidence to the evidence filed by the Commercial Energy Consumers Association of British Columbia in the Review of the Regulatory Oversight of Capital Expenditures and Projects[7].

Additionally, prioritization of projects must consider sequencing of investments with other planned work and the precedence of enabling projects. For example, the GMS – Spillway Rock Slope Stabilization project was implemented and completed in fiscal 2013 to enable safe access to the spillway chute at WAC Bennett Dam and the subsequent GMS – Bennett Dam Spillway Chute Upgrade project that was completed in fiscal 2017.

Resource availability is always a consideration in developing a capital plan. Regardless of financial resources, there are finite limits to the numbers of expert engineering and construction resources that can be brought to bear on the complex and highly technical projects that comprise the Dam Safety portfolio. Even where external consultants and contractors are employed, proper and diligent oversight of those external resources requires the time of BC Hydro's internal experts. Therefore, a mix of project types that doesn't engage in too much of one type of work and rely too heavily on one type of expert or specialized resource is also sought.

Finally, BC Hydro's capital plan for its fleet of dams must also provide for the inclusion of projects beyond those that remediate physical deficiencies in the dams.

[7] British Columbia Hydro and Power Authority Review of the Regulatory Oversight of Capital Expenditures and Projects, Exhibit B-15.

It must also include investment for improvements of infrastructure deficiencies (e.g., addition, replacement or enhancement to dam monitoring instrumentation, improvements to dam access) and management of hazards to the dams (e.g., monitoring instrumentation and/or drainage of reservoir slopes). Additionally, assets pertaining to the conveyance of water to generating units (e.g., penstocks, valves, intake and maintenance gates, hoists) have recently been added to the Dam Safety portfolio, and BC Hydro's capital plan must also include projects related to recoating, refurbishing or upgrading those assets. As a result, not all Dam Safety investments will have an associated Vulnerability Index reduction.

3.3 BC Hydro is Investing Extensively in the Safety of its Dams

The subsequent tables provide a listing of dam safety projects included in the Capital Plan. For projects beginning after the Test Period the tables have been filtered by order of magnitude of capital expenditure for additional context.

For projects in Future or Identification phase, the Authorized Amount / Engineering Estimate and Forecast In-Service Date are listed as To Be Determined (**TBD**) for the following reasons:

- For Future phase projects, a problem or opportunity has been identified, but the required response has not yet been determined; and
- In Identification phase, several identified alternative responses are being investigated, and each alternative can result in very different project scope, schedule and cost.

As a result, Authorized Amount / Engineering Estimate and Forecast In-Service Date are provided only for projects in the Definition phase and later phases.

Table FF-1 Dam Safety Projects with Capital Expenditures in the Fiscal 2023 to Fiscal 2025 Test Period

IPID	Project	Type	Phase	Forecasted ISD	Authorized Amount[8] / Engineering Estimate[9] ($ million)	Name of Strategy, Plan or Study to which Project is Linked
G000640	Lake Buntzen 1 Coquitlam Tunnel Gates Refurbishment	Sustaining	Implementation	F2023	43	Coquitlam-Buntzen System Facility Asset Plan

RE: Ministry of Energy, Mines and Low Carbon Innovation (MEMLCI or Ministry)
British Columbia Hydro and Power Authority (BC Hydro)
Greenhouse Gas Reduction (Clean Energy) Regulation Reporting Fiscal 2021 Annual Report

BC Hydro writes to submit the Business Information and Declaration (Attachment 1), the Fiscal 2021 Greenhouse Gas Reduction (Clean Energy) Regulation (**GGRR**) Annual Report (**Report**) (Attachment 2) and Low Carbon Electrification Program Results in an excel format (Attachment 3). The Report includes results for the period from April 1, 2020 to March 31, 2021 (**Fiscal 2021**) for BC Hydro's prescribed undertakings as defined in section 4 and section 5 of the GGRR.

Under section 18 of the *Clean Energy Act*, a public utility implementing prescribed undertakings defined in the GGRR must submit to the MEMLCI a report respecting the prescribed undertakings. Specifically, section 18(5) states that "a report to be submitted under section (4) must include the information the minister specifies and be submitted in the form and by the time the minister specifies."

On April 15, 2021, BC Hydro received from the MEMLCI an updated reporting template for the period from April 1, 2020 to March 31, 2021 for prescribed undertakings under the GGRR. This report contains information that reflects this updated template.

BC Hydro is providing the un-redacted Report to the Ministry and BCUC in confidence. A public version of the Report is being filed under separate cover redacting customer-specific information or information that is commercially sensitive to BC Hydro or customers. Confidential information is not to be released publicly without prior consent of BC Hydro and/or the customer.

List of Tables

1 Executive Summary

This is BC Hydro's fourth annual report regarding its activities that are "prescribed undertakings" as defined in the Greenhouse Gas Reduction (Clean Energy) Regulation (**GGRR**) for the purposes of section 18 of the *Clean Energy Act* (**CEA**). It is provided in accordance with the April 2021 “British Columbia Greenhouse Gas Reduction (Clean Energy) Regulation Reporting Requirements” (**Reporting Requirements**) provided to BC Hydro by the Ministry of Energy, Mines and Low Carbon Innovation.

This report covers the annual period from April 1, 2020 to March 31, 2021 (**Fiscal 2021 or Reporting Period**) and BC Hydro’s prescribed undertakings in three main classes:

(i) Low Carbon Electrification (**LCE**) activities under section 4(3)(a), (b), (c), and (d) of the GGRR (collectively referred to as **LCE Programs**);

(ii) LCE Infrastructure projects under section 4(2) and 4(3)(e) of the GGRR; and

(iii) Electric vehicle (**EV**) charging stations under section 5 of the GGRR.

The expenditure for the LCE Programs in fiscal 2021 is approximately $4.1 million, which covers the following undertakings:

- BC Hydro provided supporting resources[1] for nine new LCE studies and four new LCE incentive projects that are prescribed undertakings under section 4(3)(a) of the GGRR, further described in section 4.2 below;

[1] Supporting resources can include: funding provided by BC Hydro to enable studies, research, pilots, public awareness campaigns, projects, and enabling the development of standards.

- BC Hydro carried out public awareness campaign activities related to the EV charger 'Top-up' promotion from the previous fiscal year. These are prescribed undertakings under section 4(3)(a) of the GGRR; and
- BC Hydro provided supporting resources to enable the development of standards respecting technologies that use electricity instead of other sources of energy that produce more greenhouse gas emissions. These projects are undertakings prescribed under section 4(3)(d) of the GGRR.

BC Hydro also made significant progress on the Peace Region Electricity Supply (**PRES**) Project, which is a LCE Infrastructure Project undertaking under section 4(2) of the GGRR. In fiscal 2021, actual expenditure on the PRES Project was $53.3 million, with a cumulative cost of $206.2 million as at the end of fiscal 2021. It is premature to report any avoided greenhouse gas emissions for the PRES Project as it is not yet in-service. Total expenditures of $1.4 million were incurred in fiscal 2021 with respect to a [redacted] generation agreement BC Hydro entered into with [redacted] (hereinafter referred to as **Company X**) to ensure the provision of reliable electricity service from the transmission system [redacted]. This is also an LCE Infrastructure Project undertaking under section 4(2) of the GGRR.

During the Reporting Period, BC Hydro also constructed and operated EV fast charging stations which are prescribed undertakings under section 5 of the GGRR by adding five new eligible charging sites to its network of EV fast charging stations. Four of these sites were constructed with two fast charging stations each, and the fifth site was constructed with a single fast charging station. In addition, 10 existing eligible charging sites with a single fast charging station were expanded with an additional fast charging station. At the end of the Reporting Period, there were 97 eligible charging stations at 71 eligible charging sites in BC Hydro's fast charging network.

2 The GGRR and Cost Recovery

Section 18(1) of the CEA empowers the Lieutenant Governor in Council to prescribe, by regulation, classes of undertakings for the purpose of reducing greenhouse gas (**GHG**) emissions. Public utilities that choose to engage in undertakings that are within one or more prescribed class of undertaking are assured of being able to recover the costs of the undertaking in their rates, and may not be prevented by the BCUC from engaging in the undertaking.

The GGRR was first issued in 2012, and amended in 2017 by adding section 4 to the GGRR to include eight new classes of electrification undertakings and in 2020 by adding section 5 to the GGRR to include certain EV fast charging stations. Together, CEA section 18 and the GGRR provide one of the statutory pillars of the Province's GHG emission reduction policy.

One of the legal consequences of the public utility program or project being a "prescribed undertaking" is that the public utility is entitled to recover the costs of the program or project in its rates. That legal consequence is meaningful only if the costs associated with particular programs and projects that are prescribed undertakings can be identified, and thus are accounted for, by the public utility. Accordingly, the prescribed undertakings described in this fiscal 2021 GGRR Annual Report are those programs and projects with recorded costs in fiscal 2021.[2]

Pursuant to BCUC Order G-187-21, operating costs, depreciation, and cost of energy amounts related to the deployment and operation of BC Hydro's eligible EV fast charging stations and incurred during fiscal 2021 are deferred to the Electric Vehicle Costs Regulatory Account. As part of its fiscal 2023 to 2025 Revenue

[2] BC Hydro notes that the costs it incurs with regard to its LCE programs that are prescribed undertakings are all deferred to the DSM Regulatory Account, pursuant to Order in Council No. 100, issued March 1, 2017. Generally, the costs BC Hydro incurs in regard to its LCE Infrastructure Projects are capitalized.

Requirements Application, BC Hydro will apply for a recovery mechanism for this account.

3 State of the Market and Program Planning

3.1 Background

In December 2018, the Province launched the CleanBC Plan, which set out a pathway to enable the Province to meet its 2030 GHG emission targets. The CleanBC Plan calls for BC Hydro to continue to make investments in our transmission system to make it easier for large industrial operations to access clean electricity.

The February 2019 Minister's Mandate Letter to BC Hydro included an expectation for BC Hydro to continue to provide leadership in advancing the Province's climate action strategies, including through electrification, fuel switching, and energy efficiency initiatives in the built environment, transportation, oil and gas, and other sectors.

In July 2019, the Terms of Reference for Phase 2 of the Comprehensive Review (**Phase 2 Review**) were released by the Province. The objective of the Phase 2 Review is to develop recommendations that will strategically position BC Hydro for long-term success, while meeting the Province's climate goals, keeping rates affordable for British Columbians, furthering reconciliation with Indigenous Nations, and supporting quality economic development. The actions taken as part of the Phase 2 Review will support the Province's CleanBC plan, including to expand the electrification of our growing economy over the coming decades.

3.2 State of the Market Discussion

This section presents an overview of the LCE market with respect to BC Hydro's activities in fiscal 2021. Detailed information on the LCE Programs, LCE

Infrastructure Projects and EV fast charging stations is set out in section 4, section 5, and section 6 respectively below.

Beginning in fiscal 2018, BC Hydro moved forward with eight projects, referred to as Initial LCE Projects, to assess and support immediate low carbon electrification opportunities among our customers. These projects are within one (or more) class of undertakings defined in subsections 4(3)(a) and 4(3)(c). These Initial LCE Projects also:

- Helped us gain a greater understanding of the technology, market, and barriers that customers and BC Hydro would face when developing low carbon electrification options; and
- Provided BC Hydro with the ability to act early and capture time sensitive opportunities that could help inform the development of a broader low carbon electrification plan.

The Initial LCE Projects introduced in the GGRR Annual Report filed in July 2018 have been updated in subsequent reports as the expenditures were incurred. They are also included in Table 5 within this report.

In fiscal 2019, BC Hydro developed and advanced a multi-year BC Hydro funded LCE program that was designed to work in coordination with the Province's programs and is generally referred to as the BC Hydro LCE Program. The BC Hydro LCE Program is further described in section 4.

BC Hydro is forecast to be in an energy surplus position for an extended period of time. During this surplus period, the LCE-driven incremental electricity sales will increase BC Hydro's revenues and can make rates lower than they otherwise would have been to the extent there is a positive differential between domestic electricity rates and forecast export prices. These incremental electricity sales are also expected to reduce GHG emissions relative to what they otherwise would have been. .

Pursuant to the Reporting Requirements, a report by a Fairness Advisor must be provided on the competitiveness of any call process held during the Reporting Period. Consistent with our DSM process, opportunities for LCE Programs are solicited broadly through BC Hydro’s customer and community-facing employees and our existing commercial and industrial energy manager networks. In fiscal 2021, BC Hydro did not hold any call processes in regard to its LCE Programs or its LCE Infrastructure Projects. Therefore, no Fairness Advisor report is required.

BC Hydro issued tenders for construction services and equipment purchases for the installation of fast charging stations in fiscal 2021. The tenders followed standard procurement processes at BC Hydro, using bidding platforms such as BC Bid.

3.3 Province of B.C. Programs

In fiscal 2019, BC Hydro became responsible for delivering the CleanBC Better Buildings program (initially called EfficiencyBC) on behalf of the Province. The CleanBC Better Buildings is a program funded by provincial and federal governments that provides financial incentives to help households and businesses save energy and reduce GHG emissions by switching to high efficiency heating equipment and making building envelope improvements. BC Hydro is delivering the component of the CleanBC Better Buildings program that helps customers switch from fossil fuels to clean electricity.

In fiscal 2020, BC Hydro became responsible for delivering the CleanBC ‘Go Electric BC’ EV charger rebate program. The program provides rebates toward the cost of the purchase and installation of eligible level 2 EV charging equipment and supports multi-unit residential buildings (**MURB**) and workplaces seeking solutions for their EV charging needs. The CleanBC program influences what programs BC Hydro funds as it seeks to align with and complement the programs and projects funded by the Province through the CleanBC program. BC Hydro's programs that complement the CleanBC programs are discussed in section 4 below.

In fiscal 2021, the Province launched three new CleanBC programs. The CleanBC Indigenous Community Energy Coaching program provides free energy coaching services to support Indigenous communities wanting to take advantage of the CleanBC Indigenous Community Heat Pump Incentive and related energy efficiency offers. The CleanBC Better Homes New Construction program provides rebates for the construction of new, high-performance, electric homes. The CleanBC Commercial Express Program provides support to building owners and operators who wish to reduce greenhouse gas (**GHG**) emissions in their existing commercial buildings. The program targets simple, smaller electrification opportunities across commercial and institutional buildings. These programs are funded by the Province, and BC Hydro administers these programs on behalf of the Province.

3.4 Electric Vehicle Fast Charging Stations

At the beginning of fiscal 2021, BC Hydro had 81 fast charging stations in operation across the province, including three that were decommissioned during the fiscal year. At the end of fiscal 2021, BC Hydro had 97 eligible fast charging stations in operation at 71 sites. During fiscal 2021, BC Hydro continued to build out its EV fast charging network, by deploying 19 EV eligible fast charging stations. Nine of these fast charging stations were at five new sites (i.e., two charging stations at four sites, and a single charging station at the remaining new site), and 10 fast charging stations were added to existing sites that have single EV fast charging stations.

Throughout fiscal 2021, BC Hydro continued to work with the Ministry of Energy and Low Carbon Innovation (M**EMLI**), the Ministry of Transportation and Infrastructure (**MOTI**), and FortisBC to plan an efficient deployment of EV fast charging stations and to meet the provincial objective of a province-wide EV fast charging network which will enable inter-city travel with an EV.

All of BC Hydro's EV fast charging stations are all in compliance with requirements of section 5 of the GGRR.

4 LCE Programs

4.1 Overview

There are eight new classes of electrification undertaking prescribed by section 4 of the GGRR, which can be divided into two broad categories: (i) those that are program based, similar to BC Hydro's demand-side management programs;[3] and (ii) those that are infrastructure based.[4] BC Hydro refers to all the prescribed undertakings it carries out under section 4 of the GGRR as LCE activities, and further refers to its undertakings that fall within one of the classes in the former category as LCE Programs, and to its undertakings that fall within one of the classes in the latter category as LCE Infrastructure Projects. This nomenclature corresponds to the "Electrification Programs" referred to in subsection 6.7 of the GGRR Reporting Requirements, and "Transmission, Distribution and Generation" referred to in subsection 6.8 of the GGRR Reporting Requirements, respectively.

In fiscal 2021, BC Hydro spent approximately $4.1 million on its LCE Programs, including expenditures for the Initial LCE Projects and the BC Hydro LCE Program. The expenditures supported four new projects, nine new studies, and public awareness campaign activities, all undertaken in accordance with section 4(3)(a) and 4(3)(b) of the GGRR. BC Hydro also incurred expenditures to enable the

3 Being the classes of undertaking prescribed by subsections 4(3)(a)(i), 4(3)(a)(ii), 4(3)(b)(i), 4(3)(b)(ii), 4(3)(c) and 4(3)(d) of the GGRR. Undertakings can be both projects or programs. For simplicity, BC Hydro may refer to projects under these sections as programs as well or use projects/program interchangeably.

4 Being the classes of undertaking prescribed by subsections 4(2) and 4(3)(e) of the GGRR.

development of standards under section 4(3)(d) of the GGRR. These LCE undertakings are discussed in section 4.2.

In fiscal 2021, BC Hydro made new funding commitments of approximately $0.5 million, but there are no expenditures for the studies and projects associated with those commitments in the financial reporting for fiscal 2021. As noted in previous Annual Reports, funding commitments that did not result in expenditures in fiscal 2021 are not included in this Reporting Period, but will be included in a future GGRR report for the fiscal year when the expenditures are incurred.

As discussed above, since fiscal 2019, BC Hydro has been delivering the CleanBC Better Buildings program on behalf of the Province. In fiscal 2019, to complement the Province's program, BC Hydro developed and advanced a multi-year BC Hydro funded LCE Program to reach customers and to enable opportunities not covered by GHG emissions reduction programs funded by the Province or the federal government.[5] BC Hydro approved expenditures of $16.6 million for this multi-year program, focusing on opportunities in industrial process, transportation, and new construction.

In fiscal 2020, the Province, working in co-ordination with BC Hydro, decided to add a CleanBC program for new construction. The introduction of this new program prompted BC Hydro to re-consider the funding originally included within the multi-year BC Hydro LCE Program. BC Hydro decided to apply funds originally intended for supporting new construction opportunities to supporting additional energy management study and implementation opportunities for industrial and large commercial customers.

In fiscal 2021, as part of BC Hydro's multi-year program, BC Hydro undertook activities as prescribed undertakings falling under section 4(3)(a),section 4(3)(b),

5 This multi-year program is also referred to as the "BC Hydro LCE Program" to distinguish it from the programs funded by the Province.

and section 4(3)(d) of the GGRR. These undertakings are discussed in section 4.2 below. Also in fiscal 2021, BC Hydro began the development of a broad electrification plan which will describe BC Hydro's actions supporting customer fuel switching. The plan will be provided in BC Hydro's Fiscal 2023 – Fiscal 2025 Revenue Requirements Application.

4.2 Fiscal 2021 LCE Programs

The projects and activities within the LCE Programs (i.e., classes of undertaking prescribed by subsections 4(3)(a)(i), 4(3)(a)(ii), 4(3)(b)(i), 4(3)(b)(ii), 4(3)(c) and 4(3)(d) of the GGRR) that incurred expenditures in fiscal 2021 are listed below. Table 5 includes the LCE Programs results for fiscal 2021, and Figure 1 and Figure 2 show LCE Programs activities and expenditures by geographic distribution and sector distribution, respectively.

Consistent with the Reporting Requirements, two larger upstream natural gas projects have been described at a project level, while the remaining fiscal 2021 activities are components of the BC Hydro LCE Program, and have been aggregated and summarized at the program level:

(iv) [redacted] (**Project 3** in Table 5): This project is interconnected to BC Hydro transmission line [redacted] in Northeastern B.C. The supporting funding from BC Hydro is to assist the customer in the acquisition, installation, and use of equipment that will use BC Hydro's electricity instead of natural gas to power natural gas extraction, processing and production operations, and it is an undertaking within the class of prescribed undertakings set out in section 4(3)(a) of the GGRR. There are multiple project phases. The first two phases achieved Facility Commercial Operation Date (**Facility COD**)[6] in fiscal 2019 and fiscal 2020, respectively, pursuant to the terms of the LCE

[6] Under the Incentive Agreement, Facility COD is required before an incentive fund payment can be made to the customer.

Incentive Agreement for the project. A third phase of this project was originally planned for fiscal 2021 but the expected completion date for the phase has shifted to fiscal 2022. Further project phases are expected to achieve Facility COD in subsequent fiscal years;

(v) [redacted] (**Project 4** in Table 5): BC Hydro has an LCE Incentive Agreement for the [redacted] site. This project is interconnected to BC Hydro transmission line [redacted] in Northeastern B.C. There are multiple project phases. Similar to Project 3, this project is an undertaking within the class of prescribed undertakings set out in section 4(3)(a) of the GGRR. Project 4 was energized in fiscal 2019 and the first two phases achieved Facility COD in fiscal 2020 in accordance with the LCE Incentive Agreement. A third phase was originally planned for completion in fiscal 2021, but is currently expected to complete in fiscal 2022; and

(vi) The BC Hydro LCE Program: Table 1 outlines the components of the BC Hydro LCE Program and the relevant subsections of the GGRR.

Table 1 Components of the BC Hydro LCE Program

Components	GGRR Subsection
Energy Management Studies and Incentives	4(3)(a), 4(3)(b)
Public Awareness Campaigns	4(3)(a), 4(3)(b)
Research and Pilots	4(3)(c)
Standards Enabler	4(3)(d)
Education & Training	4(3)(b)

An overview of activities in fiscal 2021 for each of the components of the BC Hydro LCE Program is provided below.

Energy Management Studies and Incentives: BC Hydro provided two types of funding related to energy management. First, BC Hydro provided funding to customers for studies and assessments which would assist customers, or those who may become customers, to identify and develop project opportunities involving the acquisition, installation, or use of equipment that uses electricity instead of other sources of energy that produce more greenhouse gas emissions. Table 2 below provides descriptions of the studies that were funded. Second, BC Hydro provided incentive funding to projects of customers, or those who may become customers (also referred to incentive projects), which would assist in the acquisition, installation, or use of equipment that uses electricity instead of other sources of energy that produce more greenhouse gas emissions. Table 3 below provides descriptions of the incentive projects that were funded. In fiscal 2021, expenditures for Energy Management Studies and Incentives are reflected in the BC Hydro LCE Program (row 10 in Table 5).

Table 2 Energy Management Studies

Sector	Description	Location	Studies Completed	GGRR Sub-section
Built Environment	Two studies for the built environment sector were completed in fiscal 2021. One study investigated the low carbon electrification options for space heating of an office building. The other study examined low carbon electrification options for a district energy system of a post-secondary institution. The study examined both retrofit opportunities and future new construction.	Lower Mainland, Southern Interior	2	4(3)(a)

Sector	Description	Location	Studies Completed	GGRR Sub-section
Industrial Process	Six studies for the industrial process sector were completed in fiscal 2021. One study examined a low carbon electrification option for a portion of the route used to transport material for a mine operation in the Southern Interior. A second study in the Southern Interior investigated the use of a low carbon electrification option in place of fossil fuels for the heating system of the ventilation shaft of a mine operation. Two studies of low carbon electrification options for natural gas processing were completed for two different sites in the Northern Interior. A study was completed for a mining operation in the Northern Interior. It examined the used of a low carbon electrification option in place of diesel power for tunneling operations. A study investigating low carbon electrification options for steam powered equipment was completed for a facility in the Vancouver Island / Sunshine Coast region.	Southern Interior, Northern Interior, Vancouver Island / Sunshine Coast	6	4(3)(a)
Transportation	One study was completed in the transportation sector in fiscal 2021. This study examined terminal infrastructure modification and charging systems to support electrification of marine vessels.	Vancouver Island / Sunshine Coast	1	4(3)(a)

Table 3 Incentive Projects

Sector	Description	Location	Incentive Projects Completed	GGRR Sub-section
Built Environment	One incentive project was completed in fiscal 2021. A facility was switched from diesel power to electric power by adding their own substation to connect to the BC Hydro transmission system.	Vancouver Island / Sunshine Coast	1	4(3)(a)

Industrial Process	Three incentive projects in the Industrial Process sector completed in fiscal 2021. A mining operation built a new power line to power remotely located equipment and switch from diesel power to electric. A mining operation replaced a diesel powered hauling equipment with battery electric. A mine built a new power line to a remotely located equipment which enabled switching from diesel power to electric.	Northern Interior, Southern Interior	3	4(3)(a)

Public Awareness Campaign: This includes public awareness activities carried out by BC Hydro to educate customers with regard to energy use and greenhouse gas emissions. Public awareness campaign expenditures in fiscal 2021 represent the trailing costs of the EV charger 'Top-up' promotion from the previous fiscal year. The public awareness campaign program and 'Go Electric BC' EV charger rebate 'Top-up' promotional program are undertakings within the class of prescribed undertakings set out in section 4(3)(a) of the GGRR. The fiscal 2021 expenditures for this public awareness campaign are included in the BC Hydro LCE Program (row 10 in Table 5).

Standards Enabler: BC Hydro worked with standards making bodies such as various levels of government, who are responsible for land use, building codes, product and equipment standards, policies, bylaws, and community plans, to advance standards for technologies that use electricity instead of other sources of energy that produce more greenhouse gas emissions, or standards for technologies that affect the use of electricity by other technologies that use electricity instead of other sources of energy that produce more greenhouse gas emissions. BC Hydro's activities in this regard target the transportation and building sectors.

BC Hydro undertook the following work with regard to transportation electrification:

- BC Hydro provided support for the implementation of EV ready bylaws and for the development of an updated best practice guide on EV ready requirements for both residential and non-residential new buildings. Best practices were shared widely through a local government EV peer network;

- BC Hydro supported a local government-led study that investigates the role that local governments can play in accelerating medium and heavy-duty zero emissions vehicle adoption; and
- BC Hydro is piloting a program to advance transportation electrification within local government transportation departments by developing transportation network design requirements, land use plans, policy and bylaws, permitting, and building codes.

BC Hydro undertook the following work with regard to building electrification:

- BC Hydro, the Province and the City of Vancouver supported a study on a Building Electrification Road Map (BERM) for BC, based on consultation with over 150 stakeholders. The BERM's purpose is to provide recommendations to key building sector stakeholders on the necessary steps to achieve a smooth market transformation that achieves government emission reduction goals;
- Through a local government working group and an industry and Provincially led advisory committee, BC Hydro provided supporting resources for the development of a Low Carbon Policy Toolkit. The Toolkit provides practical guidance and recommendations on policies, guidelines and bylaws that any local government can adopt to support building electrification; and
- Some local governments are taking steps to encourage electrification of new construction through structuring their Energy Step Code requirements. BC Hydro supported local governments in the development of a best practice bulletin, which summarizes a standardized approach and supports policy consistency.

Standards Enabler undertaking expenditures fall under section 4(3)(d) of the GGRR. In fiscal 2021, expenditures for Standards Enabler undertakings are reflected in the BC Hydro LCE Program (row 12 in Table 5).

4.3 Methodology and Verification Methods

Depending on individual projects or programs within the LCE Programs, there can be up to four distinct activities that BC Hydro may use to review and verify estimates of incremental electrical load and emission reductions arising from electrification. These are: (i) technical review; (ii) site inspection; (iii) measurement and verification; and (iv) evaluation. Results from each area may be used in project or program management to ensure that BC Hydro receives the expected benefits. BC Hydro is selective in the use of these processes, and focuses its efforts where warranted to improve the accuracy of estimates and reduce exposure to risk. This approach mirrors BC Hydro's current approach to demand-side management electricity savings and provides estimates for both additional electricity demand and greenhouse-gas emission reductions.

The GHG emission reduction estimates are developed as part of the technical review for each project or program application and may be adjusted based on the outcome of site inspections and the electricity demand findings resulting from the measurement and verification activities.

The methodology BC Hydro has used to estimate GHG emission reductions involves developing engineering estimates of the amount of carbon-based fuel that will be offset by electricity and quantifying the associated GHG emission reductions using the 2017 B.C. Best Practices Methodology for Quantifying Greenhouse Gas Emissions. The calculation nets out the GHG emissions associated with BC Hydro's electricity, which are also quantified using the 2017 B.C. Best Practices Methodology for Quantifying Greenhouse Gas Emissions.

This estimate may differ from actual GHG emission reductions as determined by the customer specific to their unique electrification project(s). Where an actual value has been provided to BC Hydro by the customer, or reported by the customer to the government through an Industrial Emissions Report, BC Hydro will show the customer-reported value in Column H (i) of Table 5. BC Hydro may also conduct a technical review of baselines, calculations, and assumptions used to determine the GHG reductions in the Industrial Emissions Report. Any changes to the value reported in a previous reporting period will be reflected in the cumulative values in Column H (ii) of Table 5. The methodology used for typical electrical energy impact calculations for LCE projects is as follows:

- Total annual energy consumption = facility baseline electricity consumption + incremental LCE electricity consumption +/- baseline energy adjustments; and
- Total average monthly electrical demand = baseline average monthly electrical demand + incremental LCE average monthly electrical demand +/- baseline demand adjustments.

Baseline adjustments are determined based on any net baseline energy consumption impacts that may be a result of the LCE project.

Each of four LCE incentive projects described in Table 3 has gone through a technical review and has a site specific measurement and verification (**M&V**) plan for the estimated additional electricity consumption and average demand. M&V plans are included as part of the funding agreement between BC Hydro and the recipient. The respective methodology used for these four projects generally follow 'Option B, Retrofit Isolation: All Parameter Measurement', as set out in the International Performance Measurement & Verification Protocol (**IPMVP**) - Core Concepts October 2016 EVO 10000 - 1:2016.

4.4 Performance Metrics

Performance measurement for BC Hydro LCE programs and projects ultimately is reflected in decisions made by customers or those who may become customers to use electricity instead of other sources of energy that produce more greenhouse gas emissions.

Public awareness campaigns, energy management studies, research/pilot projects, education and training and providing funds to assist in the acquisition, installation or use of equipment that uses or affects the use of electricity are critical in enabling customers, or those who will become customers, to develop reasons and justifications to implement a fuel-switching project. Additionally, these activities provide key inputs into BC Hydro program development and design.

Performance of standards enabler undertakings considers whether the support may yield information to enable government efforts in the advancement of standards, policies, bylaws, and community plans for the electrification of certain sectors, such as new construction and retrofits within the built environment and transportation sectors.

Performance measured using the measurement and verification methodologies described in section 4.3, provides a view of electrical consumption, demand, and GHG emission reductions. Measurement and verification activities for the projects completed in fiscal 2021 are still underway.

A measurement and verification report was completed in fiscal 2021 for the Thompson Rivers University project, which was installed in fiscal 2019. The verified electricity consumption for the project is 1,129 MWh per year, which is about 41 per cent of initial review estimated energy consumption. The annual natural gas savings are estimated to be 4,838 GJ, with an associated GHG reduction of 229 tonnes CO2e per year. The lower than expected consumption was primarily due to a change in the design made after the initial BC Hydro review. The measurement and verification results have been incorporated in Table 5.

4.5 Cost-Effectiveness

Under section 4(4) of the GGRR, undertakings are in the class of undertakings prescribed by sections 4(3)(a) or 4(3)(b) of the GGRR only if they satisfy a cost-effectiveness test. That cost-effectiveness test is defined in section 4(1) of the GGRR and requires that each undertaking that is an undertaking within the class of undertakings prescribed by subsections 4(3)(a) or 4(3)(b) of the GGRR have a positive net present value (**NPV**), with the measure of a program's NPV being that of all of the programs that fall within the class of undertakings described in subsections 4(3)(a) and 4(3)(b) of the GGRR. The GGRR cost-effectiveness test is measured only at the time BC Hydro decides to carry out the program.

Table 5 shows the GGRR net present value (**NPV**) of the various LCE projects or programs prescribed under section 4(3)(a) and 4(3)(b) of the GGRR. The total GGRR NPV of these undertakings is $114 million which includes actual and committed expenditures and benefits from past, current, and future reporting periods. The GGRR NPV indicates that these undertakings are cost-effective.

4.6 Summary of Results

4.6.1 Explanation of Terms

Table 4 below includes a description of the information provided in Table 5 with regard to the LCE Programs.

Table 4 LCE Programs Results Table: Explanation of Terms

Column	Heading	Descriptions
A	GGRR	Applicable section of the GGRR.
B	Project / Program / Contract / Expenditure	Low-carbon electrification activities to encourage or enable the use of electricity in place of other sources of energy that produce more greenhouse gas emissions.

Column	Heading	Descriptions
$C_{(i)}$	Actual Expenditure ($ million)	Costs incurred at the end of the current reporting fiscal year.
$C_{(ii)}$	Cumulative: Actual Expenditures ($ million)	The sum of successive costs incurred as at the end of the reporting fiscal year.
D	Cost Effectiveness ($ million): NPV to 2030 (fiscal 2031)	The present value of the costs and benefits are determined using a discount rate equal to BC Hydro's weighted average cost of capital. The present value of the costs is subtracted from the present value of the benefits from the project start year to last year in the calculation period (fiscal 2031) to determine the net present value for the project.
E	Cost Effectiveness ($ million): GGRR NPV to 2030 (fiscal 2031)	The calculation of the GGRR NPV is based on costs and benefits as of fiscal 2018 as defined in the GGRR. Per that definition, benefits mean all revenues BC Hydro expects to earn as a result of implementing LCE programs falling under subsections 4(3)(a) or 4(3)(b), less revenues that would have been earned from the sale of that electricity to export markets. Costs mean all the costs BC Hydro expects to incur to implement LCE programs falling under subsections 4(3)(a) or 4(3)(b), including development and administration costs. For clarity, costs include historic and future cost, committed expenditures and benefits from past, current and future reporting periods.
$F_{(i)}$	Actual: Additional Energy Consumption (MWh/year)	The average annual additional energy consumption estimated to be delivered from the project in the current reporting fiscal period.
$F_{(ii)}$	Cumulative: Additional Energy Consumption (MWh/year)	The sum of the successive average annual additional energy consumption estimated to be delivered from the project as at the end of the reporting fiscal period.
$G_{(i)}$	Actual: Additional Capacity Demand (MW)	The total energy demand added.
$G_{(ii)}$	Cumulative: Additional Capacity Demand (MW)	The sum of the successive energy demand addition.
$H_{(i)}$	Actual: Estimated GHG Emission Reductions (tonnes CO_2e/year)	The average annual tonnes per year of carbon dioxide equivalent reductions from the project in the current reporting fiscal period.
$H_{(ii)}$	Cumulative: Estimated GHG Emission Reductions (tonnes CO_2e/year)	The sum of the successive additional average annual tonnes per year of carbon dioxide equivalent reductions from the project as at the end of the reporting fiscal period.

4.6.2 Results Table

Table 5 below summarizes information regarding the LCE Programs that are undertakings prescribed by sections 4(3)(a)(i), 4(3)(a)(ii), 4(3)(b)(i), 4(3)(b)(ii), 4(3)(c) and 4(3)(d) of the GGRR. The indications of "n/a" in Table 5 are due to: (1) the nature of the project, study, research or program, such that the requested information cannot be obtained; or (2) the project, study, or program are prescribed by sections 4(3)(c) and 4(3)(d) of the GGRR and the cost-effectiveness test does not apply. Attachment 3 provides an excel spreadsheet with annual expenditures, in total and by project, study, or program, as outlined in the GGRR Reporting Requirements.

1 LCE Programs shown in the table include both LCE Initial Projects (rows 1 to 9) and associated expenditure and the BC Hydro LCE Program (rows 10 to 12). LCE Initial Projects are reported individually. With the introduction of the BC Hydro LCE Program individual project expenditures have been aggregated.
2 Where a project/program has no actual or cumulative expenditures, but has an NPV, this means that the decision to go ahead with that project/program was made in this (or previous) Reporting Periods, but that the project/program is not expected to be implemented until a future year.
3 Values reported in column F represent the 'run rate' or annualized rate of additional energy consumption.
4. Project 1 and 2 were described in the fiscal 2018 Annual Report filed in July 2018.
5 Fiscal 2021 expenditures for Project 3 represent a missed accrual for a portion of the second phase of the project which completed in fiscal 2020.
6 The Start Date is the fiscal year that BC Hydro decided to proceed with the project or program.
7 The negative expenditure in fiscal 2021 represents an adjustment to the incentive amount and the negative energy consumption also represents an adjustment, following completion of the Measurement and Verification report.
8 A fleet electrification study was undertaken in fiscal 2021, but not put forward as a prescribed undertaking. The $68,000 expenditure for the study was expensed as an operating cost in fiscal 2021.

4.7 LCE Programs by Region and Sector

The GGRR Reporting Requirements also request graphical depictions of the distribution by region in the Province and the distribution by customer sector where possible. The requested graphical depictions are provided below. The sectors (built environment, industrial process, and transportation) shown in the chart below align with those reflected in the CleanBC plan and in the description in section 4.2 of this report.

For the purpose of showing LCE Program activities distributed by region and by sector we have used the term 'Project' to represent individual studies, research or pilot activities, or implementation projects where customers have acquired and installed equipment that uses electricity instead of other sources of energy that produce more GHG emissions as described in section 4.2. We did not include Public Awareness Campaigns in Figure 1 or Figure 2 as those activities were carried out Province-wide and targeted a single sector (transportation) and as such would not be meaningful in a graphical depiction.

Figure 1 below highlights that the highest number of projects are in the Southern Interior, while Figure 2 below highlights that most of the projects are in the industrial process sector.

Figure 1 Projects by Geographic Region

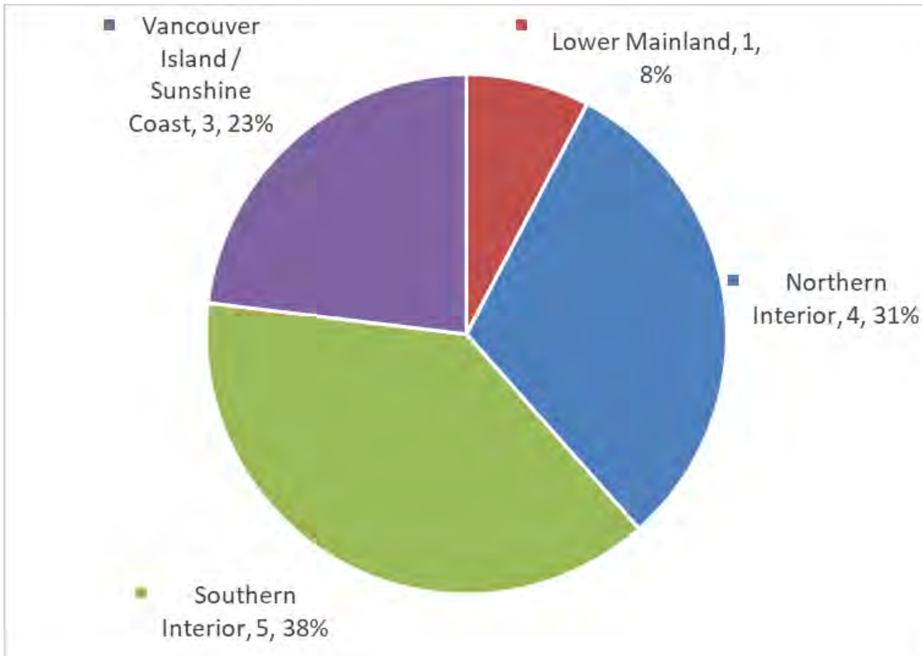

Figure 2 Projects by Sector

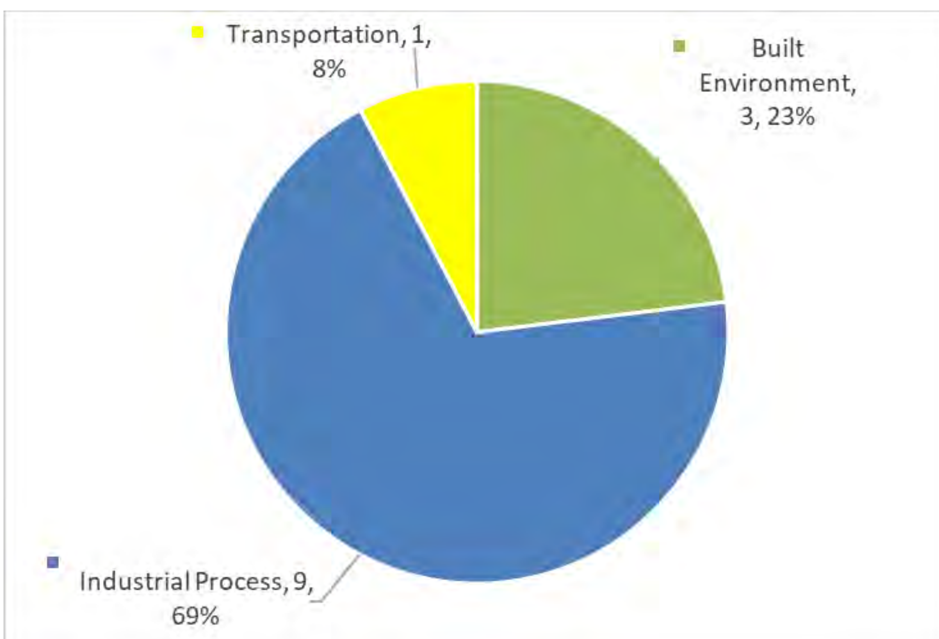

5 LCE Infrastructure Projects

5.1 Overview

In this section, we describe the LCE Infrastructure Projects (i.e., being projects within the classes of undertaking prescribed by subsections 4(2) or 4(3)(e) of the GGRR) and available evaluation results.

Northeast British Columbia is forecasted to experience a significant increase in natural gas production and processing capacity, primarily in the Montney region. In the absence of adequate electricity supply, much of this development will be powered by natural-gas fired production processes. Meanwhile, BC Hydro's transmission system in this region is constrained. Accordingly, BC Hydro will construct and operate new transmission and distribution facilities, and/or provide for [redacted] generation until such system upgrades are completed. These LCE Infrastructure Projects will enable the provision of reliable electricity service as a power supply alternative to carbon-based fuels, which will enable the reduction of existing GHG emissions or avoidance of future incremental GHG emissions.

5.2 Fiscal 2021 LCE Infrastructure Projects

In fiscal 2021, BC Hydro incurred expenditures of $54.7 million in regard to two LCE Infrastructure Projects. Expenditures incurred and recorded in future fiscal years will be included in the applicable future GGRR annual report.

5.2.1 Peace Region Electricity Supply (PRES) Project

The PRES Project was introduced in the fiscal 2018 GGRR Annual Report. As explained in the fiscal 2018 report, the PRES Project will enable natural gas producers and processors to electrify their existing and new operations, rather than self-supplying with natural gas. This includes natural gas producers and processors as defined in GGRR sections 4(2)(a)(i) and (ii). The PRES Project is expected to reduce GHG emissions in B.C. from any existing plant or from any prospective new plant that elects to take supply from BC Hydro rather than self-supply using natural gas.

The PRES Project was approved for implementation by BC Hydro's Board of Directors in June 2018. When BC Hydro's Board of Directors approved the PRES project, BC Hydro reasonably expected that the PRES project would have an in-service date no later than December 31, 2022. Therefore, the PRES Project is a prescribed undertaking pursuant to GGRR section 4(2). The PRES Project went into service in May 2021.

The PRES Project is currently in the Implementation Phase and has an estimated total cost of $285 million. As of the end of fiscal 2021, BC Hydro has incurred $206.2 million in total expenditures on developing the PRES Project, of which $53.3 million was incurred in fiscal 2021.

During fiscal 2021, BC Hydro completed construction and commissioning at the South Bank Substation 230 kV switchyard. BC Hydro also completed construction of the two new transmission lines and started reclamation, remediation and slope stabilization work at locations along the transmission corridor.

Since the project was just recently placed in-service, BC Hydro expects to report on performance metrics and environmental benefits of undertaking the PRES Project in the next reporting period.

5.2.2 [redacted] Generation Agreement

As reported in the fiscal 2018 GGRR Annual Report, BC Hydro entered into a Generation Agreement with Company X. The purpose of the Generation Agreement with Company X is to provide reliable electricity supply during periods of actual or anticipated system constraints. When Company X first interconnected to BC Hydro's transmission system, there was a known risk of area transmission system capacity constraints (thermal overload) on hot summer days. The Generation Agreement was a lower-cost and more efficient demand side solution to mitigate the risk of thermal overload until the PRES Project was in-service.

Under the Generation Agreement, BC Hydro treats Company X's generation as a firm dispatchable system resource, such that any self-generated electricity temporarily replaces electricity that would otherwise be provided from the BC Hydro transmission system. BC Hydro has the right to direct Company X to temporarily island its facilities in Northeast B.C. from the grid and self-supply them with electricity produced by Company X's on-site generating units. BC Hydro also has the right for economic dispatch of these generating units during the Agreement term.

BC Hydro terminated its right to direct Company X to temporarily island its Project 4 facility effective December 31, 2020, but maintained the right to direct Company X to temporarily island its Project 3 facility until August 31, 2021 (at which point the Generation Agreement will automatically expire, unless extended by BC Hydro). The August 2021 termination date is aligned to the original expected PRES in-service date of October 2021 and the end of summer 2021. At this time, BC Hydro does not plan to seek an Agreement extension.

The total forecast nominal value of the Generation Agreement is $12.0 million. Total expenditures incurred in fiscal 2021 with respect to this agreement are $1.4 million.

5.3 Quantitative Data – Methodology & Assumptions

BC Hydro has developed criteria to qualify customer loads for inclusion in its estimates for GHG emissions reduced or avoided due to the PRES Project.

The customer load to be included:

- Must be a new natural gas processing plant (including associated gas gathering and wellpad facilities) or existing plant converting to take grid service which takes, or commits to take, electricity service from BC Hydro in fiscal 2018 or later;

- Would have used natural gas for power supply in the absence of BC Hydro's commitment to construct and operate new facilities; and
- Will be served by the PRES Project once it is placed in-service.

These criteria include: (i) existing "brownfield" loads which fuel-switch from carbon-based fuel to grid electricity; and (ii) new "greenfield" loads that make the investment decision to take grid electricity as an alternative to carbon-based fuels for power supply.

BC Hydro notes that these criteria differ from the current British Columbia Greenhouse Gas Offset Protocol (*Fuel Switch Version 1.0, dated August 16, 2018*) which is specific to the replacement of existing gas-powered turbines with electrical grid power. Under the current protocol, GHG emission reductions would only arise where an existing customer facility fuel switches from a carbon-based fuel (such as natural gas) to low-carbon grid electricity and would not apply to any new plant that elects to be served with grid electricity in the first instance.

5.4 Performance Metrics

The GGRR performance metrics for the PRES Project are listed in Table 6 below.

Table 6 PRES Project: GGRR Performance Metrics

Type of Facility	Project(s)	Performance Metrics
Transmission & Distribution	PRES Project	New load served GHG emissions reduction
[redacted] Generation	[redacted] Generation Agreement	New load served Mitigation of system constraints GHG emissions reduction

A key purpose of the PRES Project is to enable a clean, reliable source of electrical power supply to existing and new natural gas processing operations. In the absence of the PRES Project, there would be no electricity grid service alternative. These plant operations would otherwise need to use natural gas (or other fossil fuels) for power supply. Since greenhouse gases are emitted when fossil fuels are burned to create power, the PRES Project will reduce GHG emissions in British Columbia for any existing plant that elects to take grid service rather than self-supply using natural gas.

GHG Emission Reduction Methodology

BC Hydro will estimate the impact the PRES Project will have on GHG emission reductions in British Columbia based on the assumptions and methodology set out in section 4.3 of this report. BC Hydro will apply these same assumptions and methodology to estimate the impact that [redacted] generation will have on GHG emission reductions in British Columbia until the PRES Project is in-service. For fiscal 2021 the GHG emissions intensity factors determined in accordance with this methodology are listed below for convenience:

- Average emissions intensity factor for natural gas turbine: [redacted][7];
- Less emissions intensity factor for BC Hydro grid electricity: [redacted][8]; and
- Net emissions intensity factor for electrified loads: [redacted]

Determination of Eligible Loads for GHG Emission Reduction

In fiscal 2019 and fiscal 2020, certain Company X facilities were electrified with the support provided through the Generation Agreement (to ensure reliable electricity supply) and the Incentive Agreement (to provide supporting funds for investment in electrical infrastructure) described in the previous sections. Absent these

[7] The efficiency assumption of 29.5 per cent for gas turbines was developed by calculating the weighted average efficiency from metered data of two customer operated gas turbine electrical generation units.

[8] Source: British Columbia Government: 2017 B.C. Best Practices Methodology for Quantifying Greenhouse Gas Emissions, page 17.

agreements, BC Hydro considers that the Company X loads would not have connected to the BC Hydro transmission system and taken grid service.

As discussed in section 4.2 above, Company X has two sites which are relevant to the prescribed undertakings, the [redacted] (Project 3) and the [redacted] (Project 4) sites.

The Project 3 site was energized from the BC Hydro transmission system in fiscal 2019. This site comprises three gas processing plants and one field/gathering system.

Of the three gas processing plants: one gas processing plant's (Gas Plant 1) load is not eligible for GHG emission calculation because it was previously served from the BC Hydro distribution system; one gas processing plant's (Gas Plant 2) load was new to the BC Hydro system in fiscal 2019; and the final gas processing plant has not yet been constructed.

The load associated with the field/gathering system is being phased into the BC Hydro system. One phase of the field/gathering system load was introduced to the BC Hydro system in fiscal 2019. Another phase of the field/gathering system load was new to the BC Hydro system in fiscal 2020. There were no new phases introduced to the BC Hydro system in fiscal 2021. Further phases of the field/gathering system are expected to join the system in future fiscal years.

For fiscal 2021, total Project 3 load served by BC Hydro was 127,481 MWh, with an estimated GHG emission reduction of 76,234 tonnes CO_2e.

[redacted]

The Project 4 site was energized from the BC Hydro transmission system in fiscal 2019. This site comprises two gas processing plants, one of which was operational in fiscal 2019 (Gas Plant 1), while the other was under construction (Gas Plant 2). Project 4's Gas Plant 2 is joining the BC Hydro system in phases. The first phase connected to the grid in fiscal 2020. No additional phases completed in fiscal 2021 due to project delays. For fiscal 2021, total Project 4 load served by BC Hydro was 162,143 MWh, with an estimated GHG emission reduction of 96,961 tonnes CO_2e .

[redacted]

BC Hydro notes that for each site, electrical energy consumption arising from the electrification of new loads is used to determine associated GHG emission reductions pursuant to the methodology described in section 4.3. These values have been incorporated into Summary of Results

5.4.1 Explanation of Terms

Table 7 below includes a description of the information provided in the results table for LCE Infrastructure Projects. The reason for the indications of "n/a's" is due to the nature of the PRES Project as of March 31, 2021 as described above.

Table 7 LCE Infrastructure Projects Results
Table: Explanation of Terms

Column	Heading	Descriptions
A	Prescribed Undertaking	Type of prescribed undertaking.
B	Name	Project, program, or customer name.
C (i)	Actual ($ million)	Actual costs in millions incurred at the end of the current reporting fiscal.
C (ii)	Cumulative Costs ($ million)	Cumulative actual costs in millions incurred from first year of expenditure to the end of the current reporting fiscal.
C (iii)	Forecast Total ($ million)	Approved Anticipated Total Capital Cost of Project.
D	Capacity of Facility (MW)	Planned facility capacity in megawatts at N-1 and N-0.
E	Total Capacity Committed/Secured (MW)	Cumulative total capacity committed and secured until the end of the current fiscal year in megawatts.
F	Total Customer Load(s) Served (MW)	Cumulative total customer loads served as at the end of the current fiscal year in megawatts.
G	Total Energy Provided to Customers (MW/h)	Cumulative total energy provided to customers as at the end of the current fiscal year in megawatts per hour.
H (i)	Actual: GHG Emissions Reduction Estimates (tonnes CO_2e/year)	Actual GHG Emissions Reduction at the end of the current fiscal period in tonnes of carbon dioxide equivalent per year.
H (ii)	Cumulative: GHG Emissions Reduction Estimates (tonnes CO_2e/year)	Cumulative GHG Emissions Reduction as at the end of the current fiscal period in tonnes of carbon dioxide equivalent per year.
I (i)	Type: Fossil Fuel(s) Avoided Or Displaced	Type of fossil fuels avoided or displaced or likely to be avoided or displaced.
I (ii)	Amount: Fossil Fuel(s) Avoided Or Displaced	Amount of fossil fuels avoided or displaced or likely to be avoided or displaced.

5.4.2 Results Table

Table 8 below provides the results for LCE Infrastructure Projects with expenditures in fiscal 2021.

Table 8 LCE Infrastructure Projects Results for Year Ending March 31, 2021

	A	B	C			D	E	F	G	H		I	
	Prescribed Undertaking	Name	Cost			Capacity of Facility (MW)	Total Capacity Committed/ Secured (MW)	Total Customer Load(s) Served (MW)	Total Energy[1] Provided to Customers (MW/h)	GHG Emissions Reduction Estimates[2] (tonnes CO_2e/year)		Fossil Fuel(s) Avoided or Displaced	
			Actual ($ million) (i)	Cumulative ($ million) (ii)[3]	Forecast Total ($ million) (iii)					Actual (i)	Cumulative (ii)	Type (i)	Amount (ii)
1	T&D	PRES Project	53.3	206.2	285	800 - 950	24	n/a	n/a	n/a	n/a	n/a	n/a
2	[redacted] Generation	[redacted] (Company X)	1.4	4.7	12	24	24	38	289,624	173,195	411,763	n/a	n/a

1 Reflects total new facility load served from the BC Hydro transmission system in fiscal 2021. 164,533 MWh of load is from existing brownfield facilities that fuel-switched to grid power. 125,091 MWh of load is from new greenfield facilities that electrified.

2 The GHG Emissions Reduction Estimates are specific to eligible Project 3 and Project 4 plant loads that were served by BC Hydro in fiscal 2021 in place of natural gas-fired supply.

3. An additional expenditure of $0.3 million was incurred fo [redacted] generation dispatched as an energy resource over 11 days in March 2019. BC Hydro does not consider the associated dispatch costs to be reportable GGRR costs because they were incurred for a purpose ancillary to proving reliable network service.

6 Electric Vehicles Fast Charging Stations Program

6.1 Overview

BC Hydro constructed and operated EV fast charging stations prior to the enactment of section 5 of the GGRR, commencing with the installation of the first charging station in 2013. During the Reporting Period from April 1, 2020 to March 31, 2021, BC Hydro constructed and commissioned EV fast charging stations at five new eligible charging sites. Two EV fast charging stations were installed at four of these sites, and one station was installed at the remaining site. In addition, one additional EV fast charging station was added to each of the 10 existing single station sites. As of March 31, 2021, BC Hydro has 97 EV fast charging stations in operation at 71 sites across the province.

As indicated in Appendix 1 to Attachment 2, all of BC Hydro's fast charging stations meet the requirements of section 5 of the GGRR. That is, all:

- Are available to the public 24 hours a day;
- Do not require users to be a member of a charging network to initiate a charging session;
- Are capable of charging electric vehicles of more than one make; and
- Would be put into operation prior to December 31, 2025;

In addition, as set out in Table 9 below, for those charging stations that are located in a limited municipality, the number of eligible charging sites within the limited municipality did not exceed the site limit in that municipality on the date the charging station was put into operation.

Table 9 Eligible Fast Charging Stations Added - Fiscal 2021

Location/Site	In-Service Date	Number of New EV Fast Charging Sites	Number of EV Fast Charging Stations
Port Alberni (Expansion)	16-April-2020	0	1
Chilliwack (Expansion)	8-Jun-2020	0	1
Campbell River (Expansion)	12-Jun-2020	0	1
Courtenay (Expansion)	12-Jun-2020	0	1
Port McNeill	12-Jul-2020	1	1
Coquitlam - Superstore West (Expansion)	17-Sep-2020	0	1

Sechelt (Expansion)	22-Feb-2021	0	1
Surrey - Cloverdale (Expansion)	2-Feb-2021	0	1
UBC - Wesbrook Place (Expansion)	18-Dec-2020	0	1
Vancouver - Kerrisdale (Expansion)	31-Mar-2021	0	1
Total		**5**	**19**

During the Reporting Period, BC Hydro decommissioned three of its EV fast charging sites. These sites are identified in Table 10 below, along with the date of decommissioning as well as the reason the site was decommissioned.

Table 10 Fast Charging Stations Decommissioned - Fiscal 2021

Date of Decommissioning	Site	Reasons for Decommission
Sep 30, 2020	Surrey Central City Hall	Decommissioned since the fast charging station relied on electrical infrastructure that was inside the site host's premises with restricted access.
Oct 1, 2020	Penticton	Decommissioned and re-opened by FortisBC Inc. due to its proximity to FortisBC's network.
Mar 31, 2021	Powertech Labs	Decommissioned due to non-compliance with requirements of the GGRR, and a new station planned at a site nearby Powertech Labs.

6.2 Compliance Verification

The following is an account of the processes for each compliance item:

- **Availability to the public for 24 hours** – All new charging station sites are selected based on the requirement for 24-hour access. If the 24 hour access for a site changes for any reason, BC Hydro will work with the site owner to re-instate 24 hour access or make a decision to decommission the station at the site. For example, BC Hydro negotiated with the Township of Langley to reconfigure the parking lot gates to maintain 24-hour access for the charging station at the Langley Event Centre while closing off the rest of the parking lot after hours;
- **No requirement of membership** - BC Hydro offers a one-time credit card payment service that is free of any network membership requirements. Customers use their smart phone to scan a QR code that takes them to a web portal to process a credit card payment for the charging session;
- **Capability to charge more than one vehicle make** - All BC Hydro's direct current, fast charging stations can charge all EV models from manufacturers

that subscribe to the two industry open standards for charger/car interface – CHAdeMO and CCS; and

- **Decision to Construct or Purchase** - For BC Hydro, “the date the public utility decides to construct or purchase an eligible charging station” is the date when the expenditures associated with the construction or purchase of the eligible charging station are internally approved via an Expenditure Authorization Request (EAR). BC Hydro considers the date when the appropriate approval of the EAR is obtained that it has met the requirement of section 5(2)(b) of the GGRR.
- **Site Limit** – BC Hydro determines the Site Limit for each proposed charging station based on the most recent population numbers published by BC Stats.

6.3 Summary of Results

Appendix 1 to Attachment 2 identifies each of BC Hydro’s 97 eligible charging stations at 71 eligible charging sites as of March 31, 2021. All sites are delineated in the Economic Development Region.

For all eligible charging stations identified in Appendix 1 to Attachment 2, a charging port for BC Hydro at this time is the same as a charging station. That is, each charging station is capable of charging one vehicle at a time, even though each of the 97 charging stations is equipped with two connectors - a CHAdeMO connector and a SAE CCS connector.

The number of charging sessions as well as kWh dispensed (measured by metering currently not yet approved by Measurement Canada) during fiscal 2021 for each eligible charging station is provided in Appendix 1 to Attachment 2.

For most of the sites identified in Appendix 1 to Attachment 2, population statistics are based on the 2016 Census as reported for the year 2020 by BC Stats. In some instances and as identified, the population figures are from the 2016 Census as reported by Statistics Canada. The number of eligible charging stations within each limited municipality as of March 31, 2021 is based on a review of information in Plugshare.com.

The distribution of fast charging sites by Economic Development Region is provided in Figure 3 below.

Figure 3 Distribution of Eligible Charging Sites by Economic Development Region

      - Vice-President Asset Planning, Ajay Kumar
      - Director Engineering Design, Murray Kroeker
      - Director Engineering Services, Shari Carlaw
      - Director Energy Planning & Analytics, Bill Clendinning
      - Director Dam Safety, Bob Schubak
      - Director Interconnections, Frank Lin
    - Senior Vice-President Capital Infrastructure Project Delivery, Al Leonard
      - Vice-President Project Delivery, Melissa Holland
      - Director Indigenous Relations, Lindsay Thompson
      - Director Environment, Karen Popoff
      - Director Properties, Joanna Sofield
    - Executive Vice-President Operations, Charlotte Mitha
      - Director Line Field Operations, Lanny Sawchuck
      - Director Stations Field Operations, Richard Brittin
      - Director T&D System Operations, Paul Choudhury
      - Director Generation System Operations, Heather Matthews
      - Director Program & Contract Management, Jesse Brown
      - Director Distribution Design & Customer Connect, Ranjeet Gill
      - Director Construction Services, Matt Wilson
    - Senior Vice-President Safety & Chief Compliance Officer, Kirsten Peck
      - Director Safety, Stephanie Benay
      - Director Learning & Development, Tracey Armatage
      - Director Projects, Fiona Taylor
      - Director Compliance, Kees Jansen
      - Manager Security & Emergency Management, Ben Peco
    - Executive Vice-President Finance, Technology, Supply Chain & Chief Financial Officer, David Wong
      - Chief Supply Chain Officer, Gurj Parmar
      - Chief Information Officer, Kip Morison
      - Chief Accounting Officer, Ryan Layton
      - Treasurer & Director Financial Evaluation, Michael Savidant
      - Director Finance - Site C, Henry Honda
      - Director Audit Services, Albert Lagnado
    - Senior Vice-President Customer & Corporate Affairs, Vacant*
      - Vice-President Customer Service, Keith Anderson
      - Chief Regulatory Officer, Chris Sandve
      - Chief Communications Officer, Darwin Sauer
      - Director Conservation & Energy Management, Stephen Hobson

Powerex Corp

Powertech Labs

* Senior Vice-President, Customer & Corporate Affairs role is under recruitment as of August 31, 2021.

Effective November 01, 2021

BC Hydro Fiscal 2023 – Fiscal 2025
Revenue Requirements Application

Appendix II

Proposed Fiscal 2023 to Fiscal 2025 Rates

Table of Contents

List of Tables

1 Introduction

Section 2 of this appendix describes how the requested rate increase will be applied to the default, tiered rates for BC Hydro's residential and transmission service rate classes using BCUC-approved pricing principles. The default rates for the other rate classes do not require the use of the BCUC-approved pricing principles and have been determined by increasing each component of the rate by the requested rate increase.

Section 3 contains the fiscal 2023 to rates which are requested to be effective April 1, 2022 on an interim and refundable basis. It also contains the fiscal 2024 and fiscal 2025 interim rates under the proposed rate increases.

Table II-1 of this appendix sets out the rates that will be applicable to each of the Rate Schedules in each rate class for fiscal 2023 to fiscal 2025 and compares them to the fiscal 2022 rates, which were approved on a final basis by BCUC Order No. G-187-21.

BC Hydro's Open Access Transmission Tariff (**OATT**) rates are explained in Chapter 9 of the Application. Table II-2 of this appendix sets out the applicable OATT rates for fiscal 2023 to fiscal 2025 and compares them to the fiscal 2022 rates, which were approved on a final basis by BCUC Order No. G-187-21.

2 Application of Rate Increases

2.1 Residential Rates

2.1.1 Rate Schedules (RS) 1101, 1121 – Residential Service

Rate Schedule 1101 is the Residential Inclining Block (**RIB**) rate, which is the default Residential rate, while Rate Schedule 1121 is the RIB rate for Multiple Residential Service. The RIB rate structure for Rate Schedules 1101 and 1121 consists of a Basic Charge and a two-step inclining block Energy Charge, with the first step called the Step 1 Energy Charge and the second step called the Step 2 Energy Charge. The RIB rate was implemented on October 1, 2008.

The term “pricing principles” refers to how revenue requirements rate increases are applied to each of the RIB rate’s pricing elements (Step 1 Energy Charge, Step 2 Energy Charge and Basic Charge). The approved RIB pricing principles for Rate Schedules 1101 and 1121 for each fiscal year in the Test Period are to uniformly increase the three pricing elements of the RIB rate by the amount of the approved rate increase. These pricing principles have been in place for a number of years and were most recently approved for fiscal 2021 and fiscal 2022 by BCUC Order No. G-62-20.

BC Hydro uses the approved pricing principles to derive the RIB rates shown in Table II-1 below. To derive the RIB rates, each of the three components of the RIB rate are increased by the proposed rate increase of 0.62 per cent for fiscal 2023, 0.97 per cent for fiscal 2024 and 2.18 per cent for fiscal 2025. BC Hydro is currently exploring RIB rate restructuring options with customers and stakeholders and is planning to file a rate application with the BCUC by February 2022. The approval of a new rate structure may result in changes to the rates reported in the table below.

2.2 Transmission Service Rates

2.2.1 Rate Schedule (RS) 1823 – Transmission Service – Stepped Rate

The pricing principles for the Rate Schedule 1823 Stepped Rate were first approved for fiscal 2017 to fiscal 2019 by Directive 9 of BCUC Order No. G-5-17, were extended to fiscal 2020 and fiscal 2021 by BCUC Order No. G-93-19, and were further extended by BCUC Order No. G-131-21 until March 31, 2023 or until a new rate structure for RS 1823 customers is approved by the BCUC.

Under the pricing principles:

- For fiscal 2017, the Tier 2 energy charge was set to the lower end of BC Hydro's energy long run marginal cost and the Tier 1 energy charge was set to reflect the 4.0 per cent revenue requirements rate increase according to the bill neutrality approach, i.e., 90 per cent of the Tier 1 energy charge plus 10 per cent of the Tier 2 energy charge is equal to the flat energy charge (Rate Schedule 1827 energy charge or the Rate Schedule 1823 Energy Charge A); and
- For fiscal 2018 to fiscal 2022, the applicable revenue requirements rate increases were applied equally to both Tier 1 and Tier 2 energy charges.

The fiscal 2023 to fiscal 2025 Transmission Service RS 1823 Stepped Rates in Table II-1 are based on the approved pricing principles to the end of fiscal 2023. Therefore, the proposed rate increases of 0.62 per cent in fiscal 2023, 0.97 per cent in fiscal 2024 and 2.18 per cent in fiscal 2025 are applied equally to the RS 1823 Tier 1 energy charge and the Tier 2 energy charge. BC Hydro is currently exploring Rate Schedule 1823 restructuring options with transmission service customers and stakeholders, which is expected to result in a rate application and approval of a new rate structure for RS 1823 customers. This would result in changes to RS 1823 and possibly changes in related transmission service rates reported in the table below.

3 Summary of Fiscal 2023 to Fiscal 2025 Rates

Table II-1 below provides the rates in each BC Hydro rate schedule for fiscal 2023 to fiscal 2025 and a comparison to the fiscal 2022 rates which were approved on a final basis by BCUC Order No. G-187-21.

1 **Table II-1 Fiscal 2022 to Fiscal 2025 Rates**

Rate Class	Rate Schedule	Rate	Fiscal 2022	Fiscal 2023	Fiscal 2024	Fiscal 2025
			Approved 1.00%	Rate Increase 0.62%	Rate Increase 0.97%	Rate Increase 2.18%
Residential	1101/1121	Basic Charge ($/day)	0.2077	0.2090	0.2110	0.2156
		Step-1 energy charge ($/kWh)	0.0939	0.0945	0.0954	0.0975
