Mr. Patrick Wruck
Commission Secretary and Manager
Regulatory Support
British Columbia Utilities Commission
Suite 410, 900 Howe Street
Vancouver, BC V6Z 2N3

Dear Mr. Wruck:

RE: British Columbia Utilities Commission (BCUC or Commission)
British Columbia Hydro and Power Authority (BC Hydro)
Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (the Application)

BC Hydro writes to file the Application requesting various approvals from the BCUC for fiscal 2020 and fiscal 2021.

If approved, these requests would result in a net bill increase of 1.76 per cent on April 1, 2019 and 0.72 per cent on April 1, 2020.

We request that these changes be made effective April 1, 2019, on an interim basis, pending a final BCUC decision on the Application.

For further information, please contact Chris Sandve at 604-974-4641 or by email at bchydroregulatorygroup@bchydro.com.

Yours sincerely,

Fred James
Chief Regulatory Officer

List of Figures

List of Tables

1.1 Introduction

British Columbia Hydro and Power Authority (**BC Hydro**) is a Crown corporation established under the *Hydro and Power Authority Act* and regulated by the British Columbia Utilities Commission (**BCUC**) under the *Utilities Commission Act*. Our owner and sole shareholder is the Government of B.C.

We provide electricity to 95 per cent of British Columbia's population in a service area that encompasses most of the province. We have approximately 2.0 million customer accounts and provide service to approximately 4.0 million people and businesses. Our system includes 30 hydroelectric generating facilities, two natural gas-fired generating facilities, 134 contracts with Independent Power Producers (**IPPs**) and approximately 86,000 kilometers of transmission and distribution lines.

BC Hydro files this Revenue Requirements Application (**Application**) to request various approvals from the BCUC for fiscal 2020 and fiscal 2021 (**test period**). Our requests are summarized in section 1.6 of this chapter. If approved, these requests would result in a net bill increase of 1.76 per cent on April 1, 2019 and 0.72 per cent on April 1, 2020.

These net bill increases reflect the proposed reduction of the Deferral Account Rate Rider (**DARR**) from 5 per cent to 0 per cent on April 1, 2019 and permanent general rate increases of 6.85 per cent on April 1, 2019 (for fiscal 2020) and 0.72 per cent on April 1, 2020 (for fiscal 2021).[1]

[1] Offsetting the requested general rate increase of 6.85 per cent with the requested reduction of the DARR from 5 per cent to 0 per cent reduces the net bill increase by more than 5 per cent because the DARR is applied after general rate increases. The following equation demonstrates how this works:

Start: Bill with 5 per cent DARR: $105.00.

Adjust: DARR from 5 per cent to 0 per cent: $100.00.

Adjust: General Rate Increase of 6.85 per cent: $106.85.

$106.85/$105.00 = 1.0176.

This Chapter is organized around the following key points:

- Section 1.2 explains that this application reflects careful planning and prioritization to invest in safe and reliable electricity service while keeping rate increases as low as possible.
- Section 1.3 sets out our Plan-Build-Operate-Support organizational model, which encourages consistent adoption of best practices used across the company and facilitates stronger collaboration and cooperation in similar functions across our business.
- Section 1.4 explains that Phase One of the Government of B.C.'s Comprehensive Review of BC Hydro (**Comprehensive Review**) has resulted in changes that have enhanced the BCUC's oversight of BC Hydro and reduced the forecast increase in BC Hydro's electricity rates.
- Section 1.5 identifies how we have considered and acted upon recent BCUC directives and recommendations in drafting this application.
- Section 1.6 sets out the specific approvals that we are seeking in this application.
- Section 1.7 summarizes our forecast revenue requirements, which total $5,256.5 million for fiscal 2020 and $5,288.3 million for fiscal 2021.
- Section 1.8 provides an overview of why our forecast revenue requirements in the test period represent reasonable costs to provide safe and reliable electricity.
- Section 1.9 summarizes external studies and independent expertise which demonstrate that our costs are reasonable and that our operations are well managed.
- Section 1.10 provides a proposed regulatory process for the BCUC and interveners to review this application. The proposed process reflects our belief that an open and transparent relationship with the BCUC and interveners in

regulatory proceedings leads to better decisions and improved outcomes for our customers.

1.2 Safely Providing Reliable, Affordable, Clean Electricity

BC Hydro's mission is to safely provide reliable, affordable, clean electricity throughout British Columbia. We have a responsibility to our customers to address cost pressures while keeping rate increases as low as possible. Accordingly, this application reflects careful planning and prioritization.

1.2.1 BC Hydro is Meeting Service Plan Performance Measures

Each year, BC Hydro prepares an annual Service Plan. The Service Plan sets out four goals which align with our mission. Each goal has a set of performance measures which represent the commitments we make to our customers. In fiscal 2018, we successfully met or exceeded all 13 of our Service Plan performance measures and for fiscal 2019, we are on track to meet all of our performance measures, with the exception of our target for Lost Time Injury Frequency. Our fiscal 2020 to fiscal 2022 Service Plan is provided as Appendix E.

1.2.2 Affordability is Important

One of the performance measures in our Service Plan is Affordable Bills. BC Hydro participates in an annual survey by Hydro Quebec of electricity costs in 22 cities in Canada and the United States. Our goal is to be in the first (i.e., best) quartile of utilities surveyed for residential rates. For 2018, BC Hydro's average residential bills were the third lowest and within the first quartile. Based on power consumption, small power bills were between fifth and eighth lowest; medium power bills were between third and fourth lowest and large power bills were between third and fifth lowest. BC Hydro's 2018 Electricity Rate Comparison Report is provided as Appendix V.

While the Hydro Quebec survey provides an important benchmark of BC Hydro's performance, we are conscious of the impact that any bill increase may have on our customers. Many of our residential customers face affordability challenges and many of our commercial and industrial customers face challenging market conditions.

1.2.3 BC Hydro Faces Significant Cost Pressures

Many factors continue to put upward pressure on BC Hydro's costs, which drives the amount we must charge customers for electricity. Notable factors putting upward pressure on our costs and rates include:

- **Load forecast**: Our Load Forecast expects a more moderate increase in the demand for electricity relative to the load forecast provided in our Fiscal 2017-Fiscal 2019 Revenue Requirements Application (**Previous Application**). This means less revenue is available to fund operations and investments. Further information is provided throughout Chapter 3.
- **Cost of Energy**: Our forecast costs of energy are increasing, primarily because of cost increases on existing IPP contract. Further information is provided throughout Chapter 4.
- **Operating costs**: We face significant uncontrollable operating cost increases, such as increased storm restoration costs, which reflect the higher levels of storm related damage experienced in recent years. Further information is provided throughout Chapter 5.
- **Capital investments**: Ongoing investments are required to maintain, upgrade and expand our electricity system. Further information is provided throughout Chapter 6.
- **Recovering account balances**: While BC Hydro's overall regulatory account balances are forecast to be reduced from approximately $5.4 billion at the end of fiscal 2018 to $3.6 billion at the end of fiscal 2019, the remaining balance must continue to be recovered from customers. Further information is provided throughout Chapter 7.

1.2.4 Planning and Prioritization is Required to Achieve the Right Balance Between Investment and Low Rates

BC Hydro's forecast revenue requirements are the product of careful planning and prioritization. They reflect what we believe is an appropriate level of spending in fiscal 2020 and fiscal 2021 to safely provide reliable and clean electricity, while keeping rate increases as low as possible. Examples of our planning and prioritization appear throughout this application, and include the following:

- **Cost of energy mitigation:** In Chapter 4, we identify actions taken to reduce our forecast costs of energy. BC Hydro is not acquiring new resources from IPPs, with the exception of a small number of new First Nations energy projects and some EPA renewals, such as new contracts under the Biomass Energy Program. In addition, BC Hydro and the Government of B.C. have taken steps since fiscal 2015 to reduce IPP power acquisitions. These steps include the indefinite suspension of the Standing Offer Program (**SOP**), terminating three EPAs, and not renewing three other EPAs that expired.
- **Reduction in controllable operating costs:** In Chapter 5, we explain that BC Hydro is limiting base operating cost increases[2] below the forecast rate of inflation,[3] by offsetting non-controllable cost increases with reductions to controllable costs. BC Hydro has achieved reductions in controllable costs through a variety of means, including vacancy factor savings, lease consolidations, and a reduction to advertising costs.
- **Moderating capital investment:** In Chapter 6, we explain how information on system performance has informed decisions to moderate our level of capital investment.

[2] BC Hydro explains in Chapter 5, section 5.5.1 why base operating costs should be the focus.
[3] BC Hydro uses the B.C. Consumer Price Index measure for the forecast rate of inflation. The forecast rate of inflation for fiscal 2019, fiscal 2020 and fiscal 2021 is 2.7 per cent, 2.3 per cent and 2.0 per cent, respectively.

- **Managing DSM spending:** In Chapter 10, we set out our proposed demand side management (**DSM**) expenditure schedule. It provides broad customer access to conservation and energy management opportunities, while managing the overall level of expenditures to limit forecast rate increases.

1.3 The Move to a Centralized and Functionally Aligned Organization is Complete

In October 2017, BC Hydro took the last step in moving to a centralized and functionally-aligned organizational structure. This final, incremental change completes the shift towards centralizing functions that BC Hydro has pursued over time. This functional alignment encourages consistent adoption of best practices used across the company and facilitates stronger collaboration and cooperation in similar functions across our business.

In recent years, BC Hydro had centralized its Finance, Safety and Supply Chain functions. The most significant part of the recently completed final step was to:

- Bring together the Key Business Units (**KBU**) responsible for power system planning into a Business Group called Integrated Planning; and
- Bring together the KBUs responsible for power system operations into a Business Group called Operations.

This final step was not intended to drive specific cost reductions, but we believe that the intangible benefits of improved collaboration and consistent adoption of best practices can only assist the efficient management of the company. Our Safety Business Group provides a good illustration of the benefits of functional alignment. Safety functions were previously distributed throughout the business. In its Decision on BC Hydro’s Fiscal 2009 to Fiscal 2010 Revenue Requirements Application, the BCUC encouraged BC Hydro to implement a comprehensive safety management program.[4] Since centralizing, we have been able to improve consistency of and clarity on safety requirements throughout the company. This promotes improved safety performance and a stronger safety culture.[5]

The centralized organizational structure aligns our Business Groups to the lifecycle of our work delivery. Our Business Groups are now organized under our four major work functions – Plan, Build, Operate, and Support. This is shown in Figure 1-1 below.

Figure 1-1 Plan-Build-Operate-Support Model

The change brings together groups with similar functions that were previously separated by our different lines of business - Generation, Transmission, and Distribution. In addition, KBUs within these Business Groups have aligned their work to our main asset types – station assets (generation plants and substations) and line assets (transmission and distribution lines).

A more detailed explanation of our Plan-Build-Operate-Support model is provided in Chapter 5, section 5.3.2.

4 British Columbia Utilities BCUC Decision and Order No. G-16-09, BC Hydro F2009 and F2010 Revenue Requirements Application (March 13, 2009), page 49.

5 BC Hydro 2017/18 Annual Service Plan Report, Pages 18-20, 'Goal 4: Safety Above All, Safety Performance Measures.

1.4 The Comprehensive Review of BC Hydro Has Enhanced BCUC Oversight and Reduced Forecast Rate Increases

On February 14, 2019, the Government of B.C. released a report on Phase One of the Comprehensive Review, which is included as Appendix C.

The review resulted in changes that have enhanced the BCUC's oversight of BC Hydro and reduced the forecast increase in BC Hydro's electricity rates.

1.4.1 BCUC Oversight Has Been Enhanced

To enhance the regulatory oversight of BC Hydro while still advancing its social, economic and environmental priorities, the Government of B.C. has:

- Accepted a recommendation for BC Hydro to cease using the Rate Smoothing Regulatory Account, and to write-off the balance in the account in fiscal 2019;
- Repealed a number of regulations that had restricted the BCUC's decision making in the past. Moving forward, this will enable the BCUC to review and make decisions on BC Hydro's costs, proposed rate increases and almost all regulatory accounts, programs and capital projects;
- Announced its intent to introduce legislation in spring 2019 to restore the BCUC's authority to review and approve BC Hydro's Integrated Resource Plan (**IRP**);
- Enabled the BCUC to begin setting BC Hydro's allowed net income for rate-setting purposes, following a two-year transition period for fiscal 2020 and fiscal 2021, during which BC Hydro's current net income target of $712 million will remain in place; and
- Changed the accounting rules that BC Hydro is required to follow so that BC Hydro will fully adopt International Financial Reporting Standards (**IFRS**) for fiscal 2019.

Further information on these changes is provided in Chapter 2, section 2.2.

1.4.2 Actions by BC Hydro and Government to Keep Rates Affordable

Phase One of the Comprehensive Review also includes a number of actions by the Government of B.C. and BC Hydro to keep rates affordable.

As a result of these actions, the cumulative increase in bills for ratepayers is forecast to be 8.1 per cent over the next five years (April 1, 2019 to March 31, 2024). This is approximately 40 per cent lower than the 13.7 per cent increase for the same period under the 2013 10 Year Rates Plan and more than 20 per cent lower than the forecast rate of B.C. inflation for the period. This is shown in Figure 1-2 below.

Figure 1-2 Bill Impact Forecast (Fiscal 2020 to Fiscal 2024)

	Fiscal 2020 Apr 1, 2019 – Mar 31, 2020	Fiscal 2021 Apr 1, 2020 – Mar 31, 2021	Fiscal 2022 Apr 1, 2021 – Mar 31, 2022	Fiscal 2023 Apr 1, 2022 – Mar 31, 2023	Fiscal 2024 Apr 1, 2023 – Mar 31, 2024	Cumulative Five Years
Current Rates Forecast – Annual Rate Increase before reducing the DARR	6.8%	0.7%	2.2%	0.0%	3.2%	n/a
Current Rates Forecast – Annual Bill Impact including reduction in DARR*	1.8%	0.7%	2.2%	0.0%	3.2%	8.1%
Previous Govt's 10 Year Rates Plan – Annual Bill Impact	2.6%	2.6%	2.6%	2.6%	2.6%	13.7%
Forecast BC Inflation	2.3%	2.0%	2.0%	2.0%	2.0%	10.7%

The following provides a summary of the actions that the Government of B.C. and BC Hydro are taking to keep rates affordable. These actions are reflected in the requests BC Hydro is seeking in this application.

- **Writing off $1.1 billion deferral account balance:** The write-off of the Rate Smoothing Regulatory Account contributes to a reduction in BC Hydro's forecast overall regulatory account balance at the end of fiscal 2019 by 24 per cent, from $4.7 billion to $3.6 billion. Lowering the overall regulatory account balance means lowering the amount that would otherwise be recovered from ratepayers, reducing pressure on rates. Further information is provided in Chapter 7, section 7.7.6.

- **Suspending the SOP**: The SOP has been indefinitely suspended, in accordance with Regulation 23/2019, issued under the *Clean Energy Act*. Further information is provided in Chapter 4, section 4.3.2.
- **Lower biomass costs:** Through a new Biomass Energy Program, BC Hydro will acquire up to 80 per cent, in aggregate, of the historical energy deliveries received under biomass EPAs that are due to expire before March 31, 2022. The prices offered for biomass energy will be lower relative to current contract terms to achieve savings for ratepayers. Further information is provided in Chapter 4, section 4.3.2.
- **Reduced capital investments:** BC Hydro has reduced planned capital expenditures and additions. A more moderate rate of load growth than previously anticipated means that the timing of some planned investments to expand BC Hydro's system have changed. A consistently high level of historic system performance has provided an opportunity to moderate the level of sustainment investments, compared to previously planned amounts. Further information is provided in Chapter 6, section 6.3.
- **Base operating cost increases below inflation:** Despite significant cost pressures, BC Hydro is limiting base operating cost increases below the forecast rate of inflation over the test period. Further information is provided in Chapter 5, section 5.5.2.

1.5 BC Hydro Has Considered and Acted Upon the BCUC's Directions and Recommendations

While drafting this application, we considered recent BCUC directives, recommendations and observations, including those from the BCUC's March 1, 2018 Decision on our Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (**Decision**). The following sections indicate how this application reflects the BCUC's comments.

1.5.1 Actual Load Has Tracked Close to Forecast

In its Decision, the BCUC noted that the domestic revenue variance,[6] which captures the difference between actual and forecast load, has been consistently negative and growing since fiscal 2009.[7]

The load forecast variance which is the difference between actual and approved domestic energy sales volumes,[8] is shown in Table 1-1 below. Actual results have tracked within 0.05 per cent to 0.5 per cent against the May 2016 Load Forecast from the Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (Previous Application), which is well within a range of expectancy based on industry benchmarks.

Table 1-1 Actual and Approved Domestic Energy Sales Volumes

	Approved (GWh)	Actual (GWh)	Variance (GWh)	Variance (%)
Fiscal 2017	51,550	51,577	27	0.05
Fiscal 2018	51,528	51,789	261	0.51

6 The domestic revenue variance deferred to the Non-Heritage Deferral Account is equal to the difference between the RRA forecast domestic revenue sub-total and the Actual domestic revenue sub-total (refer to Appendix A, Schedule 14.0, line 20), adjusted to remove revenues related to Seattle City Light (refer to Appendix A, Schedule 14.0, line 18). This is because variances related to Seattle City Light are deferred to the Heritage Deferral Account.

7 BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Appendix B, page 10.

8 Excluding sales to Seattle City Light.

The difference between actual and approved domestic energy sales revenues[9] is shown in Table 1-2 below. Actual results have tracked within -0.03 per cent and 0.29 percent of planned amounts.

Table 1-2 Actual and Approved Domestic Energy Sales Revenues

	Approved ($ million)	Actual ($ million)	Variance ($ millions)	Variance (%)
Fiscal 2017	4,474.3	4,473.0	(1.3)	-0.03
Fiscal 2018	4636.9	4650.4	13.5	0.29

1.5.2 We Considered an Alternative Short-Term Load Forecast Methodology

In its Decision, the BCUC noted that some utilities use a different load forecast methodology for their short-term forecast for setting rates as compared to their long-term forecast for resource planning.[10]

In light of the BCUC's observation, we reviewed other utilities' short-term forecast methodologies. We developed an alternative forecast based on the methodology used by FortisBC Inc., the other major electric utility in B.C.

Results of our alternative forecast comparison showed BC Hydro averaged a billed sales variance of -0.3 per cent (residential sector) and -0.4 per cent (commercial sector) for fiscal 2016 to fiscal 2018, using our load forecasting methodology, while the average billed sales variance using FortisBC Electric's methodology was 2.4 per cent (residential sector) and 0.8 per cent (commercial sector) for the same time period.

Considering the recent performance of our own methodology, the results of our comparison using an alternative short-term forecast methodology, and recent improvements made to our methodology, we concluded that it was appropriate to

9 Excluding sales to Seattle City Light.

10 BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Appendix B, page 11.

use our forecast methodology for this Load Forecast. Further information is provided in Chapter 3, section 3.2.11.

1.5.3 Price Elasticity Inputs Have Been Updated to Reflect Independent Expert Advice

In its Decision, the BCUC acknowledged the concerns of the Association of Major Power Consumers (**AMPC**) regarding the price elasticity used for industrial customers.[11] Utilities use price elasticity to help determine whether and to what extent customers may reduce their electricity demand in response to a price increase.

In March 2018, BC Hydro retained DNV GL to conduct an electricity price elasticity study for each of our customer sectors. DNV GL is a global quality assurance and risk management company, with a highly regarded energy advisory services division offering institutional, legal and technical expertise on electricity systems. The company has global operations in over 100 countries. The results of their price elasticity study are included as Appendix Q.

The DNV DL study results, combined with the results of our own evaluation of the residential inclining block rate (fiscal 2013 to fiscal 2017), supports the results of our previous internal studies and third party assessments that our price elasticity estimates are consistent with what is commonly reported and on the lower end of the survey data.

DNV GL’s key findings were adopted in the Load Forecast prepared for this application. Specifically, BC Hydro has increased the electricity price elasticity value used for all of the main customer sectors from -0.05 to -0.10. Further information is provided in Chapter 3, section 3.2.6.2.

[11] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Appendix B, page 6.

1.5.4 We Improved the Industrial Load Forecast Inputs and Methodology

In its Decision, the BCUC noted that there are challenges in forecasting large industrial loads.[12] Load forecasting, especially with regards to the Industrial sector, is inherently uncertain. However, in response to the Decision and as part of our continuous improvement efforts, we have made changes to our load forecast methodology. Further information is provided in Chapter 3, section 3.2.6.2 (Residential), section 3.2.7.2 (Commercial and Light Industrial) and section 3.2.8.2 (Large Industrial).

1.5.5 LNG Sector Load is Now Forecast Consistent with Large Industrial Methodology

In its Decision, the BCUC noted that BC Hydro had forecast liquefied natural gas (**LNG**) plant loads based on public information announced by LNG proponents and for which BC Hydro has received interconnection service requests.[13] In this application, we have instead forecast sales to LNG customers in the same way that sales to all other customers in the large industrial sector are forecast. We believe that this approach will improve the performance of the Load Forecast by incorporating a probabilistic assessment of LNG customers. Further information is provided in Chapter 3, section 3.2.8.2.

1.5.6 We Are Optimizing the Value from Heritage Assets

In its Decision, the BCUC expressed concern that Heritage Assets may not be providing optimal value to BC Hydro customers.[14] BC Hydro is optimizing the use of heritage assets through our approach to both operations and capital investment.

---

[12] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Appendix B, page 11.

[13] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Appendix B, page 7.

[14] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 24.

- Our monthly Energy Studies optimize our operational management of all sources of energy supply on BC Hydro's integrated system.
- Our capital planning process seeks to optimize our investment strategy for generation resources by categorizing our heritage assets as "Key", "Strategic" or "Available", according to the significance of the facility to BC Hydro's system. BC Hydro's Generation Strategic Asset Management Plan sets out a 10- year strategy for each category.

Further information is provided in Chapter 4, section 4.3.1.

1.5.7 Independent Experts Confirmed Our Energy Studies Methodology is Consistent with Leading Industry Practices

In its Decision, the BCUC recommended that BC Hydro review its approach to optimizing its portfolio of energy resources in its next IRP.[15] In fiscal 2019, BC Hydro undertook an internal audit of our monthly Energy Studies process. To complete this internal audit, two subject matter experts were engaged from SINTEF, an independent research organization that conducts contract research and development projects. These experts specialized in load forecasting, risk management, hydrothermal market modelling and hydropower scheduling models. The internal audit concluded that:

- BC Hydro has a well-established Energy Studies process in place;
- Key models are appropriate; and
- The methodologies applied are in line with leading industry practices.

The internal audit report is provided as Appendix DD. Further information is provided in Chapter 4, section 4.4.2.

[15] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 28.

1.5.8 We Are Taking Steps to Reduce IPP Costs

In its Decision, the BCUC observed that there is a potential for cost savings if additional IPP contracts are canceled or amended to reduce the volume of IPP purchases.[16] The BCUC also recommended that BC Hydro consider the timing of its existing IPP contracts and contract renewals.[17]

BC Hydro's forecast increases to our Cost of Energy are primarily driven by increasing IPP energy costs under existing agreements. BC Hydro is not acquiring new resources from IPPs, with the exception of a small number of new First Nations energy projects and some EPA renewals, such as new contracts under the Biomass Energy Program. The forecast increase in IPP energy costs from fiscal 2019 to fiscal 2021 is in large part due to pre-determined factors, including price escalation terms and other terms in existing EPAs, and IPP projects with existing EPAs reaching commercial operation.

BC Hydro and the Government of B.C. have taken steps since fiscal 2015 to reduce IPP power acquisitions. These steps include the indefinite suspension of the SOP, terminating three EPAs, and not renewing three other EPAs that expired. Further information is provided in Chapter 4, section 4.3.2.

1.5.9 We Have Clarified Our Accounting Treatment for Costs of Energy

In its Decision, the BCUC directed BC Hydro to explain, in a compliance filing, the accounting treatment of surplus energy costs and recoveries.[18]

BC Hydro's Cost of Energy was previously categorized into Heritage Energy and Non Heritage Energy. This practice stems from the Heritage Contract, which was recently repealed as a result of the Government of B.C.'s Comprehensive Review.

---

[16] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 26.

[17] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 28.

[18] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 112.

The categorization under the Heritage Contract never had any practical impact on BC Hydro's planning and operations. The financial treatment of these costs was the same regardless of how they were categorized. Similarly, the repeal of the Heritage Contract has no impact on BC Hydro's planning or operations or the financial treatment. BC Hydro continues to manage all sources of energy supply as a single portfolio. However, without the Heritage Contract, BC Hydro now has the flexibility to categorize its Cost of Energy differently in its revenue requirements model for this application. In Schedule 4.0 of Appendix A to this application, which sets out BC Hydro's Cost of Energy, BC Hydro has re-categorized its Cost of Energy into: Heritage Energy, Non-Heritage Energy and Market Energy.

These categories are for presentation purposes only and are intended to provide better clarity on the presentation of our Cost of Energy. We believe that these categories will make it easier to understand BC Hydro's energy costs. Further information is provided in Chapter 4, section 4.2.1.

1.5.10 We Are Providing More Detailed Information on Our Operating Costs

In its Decision, the BCUC stated that it did not have a high degree of comfort in BC Hydro's overall operating costs, due to its limited involvement in the approval of BC Hydro's previous revenue requirements.[19]

In response to the BCUC's observation, we have provided significantly more information on our operating costs, relative to the Previous Application. We address the composition, drivers and outcomes of the overall budget of each KBU, not just incremental amounts. This information is contained in Chapters 5A through 5G.

[19] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 33.

1.5.11 FTE Increases Are Driven by Capital Investment and Have Reduced BC Hydro's Overall Costs

In its Decision, the BCUC reviewed BC Hydro's headcount over time.[20]

The growth in Full Time Equivalents (**FTEs**) in recent years has actually been a source of cost savings:

- The Workforce Optimization Program, discussed in Chapter 5, section 5.6.1, has replaced higher cost contractors with internal FTEs, generating an estimated $18.5 million in annual savings.
- The Accenture repatriation, discussed in Chapter 5 ,section 5.6.2, has exceeded the anticipated cost savings.

In addition, as shown in Figure 1-3 below, apart from growth in the workforce directly related to increased capital investment, BC Hydro's FTEs have remained relatively flat since fiscal 2012. This includes additions related to the Workforce Optimization Program.

[20] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 34.

Figure 1-3 FTEs[21,22] (Fiscal 2012 to Fiscal 2021)

	Fiscal 2012 Actual	Fiscal 2013 Actual	Fiscal 2014 Actual	Fiscal 2015 Actual	Fiscal 2016 Actual	Fiscal 2017 Actual	Fiscal 2018 Actual	Fiscal 2019 Forecast	Fiscal 2020 Plan	Fiscal 2021 Plan
Operating	4,415	4,096	4,089	4,036	4,042	4,082	4,209	4,051	4,047	4,043
Capital	1,527	1,662	1,752	1,872	1,828	1,905	2,013	2,378	2,383	2,370
Deferred	309	250	258	223	188	161	162	165	164	164
Total FTEs	**6,251**	**6,007**	**6,099**	**6,131**	**6,058**	**6,148**	**6,385**	**6,593**	**6,594**	**6,577**

Excluding the Site C Project, FTEs are planned to remain flat during the test period. Further information is provided in Chapter 5 section 5.6.3 and section 5.6.4.

1.5.12 Workforce Optimization Program Considers Long-Term Effects and Costs

In July 2015, BC Hydro launched a Workforce Optimization Program to determine the right mix of internal and external labour resources. In its Decision, the BCUC

[21] Figure 1-3 shows total FTEs by work function (operating, capital or deferred), excluding FTEs related to the Accenture Repatriation, the Smart Metering Infrastructure Project and the Site C Project. These FTEs were removed to avoid skewing the trend line. All FTEs related to the Workforce Optimization Program are included. The numbers for Fiscal 2012 to Fiscal 2018 are actuals. Fiscal 2019 numbers are forecast and Fiscal 2020 and 2021 numbers are plan.

[22] "Deferred" FTEs, refers to FTEs whose work is charged to regulatory accounts (e.g., the DSM Regulatory Account).

observed that there did not appear to be an assessment of the long-term effects and costs of hiring contractors as employees.[23]

Decisions to replace external contractors with internal FTEs, through the Workforce Optimization Program, must be supported by a workforce adjustment request document. The documents provide both quantitative and qualitative support for converting a contractor to an employee.

The documentation required by the Workforce Optimization Program accounts for both the short-term and long-term effects and costs of hiring contractors as employees. Specifically, workforce adjustment request documents consider:

- The costs of hiring internal employees against the costs of contracting out work to an external supplier. The costs of internal employees, measured by using Standard Labour Rates, includes base salary and wages, premiums, overtime, vacation/flex time, pension, employer-paid premiums, insurance, supplemental benefits and training;
- Other implications of employing internal resources such floor space requirements; and
- Non-financial benefits such as maintaining knowledge about assets or programs in-house and establishing strong succession plans for potential retirements.

In addition, BC Hydro uses resource forecasts to determine our long-term labour needs. This includes assessing our current internal resources and external suppliers' abilities to meet the needs of our capital and maintenance plans. Further information is provided in Chapter 5, section 5.6.1.3.

[23] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 34.

1.5.13 Our Total Rewards Package Helps to Retain Employees and is Consistent with Market Rates

In its Decision, the BCUC stated that the costs and benefits of BC Hydro's total rewards initiatives were unclear.[24] BC Hydro's total rewards offer includes salary, pension, benefits and time-off (i.e., vacation). It is designed to attract and retain qualified employees. A 2017 total rewards assessment by Morneau Shepell concluded:

- On an average total cash basis, BC Hydro employees earn 11 per cent less than median market rates; and
- After factoring in the value of pension benefits and time off programs, BC Hydro's compensation package is comparable, at 2 per cent below median market rates.

BC Hydro believes that an emphasis on non-salary compensation measures (i.e., pension and time-off) improves employee retention. In fact, our voluntary turnover rate is 1.3 per cent, which is below the 3.8 per cent average for the Power and Utilities industry as reported by the Conference Board of Canada. [25] Further information is provided in Chapter 5, section 5.6.5.2.

1.5.14 Using Work Smart Gains to Address Workload and Absorb New Work is Valuable and Consistent with Practices at Other Companies

In its Decision, the BCUC expressed its belief that the efficiency savings generated by BC Hydro's Work Smart program should result in incremental cost savings.[26]

As of the end of fiscal 2018, BC Hydro has realized an estimated 80,000 annual capacity hours gained as a result of Work Smart program initiatives. The estimated

[24] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 34.

[25] MacLean, Kathryn, and Allison Cowan. *Compensation Planning Outlook 2019*. Ottawa: The Conference Board of Canada, 2018.

[26] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 34.

realized annual savings exceed the forecast amount of 46,550 hours provided by BC Hydro in the Previous Application.[27]

We believe that our approach of using these gains to address workload issues and absorb new work, so that new costs can be avoided, is beneficial. Efficiency gains through the Work Smart program are an important part of our efforts to keep operating cost increases below the rate of inflation.

Work Smart relies on front-line employees to identify opportunities to make processes more efficient and effective as well as to save time and resources. We believe that using the gains from these opportunities to address workload issues and allow employees to focus on higher value work is the most effective way to encourage employees to bring forward ideas and participate in the Work Smart process.

BC Hydro's approach of using Work Smart gains to address workload issues is also consistent with practices at other companies such as the Insurance Corporation of British Columbia and Washington State. Further information is provided in Chapter 5, section 5.4.5.

1.5.15 BC Hydro Uses Benchmarking and Our Operating and Maintenance Costs Benchmark Favourably

In its Decision, the BCUC expressed concern with the apparent lack of metrics used by BC Hydro for productivity or benchmarking purposes.[28] Although BC Hydro did not present evidence on metrics and benchmarking in the last Application, we use them on a regular basis across parts of the organization. We have also augmented that information with benchmarking prepared specifically for this proceeding.

[27] Refer to BC Hydro's Response to BCUC IR 2.213.04 in the Previous Application proceeding.

[28] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 87.

- A report prepared by The Brattle Group, provided as Appendix T, shows that BC Hydro's operating costs benchmark favourably against a peer group of U.S. utilities;
- An internal analysis provides an indicative assessment that BC Hydro's operating costs compare well against those of other major Canadian utilities;
- Recent benchmarking on maintenance delivery costs has demonstrated that BC Hydro's costs are consistent with or better than its utility peers; and
- Cost benchmarking and metrics are used in other areas of the business.

Further information on benchmarking is provided in Chapter 5, section 5.7.

1.5.16 We Have Developed a Benefits Realization Process for Technology Investments

In its Decision, the BCUC stated that it was unclear on the types of analysis performed by BC Hydro to support its technology investments. The BCUC also stated it was unable to assess how technology investments would result in quantifiable efficiencies and cost savings.[29]

BC Hydro has implemented a benefits realization process for technology projects. This process is in place so that:

- Benefits claimed in business cases are realized once projects are in service; and
- Ownership for benefits included in technology project business cases extends beyond project completion.

Further information is provided in Chapter 6, section 6.5.5.

[29] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 34.

1.5.17 This Application Identifies Projects that Are Expected to be Subject to a CPCN Proceeding

In its Decision, the BCUC noted that it reviews large planned projects to identify projects that have potentially significant public interest issues requiring further investigation through separate Certificate of Public Convenience and Necessity (**CPCN**) processes.[30] Appendix I of this application indicates which projects BC Hydro expects to be subject to a future CPCN or section 44.2 proceeding.

1.5.18 BC Hydro Has Well Established and Well Performing Practices for the Planning and Delivery of Capital Investments

In its Decision, the BCUC recommended that the adequacy of BC Hydro's planning and execution related to large capital projects be explored.[31] We have done so in this application.

BC Hydro has well-established and well-performing practices for the planning and delivery of capital investments:

- In December 2018, the Office of the Auditor General of B.C. released an independent audit of Capital Asset Management in BC Hydro. The audit found that BC Hydro has good asset management practices as a result of a decade long plan and associated efforts. It had no recommendations for improvement. This audit is included as Appendix F.
- In 2016, BC Hydro completed its second Organizational Project Management Maturity Model Assessment and placed in the top tier of participating organizations from around the world.

---

[30] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 39.

[31] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 45.

- Also in 2016, BC Hydro received the Project Management Office of the Year Award from the Project Management Institute, recognizing superior organizational project management capabilities.

A key metric to evaluate BC Hydro's performance in the delivery of capital projects is to compare the actual project costs for in-service projects to the original approved expected cost over an aggregated five-year period. Projects included in this metric for the five-year period of fiscal 2014 to fiscal 2018 had an aggregate original approved expected cost of $6.936 billion. The actual aggregate costs for these projects were $27.9 million (or 0.40 per cent) over the original approved expected cost. Since 2014, when BC Hydro began measuring its capital delivery performance with a five-year aggregate, it has been in the range of –4.75 per cent to +0.40 per cent of the original approved expected cost.

In recent years, BC Hydro has also implemented changes to further improve the delivery of large capital projects.

Further information is provided in Chapter 6, section 6.2.1.

1.5.19 We Have Provided Additional Information on Capital Expenditures and Additions

On June 13, 2018, BC Hydro filed its Revised Proposal in the Capital Expenditures and Projects Review proceeding. The BCUC established that proceeding to examine how it reviews BC Hydro's capital expenditures and projects. While that proceeding is ongoing, the information provided in this application reflects BC Hydro's Revised Proposal, which included additional information to address concerns identified in the scope of that proceeding. Further information is provided in Chapter 6, section 6.2.2.

1.5.20 Emergency RipRap Costs Are Prudent

On November 13, 2015, BC Hydro filed an application with the BCUC to upgrade the riprap on the W.A.C. Bennett Dam. The BCUC accepted the project's expenditure schedule with the exception of the costs associated with a Maintenance and

Emergency Stockpile (MES) of riprap. The BCUC directed that, in future revenue requirement applications, BC Hydro either confirm that no expenditures relating to the emergency stockpile riprap are included in the revenue requirements or explain otherwise. [32] In August 2017, BC Hydro notified the BCUC that it was proceeding with expenditures for the MES. BC Hydro believes these expenditures are prudent and is seeking to recover the total riprap costs of $0.7 million as part of the forecast revenue requirements outlined in this application. Further information is provided in Chapter 6, section 6.4.13.5.

1.5.21 BC Hydro's Use of Regulatory Accounts is Consistent with BCUC Directives

In its Decision, the BCUC issued several directives with regards to BC Hydro's regulatory accounts. BC Hydro is managing all of its regulatory accounts consistent with these directives and is not requesting any changes to those directives in this application. Further information is provided throughout Chapter 7.

1.5.22 Continued Use of the Dismantling Cost Regulatory Account is Appropriate

In its Decision, the BCUC approved BC Hydro's request to establish a Dismantling Cost Regulatory Account for the fiscal 2017 to fiscal 2019 test period. The BCUC stated that, in its view, the timing of dismantling activities is largely within BC Hydro's control but that the establishment of the account for the test period would allow BC Hydro to gain more experience with forecasting the timing of expenditures.[33]

BC Hydro believes continued use of the Dismantling Cost Regulatory Account is appropriate. In BC Hydro's view, the nature of dismantling costs makes them difficult to forecast accurately. Dismantling cost variances can be positive or negative and have ranged from $14.1 million below plan to $31.7 million above plan since

[32] BCUC Order No. G-78-16, Appendix A, page 44.
[33] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), pages 62 to 63.

fiscal 2012. Dismantling costs are largely driven by BC Hydro's capital plan and are impacted by capital project schedules. In the absence of a regulatory account to capture variances between forecast and actual dismantling expenditures, significant gains or losses could accrue to ratepayers or the Government of B.C. Continued use of the account will mean that ratepayers pay the actual costs of any dismantling activities. Further information is provided in Chapter 7, section 7.7.2.

1.5.23 We Are Requesting BCUC Approval to Close the Rate Smoothing Regulatory Account

In its Decision, the BCUC raised concerns about the Rate Smoothing Regulatory Account and the apparent decoupling of revenues and expenditures during the test period.[34] In previous fiscal years, as part of the Government of B.C.'s 2013 10 Year Rates Plan, BC Hydro deferred a portion of its approved revenue requirement to the Rate Smoothing Regulatory Account for collection in rates in future fiscal years. This kept rates lower than they otherwise would have been. As a result of the Comprehensive Review, BC Hydro ceased using the Rate Smoothing Regulatory Account and wrote off the balance in the account in fiscal 2019. In this application, we are requesting BCUC approval to close the account. This means that BC Hydro's revenues and expenditures are no longer decoupled. Further information is provided in Chapter 7, section 7.7.6.

1.5.24 We Increased Residential Demand-Side Management Programs

In its Decision, the BCUC directed BC Hydro to consider more targeted DSM programs directed at residential customers.[35] In response, BC Hydro's proposed DSM expenditure schedule increases expenditures for the residential sector by approximately 50 per cent. This increase was funded through re-allocations from other sectors and did not increase overall DSM expenditures. In addition,

[34] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 110.

[35] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Directive 21.

participation targets for the Low-Income Program have been increased and additional measures and increased incentives have been added to the Home Renovation Rebate Program. Further information is provided in Chapter 10, section 10.2.2.

1.5.25 We Have Reviewed Industry Practice for Codes and Standards Attribution

In its Decision, the BCUC directed BC Hydro to review if its approach for attributing savings that occur from the implementation of codes and standards was consistent with industry practice.[36] BC Hydro retained the Cadmus Group to conduct an assessment, which is included as Appendix CC. This assessment concluded that industry practice on codes and standards attribution is varied and evolving and that the different approaches reflect the different regulatory and business drivers facing utilities. BC Hydro's approach is consistent with other Canadian jurisdictions such as Manitoba and Ontario. In this application, we have taken steps to improve the presentation of our treatment of codes and standards savings. Further information is provided in Chapter 10, section 10.2.3.

1.5.26 We Have Launched a New DSM Program for Non-Integrated Areas

In its Decision, the BCUC acknowledged concerns raised by the Non-Integrated Areas Ratepayers Group (**NIARG**) and the Zone II ratepayers group (**Zone II**) regarding DSM activities in non-integrated areas. The BCUC also directed BC Hydro to provide certain information on DSM activities in non-integrated areas in its Annual Report on DSM Activities and in this application.[37]

- In response, BC Hydro has launched a new Non-Integrated Areas program. Further information on this program is provided in Chapter 10, section 10.2.4.

[36] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Directive 22.

[37] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Directive 23.

- Appendix Z provides BC Hydro's F2018 Annual Report on DSM Activities. This report includes a new section to track activities in non-integrated areas separately.
- Appendix X provides BC Hydro's Fiscal 2020 to Fiscal 2022 DSM Business Plan. This appendix includes an estimate of the difference in cost-effectiveness test results of programs available to customers in the non-integrated areas compared to the integrated areas.

1.5.27 We Have Considered the Adoption of Performance Based Regulation

In its Decision, the BCUC directed BC Hydro to file a report on Performance Based Regulation (**PBR**).[38] This PBR Report is provided as Chapter 11 of this application.

To assist us in identifying the opportunities and challenges associated with the adoption of PBR for BC Hydro, we retained Dr. Dennis Weisman, Ph.D., a recognized expert in PBR.

- Appendix FF provides a whitepaper completed by Dr. Weisman at BC Hydro's request titled "A Report on the Theory and Practice of Performance Based Regulation."; and
- Appendix GG provides a paper that Dr. Weisman previously co-wrote with Dr. David Sappington titled "Assessing the Treatment of Capital Expenditures in Performance Based Regulation Plans."

We have reviewed the potential implications of adopting PBR and concluded that, at this time, BC Hydro should continue to be regulated through cost of service regulation.

[38] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Directive 28.

BC Hydro respectfully recommends that the BCUC use this Revenue Requirements Application proceeding to engage interveners to canvass their views.

Should the BCUC decide to adopt PBR for BC Hydro, this report provides initial conclusions in response to the issues the BCUC has asked BC Hydro to address. These initial conclusions provide a framework for a PBR plan.

1.6 Summary of Orders Sought

In this application, we are seeking approval to amend BC Hydro's rate schedules as follows:

- A reduction of the Deferral Account Rate Rider (**DARR**) from 5 per cent to 0 per cent on April 1, 2019; and
- Permanent general increases of 6.85 per cent on April 1, 2019 (for fiscal 2020) and 0.72 per cent on April 1, 2020 (for fiscal 2021).

The reduction of the DARR from 5 per cent to 0 per cent on April 1, 2019 would offset the proposed general rate increase for fiscal 2020. As a result, if approved, these requests would result in a net bill increase of 1.76[39] per cent on April 1, 2019. The net bill increase on April 1, 2020 would be the same as the proposed general rate increase of 0.72 per cent.

We request that these changes be made effective April 1, 2019, on an interim basis, pending a final BCUC decision on our Application. Tariff Sheets reflecting these requests are provided in Appendix EE.

[39] Offsetting the requested general rate increase of 6.85 per cent with the requested reduction of the DARR from 5 per cent to 0 per cent reduces the net bill increase by more than 5 per cent because the DARR is applied after general rate increases. The following equation demonstrates how this works:
Start: Bill with 5 per cent DARR: $105.00
Adjust: DARR from 5 per cent to 0 per cent: $100.00
Adjust: General Rate Increase of 6.85 per cent: $106.85
$106.85/$105.00 = 1.0176

Second, this application also contains requests related to BC Hydro's regulatory accounts. Specifically, this application requests BCUC approval to:

- Refund the forecast fiscal 2019 net closing balance and the forecast fiscal 2020 and fiscal 2021 net additions and net interest applied to the Cost of Energy Variance Accounts, over the fiscal 2020 to fiscal 2021 test period. This would result in a net credit to the benefit of ratepayers of $329.1 million being amortized into rates during the test period;
- Defer any variances related to the accounting for EPAs determined to be leases under IFRS 16, which are not eligible for deferral treatment under existing orders, to the Non-Heritage Deferral Account;
- Defer any variances between forecast and actual amounts related to the Biomass Energy Program, which are not eligible for deferral treatment under existing orders, to the Non-Heritage Deferral Account. This will ensure BC Hydro recovers its costs with respect to the Biomass Energy Program;[40]
- Continue to defer, on an annual and ongoing basis, any variances between forecast and actual dismantling costs to the Dismantling Cost Regulatory Account, continue to apply interest to the balance of the account and recover the forecast interest charged to the account each year, and continue to recover the forecast account balance at the end of a test period over the next test period;
- Defer low-carbon electrification expenditures to the DSM Regulatory Account, consistent with the Direction to the BCUC Respecting Undertaking Costs;
- Remove the reference to the "Prescribed Standards" from the scope of what may be deferred to the Site C Regulatory Account, as BC Hydro has fully adopted IFRS. This will allow BC Hydro to continue to defer to the Site C

[40] The Government of B.C. has indicated that it intends to provide a direction to the BCUC with respect to the approval of the program documentation and to require the costs associated with the program to be recovered from ratepayers.

Regulatory Account any costs related to the Site C Project that are not able to be capitalized;

- Close the Capital Project Investigation Costs Regulatory Account at the end of fiscal 2021 as its balance will be fully amortized into rates at that time; and
- Close the Rate Smoothing Regulatory Account in fiscal 2020 as this account has a zero balance and BC Hydro is not proposing to smooth rates over the fiscal 2020 to fiscal 2021 test period.

Further information on requests related to BC Hydro's regulatory accounts is provided in Chapter 7, section 7.7.

Third, this application also requests BCUC approval of:

- Depreciation rates for the Burrard synchronous condense facility, for new Water Rights, Infrastructure Rights and LED Streetlights asset classes and for three new asset classes for agreements recognized as leases under International Financial Reporting Standard 16, *Leases*. For further information on this request, please refer to Chapter 8, section 8.2;
- Open Access Transmission Tariff (**OATT**) rates, as set out in Chapter 9, Table 9-8. For further information on this request, please refer to Chapter 9; and
- A DSM expenditure schedule of $90.8 million in fiscal 2020 and $116.3 million in fiscal 2021. For further information on this request, please refer to Chapter 10.

Fourth, this application requests that the BCUC reconsider and vary Directive 3 of the BCUC's Decision on BC Hydro's Fiscal 2017 to Fiscal 2019 Revenue Requirements Application which, among other things, directs BC Hydro to file a CPCN application for the Northwest Substation Upgrade project. This directive is inconsistent with the Transmission Upgrade Exemption Regulation. Further information is provided in Chapter 2, section 2.5.8.

Fifth, this application requests that the BCUC reconsider and rescind the following directives:

- Directive 61 of the BCUC's Decision on BC Hydro's Fiscal 2005 to Fiscal 2006 Revenue Requirements Application which directs that a prorated amount of costs from portfolio-level initiatives be added to the cost of each DSM program to assess cost effectiveness. This Directive is inconsistent with industry practice and with section 4 of the DSM regulation which was put in place after the Directive was issued. In addition, it requires a calculation that does not provide a fair assessment of the cost-effectiveness of a program and makes it challenging for some programs to be cost-effective. Further information is provided in Chapter 10, section 10.5.4.
- Directive 57 of the BCUC's Decision on BC Hydro's Fiscal 2009 to Fiscal 2010 Revenue Requirements Application which directs that BC Hydro revenue requirement applications filed after January 1, 2011 contain financial information that follows the Uniform System of Accounts. Based on conversations with BCUC staff, BC Hydro understands that the BCUC does not see a need for BC Hydro to continue providing this information in its revenue requirement applications. Accordingly, this application does not contain this information.

Chapter 2, section 2.9 provides a summary of the BCUC's legal authority with regards to these requested approvals. A Draft Order is provided in Appendix B.

1.7 Overview of BC Hydro's Revenue Requirements

This section provides an overview of our revenue requirements for fiscal 2020 and fiscal 2021 and shows the revenue shortfall that will result from the existing rates. BC Hydro requires a rate increase in order to generate the necessary revenues to provide safe and reliable service during the test period.

There are two ways to summarize BC Hydro's revenue requirements:

- **Gross View:** The Gross View shows the total costs for each component of the revenue requirements before any forecast transfers to regulatory accounts and then shows the regulatory account transfers as a separate total. In other words, “Gross View” shows the total costs incurred in fiscal 2020 and fiscal 2021.
- **Current View:** The Current View shows the total costs for each component of the revenue requirements after any forecast transfers to regulatory accounts. In other words, the “Current View” shows the actual costs being recovered from customers in rates in fiscal 2020 and fiscal 2021.

Appendix A contains the detailed financial schedules of our revenue requirements model and is intended to provide a single location for all costs contained in our Application. The working revenue requirements model that produces these schedules is also provided in electronic form as part of this filing. A reconciliation of the Gross View and the Current View for each component of the revenue requirements is provided in Schedule 3.0 of Appendix A.

1.7.1 Increased Gross Revenue Requirements Are Primarily Driven By An End to Rate Smoothing and Higher Cost of Energy

Table 1-3 below shows BC Hydro's revenue requirements for fiscal 2020 and fiscal 2021 from a Gross View.

Table 1-3 Gross View of BC Hydro's Revenue Requirements[41]

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Cost of Energy	1.0 L1	1,549.3	1,505.5	1,657.8	1,538.7	1,762.9	1,673.4	1,887.0	1,920.2
2	Operating Costs	1.0 L2	1,185.0	1,165.1	1,220.0	1,228.7	1,221.0	1,257.5	1,224.2	1,229.3
3	Taxes	1.0 L3	223.3	223.1	231.8	231.1	238.7	242.2	249.8	262.2
4	Amortization	1.0 L4	783.2	777.9	821.1	807.6	850.9	871.5	915.7	936.5
5	Finance Charges	1.0 L5	708.8	579.2	735.0	805.9	773.8	684.6	757.5	726.9
6	Return on Equity	1.0 L6	684.0	683.5	698.0	684.0	712.0	(424.3)	712.0	712.0
7	Miscellaneous Revenue	1.0 L7	(137.1)	(143.1)	(138.3)	(143.7)	(140.6)	(202.9)	(240.8)	(247.2)
8	Inter-Segment Revenue	1.0 L8	(62.5)	(56.9)	(64.3)	(66.4)	(65.3)	(64.3)	(69.0)	(72.6)
9	Deferral Account Transfers	1.0 L12	182.0	245.8	197.0	410.4	215.3	460.2	(152.5)	(158.1)
10	Other Regulatory Account Transfers	1.0 L16	(285.9)	(138.0)	(358.1)	(461.2)	(346.8)	804.2	125.3	131.9
11	Subsidiary Net Income	1.0 L19	(119.7)	(132.4)	(119.9)	(139.6)	(120.2)	(208.6)	(124.0)	(124.3)
12	Other Utilities Revenue	1.0 L20	(12.6)	(13.0)	(12.0)	(11.9)	(12.1)	(28.6)	(28.6)	(28.7)
13	Liquefied Natural Gas Revenue	1.0 L21	(4.4)	(0.4)	(10.7)	(1.3)	(10.9)	(0.3)	0.0	0.0

Table 1-4 below provides an explanation of the difference between the fiscal 2019 RRA and the fiscal 2021 plan amounts, based on the Gross View. This provides a summary of the key differences between the revenue requirements in this

[41] Forecast BC Hydro contributions to Government in fiscal 2020 are approximately $1.3 billion and include taxes (line 3 above, which includes amounts paid to the Province and municipalities), return on equity (line 6 above) and water rentals (part of line 1 above; in fiscal 2020 the forecast amount is $347 million and can be seen by adding lines 23 and 32 of Appendix A, Schedule 4.0).

application and the revenue requirements approved by the BCUC in the Previous Application.

Table 1-4 Explanation of Differences Between Fiscal 2019 RRA and Fiscal 2021 Plan (Gross View)

Cost Component and References	Difference ($ million)	Explanation
Cost of Energy Chapter 4 Appendix A, Schedule 4.0	157.3	Cost of Energy is increasing, primarily because of cost increases on existing IPP contracts due to operational changes, price escalation, capacity increases and forecast delivery changes.
Operating Costs Chapter 5 Appendix A, Schedule 5.0	8.3	BC Hydro is limiting base operating cost increases below the forecast rate of inflation, by offsetting non-controllable cost increases with reductions to controllable costs.
Taxes Chapter 8, Section 8.6 Appendix A, Schedule 6.0	23.5	Four factors are increasing the taxes paid by BC Hydro: increased assessed property values, the completion of new capital projects that are subject to taxation, increased grants-in-lieu due to an increase in forecast electricity sales and increases to provincial and municipal taxation rates.
Amortization Chapter 8, Section 8.2 Appendix A, Schedule 7.0	85.6	Two factors are driving increased amortization costs during the test period. First, BC Hydro’s forecast capital additions have increased as a result of recent capital investments. Second, in 2018, the BCUC approved BC Hydro’s purchase of the remaining two-thirds interest in the Waneta Dam.
Finance Charges Chapter 8, Section 8.5 Appendix A, Schedule 8.0	(46.9)	Forecast interest during construction has increased, which decreases finance charges. This decrease is partially offset by an increase in forecast borrowing costs, primarily due to recent capital expenditures.
Return on Equity Chapter 8, Section 8.3 Appendix A, Schedule 9.0	0	Section 8 of Direction No. 8 states that the BCUC must set BC Hydro’s Return on Equity at $712 million for fiscal 2020 and fiscal 2021. This amount is equal to the amount for fiscal 2019.
Miscellaneous Revenue Chapter 8, Section 8.7 Appendix A, Schedule 15.0	(106.6)	Miscellaneous revenues reduce overall revenue requirements and are planned to increase during the test period, primarily due to lease and other revenues related to BC Hydro’s acquisition of the remaining two-thirds interest in the Waneta Dam.
Inter-Segment Revenue Chapter 8, Section 8.8 Appendix A, Schedule 3.0	(7.2)	Inter-segment revenues are relatively consistent from fiscal 2019 RRA to fiscal 2021 plan.
Deferral Account Transfers Chapter 7 , section 7.7.1 Appendix A, Schedule 2.1	(373.4)	The decrease in deferral account transfers reflects BC Hydro’s request for BCUC approval to refund the forecast fiscal 2019 net closing balance and the forecast fiscal 2020 and fiscal 2021 net additions and net interest applied to the Cost of Energy Variance Accounts, over the test period.

Cost Component and References	Difference ($ million)	Explanation
Other Regulatory Account Transfers Chapter 7 Appendix A, Schedule 2.2	478.7	The increase in other regulatory account transfers primarily reflects that BC Hydro is no longer using, and is requesting BCUC approval to close the Rate Smoothing Regulatory Account. Transfers to this account were $321 million for fiscal 2019 RRA and are $0 in fiscal 2020 and fiscal 2021 plan.
Subsidiary Net Income Chapter 8, Section 8.9 Appendix A, Schedule 1.0	(4.1)	The inclusion of subsidiary net income in BC Hydro's revenue requirements reduces the overall revenue requirements. Subsidiary net income includes net income from BC Hydro's energy trading subsidiary Powerex as well as our subsidiary Powertech. Subsidiary net income is increasing, primarily due to an increase in the five-year average that is used to forecast Trade Income.
Other Utilities Revenue Chapter 8, Section 8.13.2 Appendix A, Schedule 14.0	(16.6)	The inclusion of Other Utilities Revenue in BC Hydro's revenue requirements reduces the overall revenue requirements. Other Utilities Revenue is increasing, primarily due to the adoption of IFRS 15 which impacts the accounting of payments made by Seattle City Light under the terms of the Skagit River Agreement.
Liquefied Natural Gas Revenue Chapter 2, Section 2.5.9 Appendix A, Schedule 14.0	10.9	In October 2018, the Government of B.C. removed a previous provision that prevented LNG customers from receiving service under BC Hydro's transmission rate schedules. This means that revenue from LNG customers is now recorded as general rate revenue and not as a separate line item.
Deferral Rider Revenue Chapter 7 Appendix A, Schedule 14.0	241.8	The decrease in DARR revenue reflects BC Hydro's request for BCUC approval to reduce the DARR from 5 per cent to 0 per cent on April 1, 2019.

1.7.2 BC Hydro's Requested Bill Increase is Primarily Driven by an End to Rate Smoothing and Increased Capital Investment

Table 1-5 below shows BC Hydro's revenue requirements for fiscal 2020 and fiscal 2021 from a Current View.

Table 1-5 Current View of BC Hydro's Revenue Requirements

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Cost of Energy	3.0 L12	1,723.9	1,715.8	1,838.6	1,854.1	1,951.8	1,933.5	1,735.1	1,768.2
2	Operating Costs	3.0 L21	984.2	990.9	953.8	972.8	961.6	2,107.1	1,298.6	1,305.2
3	Taxes	3.0 L24	223.3	223.5	231.8	232.9	238.7	242.2	249.8	262.2
4	Amortization	3.0 L30	860.7	860.7	917.5	916.3	955.3	950.8	1,035.6	1,060.2
5	Finance Charges	3.0 L37	504.6	504.0	512.4	513.1	555.5	555.6	697.5	662.3
6	Return on Equity	3.0 L41	684.0	683.5	698.0	684.0	712.0	(424.3)	712.0	712.0
7	Miscellaneous Revenue	3.0 L46	(137.1)	(143.4)	(138.3)	(143.7)	(140.6)	(151.6)	(237.7)	(243.7)
8	Inter-Segment Revenue	3.0 L51	(62.5)	(56.9)	(64.3)	(66.4)	(65.3)	(64.3)	(69.0)	(72.6)
9	Subsidiary Net Income	3.0 L69	(70.8)	(68.4)	(69.3)	(67.7)	(67.3)	(55.6)	(136.6)	(136.9)
10	Other Utilities Revenue	3.0 L70	(12.6)	(13.0)	(12.0)	(11.9)	(12.1)	(28.6)	(28.6)	(28.7)
11	Liquefied Natural Gas Revenue	3.0 L71	(4.4)	(0.4)	(10.7)	(1.3)	(10.9)	(0.3)	0.0	0.0
12	Deferral Rider Revenue	3.0 L72	(223.5)	(223.7)	(231.3)	(233.2)	(241.8)	(241.2)	0.0	0.0
13	Total Rate Revenue Requirement	3.0 L73	4,469.9	4,472.6	4,626.1	4,649.1	4,836.8	4,823.4	5,256.5	5,288.3
14	Less Revenue at F2019 Rates	1.0 L28	(4,469.9)	(4,472.6)	(4,626.1)	(4,649.1)	(4,836.8)	(4,823.4)	(4,919.6)	(4,913.7)
15	Revenue Shortfall	1.0 L29	0.0	0.0	(0.0)	0.0	0.0	0.0	336.9	374.5
16	Annualized Rate Increase	1.0 L30	4.00%	4.00%	3.50%	3.50%	3.00%	3.00%	6.85%	0.72%
17	Deferral Account Rate Rider	1.0 L31	5.00%	5.00%	5.00%	5.00%	5.00%	5.00%	0.00%	0.00%
18	Net Bill Increase	1.0 L32	4.00%	4.00%	3.50%	3.50%	3.00%	3.00%	1.76%	0.72%

Table 1-6 below provides an explanation of the difference between the fiscal 2019 RRA and the fiscal 2021 plan amounts, based on the Current View. This provides a summary of the key differences between the revenue requirements in this application and the revenue requirements approved by the BCUC in the Previous Application.

Table 1-6 Explanation of Differences Between Fiscal 2019 RRA and Fiscal 2021 Plan (Current View)

Cost Component and References	Difference ($ million)	Explanation
Cost of Energy Chapter 4 Appendix A, Schedule 4.0	(183.6)	Current cost of energy is decreasing, primarily because BC Hydro is requesting BCUC approval to refund the credit balance in the Heritage Deferral Account and the Non-Heritage Deferral Account to ratepayers. These accounts are used to capture variances between forecast and actual cost of energy and are discussed further in Chapter 7, section 7.7.1. Gross cost of energy is increasing during the test period, primarily due to an increase in costs associated with IPPs and Long-Term Commitments.
End to Rate Smoothing Chapter 7, Section 7.7.6 Appendix A, Schedule 5.0	321.4	In previous fiscal years, BC Hydro deferred a portion of its approved revenue requirements to the Rate Smoothing Regulatory Account, for collection in rates in future fiscal years. This kept rates lower than they otherwise would have been. In its Decision Previous Application, the BCUC raised concerns about this approach and its apparent decoupling of revenues and expenditures.[42] In this application, BC Hydro is requesting BCUC approval to close the Rate Smoothing Regulatory Account. Transfers to the Rate Smoothing Regulatory Account represented a pool of costs, with no identification of what specific costs made-up the transfer amount. For presentation purposes, these transfers were shown as negative recoveries from regulatory accounts and included in the Operating Costs component of the Current View. Therefore the increase to Operating Costs from fiscal 2019 RRA to fiscal 2020 plan is primarily due to the absence of transfers to the Rate Smoothing Regulatory Account. The fiscal 2019 forecast amount reflects the write-off of the Rate Smoothing Regulatory Account.

[42] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 110.

Cost Component and References	Difference ($ million)	Explanation
Operating Costs (net of Rate Smoothing) Chapter 5 Appendix A, Schedule 5.0	22.2	BC Hydro is limiting base operating cost increases[43] below the forecast rate of inflation,[44] by offsetting non-controllable cost increases with reductions to controllable costs. Three factors are driving most of BC Hydro's forecast base operating cost increases. Two of these factors – storm restoration and the employer health tax[45] – are non-discretionary and are beyond BC Hydro's control. The third – Standard Labour Rate increases – is tied to the bargaining mandate for union staff provided to BC Hydro by the Public Sector Employers Council. To partially offset these increases, BC Hydro has achieved reductions in controllable costs through a variety of means, including vacancy factor savings, lease consolidations, and a reduction to advertising costs.
Taxes Chapter 8, Section 8.6 Appendix A, Schedule 6.0	23.6	Four factors are increasing the taxes paid by BC Hydro: increased assessed property values, the completion of new capital projects that are subject to taxation, increased grants-in-lieu due to an increase in forecast electricity sales and increases to provincial and municipal taxation rates.
Amortization Chapter 8, Section 8.2 Appendix A, Schedule 7.0	104.9	Two factors are driving increased amortization costs during the test period. First, BC Hydro's forecast capital additions have increased as a result of recent capital investments. Second, in 2018, the BCUC approved the 2017 Waneta Transaction. As discussed below, under Miscellaneous Revenues and Other, the Waneta 2017 Transaction is reducing BC Hydro's overall revenue requirements by increasing miscellaneous revenues to BC Hydro. Further information on our capital expenditures and additions are provided throughout Chapter 6 and further information on the Waneta 2017 Transaction is provided in Chapter 4, section 4.2.3.
Finance Charges Chapter 8, Section 8.5 Appendix A, Schedule 8.0	106.8	A credit balance in the Finance Charges Regulatory Account was refunded to ratepayers over the fiscal 2017 to fiscal 2019 period, which resulted in lower finance charges in fiscal 2019. In this application, forecast finance charges are increasing, primarily because this credit balance has now been returned to ratepayers and is no longer offsetting total finance charges in this test period. The other driver for the increase in finance charges is an increase to forecast borrowing costs, primarily due to recent capital expenditures. These increases more than offset a decrease in finance charges related to an increase in forecast interest during construction.

43 BC Hydro explains in Chapter 5, section 5.5.1 why base operating costs should be the focus.

44 BC Hydro uses the B.C. Consumer Price Index measure for the forecast rate of inflation. The forecast rate of inflation for fiscal 2019, fiscal 2020 and fiscal 2021 is 2.7 per cent, 2.3 per cent and 2.0 per cent, respectively.

45 The Employer Health Tax is partially offset by the elimination of Medical Services Plan premiums. As discussed in Chapter 7, section 7.8.11, the elimination of Medical Services Plan Premiums significantly reduced the balance in the Non-Current Pension Costs Regulatory Account.

Cost Component and References	Difference ($ million)	Explanation
Return on Equity Chapter 8, Section 8.3 Appendix A, Schedule 9.0	0	As part of the Comprehensive Review, the Government of B.C. is providing direction to the BCUC to help transition BC Hydro to increased regulation over time. Section 8 of Direction No. 8 states that the BCUC must set BC Hydro's Return on Equity at $712 million for fiscal 2020 and fiscal 2021. This amount is equal to the amount for fiscal 2019, which means that Return on Equity is not contributing to the proposed bill increase. For fiscal 2022 onwards, the BCUC will be able to determine BC Hydro's Return on Equity.
Miscellaneous Revenue Chapter 8, Section 8.7 Appendix A, Schedule 15.0	(103.1)	Miscellaneous revenues reduce overall revenue requirements and are planned to increase during the test period, primarily due to lease and other revenues related the Waneta 2017 Transaction which is discussed further in Chapter 4, section 4.2.3.
Inter-Segment Revenue Chapter 8, Section 8.8 Appendix A, Schedule 3.0	(7.2)	Inter-segment revenues are relatively consistent from fiscal 2019 RRA to fiscal 2021 plan.
Subsidiary Net Income Chapter 8, Section 8.9 Appendix A, Schedule 1.0	(69.6)	Subsidiary net income is increasing, primarily due to an increase in the five-year average that is used to forecast Trade Income[46] and because BC Hydro is requesting BCUC approval to refund the credit balance in the Trade Income Deferral Account to ratepayers. The Trade Income Deferral Account is used to capture variances between forecast and actual Trade Income and is discussed further in Chapter 7, section 7.7.1.
Other Utilities Revenue Chapter 8, Section 8.13.2 Appendix A, Schedule 14.0	(16.6)	The inclusion of Other Utilities Revenue in BC Hydro's revenue requirements reduces the overall revenue requirements. Other Utilities Revenue is increasing, primarily due to the adoption of IFRS 15 which impacts the accounting of payments made by Seattle City Light under the terms of the Skagit River Agreement.
Liquefied Natural Gas Revenue Chapter 2, Section 2.5.9 Appendix A, Schedule 14.0	10.9	In October 2018, the Government of B.C. removed a previous provision that prevented LNG customers from receiving service under BC Hydro's transmission rate schedules. This means that revenue from LNG customers is now recorded as general rate revenue and not as a separate line item.
Deferral Rider Revenue Chapter 7 Appendix A, Schedule 14.0	241.8	The decrease in DARR revenue reflects BC Hydro's request for BCUC approval to reduce the DARR from 5 per cent to 0 per cent on April 1, 2019.

1.8 This Application Balances Affordability and Reliability

The approvals that we are seeking in this application balance affordability and reliability to deliver value to our ratepayers. The following sections explain, at a high

[46] Trade Income is the greater of (a) the amount that is equal to BC Hydro's consolidated net income, less BC Hydro's non-consolidated net income, less the net income of BC Hydro's subsidiaries except Powerex, less the amount that BC Hydro's consolidated net income changes due to foreign currency translation gains and losses on intercompany balances between BC Hydro and Powerex; and (b) zero.

level, why the forecast revenue requirements in the test period represent reasonable costs to provide safe and reliable service to our customers.

1.8.1 Legal and Regulatory Framework Provides Guidance

Chapter 2 provides an overview of the legislation relevant to BC Hydro's revenue requirements as well as the specific regulations and policies that will inform the BCUC's consideration of the approvals that BC Hydro is seeking in this application. Chapter 2 is organized around the following key points:

- Section 2.2 explains that the Comprehensive Review has resulted in regulatory changes and plans to table legislative amendments that enhance the BCUC's oversight of BC Hydro generally and with respect to the review of this application.
- Section 2.3 explains how BC Hydro's powers and mandate under the *Hydro and Power Authority Act* remain unchanged.
- Section 2.4 describes how the *Utilities Commission Act* provides the BCUC with the ability to set BC Hydro's rates and to accept or reject the proposed DSM expenditure schedule. As a result of the changes from the Comprehensive Review, the BCUC's mandate in these areas with regards to BC Hydro is now similar to other regulated utilities in British Columbia.
- Section 2.5 identifies certain aspects of BC Hydro's revenue requirements that continue to be directed or guided by regulations issued under the *Utilities Commission Act*.
- Section 2.6 addresses the continued application of the *Clean Energy Act* to BC Hydro. The Act affects BC Hydro's Cost of Energy and DSM expenditures and requires the BCUC to allow BC Hydro to recover certain costs.
- Section 2.7 discusses BC Hydro's obligation to provide service to remote communities.

- Section 2.8 explains that BC Hydro is not proposing any changes to Standard Charges in this application.
- Section 2.9 provides a summary of the BCUC's legal authority with regards to the approvals that BC Hydro is seeking in this application.

The evidence provided in Chapter 2 is supported by the following appendices:

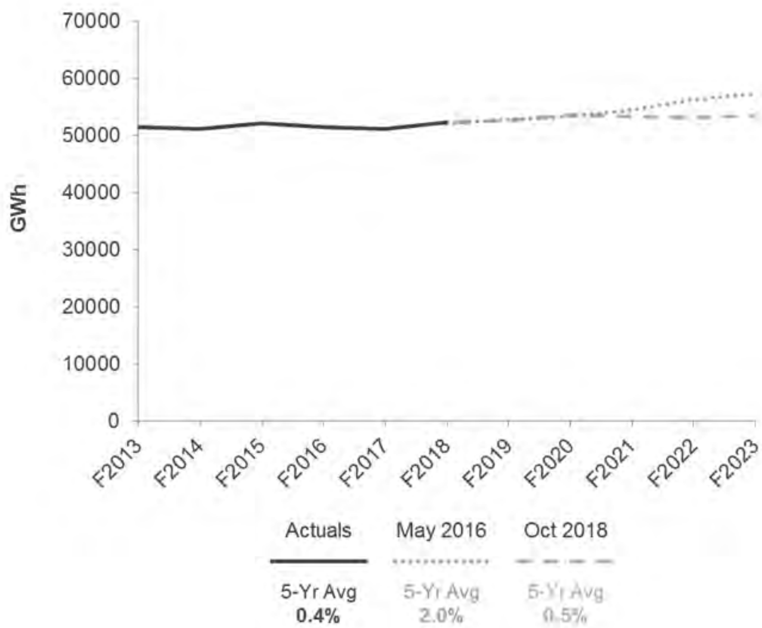
- Appendix B provides a Draft Order;
- Appendix C provides the report on the Comprehensive Review; and
- Appendix D provides copies of key regulations summarized in Chapter 2.

1.8.2 Our Load and Revenue Forecasts Are Reasonable

Chapter 3 provides our Load Forecast and associated Revenue Forecast. The forecasts for fiscal 2020 and fiscal 2021 are used in the calculation of the test period revenue requirements.

The Load Forecast was completed in October 2018. Overall, BC Hydro is forecasting a lower load growth rate relative to the May 2016 Load Forecast as contained in the Previous Application. This is shown in Figure 1-4 below.

Figure 1-4 Electricity Sales Summary – Oct 2018 Load Forecast vs. May 2016 Load Forecast[47]



Chapter 3 is organized around the following key points:

- Section 3.2 explains our load forecast methods, and the inputs used for each customer sector. We conclude that our methodology and inputs are the appropriate basis for the Load Forecast in this application considering:
  - The recent performance of our own methodology;
  - The endorsement of the methodology by an internal audit review conducted by an independent expert;
  - Improvements to our methodology, which address the audit recommendations and the issues raised by the BCUC;

[47] The graph shows a fiscal 2019 to fiscal 2023 compound growth rate using billed sales forecast after rates and after DSM savings

    - The Auditor General's recent determination that our methodology is robust and compares favourably with industry standards; and
    - The favourable performance of our methodology relative to an alternative short-term forecast methodology.
- Section 3.3 presents the results of the Load Forecast, both the mid forecast and the high and low uncertainty bands:
    - Demand for electricity is forecast to increase by approximately 650 GWh or 1.2 per cent from fiscal 2019 to fiscal 2021; and
    - The high and low band around the forecast is the product of Monte Carlo analysis, and illustrates the range of uncertainty.
- Section 3.4 explains our Revenue Forecast methodology, which is straightforward and unchanged from the methodology used in the Previous Application; and
- Section 3.5 presents the results of the Revenue Forecast by customer sector, based on the output of the improved load forecast methodology.

The evidence provided in Chapter 3 is supported by the following appendices:

- Appendix O provides BC Hydro's October 2018 Load Forecast and supporting documentation which is the source of the fiscal 2020 and fiscal 2021 Load Forecast provided in this application;
- Appendix P provides BC Hydro's internal audit on Load Forecasting; and
- Appendix Q provides an Elasticity Study completed by DNV GL. We have updated the price elasticity inputs to our Load Forecast based on this study.

1.8.3 Actions are Being Taken to Limit BC Hydro's Cost of Energy

Chapter 4 discusses BC Hydro's energy costs.

BC Hydro is not, as part of this application, proposing any generation projects or seeking acceptance of any EPAs. Rather, this chapter provides the necessary information to demonstrate that the forecast Cost of Energy is reasonable for the purpose of setting rates in the test period. While the forecast Cost of Energy is used in determining our total revenue requirements, customers ultimately only pay the actual Cost of Energy through the use of regulatory accounts.

Chapter 4 is organized around the following key points:

- Section 4.2 provides background information on how BC Hydro's Cost of Energy is categorized. In light of the elimination of the Heritage Contract, BC Hydro has restructured the presentation of the Cost of Energy in our revenue requirements model to improve clarity of the accounting treatment of our Cost of Energy.[48] The presentation change has no operational or financial impact.
- Section 4.3 describes BC Hydro's approach to managing future energy supply, which includes a number of steps to reduce IPP energy costs. This section also discusses the impacts of the Comprehensive Review on BC Hydro's Cost of Energy.
- Section 4.4, discusses how BC Hydro maximizes the expected value of its energy supply portfolio through its use of monthly Energy Studies. The

[48] The costs of Market Electricity Purchases, Surplus Sales, Net Purchases (Sales) from Powerex and Domestic Transmission - Export were previously distributed into Heritage and Non Heritage Energy costs, based on the Heritage Contract threshold of 49,000 GWh. As discussed in Chapter 2, section 2.2.1, as part of the Comprehensive Review, the Government of B.C. repealed Direction No. 7 to the BCUC, which included the Heritage Contract. The repeal of the Heritage Contract has no impact on BC Hydro or ratepayers; however, it provides BC Hydro with the flexibility to re-categorize its Cost of Energy for this application by creating a third category, Market Energy, which includes the four components – Market Electricity Purchases, Surplus Sales, Net Purchases (Sales) from Powerex and Domestic Transmission - Export.

methodology has been endorsed by independent experts as part of a recent audit.

- Section 4.5 provides BC Hydro's forecast Cost of Energy for the test period, and explains the treatment of variances between the forecast Cost of Energy and actual Cost of Energy.
- Sections 4.6, 4.7 and 4.8 provide a more detailed breakdown of the Cost of Energy by category (Heritage, Non-Heritage and Market). Overall, by fiscal 2021, BC Hydro's Cost of Energy is forecast to increase by $157 million from the fiscal 2019 RRA amount. This forecast increase is primarily driven by an increase in costs related to IPPs and Long-Term Commitments. These forecast costs are primarily associated with existing EPAs, and because the terms of these agreements are already set, the forecast costs for these EPAs are largely prescribed. With few exceptions, BC Hydro is not acquiring new resources from IPPs and those exceptions represent only a very small portion of the forecast Cost of Energy.

The evidence provided in Chapter 4 is supported by the following appendix:

- Appendix DD provides BC Hydro's internal audit on the Energy Studies process.

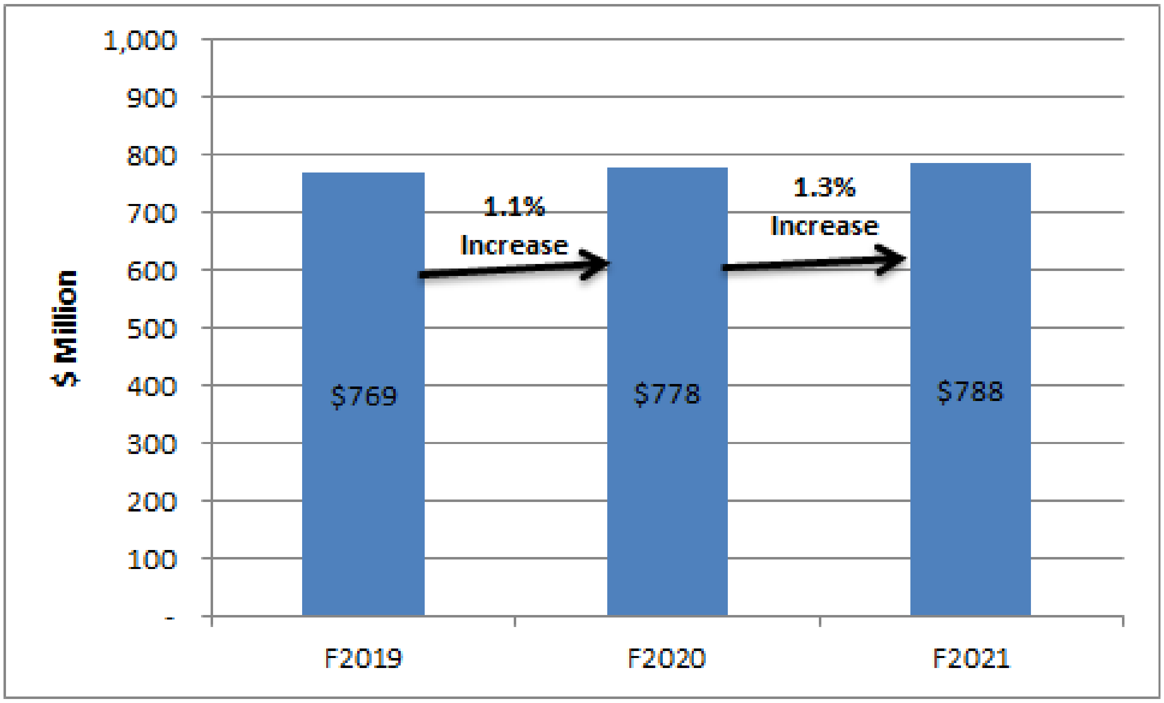
1.8.4 Despite Increases in Uncontrollable Costs, We Have Held Our Base Operating Cost Increases Below Inflation by Reducing Controllable Costs

Chapter 5 describes our planned operating costs and FTEs for the test period. As shown in Figure 1-5 below, BC Hydro is limiting base operating cost increases[49] below the forecast rate of inflation[50] over the test period.

[49] BC Hydro explains in Chapter 5, section 5.5.1 why base operating costs should be the focus.

[50] BC Hydro uses the B.C. Consumer Price Index measure for the forecast rate of inflation. The forecast rate of inflation for fiscal 2019, fiscal 2020 and fiscal 2021 is 2.7 per cent, 2.3 per cent and 2.0 per cent, respectively.

Figure 1-5 Base Operating Cost Increases Are Below Forecast Inflation



BC Hydro has been able to limit base operating cost increases to below the forecast rate of inflation for the test period by partially offsetting non-controllable cost increases with reductions to controllable costs.

Detailed support for BC Hydro's forecast operating costs, by Business Group, are provided in Chapters 5A through 5G. In response to commentary from the BCUC about needing to better understand BC Hydro's operating cost budget, these chapters provide significantly more information than the Previous Application on the operating costs and FTEs for each of BC Hydro's six business groups and 39 KBUs. The composition of the entire budget of each KBU, not just the incremental costs, is addressed in these Chapters.

Chapter 5 is organized around the following key points:

- Section 5.2 summarizes how BC Hydro has considered and responded to the BCUC's comments and recommendations about BC Hydro's operating costs in its Decision;[51]
- Section 5.3 describes changes to BC Hydro's organizational structure since the Previous Application. We have completed the transition to a centralized and functionally-aligned structure;
- Section 5.4 explains that BC Hydro has a robust budgeting process, with both top-down and bottom-up elements;
- Section 5.5 provides an overview of BC Hydro's operating costs during the test period:
  - ▶ Controllable cost pressures were absorbed within existing budgets, which means that after accounting for Standard Labour Rate increases, most KBUs were held to their current level of spend; [52] and
  - ▶ BC Hydro has achieved reductions in controllable costs through a variety of means, including vacancy factor savings, lease consolidations, and a reduction to advertising costs.
- Section 5.6 provides an overview of BC Hydro's FTEs and Standard Labour Rates:
  - ▶ The Workforce Optimization Program has reduced BC Hydro's total labour costs by replacing contractors with internal employees;
  - ▶ The repatriation of services previously provided by Accenture has resulted in higher than expected cost savings;

---

[51] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 33.

[52] Operating costs for some KBUs may increase or decrease from fiscal 2019 forecast to fiscal 2020 plan, due to budget transfers related to re-organizations. Overall, these transfers are cost neutral.

    - Apart from growth in the workforce directly related to increased capital investment, BC Hydro's FTEs have remained relatively flat since fiscal 2012 and will remain flat during the test period; and
    - A 2017 assessment by Morneau Shepell concluded that on a total cash basis, BC Hydro's employee compensation is 11 per cent below median market rates. After factoring in the value of pension benefits and time off programs, employee compensation is comparable to median market rates.
- Section 5.7 addresses benchmarking:
    - A report prepared by The Brattle Group shows that BC Hydro's operating costs[53] benchmark favourably against a peer group of U.S. utilities;
    - An internal analysis provides an indicative assessment that BC Hydro's operating costs compare well against those of other major Canadian utilities;
    - Recent benchmarking on maintenance delivery costs has demonstrated that BC Hydro's costs are consistent with or better than its utility peers; and
    - Cost benchmarking and metrics are used in other areas of the business.
- Section 5.8 explains how BC Hydro is optimizing the level of Power System maintenance, successfully mitigating increases in maintenance expenditures in recent years despite a growing Power System asset base, aging assets, and increased regulatory requirements.
- Section 5.9 outlines the content of Chapters 5A to 5G, which provide the composition, drivers and outcomes of each KBU budget in more detail than in the Previous Application.

[53] The Brattle Benchmarking Study focused on operations and maintenance costs, excluding the costs of fuel and water rental that are used in the power production process. The Brattle Benchmarking Study refers to these costs as "non-fuel operations and maintenance expenses", or by the acronym "NFOM". The costs of fuel and water rentals that are used in the power production process are excluded because they are reflected in BC Hydro's cost of energy. Cost of Energy is addressed in Chapter 4 of the Application.

The evidence provided in Chapter 5 and Chapters 5A to 5G is supported by the following appendices:

- Appendix R provides BC Hydro's Organization Chart;
- Appendix S provides a Summary of Organization Changes since our Previous Application;
- Appendix T provides the Brattle Benchmarking Study; and
- Appendix U provides the data used for BC Hydro's internal analysis of operating costs other major Canadian utilities.

1.8.5 Capital Expenditures and Additions Are Required for a Safe, Reliable System

Chapter 6 explains BC Hydro's capital planning and delivery processes as well as our planned capital expenditures and additions in fiscal 2020 and fiscal 2021. Capital "additions" are the capital investments that are affecting rates during the test period, which occurs when projects enter service. Capital "expenditures" represent spending incurred during the test period that will not affect rates until the project goes in service.

The capital forecasts in Chapter 6 are derived from the fiscal 2020 to fiscal 2024 Capital Plan (**Capital Plan**) that BC Hydro finalized in October 2018. The Capital Plan supported the Comprehensive Review and contains investment-level detail for fiscal 2020 to fiscal 2024, and a high-level investment projection for fiscal 2025 to fiscal 2029.

Planned capital expenditures and additions in fiscal 2020 and fiscal 2021 are lower than the fiscal 2017 to fiscal 2019[54] test period due to the completion of major projects such as the John Hart Generating Station Replacement project.

---

54 Based on average annual amounts and excluding the Site C Project and BC Hydro's acquisition of Teck Resources Ltd.'s two-thirds interest in the Waneta generation facility.

Chapter 6 is organized around the following key points:

- Section 6.2 explains how the information provided in this application is aligned with BC Hydro's Revised Proposal filed on June 13, 2018 in the Capital Expenditures and Projects Review proceeding. It also identifies how BC Hydro has responded to the BCUC's Decision on our Previous Application;
- Section 6.3 describes our four-step Enterprise Capital Planning Process which appropriately balances affordability and system performance, and explains how this process was applied to create the Capital Plan that forms the basis of the capital investment information in this application;
- Section 6.4 describes how our Power System capital investments, which includes Generation, Transmission and Distribution Assets, are appropriately planned, delivered and forecast for the test period. The section describes the nature of the assets, the bottom-up planning processes, the delivery processes, and provides the forecast capital expenditures and additions; and
- Sections 6.5 through 6.9 describe our Technology, Properties, Fleet and Business Support and other capital investments including the nature of these investments and how they are appropriately planned, delivered and forecast for the test period.

The evidence provided in Chapter 6 is supported by the following appendices:

- Appendix F provides the Office of the Auditor General of B.C. Report, titled *Independent Audit of Capital Asset Management in BC Hydro*;
- Appendix H provides BC Hydro's Capital Plan with an outline of major investments, related risks, and opportunities;
- Appendix I provides capital investment information for projects that are greater than $2 million for technology or greater than $5 million for other projects with planned capital expenditures or additions in the test period;

- Appendix J provides capital project descriptions for 53 projects and programs of projects with planned total capital expenditures greater than $20 million with planned capital expenditures or additions in the test period;
- Appendix K provides summaries of Strategies, Plans, and Studies;
- Appendix L provides BC Hydro's Technology Strategy and Five-Year Plan;
- Appendix M provides asset health indices for BC Hydro's generation assets; and
- Appendix N provides asset health indices for BC Hydro's transmission and distribution assets.

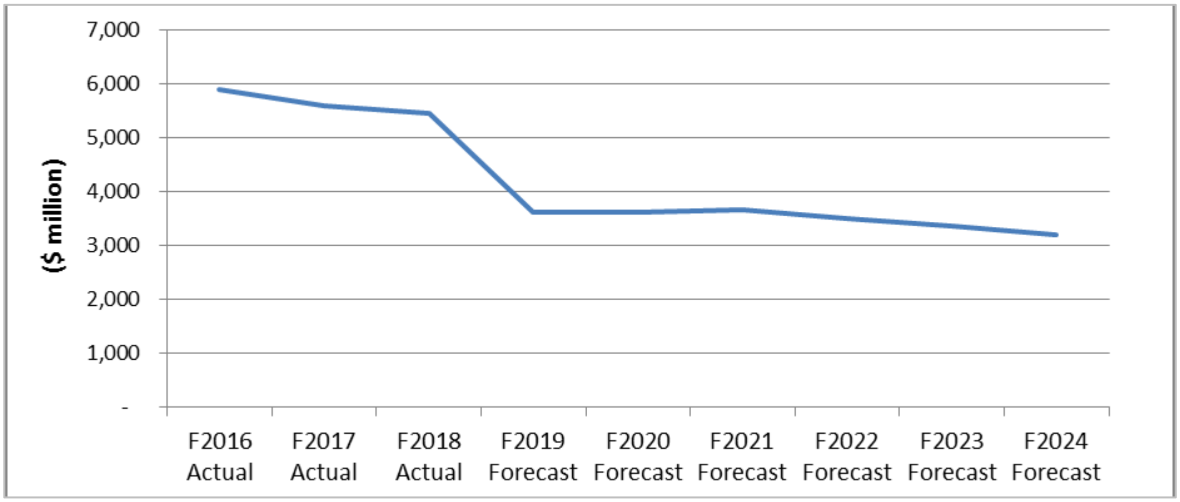
1.8.6 Our Use of Regulatory Accounts is Consistent with Accounting Standards and BCUC Guidelines

Chapter 7 describes BC Hydro's deferral and regulatory accounts (collectively referred to as regulatory accounts) and our proposals to change or close those accounts. BC Hydro is not requesting approval of any new regulatory accounts in this application.

BC Hydro's use of regulatory accounts is in accordance with International Financial Reporting Standards (**IFRS**) and in compliance with BCUC Orders and government directions. Rate-regulated accounting is permitted under International Financial Reporting Standard 14, *Regulatory Deferral Accounts* (**IFRS 14**).

As shown in Figure 1-6 below, BC Hydro has had three successive years of declining regulatory account balances.

Figure 1-6 Regulatory Account Balances
Fiscal 2016 to Fiscal 2018 Actual and
Fiscal 2019 to Fiscal 2024 Forecast



As shown in Figure 1-6 above, BC Hydro's total net regulatory account balance peaked at $5.9 billion in fiscal 2016 and is forecast to be reduced to $3.6 billion at the end of fiscal 2019 (a reduction of $2.3 billion or 39 per cent) and to $3.2 billion at the end of fiscal 2024.

Chapter 7 is organized around the following key points:

- Section 7.2 explains that the Comprehensive Review has responded to concerns raised by the Auditor General by enhancing the BCUC's oversight of BC Hydro.
- Section 7.3 presents our approach to managing regulatory account balances over the next five years. It shows the actual and forecast closing account balances of the regulatory accounts by year from fiscal 2017 to fiscal 2024. Based on the requests in this application, the total balance in the regulatory accounts is expected to decline by approximately $2.3 billion from fiscal 2018 to fiscal 2024.
- Section 7.4 explains that BC Hydro's use of regulatory accounts is in accordance with IFRS.

- Section 7.5 explains that the types of regulatory accounts used by BC Hydro are consistent with those in the BCUC Regulatory Account Filing Checklist,[55] and outlines considerations to set appropriate mechanisms to ensure the balances in our regulatory accounts are recovered over the appropriate time period.
- Section 7.6 outlines criteria for evaluating the establishment of new regulatory accounts.
- Section 7.7 describes the existing regulatory accounts where BC Hydro is requesting changes, outlines the reasons for each request, and provides a description of each regulatory account for context.
- Section 7.8 explains that BC Hydro is not requesting changes to most of its existing regulatory accounts, and provides a description of each unchanged regulatory account for context.
- Section 7.9 explains that BC Hydro applies interest to several regulatory accounts at BC Hydro's weighted average cost of debt in recognition of the carrying costs incurred by BC Hydro.
- Section 7.10 provides a high-level summary of the information in this chapter for each of BC Hydro's regulatory accounts.

1.8.7 Other Revenue Requirements Items

Chapter 8 describes the other revenue requirements items, including amortization expense, return on equity, capital structure, finance charges, taxes, miscellaneous and inter-segment revenues, subsidiary net income, the allocation of BC Hydro's business support costs, and provisions and other. This Chapter also explains accounting changes required due to the full adoption of IFRS in fiscal 2019.

55 https://www.bcuc.com/Documents/Guidelines/2017/05-03-2017_RegulatoryAccountFilingChecklist.pdf

1.8.8 Transmission Revenue Requirements

Chapter 9 describes how BC Hydro's proposed Open Access Transmission Tariff (**OATT**) rates are determined to recover BC Hydro's Transmission Revenue Requirement (**TRR**) consistent with past Orders of the BCUC. The rates charged under the OATT are for Network Integration Transmission Service (**NITS**), Point-To-Point (**PTP**) Transmission Service and Ancillary Services. As the main users of the transmission system, BC Hydro and Powerex account for approximately 98.5 per cent of the revenue collected through the OATT. External transmission customers account for the remaining approximately 1.5 per cent of revenue.

1.8.9 Our Proposed DSM Expenditures Provide Broad Access and Limit Forecast Rate Increases

Chapter 10 sets out the information and analysis in support of our proposed fiscal 2020 to fiscal 2021 demand-side measures expenditure schedule. We are requesting that the BCUC accept this schedule under section 44.2 of the *Utilities Commission Act*.

The proposed expenditure schedule includes expenditures on demand-side measures that we anticipate making over the fiscal 2020 to fiscal 2021 test period. This includes expenditures on the thermo-mechanical pulp program.[56] In addition to the proposed schedule, BC Hydro anticipates expenditures on low-carbon electrification prescribed undertakings over the same period.[57] All of these expenditures will help customers manage their energy use.

[56] Expenditures for the Thermo-Mechanical Pulp program are shown separately, since the costs of this program are covered by the Direction to the British Columbia Utilities Commission Respecting the Authority's TMP Program (B.C. Reg. 139/2015). A copy is provided in Appendix D.

[57] Expenditures for the low-carbon electrification initiatives are shown separately, since the costs of these initiatives are covered by the Direction to the British Columbia Utilities Commission Respecting Undertaking Costs (OIC 100/2017) and the Greenhouse Gas Reduction (Clean Energy) Regulation (B.C. Reg. 102/2012) as amended by OIC 101/2017. In this application, BC Hydro is requesting confirmation of the deferral treatment of low-carbon electrification expenditures in Chapter 2, section 2.8. A copy of the low-carbon electrification directions are provided in Appendix D.

Our request responds to the BCUC's Decision on our Previous Application by increasing expenditures for the residential sector by approximately 50 per cent and providing a new program for customers in Non-Integrated Areas, while staying within the overall portfolio spending envelope. It also continues our moderation approach, providing broad customer access to conservation and energy management opportunities while managing the overall level of expenditures to limit forecast rate increases while BC Hydro is in an energy surplus.

The expenditures associated with each of these initiatives are shown in Table 1-7 below.

Table 1-7 Fiscal 2020 to Fiscal 2021 Demand-Side Measures Expenditure Schedule and Low-Carbon Electrification Expenditures

	Expenditure ($ million)
Fiscal 2020 Demand-Side Measures	90.8
Fiscal 2021 Demand-Side Measures	89.1
Thermo-Mechanical Pulp (Fiscal 2020-Fiscal 2021)	27.2[58]
Two-Year Total (for section 44.2 acceptance)	**207.1**
Low-Carbon Electrification (Fiscal 2020-Fiscal 2021)	28.0
Two-Year Total (including Low-Carbon Electrification)	**235.1**

Chapter 10 is organized around the following key points:

- Section 10.2 reviews the outcomes of the fiscal 2017 to fiscal 2019 DSM initiatives and low-carbon electrification undertakings and BC Hydro's response to directives from the Previous Application.
- Section 10.3 explains that BC Hydro is complying with the regulatory and legislative framework applicable to BC Hydro's traditional DSM and low-carbon electrification expenditures.

[58] All expenditures related to Thermo-Mechanical Pulp are forecasted to occur in fiscal 2021.

- Section 10.4 presents BC Hydro's approach for determining the level of expenditures during the test period.
- Section 10.5 presents an overview of BC Hydro's expenditures over the test period, the anticipated energy and capacity impacts as well as the cost-effectiveness and other benefits of the plan. This section also sets out BC Hydro's request to revise the approach to allocating portfolio-level costs to programs, provides evidence on the persistence of DSM savings and describes how BC Hydro has re-categorized its energy management activities into a new program called Energy Management Activities within each sector.
- Section 10.6 demonstrates that BC Hydro manages the performance of the plan in a comprehensive manner, including tracking a number of performance metrics and regular management oversight and reporting.

The evidence provided in Chapter 10 is supported by the following appendices:

- Appendix X provides BC Hydro's Fiscal 2020 to Fiscal 2022 DSM Business Plan.
- Appendix Y provides information on BC Hydro's Fiscal 2019 to Fiscal 2021 Low Carbon Electrification Program.
- Appendix Z provides our Annual DSM Reports to the BCUC.
- Appendix AA provides our Annual DSM Measurement, Verification and Evaluation Reports to the BCUC.
- Appendix BB provides our Greenhouse Gas Reduction Regulation Annual Reports.
- Appendix CC provides the Codes and Standards Attribution Report completed by the Cadmus Group.

1.9 Benchmarking and Audits Indicate that BC Hydro is Well Managed and Revenue Requirements Are Reasonable

Throughout this application, BC Hydro has referenced external studies and independent expertise which indicate that our costs are reasonable and that our operations are well-managed. We have also identified recommendations and opportunities for improvement, where applicable.

External studies and reports referenced throughout this application are summarized below. In a number of cases, these studies were commissioned by BC Hydro's Audit Services department, which is discussed further in Chapter 5E, section 5E.4.1.4. Independent subject matter experts are engaged by Audit Services when expertise is required on the audit subject. A summary of all audits conducted by the Audit Services department from fiscal 2017 to fiscal 2019 to-date is provided in Appendix HH.

- ***Operating costs benchmark favourably*** - A 2019 independent report prepared by The Brattle Group for this proceeding, led by Principal William P. Zarakas, found that BC Hydro's operating costs benchmark favourably against a peer group of U.S. utilities. This benchmarking study is provided as Appendix T.
- ***Maintenance costs are consistent with or better than utility peers*** - BC Hydro regularly commissions independent benchmarking on maintenance delivery costs from Navigant and First Quartile, both of which are experts in this field. Recent results have demonstrated that BC Hydro's maintenance costs are consistent with or better than its utility peers. Further information is provided in Chapter 5, section 5.8.
- ***Compensation is below median market rates*** - Compensation benchmarking performed by Morneau Shepell in 2017 concluded that on an average total cash basis, BC Hydro employees earn 11 per cent less than median market rates.

After factoring in the value of pension benefits and time off programs, BC Hydro's compensation package is comparable, at 2 per cent below median market rates. Further information is provided in Chapter 5, section 5.6.5.

- ***Project management practices are strong*** - In 2016, BC Hydro completed its second Organizational Project Management Maturity Model Assessment and placed in the top-tier of participating organizations from around the world. Also in 2016, BC Hydro also received the Project Management Office of the Year Award from the Project Management Institute, recognizing superior organizational project management capabilities. Further information is provided in Chapter 6, section 6.2.1.1.
- ***Asset management practices are strong*** - In December 2018, the Office of the Auditor General of B.C. released an independent audit of Capital Asset Management in BC Hydro. The audit found that BC Hydro has good asset management practices as a result of a decade-long plan and associated efforts and did not identify any recommendations. This audit is provided as Appendix F.
- ***DSM processes and controls are in place -*** In fiscal 2017, BC Hydro's Audit Services department engaged experts from GDS Canada Consulting Ltd., with over 40 years of experience in market evaluations and managing energy efficiency programs, to help assess whether effective processes and controls were in place for our DSM activities and programs. The internal audit found that processes and controls are in place for planning, program development, implementation and evaluation. Recommendations included simplifying the planning process, documentation of assumptions and processes and developing a central assumptions database. Further information on our DSM processes and controls is provided in Chapter 10, section 10.6.
- ***Progress has been made on Disaster Preparedness -*** In fiscal 2017, BC Hydro's Audit Services department engaged PricewaterhouseCoopers'

business resilience practice to help assess BC Hydro's plans and ability to respond to and recover from, a catastrophic disruption of business operations. The internal audit found that an effective governance structure and framework has been formulated but not fully implemented. Emergency management plans, exercise and training programs are in place but efforts in enterprise-wide business impact analysis, business continuity, information technology disaster recovery and corrective action plans require further enhancement. While this internal audit indicates that further work is required, it demonstrates significant progress since BC Hydro's initial internal audit on disaster preparedness in fiscal 2013. Further information is provided in Chapter 5D, section 5D. 7.

- ***Load forecasting methodologies are consistent with best practices -*** In fiscal 2018, BC Hydro's Audit Services department engaged experts from GDS Associates Inc., with over 30 years of load forecasting experience, to help review BC Hydro's load forecasting process to ensure timely and reliable energy and peak demand forecasts to support operational, financial and strategic planning. The internal audit found that BC Hydro's load forecasting function compares favourably to industry standards and to other large electric utilities in North America and that load forecasting methodologies are consistent with best practices. This audit is provided as Appendix P.
- ***Dam Safety Program is consistent with international practices and in some aspects is at best practice levels -*** In fiscal 2019, BC Hydro's Audit Services department engaged a Commissioner for Dam Safety from the Swiss Federal Office of Energy and a Professional Engineer at Health and Safety Executive, the statutory regulator of occupational health and safety in Great Britain. These experts helped to review whether dam safety risks are identified, prioritized and managed to ensure the objectives of BC Hydro's Dam Safety Program are achieved. The internal audit found that BC Hydro has a well-established Dam Safety Program that is in line with international practices with some aspects operating at best practice levels. Governance is effective

with appropriate oversight and the relationship with the regulator is strong and forthcoming. A robust risk assessment process continues to drive key dam safety activities and operational activities are executed to monitor dams. Further information on BC Hydro's Dam Safety Program is provided in Chapter 5A, section 5A.5 and Chapter 6, section 6.4.2.2.

- ***Smart Metering System is delivering intended services with appropriate controls -*** In fiscal 2019, BC Hydro's Audit Services department engaged experts from Bridge Energy Group with extensive experience in technology strategy, enterprise architecture, integration and utility security to assess whether the Smart Metering system is fully operationalized, managed and functioning effectively. The internal audit found that the Smart Metering System is delivering intended services to stakeholders with controls around data and application security, access and privacy. Operations are effectively governed and the system is well monitored. Further information on the benefits of BC Hydro's Smart Metering System is provided in Chapter 5E, section 5E.5.2.5.
- ***Energy Studies methodology is consistent with leading practices*** - In fiscal 2019, BC Hydro's Audit Services department engaged experts from SINTEF, an independent research organization that conducts contract research and development projects. These experts specialized in load forecasting, risk management, hydrothermal market modelling and hydropower scheduling models. The internal audit found that BC Hydro has a well-established Energy Studies process in place, that key models are appropriate and that the methodologies applied are in line with leading industry practices. This audit is provided as Appendix DD.

1.10 Proposed Regulatory Process

This section sets out a proposed regulatory process for this application. The proposed process reflects our belief that an open and transparent relationship with the BCUC and interveners in regulatory proceedings leads to better decisions and improved outcomes for our customers.

1.10.1 BC Hydro Will Continue With the Pragmatic and Transparent Approach Used in the Previous Proceeding

In the proceeding for our Previous Application, BC Hydro adopted a pragmatic and transparent approach to providing evidence and answering information requests. The BCUC noted the high quality and depth of the evidence on the record and recognized BC Hydro's pragmatic approach.[59] BC Hydro is adopting the same pragmatic and transparent approach in this proceeding.

1.10.2 Proposed Initial Timetable Reflects Input of Interveners

Table 1-8 below sets out a proposed initial regulatory review process for this application. From October 2018 to December 2018, BC Hydro consulted with some potential interveners[60] on a proposed regulatory process for this application. The timetable provided below reflects the input that BC Hydro received.

The proposed initial timetable contemplates two rounds of information requests, followed by the first Procedural Conference to determine the remaining steps in the proceeding.

We believe that it makes sense to hold the procedural conference after two rounds of information requests, rather than immediately following the filing of the Application. The typical reasons for holding a Procedural Conference prior to the first round of information requests are absent in this instance. Specifically:

[59] BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, Exhibit A-18, Reasons for Decision for Order No. G-7-17, pages 7 to 8.

[60] BC Hydro met with AMPC, BCSEA, CEBC, MoveUp and Zone II Ratepayers.

- An early Procedural Conference is typically held to determine how many rounds of information requests there will be (i.e., one or two). In this case, BC Hydro is proposing two rounds of information requests, not one.
- An early Procedural Conference is typically held to determine the scope of issues for the Application. In this case, given our commitment to take a pragmatic and transparent approach when answering information requests, we believe that a Procedural Conference to determine the scope of the Application is not required. Provided that information requests are proper and relevant to matters that affect the test period revenue requirements, BC Hydro anticipates being able to provide answers. We believe it would be more efficient to address issues on specific questions in writing, if and when they arise.

BC Hydro recommends that a Procedural Conference be held after responses to Round 2 Information Requests are received and reviewed by the BCUC and interveners. The purpose of this Procedural Conference would be to determine further process. We submit that this approach is efficient and is fair to all parties.

Table 1-8 Proposed Regulatory Review Process

Process	Date
Registration of Interveners and Interested Parties	March 14, 2019
BC Hydro Workshop No. 1	March 15, 2019
BCUC Information Request No.1 to BC Hydro	April 2, 2019
Intervener Information Request No. 1 to BC Hydro	April 11, 2019
BC Hydro responds BCUC and Intervener Information Request No. 1	May 16, 2019
BCUC Information Request No. 2	June 11, 2019
Intervener Information Request No. 2	June 20, 2019
BC Hydro responds to BCUC and Intervener Information Request No. 2	July 18, 2019
Procedural Conference	August 1, 2019

1.11 Communications

Communications regarding this application should be directed to:

Fred James Chief Regulatory Officer BC Hydro 16th Floor 333 Dunsmuir Street Vancouver, BC V6B 5R3 Telephone: 604-623-4046 Fax: 604-623-4407 Email: bchydroregulatorygroup@bchydro.com	Matthew Ghikas Legal Counsel Fasken Martineau DuMoulin LLP 2900-550 Burrard Street Vancouver, BC V6C 0A3 Telephone: 604-631-3191 Fax: 604-631-3232 Email: mghikas@fasken.com	Christopher Bystrom Legal Counsel Fasken Martineau DuMoulin LLP 2900-550 Burrard Street Vancouver, BC V6C 0A3 Telephone: 604-631-4715 Fax: 604-631-3232 Email: cbystrom@fasken.com

Fiscal 2020 to Fiscal 2021

Revenue Requirements Application

Chapter 2

Legal and Regulatory Framework

Table of Contents

List of Tables

2.1 Chapter Overview

This chapter provides an overview of the legislation relevant to BC Hydro's revenue requirements as well as the specific regulations and policies that will inform the BCUC's consideration of the approvals that BC Hydro is seeking in this application. This Chapter is organized around the following key points:

- Section 2.2 explains that the Comprehensive Review has resulted in regulatory changes and plans to table legislative amendments that enhance the BCUC's oversight of BC Hydro generally and with respect to the review of this application.
- Section 2.3 explains how BC Hydro's powers and mandate under the *Hydro and Power Authority Act* remain unchanged.
- Section 2.4 describes how the *Utilities Commission Act* provides the BCUC with the ability to set BC Hydro's rates and to accept or reject the proposed DSM expenditure schedule. As a result of the changes from the Comprehensive Review, the BCUC's mandate in these areas with regards to BC Hydro is now similar to other regulated utilities in British Columbia.
- Section 2.5 identifies certain aspects of BC Hydro's revenue requirements that continue to be directed or guided by regulations issued under the *Utilities Commission Act*.
- Section 2.6 addresses the continued application of the *Clean Energy Act* to BC Hydro. The Act affects BC Hydro's cost of energy and DSM expenditures and requires the BCUC to allow BC Hydro to recover certain costs.
- Section 2.7 discusses BC Hydro's obligation to provide service to remote communities.

- Section 2.8 explains that BC Hydro is not proposing any changes to Standard Charges in this application.
- Section 2.9 provides a summary of the BCUC's legal authority with regards to the approvals that BC Hydro is seeking in this application.

2.2 BCUC Oversight Has Been Enhanced

In June 2018, the Government of B.C. initiated the Comprehensive Review. Further information on this review is provided in Chapter 1, section 1.4 and the report on the review is provided in Appendix C. Phase One of this review resulted in changes to the regulations applicable to BC Hydro, which have enhanced the BCUC's oversight of this application. As noted in the report provided in Appendix C, the Government of B.C. also plans to table legislative amendments that will further update BC Hydro's regulatory framework. This section provides an overview of these changes and identifies their specific impact on this application.

2.2.1 Government Has Repealed Limiting Directions

As a result of the Comprehensive Review, the Government of B.C. repealed Directions No. 3, 6 and 7 to the BCUC. These repeals mean that most of the matters considered in this application are now subject to full review and oversight by the BCUC.

The Government of B.C. also repealed part of the Government Organization Accounting Standards Regulation (B.C. Reg. 257/2010) under the *Budget Transparency and Accountability Act*. BC Hydro has subsequently adopted International Financial Reporting Standards (IFRS) as of its fiscal 2019 year-end statements.

Lastly, the Government of B.C. issued Direction No. 8 to the BCUC which continues to provide direction to the BCUC in specific areas previously covered by Direction No. 7. These directions are intended to:

- Help transition BC Hydro to enhanced regulation over time;
- Provide interim direction ahead of proposed legislative amendments that are expected to be tabled in the B.C. Legislature this spring; and
- Continue to allow BC Hydro to recover costs related to previous policy decisions by the Government of B.C.

Table 2-1 below summarizes the areas that are now subject to enhanced BCUC oversight as a result of these repeals and identifies their specific impact on this application. It also identifies where Direction No. 8 continues to provide direction to the BCUC.

Table 2-1 Resulting BCUC Oversight from the Repeal of Directions No. 3, 6 and 7

Direction Repealed	Purpose of Direction	Impact on this Application
Repeal of Direction Nos. 3 and 6		
Direction No. 3	This Direction relates to BC Hydro's Fiscal 2012 to Fiscal 2014 Revenue Requirements Application and most of its directives are no longer applicable. Section 3 (2) had provided direction to the BCUC with regards to the amortization periods of the IFRS transition regulatory accounts and the Capital Project Investigation Costs Regulatory Account. By Order No. G-77-12A, the BCUC approved the amortization periods for these accounts, as directed. Section 3 (2) also directed the BCUC to allow BC Hydro to transition the overhead costs that can no longer be capitalized under IFRS into rates over a ten-year period.	As discussed in Chapter 7, sections 7.8.20 and 7.8.21, BC Hydro believes that the existing amortization periods for the two IFRS Transition regulatory accounts continue to be appropriate. As discussed in Chapter 7, section 7.7.5, the balance in the Capital Project Investigations Costs Regulatory Account will be fully amortized by the end of this test period. Accordingly, in this application, BC Hydro is requesting BCUC approval to close this account at the end of fiscal 2021. As discussed in Chapter 5G section 5G.8.1, ineligible capitalized overhead costs will be fully transitioned into rates by fiscal 2022.
Direction No. 6	This Direction relates to BC Hydro's Fiscal 2015 to Fiscal 2016 Revenue Requirements Application and its directives are no longer applicable.	None.
Repeal of Direction No. 7		
Sections 1, 2 (Definitions and Application)	Section 1 contains definitions and Section 2 states that the direction is issued under Section 3 of the *Utilities Commission Act*.	None.
Section 3 (Designing rates for transmission rate customers)	This section had provided direction to the BCUC on rate design for transmission service rate customers. It prevented the BCUC from reviewing Tariff Supplement Nos 5 and 6. Tariff Supplement No. 5 sets out terms and conditions under which BC Hydro will provide electricity to its customers receiving service at transmission voltage. Tariff Supplement 6 stipulates the terms, conditions and cost allocation for the construction of BC Hydro and private transmission facilities required to serve new load.	None. These issues will be addressed through individual rate design application proceedings.

Direction Repealed	Purpose of Direction	Impact on this Application
Section 4 (Net Income)	This section had required the BCUC to set BC Hydro's Return on Equity at $712 million for fiscal 2019 and subsequent years.	Section 3 of Direction No. 8 provides direction in this area to help transition BC Hydro to increased enhanced regulation over time. It states that the BCUC must set BC Hydro's Return on Equity at $712 million for fiscal 2020 and fiscal 2021. For fiscal 2022 onwards, the BCUC will be able to determine BC Hydro's Return on Equity. In the Comprehensive Review Report, the Government of B.C. indicated that it may provide policy guidance to the BCUC to inform this process.
Section 5 (a) and (b) (Heritage Contract)	These sections directed the BCUC to consider the Heritage Contract and to determine the energy required by BC Hydro to meet its domestic service obligations and the cost to BC Hydro of the portion of that required energy that is in excess of the energy supplied under the Heritage Contract. As explained by BC Hydro in our April 27, 2018 compliance filing in the Fiscal 2017 to Fiscal F2019 Revenue Requirements Application proceeding and Chapter 4, section 4.2 of this application, the Heritage Contract had no impact on BC Hydro's planning and operations or on how BC Hydro's cost of energy and rates are determined.	As discussed in Chapter 4, section 4.2, the repeal of the Heritage Contract has no impact on our planning and operations. However, it does provide BC Hydro with the flexibility to categorize its costs of energy differently for presentation purposes in the revenue requirements model for this application. In this application, Costs of Energy are categorized as Heritage Energy, Non-Heritage Energy or Market Energy. These categories are for presentation purposes only and are intended to provide better clarity of the accounting treatment of our Costs of Energy.
Section 5 (c) and (d) (Performance Based Regulation) (**PBR**)	These sections duplicated the authority already provided to the BCUC under section 60 (b.1) of the *Utilities Commission Act*, which allows the BCUC to set BC Hydro's rates through a mechanism such as PBR.	This application is being submitted on a cost of service basis. In response to Directive 28 of the BCUC's Decision on the Previous Application, BC Hydro has included a report on PBR as Chapter 11 of this application.

Direction Repealed	Purpose of Direction	Impact on this Application
Section 6 (Powerex Net Income)	This section required a loss from BC Hydro's electricity trading subsidiary, Powerex, to be borne by the shareholder, not BC Hydro's ratepayers.	As explained in Chapter 8, section 8.9, BC Hydro believes that it continues to be appropriate for Powerex's forecast net income to be included in BC Hydro's revenue requirements and that if Powerex incurs a loss, it should be borne by the shareholder. Powerex's net income continues to be forecast based on the historical five year average, and variances between actual net income and forecast net income are captured by the Trade Income Deferral Account. If Powerex's actual net income in a given year were to be less than $0, BC Hydro would only transfer the variance between forecast net income and $0 to the Trade Income Deferral Account.
Section 7 (a), (b) and (c) (Energy Variance Accounts)	These sections directed the BCUC to continue to allow certain variances to be deferred to the Heritage Deferral Account, the Non-Heritage Deferral Account and the Trade Income Deferral Account. Section 7 (c) also required costs associated with the decommissioning of portions of Burrard Thermal not required for transmission support services to be deferred to the Non-Heritage Deferral Account.	As explained in Chapter 7, section 7.7.1, BC Hydro believes that the variances captured by the Heritage Deferral Account, Non-Heritage Deferral Account and Trade Income Deferral Account continue to be appropriate.
Section 7 (d) (Demand Side Management Regulatory Account)	This section provided direction to the BCUC on the scope and amortization period of the Demand Side Management Regulatory Account.	As discussed in Chapter 10, section 10.5.6, BC Hydro believes that the scope and amortization period for the Demand Side Management Regulatory Account continue to be appropriate.

Direction Repealed	Purpose of Direction	Impact on this Application
Section 7 (e) (Rock Bay Remediation Regulatory Account)	This section directed the BCUC to allow Rock Bay remediation costs to be deferred.	As discussed in Chapter 7, section 7.8.4, the existing credit balance in the Rock Bay Remediation Regulatory Account will be returned to ratepayers over this test period. Remediation of the Rock Bay property was completed in fiscal 2019 and BC Hydro is not forecasting the deferral of any further remediation expenditures to this account over the test period. However, there may be minor differences between fiscal 2019 forecast and actual remediation costs and forecast and actual interest applied to this account over the test period. BC Hydro believes it continues to be appropriate to defer these variances to the Rock Bay Remediation Regulatory Account.
Section 7 (f) (Remediation Regulatory Account)	This section directed the BCUC to allow asbestos remediation cost variances to be deferred.	As discussed in Chapter 7, section 7.8.6, BC Hydro believes that it continues to be appropriate to defer the variances between actual and forecast asbestos remediation costs to the Remediation Regulatory Account.
Section 7 (g) (Non-Current Pension Costs Regulatory Account)	This section directed the BCUC to allow non-current pension cost variances to be deferred.	As discussed in Chapter 7, section 7.8.11, BC Hydro believes that it continues to be appropriate to defer the variances between actual and forecast non-current pension costs to the Non-Current Pension Costs Regulatory Account.
Section 7 (h) (i) (Rate Smoothing Regulatory Account)	This section directed the BCUC to allow BC Hydro to establish a rate smoothing regulatory account to defer portions of the approved revenue requirements in a particular fiscal year.	As an outcome of the Comprehensive Review, BC Hydro ceased using the Rate Smoothing Regulatory Account at the end of the third quarter of fiscal 2019. In this application, BC Hydro is not proposing to smooth rate increases and is requesting BCUC approval to close the Rate Smoothing Regulatory Account.

Direction Repealed	Purpose of Direction	Impact on this Application
Section 7 (h) (ii) (Real Property Sales Regulatory Account)	This section directed the BCUC to allow BC Hydro to establish a real property sales regulatory account to defer the variances between actual and forecast real property gains and losses.	As discussed in Chapter 7, section 7.8.7, BC Hydro believes that it continues to be appropriate to defer the variances between actual and forecast real property gains and losses to the Real Property Sales Regulatory Account.
Section 7 (i) (Interest Accrual for the First Nations Cost Regulatory Account and the Real Property Sales Regulatory Account)	This section directed the BCUC to allow the First Nations Costs Regulatory Account and the Real Property Sales Regulatory Account to accrue interest at BC Hydro's weighted average cost of debt.	As discussed in Chapter 7, section 7.9, BC Hydro believes it continues to be appropriate for the First Nations Costs Regulatory Account and the Real Property Sales Regulatory Account to accrue interest at BC Hydro's weighted average cost of debt.
Section 7 (j) and (k) (Regulatory Accounts and Rates)	These sections stated that the BCUC may allow BC Hydro to establish other regulatory accounts and that the BCUC must set rates to allow regulatory accounts to be cleared from time to time and within a reasonable period.	The repeal of these sections has no practical effect. These sections duplicated the BCUC's existing authority under the *Utilities Commission Act* to approve deferral and other regulatory accounts and to determine how those accounts should be cleared. BC Hydro is not seeking approval of any new regulatory accounts in this application. Section 2.4.1 provides further information on the requirements that inform the BCUC's rate setting function.
Section 8 (Dividend)	This section directed the BCUC to set rates that would ensure BC Hydro could collect sufficient revenue to allocate dividends to the Government of B.C. as specified under section 4 of the *BC Hydro Public Power Legacy and Heritage Contract Act* or section 35 of the *Hydro and Power Authority Act*. As explained in section 2.3, Heritage Special Directive No. HC1, issued under the *Hydro and Power Authority Act* states that BC Hydro is not required to pay a dividend to the Government of B.C. until its debt to equity ratio reaches 60:40.	The repeal of this section has no impact on this application. As shown in Appendix A, Schedule 9.0, BC Hydro's forecast debt to equity ratio is 80:20 in fiscal 2020 and 79:21 in fiscal 2021. As a result, BC Hydro is not forecasting any dividend payments to the Government of B.C. during the test period.

Direction Repealed	Purpose of Direction	Impact on this Application
Section 9 (1) and (2) (Rate Caps)	These sections related to BC Hydro's Fiscal 2017 to Fiscal F2019 Revenue Requirements Application. The sections directed the BCUC to cap rate increases at 4 per cent for fiscal 2017, 3.5 per cent for fiscal 2018 and 3 per cent for fiscal 2019.	None.
Section 9 (3) (Rate Re-Balancing)	This section prevented the BCUC from setting rates in fiscal 2017, fiscal 2018 and fiscal 2019 for the purpose of changing the revenue-cost ratio for a class of customers.	Section 5 of Direction No. 8 provides interim direction in this area ahead of proposed legislative amendments that are expected to be tabled in the B.C. Legislature this spring. It states that the BCUC must not set rates for fiscal 2020 or fiscal 2021 for the purpose of changing the revenue-cost ratio for a class of customers.
Section 10 (Deferral Account Rate Rider)	This section directed the BCUC to maintain the deferral account rate rider (DARR) at 5 per cent and to allow a portion of forecast revenue from the DARR to be accounted for as general revenue.	As discussed in Chapter 7, section 7.7.1, BC Hydro is seeking approval to reduce the DARR from 5 per cent to 0 per cent, effective April 1, 2019.
Section 11 (Cost Recovery)	This section directed the BCUC to not disallow the recovery in rates of the costs incurred with respect to: • The construction of extensions to BC Hydro's plant or system that came into service before fiscal 2017; • Energy supply contracts entered into before fiscal 2017; • The Rock Bay settlement; • Three First Nations settlements; • The October 4, 2013 settlement between Powerex and various California parties; • Costs incurred from the decommissioning of portions of Burrard Thermal not required for transmission support services; and • Costs deferred to the Smart Metering Infrastructure Regulatory Account.	Section 4 of Direction No. 8 provides direction in this area to recover costs related to previous policy decisions by the Government of B.C. It states that the BCUC must not disallow recovery in rates of the balance of BC Hydro's regulatory accounts as at March 31, 2019. It also states that the BCUC must also not disallow costs incurred by BC Hydro with respect to: • The construction of extensions to BC Hydro's plant or system that came into service before fiscal 2017; • Energy supply contracts entered into before fiscal 2017, and • Debt servicing costs related to the Rate Smoothing Regulatory Account approved by Order No. G-48-14.

Direction Repealed	Purpose of Direction	Impact on this Application
Section 12 (Expenditures for Export)	This section directed the BCUC to not comply with section 4 (5) of the *Clean Energy Act* when setting rates for BC Hydro for fiscal 2014, fiscal 2015, fiscal 2016, fiscal 2017, fiscal 2018 and fiscal 2019.	Section 6 of Direction No. 8 provides interim direction in this area ahead of proposed legislative amendments that are expected to be tabled in the B.C. Legislature this spring. It states that the BCUC must not comply with section 4 (5) of the *Clean Energy Act* when setting rates for fiscal 2020 and fiscal 2021.
Section 13 (Powerex)	This section directed the BCUC to not exercise any power under Part 3 of the *Utilities Commission Act* in regard to the gas and electricity trading activities of Powerex Corp.	Section 8 of Direction No. 8 provides interim direction in this area ahead of proposed legislative amendments that are expected to be tabled in the B.C. Legislature this spring. It states that the BCUC may not exercise any power or perform any duty under Part 3 of the *Utilities Commission Act* in regard to Powerex Corp.
Section 14 (Retail Access)	This section directed the BCUC to accept BC Hydro's withdrawal from any obligation to offer unbundled transmission services and to not set rates for BC Hydro that would result in the direct or indirect provision of unbundled transmission services to retail customers in British Columbia, or to those who supply such customers, except on application by BC Hydro.	Section 7 of Direction No. 8 provides direction in this area. It states that except on application by BC Hydro, the BCUC must not set rates for BC Hydro that would result in the direct or indirect provision of unbundled transmission services to retail customers in British Columbia, or to those who supply such customers.
Section 15 (Burrard Thermal)	These sections directed the BCUC to allow BC Hydro to cease operating those portions of Burrard Thermal that were not required for transmission to support services and to set depreciation rates for the classes of property, plant and equipment at Burrard Thermal, as specified, for fiscal 2015 and fiscal 2016. This section related to BC Hydro's Fiscal 2015 to Fiscal 2016 Revenue Requirements Application.	None. On December 29, 2016, the BCUC approved BC Hydro's application under section 41 of the *Utilities Commission Act* to permanently cease operating those portions of Burrard Thermal Generating Station that were not required for transmission support services. In our Previous Application, BC Hydro applied for depreciation rates for the classes of property, plant and equipment at Burrard Thermal. The depreciation rates for fiscal 2017 to fiscal 2019 were not directed. The BCUC reviewed and approved the depreciation rates proposed by BC Hydro.
Section 16	These sections related to previous revenue requirement applications.	None.

2.2.2 Government Plans to Table Legislation

As an outcome of the Comprehensive Review, the Government of B.C. also announced that it intends to table legislation to further update BC Hydro's regulatory framework. These plans have potential implications in the following three areas:

- **Integrated Resource Plan (IRP):** The Government of B.C. intends to propose amendments to the *Hydro and Power Authority Act* and the *Clean Energy Act* so that section 44.1 of the *Utilities Commission Act* applies to BC Hydro. This would mean that, going forward, BC Hydro's IRP would be reviewed and approved by the BCUC and not by the Government of B.C. On December 10, 2018, the Government of B.C. issued the BC Hydro Integrated Resource Plan Regulation (B.C. Reg. 266/2018) under the *Clean Energy Act* prescribing February 28, 2021 as the date for BC Hydro's next IRP.
- **Demand side management adequacy requirements:** The proposed application of section 44.1 of the *Utilities Commission Act* to BC Hydro, discussed above, would also require BC Hydro's traditional demand side management programs to meet the adequacy requirements set out in the Demand-Side Measures Regulation under the Act. These adequacy requirements set out the measures that a demand side management portfolio must include in order to be considered adequate. While BC Hydro is not currently required to meet these adequacy requirements, our demand side management plans have always been consistent with them. Table 10-7 in Chapter 10, section 10.3.1.4 shows how BC Hydro's proposed traditional demand side management plan aligns with the adequacy requirements set out in the Demand-Side Measures Regulation.
- **Areas Covered by Direction No. 8:** The Government of B.C. intends to propose amendments to the *Utilities Commission Act* to prohibit rate re-balancing except on application by BC Hydro and to clarify that the Act does not apply to Powerex. The Government of B.C. also intends to propose

amendments to the *Clean Energy Act* to eliminate the concept of expenditures for export. These amendments would have the same practical effect as the sections 5, 6, and 8 of Direction No. 8 to the BCUC.

2.3 BC Hydro's Powers and Mandate Are Unchanged

The *Hydro and Power Authority Act* sets out BC Hydro's powers and mandate. It also specifies the legislation that does and does not apply to BC Hydro and sets out the Government of B.C.'s ability to issue directives to BC Hydro. BC Hydro's powers and mandate under this Act have not changed.

BC Hydro's mandate is to generate, manufacture, conserve, supply, acquire and dispose of power and related products. It acts as an agent of the Government of B.C. and reports to the Government through the Minister of Energy, Mines, and Petroleum Resources. The Minister of Finance is the fiscal agent of BC Hydro. The Lieutenant Governor in Council appoints BC Hydro's Board of Directors and Chair. The Board is responsible for managing the affairs of BC Hydro or supervising the management of those affairs and may delegate its responsibilities to the President and Chief Operating Officer.

Section 32 of the *Hydro and Power Authority Act* sets out the legislation that does and does not apply to BC Hydro. Specifically, it states that the following sections of the *Utilities Commission Act* do not apply to BC Hydro:

- Long-term resource and conservation planning (section 44.1);
- Issuance of securities (sections 50 and 51 (c));
- Disposition of property (section 52);
- Creation and maintenance of reserve funds (section 57 (2));
- Lien on land (section 95); and
- Dissolution of a defaulting utility (section 98).

As discussed in section 2.2.2 above, the Government of B.C. plans to propose amendments so that BC Hydro would be subject to section 44.1 of the *Utilities Commission Act* going forward.

The effect of the remainder of these exclusions is that BC Hydro does not need to seek BCUC approval for the issuance of securities or for the disposition of property, franchises, licences, permits, concessions, privileges or rights.

Under section 35 of the *Hydro and Power Authority Act*, the Government of B.C. may issue directives to BC Hydro regarding dividend payments from BC Hydro to the Government of B.C., and may also direct BC Hydro to pay specified amounts to past or present customers. Heritage Special Directive No. HC1, issued under this section of the Act, states that BC Hydro is not required to pay a dividend to the Government of B.C. until its debt to equity ratio reaches 60:40. As BC Hydro's debt to equity ratio is currently higher than 60:40, there are no forecast dividend payments in the fiscal 2020 to fiscal 2021 test period. Further information is provided in Chapter 8, section 8.4.

2.4 Utilities Commission Act

This section provides an overview of the sections of the *Utilities Commission Act* that are relevant to the BCUC's review of this application, organized into the following three topic areas:

- Rate setting;
- Demand side management expenditures acceptance; and
- Review of capital expenditure schedules and energy acquisition expenditure schedules.

As a result of the changes from the Comprehensive Review, the BCUC's jurisdiction in these areas with regards to BC Hydro is now largely the same as other regulated utilities in British Columbia.

2.4.1 Applying the Standard Rate Setting Provisions and Principles to BC Hydro

In this application, BC Hydro is seeking the BCUC's approval to set rates for fiscal 2020 and fiscal 2021. Sections 59 to 61 of the *Utilities Commission Act* set out the rate setting functions of the BCUC and provide the BCUC with the authority to approve the rates sought in this application. These sections reflect standard regulatory principles that must be respected, while still providing the BCUC with discretion in setting rates.

Section 60 specifies that the BCUC must have due regard to the setting of a rate that:

- Is not unjust or unreasonable within the meaning of section 59;
- Provides the public utility with a fair and reasonable return on any expenditure made by it to reduce energy demands (i.e., demand side management expenditures); and
- Encourages public utilities to increase efficiency, reduce costs and enhance performance.

Section 59 defines what it means for a rate to be "unjust" or "unreasonable". A rate is unjust or unreasonable if it is:

- More than a fair and reasonable charge for service of the nature and quality provided by the utility;
- Insufficient to yield a fair and reasonable compensation for the service provided by the utility, or a fair and reasonable return on the appraised value of its property; or
- Unjust and unreasonable for any other reason as determined by the BCUC.

Section 60 (b.1) states that the BCUC may use any mechanism, formula or other method to set rates that it considers advisable. The section provides the BCUC with the authority to set BC Hydro's rates through PBR. This application is being submitted on a cost of service basis. In response to Directive 28 of the BCUC's Decision on BC Hydro's Previous Application, BC Hydro has included a report on PBR as Chapter 11 of this application.

Section 61 requires public utilities to file rate schedules with the BCUC, to receive the BCUC's consent before rescinding or amending a schedule, and to charge only those rates that are in accordance with the filed schedules. Appendix EE contains updated rate schedules which reflect the approvals that BC Hydro is seeking in this application.

2.4.2 Acceptance of a Demand Side Management Expenditures Schedule

Among other things, section 44.2 of the *Utilities Commission Act* states that a public utility may seek acceptance of demand side measures expenditures that it has made or anticipates making. In this application, BC Hydro is seeking the BCUC's acceptance of our proposed demand side measures expenditures schedule for fiscal 2020 and fiscal 2021 under section 44.2 of the *Utilities Commission Act*. Information on our proposed demand side management expenditures is provided in Chapter 10.

Section 44.2 of the Act sets out the factors that the BCUC must consider when deciding whether to accept a demand side measures expenditure schedule filed by a public utility. It specifies that the BCUC must consider the energy objectives set out in the *Clean Energy Act* as well as the utility's most recent long-term resource plan. It further states that the BCUC must accept an expenditure schedule if it considers that making the expenditures would be in the public interest. Otherwise, the BCUC must reject the schedule. Alternatively, the BCUC may accept or reject a part of the expenditure schedule. However, the BCUC cannot order specific modifications to the schedule.

2.4.3 Review of Capital Projects, Expenditures and Additions

The BCUC exercises oversight over BC Hydro's capital expenditures and additions. As discussed in Chapter 6, the capital expenditures and capital additions represent two distinct concepts when we discuss capital projects/programs. The distinction is important because BC Hydro has numerous capital projects that span across different test periods. Forecast capital expenditures reported in revenue requirements applications represent spending to be incurred during a test period, but will not affect rates until later when the project goes in service. Forecast capital additions represent capital projects going into service during the test period, and may reflect capital expenditures made in past years.

The BCUC can review BC Hydro's non-exempt capital projects and associated expenditures and additions through various means, including through the review of:

- major projects for which BC Hydro files an application for a Certificate of Public Convenience and Necessity (**CPCN**) under Section 45 of the *Utilities Commission Act;*
- major projects for which BC Hydro files an application for acceptance of capital expenditure schedules under Section 44.2 of the *Utilities Commission Act*;
- revenue requirements applications, in which BC Hydro forecasts capital expenditures and capital additions for a test period for the purpose of rate setting; and
- Prudency of total capital expenditures for a project, usually conducted after the completion of the project when the total expenditures are known.

BC Hydro files applications for a CPCN or acceptance of a capital expenditure schedule for projects with an authorized cost estimate[61] that exceeds the financial thresholds in BC Hydro's 2010 Capital Project Filing Guidelines. BC Hydro has

[61] The authorized cost estimate is the requested funding for a project, inclusive of all contingencies and reserves, and based on a fixed scope and in-service date.

proposed an update to these guidelines in the Review of the Regulatory Oversight of Capital Expenditures and Projects proceeding currently before the BCUC. The BCUC also has discretion to direct BC Hydro to file a CPCN for projects that are below the financial thresholds, if they are extensions to BC Hydro's system.

The scope of the BCUC's review of capital expenditures and additions in a revenue requirements application depends on whether the project has been or will be subject to a separate CPCN or section 44.2 application, or is subject to legislation that exempts the project from BCUC review.

- For projects that are not expected to be subject to a separate CPCN or section 44.2 proceeding or legislated exemption, the BCUC may use this proceeding to examine project need and alternatives as well as the reasonableness of BC Hydro's forecast capital additions for the test period. The BCUC may also direct BC Hydro to seek a CPCN for any of these projects.
- For projects subject to a future CPCN or section 44.2 application, it is more efficient for the BCUC to conduct the assessment of project need and alternatives and the reasonableness of forecast capital expenditures during the future CPCN or section 44.2 proceeding.
- For projects that are subject to a legislated exemption, there is no need for an assessment of project need or alternatives or the reasonableness of forecast capital expenditures.

Appendix I includes a column that identifies projects that have a CPCN, section 44.2 acceptance or legislated exemption or that BC Hydro expects to be subject to a future CPCN or section 44.2 application.

Projects that are not subject to a future CPCN or section 44.2 application can be reviewed in a revenue requirements proceeding. For projects that were completed in the previous test period and are now in service, Appendix G provides an explanation of material variances between the original applied-for cost and final project cost.

Detailed consideration of BC Hydro's project execution is typically reviewed at project completion, when the total cost and outcomes are known. As explained in Chapter 7, section 7.8.2, the Amortization of Capital Additions Regulatory Account captures the difference between forecast and actual amortization of capital additions. This means that ratepayers only pay the actual amortization costs.

2.4.4 Energy Supply Contracts Are Reviewed Separately

BC Hydro is not seeking approval of energy supply contracts (sometimes referred to as Electricity Purchase Agreements) in this application. BC Hydro files separate applications pursuant to section 71 of the *Utilities Commission Act* seeking acceptance of each energy supply contract.

Chapter 4 provides information on our forecast Cost of Energy as these costs impact rates in fiscal 2020 and fiscal 2021. As explained in Chapter 4, section 4.5.1 and Chapter 7, section 7.7.1, the Non-Heritage Deferral Account captures the difference between forecast and actual cost of non-heritage energy. This means that ratepayers only pay the actual costs.

In its report on the Comprehensive Review, the Government of B.C. announced the Biomass Energy Program. This program is a cost and volume limited, transitional measure, intended to allow time for the forestry sector to develop and implement new product lines consistent with the industry's diversification and competitiveness goals. It allows for the continued operation of those biomass generating facilities with expiring Electricity Purchase Agreements over the next three years. The Government of B.C. has indicated that it intends to provide a direction to the BCUC with respect to the approval of the program documentation and to require the costs associated with the program to be recovered from ratepayers. Further information on this program is provided in Chapter 4, section 4.3.2.

2.4.5 Other Miscellaneous Sections of the *Utilities Commission Act*

Other sections of the *Utilities Commission Act* that may inform the BCUC's consideration of this application include:

- Section 3 which requires the BCUC to comply with directions issued to it by the Government of B.C. Section 2.5 provides summaries of directions issued to the BCUC under this section which apply to this application. Direction 8, also issued under this section, is explained in section 2.2.
- Section 22 which allows the Minister of Energy, Mines, and Petroleum Resources to issue regulations to exempt a public utility or "any equipment, facility, plant, project, activity, contract, service or system of the public utility" from BCUC regulation or certain aspects of BCUC regulation. An example of a ministerial regulation under this section is the Transmission Upgrade Exemption Regulation, discussed in section 2.5.8 below.
- Section 23 which provides the BCUC with a general supervision mandate over public utilities. BC Hydro is not relying on this section for any of the approvals it is seeking in this application.
- Section 24 which allows the BCUC to make inquiries about the conduct of the public utility business to keep itself informed and to ensure compliance of the public utilities with the Act. BC Hydro is not relying on this section for any approval sought in this application.
- Section 49 which permits the BCUC to adopt a uniform system of accounting for public utilities of the same class. As discussed in Chapter 1, section 1.6, BC Hydro is requesting that the BCUC rescind the requirement for BC Hydro to file Uniform System of Accounts information.

2.5 Other Regulations Affecting Revenue Requirements

There are a number of other regulations issued under the *Utilities Commission Act* that continue to affect aspects of BC Hydro's revenue requirements. They are summarized below.

2.5.1 Demand-Side Measures Regulation (B.C. Reg. 326/2008)

This regulation sets out the requirements for a demand side management portfolio to be considered adequate and for the demand side measures within that portfolio to be considered cost-effective. Chapter 10, section 10.3.1, explains how BC Hydro's proposed demand side measures expenditure schedule meets these requirements.

2.5.2 Shore Power Regulation (B.C. Reg. 291/2008)

This regulation is designed to encourage operators of cruise ships docked at Canada Place wharf in Vancouver to use port electricity instead of on-board, diesel-generated electricity. In setting the rate for shore power service, the BCUC must ensure that the rate allows BC Hydro to collect sufficient revenue to recover the costs incurred to provide that service. BC Hydro's proposed shore power rates for fiscal 2020 and fiscal 2021, in accordance with the approvals sought in this application, are set out in Appendix EE.

2.5.3 TMP Program Direction (B.C. Reg. 139/2015)

BC Hydro has a program to provide funding to increase the electrical efficiency of mills that use thermo-mechanical pulping processes (**TMP Program**). This direction requires the BCUC to allow BC Hydro to recover the costs incurred to carry out the TMP program up to $100 million. Further, the regulation requires the BCUC to allow BC Hydro to defer these costs to the DSM Regulatory Account. BC Hydro's TMP program expenditures are discussed in Chapter 10, section 10.3.2. Our demand side management expenditure request lists TMP program expenditures separately, because of this direction.

2.5.4 Mining Customer Payment Program Direction (B.C. Reg. 47/2016)

BC Hydro has a program to help mines remain in operation when prices for the commodities they produce are low (Mining Customer Payment Program). Government direction required the BCUC to approve Tariff Supplement No. 90. This tariff supplement allows eligible mining customers to temporarily defer payment of a portion of their BC Hydro electricity bills when commodity prices are low. It also prescribes the interest rates to be charged on those deferred payments and requires the deferred amounts, plus the prescribed interest, to be paid back as commodity prices increase. Any remaining balance is to be paid back when the program ends on March 14, 2021.

This Direction requires the BCUC to allow BC Hydro to establish a regulatory account for any impaired balances of participating mining customers. It also requires the BCUC to allow BC Hydro to recover the balance of this regulatory account in rates.

Information on the status on the Mining Customer Payment Plan and the Mining Customer Payment Plan Regulatory Account is provided in Chapter 7, section 7.8.

2.5.5 Meter Choices Program Direction (B.C. Reg. 203/2013)

BC Hydro has a program to provide legacy meters or radio-off meters to customers instead of smart meters for specified periods, if certain conditions are met (Meter Choices Program). This direction requires the BCUC to allow BC Hydro to collect sufficient revenue to recover the costs of this program from customers who are participating in the program. BC Hydro's Electric Tariff sets out the standard charges to recover these costs. This direction prohibits the BCUC from amending these charges, except on application by BC Hydro. BC Hydro is not applying to amend these charges in this application. The costs of the program are reflected in the forecast revenue requirements in this application.

2.5.6 Skagit Agreement Direction (B.C. Reg. 390/85)

On March 30, 1984, the Government of B.C. and the City of Seattle signed an agreement concerning the supply of electricity to the City of Seattle. The Government of B.C. subsequently assigned certain rights and obligations from this agreement to BC Hydro. This direction requires the BCUC to consider all payments related to this assignment as revenue to BC Hydro. Consistent with this direction, volumes delivered to and the related revenues received from Seattle City Light, which is the electricity provider for the City of Seattle, are recorded as domestic revenue as shown in schedule 14, line 8, of Appendix A. All else equal, these revenues reduce BC Hydro's revenue requirements.

2.5.7 Iskut Extension Project Direction (B.C. Reg. 137/2013)

This direction, as amended by B.C. Reg. 24/2019, exempts the Iskut Extension project from the CPCN requirements under section 45, 46 and 47 of the *Utilities Commission Act*. It also requires the BCUC to ensure that BC Hydro is able to collect sufficient revenue to recover its costs related to the Iskut Extension Project, including any costs for related agreements and negotiations with First Nations. As shown in Chapter 6, Table 6-4, the project cost will be approximately $113 million at completion.

2.5.8 Transmission Upgrade Exemption Regulation (B.C. Reg. 140/2013)

This direction, as amended by B.C. Reg. 160/2018, exempts BC Hydro from Part 3 of the *Utilities Commission Act* with regards to:

- A series capacitor station and related facilities and equipment in the vicinity of the District of Vanderhoof, the Village of Burns Lake and the Village of Telkwa;
- Various upgrades and additions at the Skeena and Minette substations; and
- Construction, operation, upgrades or extensions, reasonably expected to come into service before October 1, 2025, to provide service to an LNG facility in the

vicinity of the District of Kitimat and to provide service to facilities necessary for the construction of that LNG facility.

This direction exempts the Northwest Substation Upgrade Project (which primarily consists of the construction, operation, upgrades and extensions of BC Hydro's facilities to provide service to LNG Canada) from Part 3 of the *Utilities Commission Act*, provided that these facilities are placed in service before October 1, 2025. In Directive 3 of its Decision on our Previous Application, the BCUC ordered BC Hydro to file a CPCN for the Northwest Substation Upgrade Project. BC Hydro is requesting an amendment to Directive 3 to remove this requirement as it is inconsistent with this regulation.

2.5.9 LNG Customers Direction (B.C. Reg. 197/2018)

This direction removes a previous provision that prevented LNG customers from receiving service under BC Hydro's transmission rate schedules. It states that, except on application by BC Hydro, the BCUC must not set any rates for transmission service to LNG customers other than the rates applicable under Rate Schedules 1823, 1825, 1827 or 1852. In addition, it states that the BCUC must allow BC Hydro to rescind Tariff Supplements 91 and 92 so that FortisBC's Tilbury Island LNG facility can receive service under Rate Schedule 1823. BC Hydro expects to submit a separate application to the BCUC to rescind Tariff Supplements 91 and 92. BC Hydro is not applying for any new rates for LNG customers in this application.

2.5.10 Special Direction No. 9 (B.C. Reg. 157/2005)

This direction prevents the BCUC from requiring BC Hydro to provide storage services.

2.5.11 Special Direction No. 10 (B.C. Reg. 245/2007)

This direction requires the BCUC to consider the objective for BC Hydro to achieve electricity self-sufficiency when considering CPCN applications and energy supply contracts. It also requires that the BCUC ensure BC Hydro collects sufficient revenue in each fiscal year to achieve self-sufficiency. The self-sufficiency objective is explained further in section 2.6.1 below.

This direction also set out factors to guide the BCUC's consideration of certain biomass contracts under section 71 of the *Utilities Commission Act*.

Lastly, this direction requires the BCUC to ensure that BC Hydro's rates available to customers in the Non-Integrated Area are also available to customers who receive electricity service under the Remote Communities Regulation. It also requires that the BCUC ensure BC Hydro collects sufficient revenue in each fiscal year to recover costs related to providing this service. The Remote Communities Regulation is discussed further in section 2.7.

2.6 Clean Energy Act

The *Clean Energy Act* continues to apply to BC Hydro. It sets out considerations for BC Hydro's cost of energy and DSM expenditures and requires the BCUC to allow BC Hydro to recover certain costs.

2.6.1 Self-Sufficiency is Considered in Forecasting Energy Cost

The *Clean Energy Act* sets out the energy objectives of British Columbia in section 2. This includes the objective for BC Hydro to achieve electricity self-sufficiency by 2016 and each year after by meeting its electricity supply obligations solely from generating facilities within the province. The electricity self-sufficiency regulation issued under the *Clean Energy Act* states that these obligations are to be determined based on the mid-level load forecast. It also states that BC Hydro must be able to meet these obligations assuming the maximum amount of annual energy generated under average water conditions.

The BCUC is required to ensure that rates allow BC Hydro to collect sufficient revenue to recover the costs associated with the achievement of electricity self-sufficiency.

2.6.2 Energy Objectives Are Considered for Demand Side Management

The BCUC must consider the energy objectives in section 2 of the *Clean Energy Act* when reviewing applications made under sections 44.1, 44.2, 45 and 71 of the *Utilities Commission Act*. Accordingly, the energy objectives are one of the factors the BCUC must consider when determining whether to accept or reject BC Hydro's proposed demand side management expenditures in this application. Chapter 10, Table 10-6 of this application demonstrates how BC Hydro's proposed demand side management expenditures align with the energy objectives.

2.6.3 Rates Must Recover Costs of Exempt Projects

Section 7 of the *Clean Energy Act* exempts the various projects, programs, contracts and expenditures from BCUC review under sections 45 to 47 and 71 of the *Utilities Commission Act*. Section 8 requires the BCUC to ensure that BC Hydro collects sufficient revenue to recover the costs associated with these projects, programs, contracts and expenditures. The capital projects exempted by section 7 of the *Clean Energy Act* that have capital additions in fiscal 2020 or fiscal 2021 are identified in Appendix I.

2.6.4 Rates Must Recover Costs of Prescribed Undertakings

Section 18 of the *Clean Energy Act* requires the BCUC to allow BC Hydro to collect sufficient revenue to recover costs incurred for prescribed undertakings. Prescribed undertakings are projects, programs, contracts or expenditures prescribed for the purpose of reducing greenhouse gas emissions in British Columbia. The Greenhouse Gas Reduction Regulation issued under the *Clean Energy Act* (B.C. Reg. 102/2012) sets out prescribed undertakings for electrification. Some undertakings must meet cost effectiveness test to be prescribed undertakings.

The Peace Region Electricity Supply Project, which has planned capital expenditures in fiscal 2020 and fiscal 2021, meets the requirements to be considered a prescribed undertaking.[62] Under the requirements of the regulation, it is not subject to the cost effectiveness test.

BC Hydro's proposed low carbon electrification expenditures for fiscal 2020 and fiscal 2021 also meet the requirements to be considered prescribed undertakings for electrification including the cost effectiveness test where applicable.

The Direction to the BCUC Respecting Undertaking Costs, issued under section 3 of the *Utilities Commission Act* (B.C. Reg. 77/2017), requires the BCUC to allow BC Hydro to defer the costs incurred for prescribed undertakings to the Demand Side Management (**DSM**) Regulatory Account. In this application, BC Hydro is requesting BCUC approval to defer low-carbon electrification expenditures to the DSM Regulatory Account, consistent with this Direction. BC Hydro has included information on forecast expenditures related to these prescribed undertakings in Chapter 10, section 10.4.3 and in Appendix Y.

2.6.5 Standing Offer Program is Indefinitely Suspended

Section 15 of the *Clean Energy Act* states that BC Hydro must establish and maintain a standing offer program to acquire electricity from eligible facilities, except in the prescribed circumstances. As part of the Comprehensive Review, the Government of B.C. issued a Regulation (B.C. Reg. 23/2019) to specify a new prescribed circumstance. Through the Standing Offer Program, BC Hydro has contracted with facilities totalling more than 170 MW of nameplate capacity. The effect of the Regulation is that BC Hydro is not obligated to maintain the Standing

[62] In Exhibit B-18 of the Fiscal 2017 to Fiscal F2019 Revenue Requirements Application, BC Hydro informed the BCUC that "OIC 101 adds as prescribed undertakings for the purpose of section 18 of the *Clean Energy Act* investments in infrastructure in Northeast British Columbia that primarily serve natural gas producers and processors (the new section 4(2) of the Greenhouse Gas Reduction (Clean Energy) Regulation). This will include BC Hydro's planned transmission project known as the Peace Region Electricity Supply (**PRES**) Project and accordingly, should we decide to proceed with PRES, BC Hydro will not be filing an application under section 45(5) of the *Utilities Commission Act* for a Certificate of Public Convenience and Necessity for the PRES Project."

Offer Program while the cumulative capacity of facilities under the program exceeds 100 MW. Through the Standing Offer Program, BC Hydro has contracted with facilities totalling more than 170 MW of nameplate capacity. In accordance with the regulation, BC Hydro has indefinitely suspended the Standing Offer Program. While this means that BC Hydro will not be acquiring additional electricity through the Standing Offer Program, existing Electricity Purchase Agreements under this program remain valid.

2.7 BC Hydro's Obligation to Provide Service to Remote Communities

When setting rates for BC Hydro, the BCUC must comply with any regulations made by the Government of B.C. under the BC Hydro Public Power Legacy and Heritage Contract Act. In addition, BC Hydro must provide the service required by the regulations made under this Act in accordance with the terms and conditions specified in those regulations. The Remote Communities Regulation is the only regulation currently in effect under this Act. It requires BC Hydro to provide service to customers in 11 remote communities, which are set out in a schedule under the regulation.

2.8 Standard Charges

Section 11 of BC Hydro's Electric Tariff includes its Schedule of Standard Charges. Some of these charges were last approved by BCUC Order No. G-5-17 to BC Hydro's 2015 Rate Design Application. As part of that process, BC Hydro proposed to regularly review its Standard Charges and to propose changes, as required, in upcoming revenue requirement applications so that the charges would remain current.

BC Hydro is not proposing to update any of the Standard Charges in this application. Many of the Standard Charges include cost elements of Customer Service functions that were previously provided by Accenture. BC Hydro has only recently repatriated Customer Service functions from Accenture and is still working to identify the cost of tasks involved in the Account Charge, Returned Payment Charge and Minimum Reconnection Charges.

BC Hydro plans to review and file separate applications related to the methodologies for calculating the service connection, Meter Choices Program and Net Metering related Standard Charges, in the future.

2.9 Summary of Legal Authority for Orders Sought

The approvals that BC Hydro is seeking in this application are set out in Chapter 1, section 1.6. Table 2-2 below provides a summary of these requests as well as the applicable legislation and regulations and the role of the BCUC within that framework.

Table 2-2 Summary Approvals Sought and Legal/Regulatory Framework

Approvals Sought	Applicable Legislation and Regulations	BCUC's Role
A reduction of the DARR from 5 per cent to 0 per cent on April 1, 2019; and Permanent general increases of 6.85 per cent on April 1, 2019 (for fiscal 2020) and 0.72 per cent on April 1, 2020 (for fiscal 2021). If approved, these requests would result in a net bill increase of 1.76[63] per cent on April 1, 2019. The net bill increase on April 1, 2020 would be the same as the proposed general rate increase of 0.72 per cent. We request that these changes be made effective April 1, 2019, on an interim basis, pending a final BCUC decision on our application. Tariff Sheets reflecting these requests are provided in Appendix EE.	Sections 59-61 of the *Utilities Commission Act*	The BCUC must approve rates that are just and reasonable, with reference to BC Hydro's forecast revenue requirements. BC Hydro's forecast revenue requirements reflect a variety of other legislative and regulatory requirements as discussed in this Chapter.
Refund the forecast fiscal 2019 net closing balance and the forecast fiscal 2020 and fiscal 2021 net additions and interest applied to the Cost of Energy Variance Accounts over the fiscal 2020 to fiscal 2021 test period. This would result in a net credit to the benefit of ratepayers of $329.1 million being amortized into rates during the test period; Defer any variances related to the accounting for EPAs determined to be leases under IFRS 16, which are not eligible for deferral treatment under existing orders, to the Non-Heritage Deferral Account; Continue to defer, on an annual and ongoing basis, any variances between forecast and actual dismantling costs. In the Dismantling Cost Regulatory Account, continue to apply interest to the balance of the account and recover the forecast interest charged to the account each year,	Sections 59-61 of the *Utilities Commission Act*	The BCUC has the power to direct that certain components of the forecast revenue requirements be deferred by recording the amount in a regulatory account for future recovery. The approved rates/revenue requirements must reflect reasonable amortization expense from previously deferred amounts.

[63] Offsetting the requested general rate increase of 6.85 per cent with the requested reduction of the DARR from 5 per cent to 0 per cent reduces the net bill increase by more than 5 per cent because the DARR is applied after general rate increases. The following equation demonstrates how this works:
Start: Bill with 5 per cent DARR: $105.00
Adjust: DARR from 5 per cent to 0 per cent: $100.00
Adjust: General Rate Increase of 6.85 per cent: $106.85
$106.85/$105.00 = 1.0176.

Approvals Sought	Applicable Legislation and Regulations	BCUC's Role
and continue to recover the forecast account balance at the end of a test period over the next test period; Remove the reference to the "Prescribed Standards" from the scope of what may be deferred to the Site C Regulatory Account, as BC Hydro has fully adopted IFRS. This will allow BC Hydro to continue to defer to the Site C Regulatory Account any costs related to the Site C Project that are not able to be capitalized. Close the Capital Project Investigation Costs Regulatory Account at the end of fiscal 2021 as its balance will be fully amortized into rates at that time; and Close the Rate Smoothing Regulatory Account as this account has a zero balance and BC Hydro is not proposing to smooth rates over the fiscal 2020 to fiscal 2021 test period. Further information on requests related to BC Hydro's regulatory accounts is provided in Chapter 7, section 7.7.		
Defer any variances between forecast and actual amounts related to the Biomass Energy Program, which are not eligible for deferral treatment under existing orders to the Non-Heritage Deferral Account. This will ensure BC Hydro recovers its costs with respect to the Biomass Energy Program. For further information in this request, please refer to Chapter 7, section 7.7.1.3.	Sections 59-61 of the *Utilities Commission Act*	The Government of B.C. has indicated that it intends to provide a direction to the BCUC with respect to the approval of the program documentation and to require the costs associated with the program to be recovered from ratepayers.
Defer low-carbon electrification expenditures to the DSM Regulatory Account. For further information in this request, please refer to Chapter 7, section 7.7.3.	Direction to the BCUC Respecting Undertaking Costs (B.C. Reg. 77/2017)	The BCUC must allow BC Hydro to defer these expenditures to the DSM Regulatory Account.
Set depreciation rates for the Burrard synchronous condense facility, for new Water Rights, Infrastructure Rights and LED Streetlights asset classes and for three new asset classes for agreements recognized as leases under International Financial Reporting Standard 16, Leases. For further information on this request, please refer to Chapter 8, section 8.12;	Sections 59-61 of the *Utilities Commission Act*	The BCUC must set proper and adequate rates of depreciation.

Approvals Sought	Applicable Legislation and Regulations	BCUC's Role
Approve the Open Access Transmission Tariff (OATT) rates, as set out in Chapter 9, Table 9-8. For further information on this request, please refer to Chapter 9.	Sections 59-61 of the *Utilities Commission Act*	The BCUC must approve rates that are just and reasonable, with reference to BC Hydro's forecast revenue requirements. BC Hydro's forecast revenue requirements reflect a variety of other legislative and regulatory requirements as discussed in this Chapter.
Accept a DSM expenditure schedule of $90.8 million in fiscal 2020 and $116.3 million in fiscal 2021. For further information on this request, please refer to Chapter 10.	Section 44.2 of the *Utilities Commission Act* Section 2 of the *Clean Energy Act* Demand-Side Measures Regulation	The BCUC must accept the schedule if it considers that making the expenditures would be in the public interest. The public interest inquiry includes consideration of "British Columbia's energy objectives" under the *Clean Energy Act*. Alternatively, the BCUC may reject the schedule or reject a part of the schedule.
Reconsider and vary Directive 3 of the BCUC's Decision on BC Hydro's Fiscal 2017 to Fiscal 2019 Revenue Requirements Application which, among other things, directs BC Hydro to file a CPCN application for the Northwest Substation Upgrade project. This directive is inconsistent with the Transmission Upgrade Exemption Regulation. Further information is provided in section 2.5.8.	Section 99 of the *Utilities Commission Act* Transmission Exemption Regulation	The BCUC must comply with the Transmission Upgrade Exemption Regulation. The BCUC may reconsider a decision and may vary or rescind the decision to comply with the Regulation.
Reconsider and rescind Directive 61 of the BCUC's Decision on BC Hydro's Fiscal 2005 to Fiscal 2006 Revenue Requirements Application. This Directive is inconsistent with section 4 of the Demand-Side Measures Regulation. For further information, please refer to Chapter 10, section 10.5.5.	Section 99 of the *Utilities Commission Act* Demand-Side Measures Regulation	The BCUC may reconsider a decision and may vary or rescind the decision.

Approvals Sought	Applicable Legislation and Regulations	BCUC's Role
Reconsider and rescind Directive 57 of the BCUC's Decision on BC Hydro's Fiscal 2009 to Fiscal 2010 Revenue Requirements Application, which had required BC Hydro to adopt a uniform system of accounts. For further information, please refer to Chapter 1, section 1.6.	Section 49 of the *Utilities Commission Act* Section 99 of the *Utilities Commission Act*	The BCUC may adopt a uniform system of accounting for public utilities of the same class. The BCUC may reconsider a decision and may vary or rescind the decision.

Fiscal 2020 to Fiscal 2021
Revenue Requirements Application

Chapter 3

Load and Revenue Forecast

Table of Contents

List of Figures

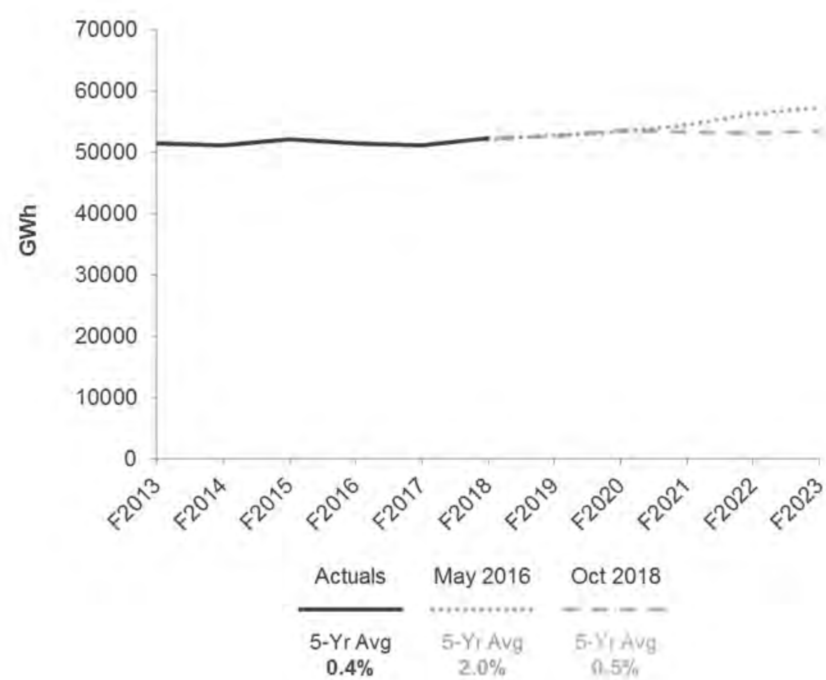
List of Tables

3.1 Introduction

This chapter provides our Load Forecast[64] and associated Revenue Forecast. The forecasts for fiscal 2020 and fiscal 2021 are used in the calculation of the test period revenue requirements.

The Load Forecast was completed in October 2018. Overall, BC Hydro is forecasting a lower load growth rate relative to the May 2016 Load Forecast contained in the Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (**Previous Application**). This is shown in Figure 3-1 below.

Figure 3-1 Electricity Sales Summary – October 2018 Load Forecast vs. May 2016 Load Forecast[65]



64 For the purposes of this application, the terms load forecast and electricity sales are used interchangeably.

65 The graph shows a fiscal 2019 to fiscal 2023 compound growth rate using billed sales forecast after rates and after DSM savings.

While events since October 2018, such as the announcement of the Government of B.C.'s CleanBC Plan are not included as part of this Load Forecast, they are captured within the uncertainty discussion provided in section 3.3.6.

The information provided in this chapter on our Load Forecast is supplemented by BC Hydro's Electric Load Forecast Report Fiscal 2019 to Fiscal 2024 (October 2018),[66] which is provided as Appendix O to this application. Appendix O provides a comprehensive description of the methods and results of the Load Forecast discussed in this chapter. Collectively, the information provided demonstrates why we believe that the Load Forecast, and the associated Revenue Forecast, are reasonable for the purposes of setting rates in the test period.

This Chapter is organized around the following key points:

- Section 3.2 explains our load forecast methods, and the inputs used for each customer sector. We conclude that our methodology and inputs are the appropriate basis for the Load Forecast in this application considering:
    - ▶ The recent performance of our own methodology;
    - ▶ The endorsement of the methodology by an internal audit review conducted by an independent expert;
    - ▶ Improvements to our methodology, which address the audit recommendations and the issues raised by the BCUC;
    - ▶ The Auditor General's recent determination that our methodology is robust and compares favourably with industry standards; and
    - ▶ The favourable performance of our methodology relative to an alternative short-term forecast methodology.

[66] Appendix A, Schedule 14 of this application contains the electricity sales forecasts by sector from fiscal 2019 to fiscal 2021. Appendix A, Schedule 14 and the forecast results in section 3.3 show the electricity sales forecast on an accrued sales basis. Appendix O shows the electricity sales forecast on a billed sales basis. For further details on accrued vs. billed sales refer to Appendix O.

- Section 3.3 presents the results of the load forecast, both the mid forecast and the high and low uncertainty bands.
  - Demand for electricity is forecast to increase by approximately 650 GWh or 1.2 per cent from fiscal 2019 to fiscal 2021; and
  - The high and low band around the forecast is the product of Monte Carlo analysis, and illustrates the range of uncertainty.
- Section 3.4 explains our Revenue Forecast methodology, which is straightforward and unchanged from the methodology used in the Previous Application.
- Section 3.5 presents the results of the Revenue Forecast by customer sector, based on the output of the improved load forecast methodology.

3.2 The Improved Load Forecast Methodology

The Load Forecast is an important input to BC Hydro's revenue requirements during the test period because it provides the basis for estimating future electricity sales revenues from our existing and future customers. It is also an input to our generation system optimization studies, which are undertaken to estimate market purchases and market purchases costs. We explain below five reasons why the methodology and inputs used in the Load Forecast in this application are appropriate:

(i) The recent strong performance of our own methodology;

(ii) The endorsement of the methodology by an audit review conducted by an independent expert;

(iii) Improvements to our methodology, which address the audit recommendations and the issues raised by the BCUC;

(iv) The Auditor General's recent endorsement of our methodology as "robust"; and

(v) The favourable performance of our methodology relative to an alternative short term forecast methodology.

3.2.1 Sales Since May 2016 Have Closely Tracked the Load Forecast

The Load Forecast for the Previous Application was developed in May 2016. Actual results have tracked within 0.1 per cent to 0.5 per cent against this Load Forecast for fiscal 2017 and fiscal 2018, which are well within a range of expectancy based on industry benchmarks.

3.2.2 Independent Expert Endorsed Overall Methodology in a Recent Audit

An August 2017 audit of our load forecasting function endorsed the overall load forecast methodology, while making some recommendations as to how to improve upon particular aspects which have been substantially incorporated into the 2018 Load Forecast.

The audit of our load forecasting function was completed by BC Hydro Audit Services (**Load Forecasting Audit**). The objective was to review load forecasting processes to ensure timely and reliable forecasts. A copy of this audit is included as Appendix P to this application.

The audit relied on an independent subject matter expert, GDS Associates Inc., retained specifically for the audit. GDS Associates Inc. is a U.S. based firm with load forecasting experience within the electrical utility industry. The principal at GDS Associates Inc., who undertook the work, has over 30 years of load forecasting experience. His experience included preparing load forecasts for utility clients (ranging from day-ahead to annual and long-term time frames), and filing regulatory testimony related to load forecasting and statistical analyses.

GDS's findings, which were adopted by the Load Forecasting Audit, included:

- "Overall, the load forecasting function at BC Hydro compares favorably to industry standards and to other large electric utilities in North America. No critical weaknesses were found."

- "Load forecasting methodologies are consistent with best practices and load forecast outputs are provided to users and stakeholders on a timely basis."
- "The greatest risk of load forecasting inaccuracy falls on the industrial class and is due to the uncertainty of future economic activity and the volatility of many individual customer loads."
- "Areas for improvement identified primarily relate to making adjustments to forecast models and inputs to enhance overall forecast accuracy."[67]

The Load Forecasting Audit included recommendations focused on adjustments to our models and inputs that could improve forecast performance. For example, the audit recommended that we "accelerate internal studies and development on the elasticity coefficients used in the development of the Load Forecast, including price elasticity and statistical adjusted end-use (**SAE**) model elasticity." As discussed next, we have addressed the audit recommendations.

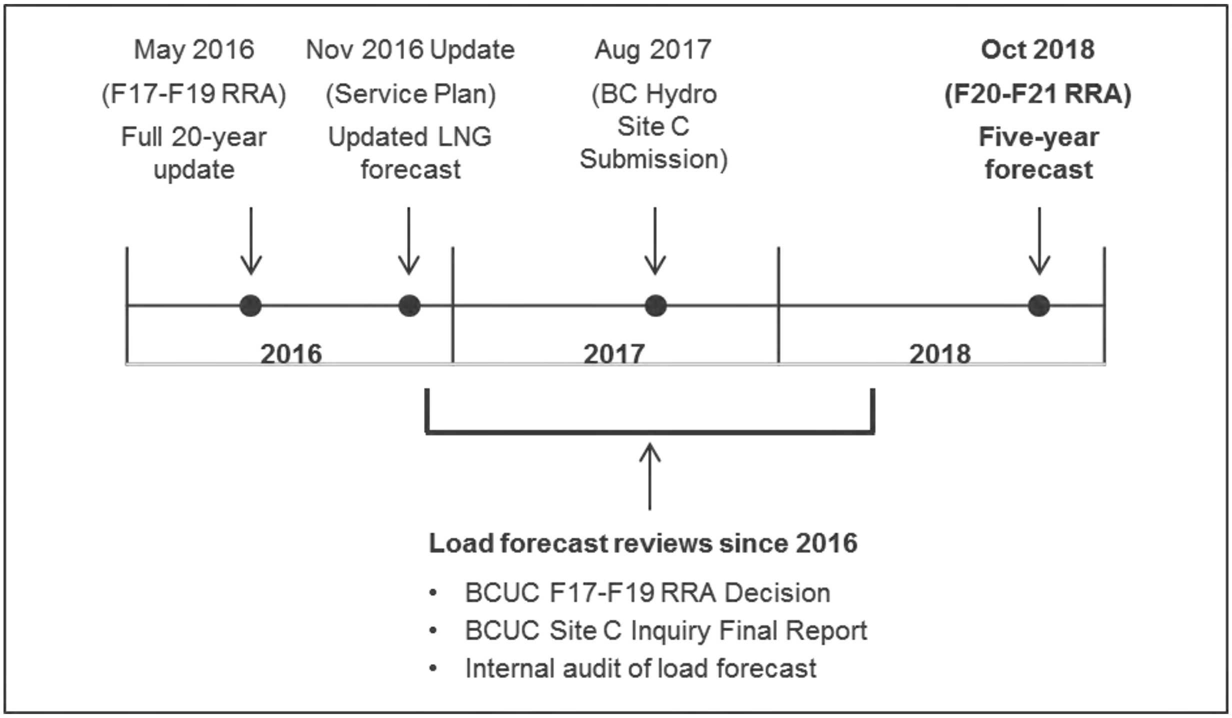
3.2.3 BC Hydro Has Addressed the Audit Recommendations and the Issues Raised by the BCUC

The load forecast used for the Previous Application was prepared in May 2016. Since that time, we have received feedback from the BCUC as well as the audit recommendations referenced above. The methodological improvements described later in this chapter address the issues identified by the BCUC.

Figure 3-2 below shows the load forecasts, the BCUC regulatory review and decisions, and the Load Forecasting Audit that have occurred since that time.

[67] All quotes have the same reference – Appendix P, page 5.

Figure 3-2 Load Forecast Chronology – 2016 to 2018



Load forecasts produced or reviewed since the May 2016 Load Forecast include:

- **May 2016 (November 2016 Update):** Prepared for BC Hydro's fiscal 2018 to fiscal 2020 Service Plan. It updated the LNG terminal forecast to reflect delays in projects' final investment decisions.
- **May 2016 (August 2017 Review):** BC Hydro's submission to the BCUC to the Site C Inquiry included a review of BC Hydro's May 2016 Load Forecast.
- **October 2018 Load Forecast:** Developed for this application. It is our new forecast of electricity sales from fiscal 2019 to fiscal 2024.
- The BCUC reviews since the May 2016 Load Forecast include:
  - **August 2017, Fiscal 2017 to Fiscal 2019 Revenue Requirements Application Decision:** The BCUC found that BC Hydro's May 2016 Load Forecast was, "reasonable for use for the fiscal 2017 to fiscal 2019 test

period", but acknowledged concerns regarding price elasticity and historical load forecast accuracy;[68]

- The BCUC acknowledged BC Hydro's observation that electricity rate increases "were known to industrial customers when BC Hydro's key account managers conducted their forecast surveys. Accordingly, [the BCUC was] satisfied that the issue of price elasticity for future, unknown price increases [was] not an issue in the test period;"[69] and
- The BCUC further noted that "other utilities such as Pacific Northern Gas, FortisBC (natural gas) and FortisBC (electricity) use a different load forecast methodology for [their] short term forecast for setting rates as compared to its long term forecast for resource planning."[70]

- **November 2017, Site C Inquiry Final Report**: The Inquiry was more focussed on long-term demand, as opposed to the short-term forecast for a particular test period. However, the BCUC identified a number of issues related to BC Hydro's Load Forecast, including:
  - The accuracy of the industrial forecast and, in particular, that "BC Hydro had not made a probabilistic assessment of the likelihood of the LNG load materializing";[71]
  - "GDP[72] and disposable income estimates used by BC Hydro in its current Load Forecast are higher than similar Conference Board of Canada estimates;"[73] and

[68] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Appendix B, page 12.

[70] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Appendix B, page 11.
[71] BCUC Final Report With Respect to the Site C Inquiry (November 1, 2017), page 78.
[72] All instances of GDP are Real GDP and not Nominal GDP.
[73] BCUC Inquiry Respecting Site C – Final Report (November 1, 2017), page 78.

- For price elasticities, "long-run price elasticity used by BC Hydro for all rate classes [being] too low in magnitude."[74]

Key concerns expressed by the BCUC and the Load Forecasting Audit about the methodology have now been addressed. Table 3-1 provides examples of BCUC concerns raised and how they have been addressed. Information on specific improvements is embedded within the discussion of each of the customer sector forecasts in the sections immediately following this one.

Table 3-1 Summary of BC Hydro's Response to BCUC Recommendations and Comments

Fiscal 2017 to Fiscal 2019 Revenue Requirements Application Decision	
BCUC Recommendations/Comments	**Location of BC Hydro's Response**
"Panel acknowledges the concerns of AMPC regarding price elasticity use for industrial customers," but is nevertheless "satisfied that the issue of price elasticity for future unknown price increases is not an issue in the test period."[75]	BC Hydro engaged DNV GL consulting to review price elasticity and recommended increasing elasticity values from -0.05 to -0.1 and applying price elasticity across all customer sectors. Please refer to section 3.2.6.2.
"Panel further notes that other utilities such as Pacific Northern Gas, FortisBC (natural gas) and Fortis BC (electricity) use a different load forecast methodology for their short term forecast for setting rates as compared to its long term forecast for resource planning."[76]	We reviewed alternative short- term methodologies and developed a comparator forecast using FortisBC (electricity) methods. Please refer to section 3.2.11 and Table 3-2.

[74] BCUC Inquiry Respecting Site C – Final Report (November 1, 2017), page 79.

[76] BCUC Decision on BC Hydro's Fiscal 2017 to Fiscal 2019 Revenue Requirements, Appendix B (March 1, 2018), page 11.

BCUC Site C Inquiry Final Report	
BCUC Recommendations/Comments	**Location of BC Hydro's Response**
"Panel agrees with several parties who express concern with the fact that BC Hydro has not made a probabilistic assessment of the likelihood of the LNG load materializing."[77]	We have now aligned how we forecast sales to LNG customers in a manner consistent with other large industrial customers: using the probabilistic assessment approach. Please refer to section 3.2.8.2.
"Panel finds the GDP and disposable income used by BC Hydro are higher than similarly Conference Board of Canada estimates."[78]	As part of BC Hydro's normal competitive procurement practices, the Conference Board of Canada was the successful proponent on an RFP for economic consulting services to provide us with a sub-regional and aggregate economic forecast for the province.

3.2.4 Auditor General Characterizes Our Process as "Robust" and Our Capability as Comparing Favourably With Industry Standards

The Auditor General recently issued a report on BC Hydro's asset management practices. The audit included whether BC Hydro has the information, practices, processes and systems needed to support good asset management. That included information collection about matters such as "forecasting future demand for assets". The Auditor General characterized the Load Forecast process as "robust" and made the following observations (emphasis in original):

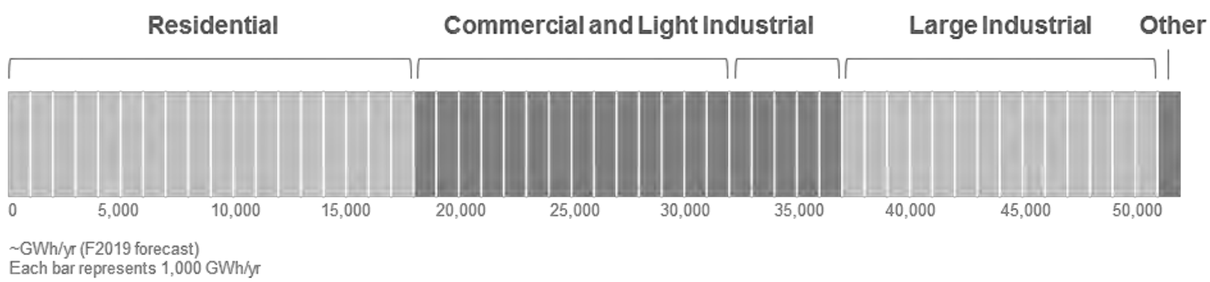
> "**Load forecasting process is robust**
>
> BC Hydro has a load-forecasting capability that compares favourably with industry standards. The process it uses includes three components:
>
> > Projecting what will drive residential and commercial demand at a future date;
> >
> > Conducting sensitivity analyses to adjust for various demand outcomes; and
> >
> > Producing a set of demand probability scenarios (low, medium and high peak load forecasts) which can be applied to strategic planning."

[77] BCUC Inquiry Respecting Site C – Final Report (November 1, 2017), page 78.
[78] BCUC Inquiry Respecting Site C – Final Report (November 1, 2017), page 78.

3.2.5 The Load Forecast Aggregates Sector Forecasts

BC Hydro's Load Forecast is divided into the following four sectors as shown in Figure 3-3: Residential, Commercial and Light Industrial, Large Industrial and Other[79] (which includes inter-utility sales, firm exports, street lighting and irrigation demand). Although similarities exist with the load forecasting methods used for these sectors, the processes differ sufficiently such that they are each described separately in the following sections.

Figure 3-3 BC Hydro Load Forecast by Customer Sector



3.2.6 Residential Sector Methodology Has Been Improved

The residential sector consists of approximately 1.8 million accounts and represents approximately one-third of total sales. The residential forecast retains the same basic methodology as was used in the Previous Application. However, we have made some notable improvements to it.

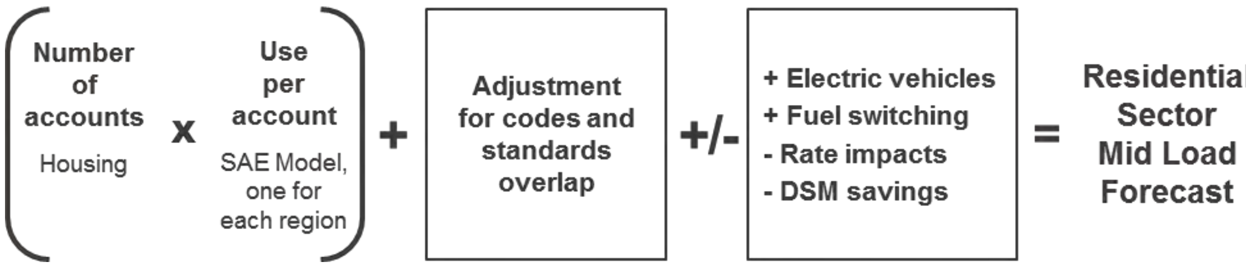
3.2.6.1 Residential Forecast Retains Same Basic Methodology

As in the past, BC Hydro develops residential sector forecasts for four regions: the Lower Mainland, Vancouver Island, South Interior and the North Region. These regional forecasts capture geographic differences in population growth, disposable income and temperature.

[79] Chapter 3 splits the Load Forecast into four sectors as it conforms to how BC Hydro presents the data in the Domestic Energy Sales and Revenue in Appendix A, Schedule 14, and section 3.5. Appendix O splits BC Hydro's Load Forecast in to five sectors by not combining the Commercial and Light Industrial sectors.

The process for forecasting residential sector sales is shown in Figure 3-4, showing sales are a product of the number of accounts and anticipated electricity use per account. The process of developing the forecast is outlined in the following steps.

Figure 3-4 Residential Sector Load Forecast Methodology[80]



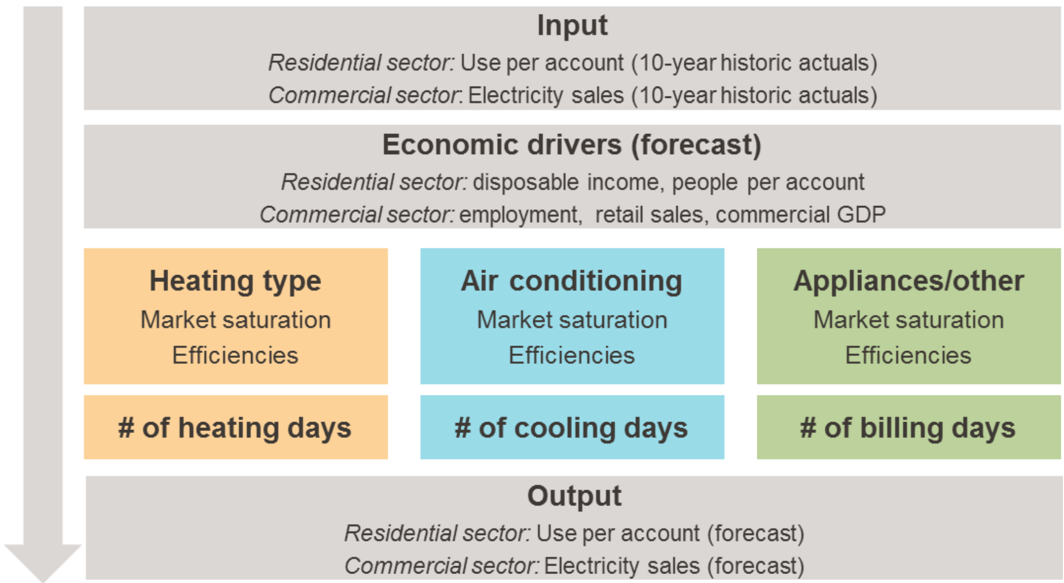
Step 1 - Number of Accounts: As with the forecast used in the Previous Application, to calculate the growth in the number of accounts the four regions are further divided into 15 sub-regions. The accounts themselves are also divided into single family dwelling accounts and multiple family dwelling accounts, respectively. The number of accounts forecast using this breakdown is based on a housing forecast from the Conference Board of Canada, June 2018 Economic Forecast. Our new method of forecasting accounts employs a ratio that translates housing projections into a number of residential customer accounts. The ratio has been updated (as discussed in section 3.2.6.2) to reflect current data.

Step 2 - Use Per Account: As with the forecast used for the Previous Application, the use per account forecast employs SAE regression models that establish a relationship between data and factors that influence the average use per account. The SAE models are products developed by ITRON (an energy forecasting consulting firm) and sold to BC Hydro. BC Hydro then adapts and populates the model with BC Hydro's customers' historical data and inputs. BC Hydro maintains full care and control of all customer information and it is never provided to a

80 The terms in this figure are defined within the process steps of the main text. While not shown in the Figure 3-4 and Figure 3-7, load reductions rate impacts, DSM savings, and savings from loss reductions.

third-party. SAE models are commonly used by utilities across North America and are considered to be an industry best practice, as highlighted in the Load Forecasting Audit. Figure 3-5 provides a conceptual overview of our implementation of the ITRON SAE models.

Figure 3-5 Illustrative Summary of SAE Model[81]



We use a single SAE model like this to forecast the average use per account for the each of the four residential regions.

The residential SAE models are called statistical regression models because they involve a set of statistical processes for estimating the relationships among variables. In the case of our residential forecasts, the SAE models identify the relationships between use per account and the following variables over the most recent 10-year history (model calibration period) ending in fiscal 2018:

- Consumer preferences and average efficiency of electricity end-uses;
- Temperature variables;

[81] Figure 3-5 is an illustrative summary of inputs, economic drivers, and outputs for both residential and commercial sector models.

- People per household; and
- Disposable incomes.

Using the relationships established from the model calibration period of the past ten years of data, the models then generate forecasts of future electricity use per account based on our expectations of future electricity end-uses, people per household, disposable incomes, and average temperature conditions. The future electricity end uses are developed with a combination of our own recent end use survey data and recent data from the US Energy Information Administration (**EIA**).

Step 3 - Adjustment to avoid double-counting: Once the SAE models produce results, an adjustment is made to account for the fact that there is an overlap between savings included in our SAE models' results and savings derived from our DSM Plan that are included later in the process. This overlap results because there are energy savings from codes and standards that are reflected in both our DSM Plan and the US EIA assumptions included in the SAE model. An example of a standard is an appliance minimum efficiency standard. We adjust the SAE models' results to mitigate potential double counting by using an estimate of the overlap between the SAE models and our DSM plan.

Step 4 - Add loads not accounted for in the SAE model: These include:

- **Electric vehicle load allocated to the residential sector**: Electric vehicle load is estimated from BC Hydro's electric vehicle forecast model. The residential sector is allocated 85 per cent of the electric vehicle model's results. The allocation is based on recent data on electric vehicles from ICBC.
- **Fuel switching load**: New loads when customers convert from a non-electric source of energy to electricity. We forecast fuel switching based on specific government or BC Hydro programs that incent customers to switch from fossil fuel-based energy to clean electricity. A summary of BC Hydro's Low Carbon

Electrification Program is found within Appendix Y, while the amounts for fuel switching by customer sector are listed in Appendix O.

Step 5 – Subtract loads for various reasons: The final step to complete the Residential Sector Load Forecast is to account for three other sources of load reductions:

- **Rate impacts:** Load reductions estimated using price elasticity and bill impact projections in real dollars (net of inflation). The bill impact projections reflected in the October 2018 Load Forecast are based on the last five years of the 2013 10 Year Rates Plan. Price elasticity is the impact of future electricity rate increases on customer demand. Price elasticity is expressed as the per cent change in quantity to a one per cent change in electricity price.
- **Loss reductions:**[82] Load reductions to account for efficiencies at BC Hydro's distribution substations to improve voltage levels to minimize line losses resulting in energy savings. These reductions are relatively small amounts over the test period.
- **DSM savings**: Load reductions to account for our DSM Plan. Further details on BC Hydro's DSM Plan are described in Chapter 10, section 10.1.2.
- The aggregated results constitute the Residential Sector Load Forecast.

3.2.6.2 Improvements to the Residential Sector Methodology

BC Hydro has made the following methodology improvements to the Residential Sector Load Forecast:

- **Recalibrated residential account growth relationship to housing starts:** We updated our approach to forecasting account growth. Previously, the methodology assumed that growth in the number of accounts was correlated

[82] Loss reductions were referred in the Previous Application as Var and Voltage Optimization (**VVO**) savings. Loss reductions are applied to residential, light industrial and commercial customers.

with housing growth on a 1:1 basis. However, a review of recent data indicated this is not the case. We have replaced the 1:1 ratio of residential accounts to every unit of housing with a ratio of 0.9:1, which is the average ratio indicated by our data.

- **Updated customer response to temperature:** We reviewed the relationship between temperature and residential use per account using smart meter data. The objective of this review was to examine the average temperature at which sales begin to increase in response to colder temperatures (generally associated with use of electric heating). We conducted a similar update looking at the average temperature at which sales begin to increase in response to warmer temperatures in the summer months (generally associated with air conditioning). Our review found that our previous approach of using a single temperature of 18°C as the point at which customers respond to outside temperatures could be improved. We now model multiple temperature thresholds, which has enabled the development of more statistically sound SAE models. For example, for the residential load in the Lower Mainland we found there is a response to colder temperatures at 15°C and 3°C. For the largest segment of commercial load in the Lower Mainland we found there is a response to colder temperatures at 12 °C and 3°C.

- **Recalibrated the relationship between economic variables and electricity sales:** In response to the Load Forecasting Audit recommendations mentioned previously, we reviewed and updated relationship coefficients between economic variables, such as disposable income, and use per account for all residential SAE models.

- **Adjusted our price elasticity assumption:** The need to review and update our price elasticity assumption was a finding from the Load Forecasting Audit, the Previous Application’s proceeding as well as the Site C Inquiry. In March 2018, BC Hydro retained DNV GL to conduct an electricity price elasticity study for each of our customer sectors. DNV GL is a global quality assurance and risk management company, with a highly regarded energy advisory services division offering institutional, legal and technical expertise on electricity systems. The company has global operations in over 100 countries. The results of their price elasticity study are included as Appendix Q (Elasticity Study & GDP Study).

DNV GL's key findings, which were adopted for this forecast, included:

- "In our survey, the most commonly reported price elasticity for the residential sector is -0.10. While values as low as -0.06 and as high as -0.26 are in use among the utilities we reviewed, the most commonly reported value is a useful indicator of typical consumer response to rate changes. The -0.10 value is also most commonly reported for the two other sectors. Further, this value (-0.10) was recently recommended in an expert testimony to the Manitoba Public Utilities Commission presented in the table above."
- "Values from external sources as well as those determined by BC Hydro from its own and neighbouring utility data, indicate a residential price elasticity value that centres around -0.10 is a reasonable value for BC Hydro's residential customers. Therefore, we recommend that BC Hydro increase the price elasticity in use to assess rate impact and determine load forecast growth for the residential customers. Based on the convergence of values, we find an increase to -0.10 to be reasonable."
- "Recommendation: In general, we find BC Hydro's application of price elasticity to be consistent with that of many of the Canadian and U.S. utilities we reviewed. DNV GL supports the continuation of BC Hydro's approach to load forecasting which involves building up sector specific forecasts, including site-specific large commercial and industrial forecasts, and applying a single price elasticity to account for price changes in the forecast. Given that

> BC Hydro employs a site by site assessment for industrial facilities which captures price effect for a selection of energy intensive facilities, such as pulp mills; and precedent elsewhere, of applying the same price elasticity across all three sectors, we recommend that BC Hydro continue to use the same price elasticity estimate for all sectors. The actual elasticity value will depend on whether BC Hydro adopts the weighted average elasticity from its 2016/17 Residential Inclining Block (**RIB**) evaluation (-0.09) or the recommended -0.10 price elasticity estimate from our research and expert recommendations".

The DNV GL study results, combined with the results of our own evaluation of the residential inclining block rate (fiscal 2013 to fiscal 2017), supports the results of our previous internal studies and third party assessments that our price elasticity estimates are consistent with what is commonly reported and on the lower end of the survey data.

For this forecast, BC Hydro has increased the electricity price elasticity value used for all of the main customer sectors in the Load Forecast for this application from -0.05 to -0.10. The impact of changing the elasticity, all else equal, results in a small net change to the total Load Forecast of about 21 GWh in fiscal 2020 and about 37 GWh in fiscal 2021.

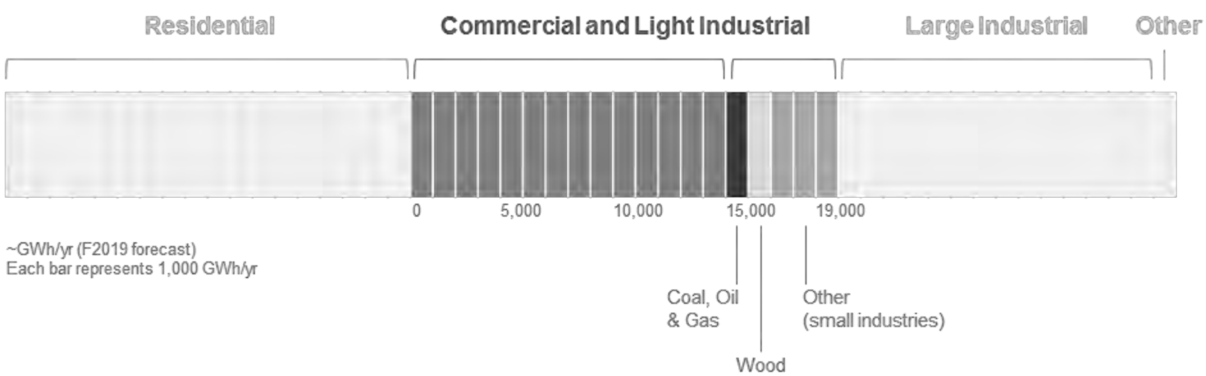
3.2.7 Commercial and Light Industrial Sector Methodology Has Been Improved

The commercial and light industrial sector consists of approximately 210,700 accounts and represents approximately one-third of total electricity sales. The forecast for this sector consists of two customer groups connected at distribution voltages:

- **Commercial Sector:** This sector includes customers such as office buildings, retail stores and warehouses. It represents approximately 80 per cent of sales to the commercial and light industrial sector.

- **Light Industrial Sector:** This sector includes small and medium sized forestry, oil and gas and coal mining operations, and other light industrial loads from various sectors including manufacturing, agriculture, etc. It also includes incremental cannabis and cryptocurrency loads receiving distribution service. It represents approximately 20 per cent of sales to the commercial and light Industrial sector.

Figure 3-6 Commercial and Light Industrial Sector Relative to Overall Load

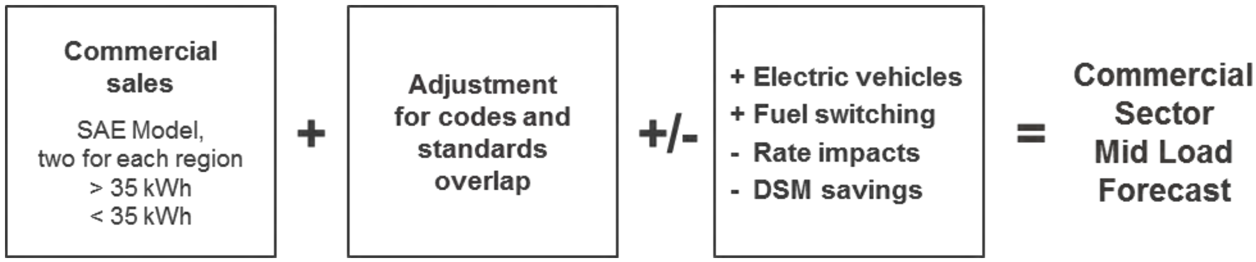


The Commercial and Light Industrial Forecast retains the same basic methodology. However, we have made improvements to the model.

3.2.7.1 Commercial Sector Methodology Uses Standard Modelling Techniques

The Commercial Load Forecast is an aggregation of forecasts developed for each of four service regions: the Lower Mainland, Vancouver Island, South, Interior, and the North Region. As with the residential sector, and consistent with the forecast prepared for the Previous Application, an SAE modelling approach is used. Within each region, separate SAE forecast models are used for small commercial customers (below 35 kW) and large commercial customers (above 35 kW). Figure 3-7 illustrates the process of developing the Commercial Sector Load Forecast.

Figure 3-7 Commercial Sector Load Forecast Methodology



While the residential sector uses the SAE model to forecast use per account, our commercial sector SAE models estimate commercial sales directly. The different approach for the commercial sector is because:

- We have not identified an economic driver that provides a reasonably accurate predictor of commercial account growth; and
- There are practical limitations given the greater diversity that exists within the commercial sector. This diversity creates additional complexity in developing a forecast process that estimates intensity, efficiency, and square footage of all the building types that exist across the various commercial segments.

The models use statistical regression to establish relationships between commercial sales, major commercial electricity end-uses, temperature variables and economic variables over the most recent ten-year history (model calibration period). The models then forecast future sales based on forecasts of economic variables (commercial GDP, employment, retail sales), the recent U.S. EIA forecasts for future end-use average efficiency trends and share of commercial electricity equipment and temperature conditions based on a historical average (as is the case in the residential SAE model). Similar to the residential sector, SAE modeling is considered by the audit findings to be the "best approach for modeling commercial sector sales". As referenced in section 3.2.6.1, Figure 3-5 provides a simplified conceptual representation of the SAE models showing the inputs used in the commercial model as well as the residential models.

As shown in Figure 3-7, and consistent with the development of the Residential Sector Load Forecast, to develop the Commercial Sector Forecast we follow these additional steps:

1. We make an adjustment to avoid double counting the impact of codes and standards between the SAE model and our DSM Plan savings, as described for the residential forecast in section 3.2.6.1.
2. Loads which are not accounted for in the SAE models are added. These include a) electric vehicle loads - the commercial sector is allotted 15 per cent of BC Hydro's electric vehicle forecast, with the remainder included in the residential forecast; and b) fuel switching loads as they relate to this sector.[83]
3. Loads are reduced to account for rate impacts and DSM savings.

The aggregated results constitute the Commercial Sector Load Forecast.

3.2.7.2 Improvements to the Commercial Sector Methodology

Improvements made to this sub-sector were similar to the SAE model-related improvements from the Residential Sector Load Forecast listed in section 3.2.6.2. These include:

- Updated customer response to temperature;
- Recalibrated relationship of economic variables to electricity sales based on an updated 10-year model calibration period; and
- Updating price elasticity from -0.05 to -0.10, consistent with the results of the independent elasticity study.

[83] Estimates based on the Government of B.C.'s and BC Hydro's low carbon electrification programs which encourage fuel switching from fossil fuels to electricity. These adjustments apply to all sectors and they are relatively small over the test period.

3.2.7.3 Light Industrial Sector Methodology Incorporates Tailored Methods

The light industrial sector represents a relatively small component of the overall load forecast (8 per cent). The sector consists of approximately 30,000 customers in a diverse range of industries. As such, a variety of forecasting methods are used, ranging from account-by-account forecasts, regression models, and production intensity based methods. These industrial sub-sectors and descriptions of their forecast methods are listed below:

- **Coal Mining:** The forecast is determined on an individual customer account basis in similar manner to the large industrial coal mining customers outlined in the mining summary in section 3.2.8.1.
- **Forestry:** Customers in this sub-sector are sawmills, panel mills and pellet plants. The forecast for this sub-sector is determined by developing mill by mill production forecasts, aggregating those forecasts by region and then multiplying the total by the historical electricity use intensity for each region and mill type.
- **Oil and Gas:** Customers in this sub-sector are primarily production and processing, transport (pipelines, pump stations, truck terminals, etc.) and support services for the oil and gas industry. The forecast is primarily determined on an individual customer account basis outlined in the oil and gas summary in section 3.2.8.1.
- **Other Light Industrial:** Sales for this sub-sector are primarily forecast using a regression model built on the historical relationship between sales to these customers and provincial GDP. The inputs to the regression model to determine the sales forecast is the short-term GDP forecast from the B.C. Ministry of Finance. Then, additional industry loads are added:
  - Cannabis and Cryptocurrency: as emerging industries, the forecast is developed with customer requested loads that are considered highly

probable based on their advanced stage of progress in BC Hydro's interconnection process; and

- Load expected to power the construction of LNG plants and other facilities. These construction loads are separate from plant operational requirements.

Two further steps are undertaken for the light industrial sector forecast, including:

1. Fuel switching load estimates are added to the sector as a whole.
2. Estimated load is reduced to account for rate impacts and DSM savings.

The end result is BC Hydro's Light Industrial Sector Load Forecast.

3.2.7.4 Other Changes to the Light Industrial Sector Methodology

Price elasticities were revised from -0.05 to -0.10 as discussed in section 3.2.6.2

3.2.8 Large Industrial Sector Methodology Has Been Improved

BC Hydro has approximately 190 large industrial customers which represent approximately 26 per cent of total sales. Customers in the large industrial sector are categorized into the same sub-sectors as light industrial customers (mining, forestry, oil and gas, and other large industrial customers) shown in Figure 3-8. While light industrial customers are connected at distribution voltage, large industrial customers are connected at transmission voltage.

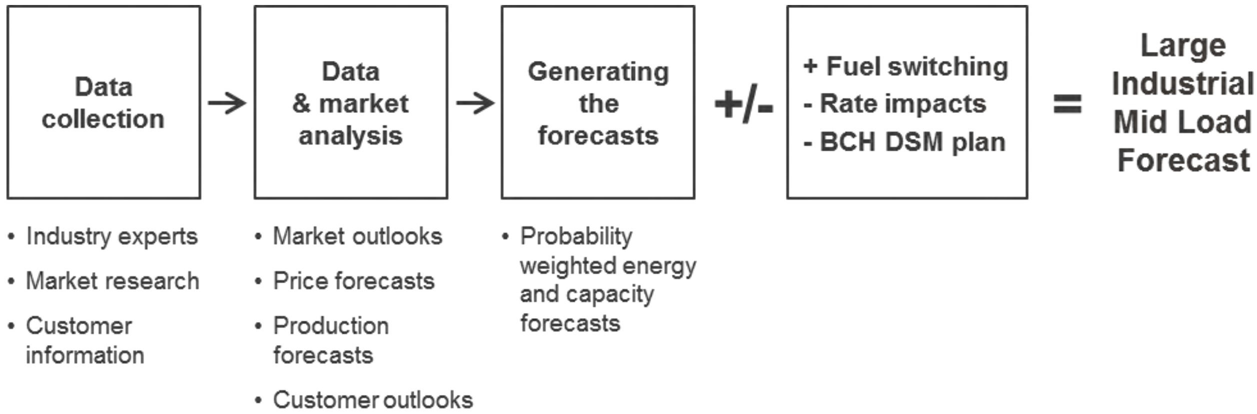
Figure 3-8 Large Industrial Sector Relative to Overall Load

As in prior years, sales to the large industrial sector are forecast on an individual customer account basis. While we continue to follow this approach, a number of methodological improvements have been made in areas identified in the Decision to the Previous Application and the Site C Inquiry.

3.2.8.1 Account by Account Approach Remains Appropriate

The account-by-account process that we use to produce the Large Industrial Sector Load Forecast is shown in Figure 3-9.

Figure 3-9 Preparing the Large Industrial Sector Load Forecast



We develop the Large Industrial Sector Load Forecast using information from several sources. These include:

- **Industry experts:** BC Hydro retains external consultants who develop production and commodity price forecasts and provide facility and/or sector-specific market assessments.
- **Market research:** BC Hydro subscribes to a number of services from companies that provide market research and industry analyses. BC Hydro also relies on various publically available reports from government agencies, such as the BC Oil and Gas Commission.
- **Information from our customers:** BC Hydro uses customer-specific information gathered by our Key Account Management and Load Interconnections groups, who are in direct contact with our customers.

Using these sources of information, we develop a probability weighting for expected sales to our current customers. This probability weighting represents a risk assessment of the likelihood of future sales increasing, decreasing or remaining steady.

For each potential new customer, these same sources of information are used to develop similar probability weightings to forecast if and when new demand will materialize.

Each of these probability weightings represents our professional judgement based on a synthesis of information from the sources listed above. Some of the factors that are considered when assigning probability weightings include:

- How far a customer has passed through our interconnection processes;
- The status of the customer's regulatory/approval permits and project financing;
- BC Hydro's ability to meet the customer's requested in-service date;
- Consultant mill and market assessments, where applicable;
- The market outlook for the customer's products;
- The credit and financial viability of the customer;
- The impact of electricity costs on the customer;[84] and
- The likelihood that the customer will take electricity supply from BC Hydro instead of self-supplying their power needs.

Due to commercial sensitivities, individual account assessments are kept confidential. To maintain this confidentiality the large industrial forecast is aggregated by sub-sector.

The following provides a summary of the main drivers of electricity sales in each of the large industrial sub-sectors:

---

[84] This factor incorporates the impacts of future electricity costs on electricity demand relative to how much their electricity costs are to overall cost of production on a sub-sector wide basis. This is separate from, but needs to be considered along with, price elasticity when assessing the overall impacts of future electricity prices.

- **Mining:** The mining sub-sector includes both metal and coal mining operations. It represents approximately 29 per cent of sales to the large industrial sector. Sales to the mining sector depend on global commodity prices which are driven by economic growth within parts of Asia, such as China, as well as the supply and demand outlooks for copper, gold and coal. Other factors that impact mining sales and sales to other industrial sub-sectors, include the availability of financing, regulatory and environmental approvals and First Nations considerations.
- **Forestry:** The forestry sub-sector includes pulp and paper, wood products and chemical segments. It represents approximately 51 per cent of the total large industrial sales. Sales to the pulp and paper segment depend on global pulp prices, B.C. fibre supply, the demand for paper products (such as newsprint, packaging and speciality coated papers), and the cost competitiveness of B.C. pulp and paper mills. Sales to the wood segment depend on the U.S. housing market, global wood products supply and demand drivers, and the supply and demand of B.C. wood fibre. Sales to the chemical segment are linked to B.C. demand (pulp and paper, water purification and industrial cleaning) and the opportunity for exports.
- **Oil and Gas:** The oil and gas sub-sector currently makes up approximately 11 per cent of total large industrial sales and includes:
  - Natural gas and natural gas liquids production and processing (i.e., primarily shale gas, but also conventional gas);
  - Oil (and condensate) pipelines;
  - Oil refineries and oil producers;
  - Natural gas pipelines;
  - Propane terminals; and
  - LNG terminals.

- Sales to the oil and gas sector depend upon commodity price outlooks for oil, natural gas, natural gas liquids, and LNG; the competitiveness of B.C. oil and gas producers, and the operational environment. The relative cost of natural gas and electricity is a significant factor when forecasting electricity sales to this sub-sector since it influences the likelihood that customers will take electricity service from BC Hydro rather than self-supply their power needs with natural gas.
- **Other Large Industrial**: This sub-sector makes up approximately 9 per cent of total large industrial sales and includes customers connected at transmission voltage not captured by the other large industrial sub-sectors mentioned above. Examples of customers include airports, seaports, universities and cement operations. This sub-sector also includes cannabis and cryptocurrency loads connected at transmission voltage instead of distribution voltage. The drivers of electricity sales in this sub-sector vary by customer.

BC Hydro makes load additions and reductions similar to those made for the residential and commercial and light industrial sectors. Specifically, load from fuel switching is added. Load reductions are then applied for rate impacts, loss reductions and DSM savings.

The aggregated results constitute the Large Industrial Sector Load Forecast.

3.2.8.2 Improvements to the Large Industrial Sector Methodology

We made improvements to the Large Industrial Sector Load Forecast methodology. These improvements specifically address, but also go beyond, issues raised by the BCUC and the Load Forecasting Audit:

- **LNG:** We updated our methodology for forecasting sales to LNG customers. In the Site C Inquiry Final Report, the BCUC observed that “BC Hydro has not made a probabilistic assessment of the likelihood of the LNG load materializing."[85] In this application, we forecast sales to LNG customers in a manner consistent with other large industrial customers: using the probabilistic assessment approach outlined in the Large Industrial Sector Methodology section and discussed in the next bullet.

- **Probability Weightings:** As part of our ongoing internal efforts to improve our load forecast methodology, we changed how we incorporate individual customer probability assessments into the first three years of our Large Industrial Sector Load Forecast (fiscal 2019 to fiscal 2021).

Previously, a customer's load was adjusted by the probability weighting we assigned to it over the forecast period. The probability weightings reflect a number of risk factors, including the likelihood that customers will expand, contract or maintain operations; close operations; or start new operations (e.g., in the case of new customers). A review of our fiscal 2018 Load Forecast variance showed a significant positive variance (higher actual loads relative to forecast) and negative variance (lower actual loads relative to forecast) for several industrial sub-sectors, notably forestry (positive variances) and oil and gas (negative variances). These variances were determined to be attributed to risk adjustments (i.e., probability weightings) on specific customers that were significantly driven by closure risk considerations (for some existing customers) or start-up likelihood consideration (for new customers). For example, a customer with a 25 per cent probability of closure would have their anticipated load included in a load forecast at 75 per cent. Operationally, the net effect of facility closures or start-ups is that a facility will either be fully operational (i.e., on) or not operating at all (i.e., off). However, the net effect of reflecting those "on/off" risk adjustments in the load forecast results in partial loads. It is the difference between those partial loads reflected in the forecast and actual operations being either "on" or "off" which largely explains the recent industrial sub-sector load forecast variances.

[85] BCUC Final Report with Respect to the Site C Inquiry (November 1, 2017), page 78.

In order to address this issue, BC Hydro has moved to a binary approach for the first three years of the forecast. The binary method results in a discrete projection (i.e., in or out) of load and revenues. This approach is applied as follows:

- We continue to undertake probability assessments on an individual customer account basis.
- Where the dominant risk factor amongst all others is closure risk, customer loads included in the forecast are reflected at either their full expected load (weighted at 100 per cent probability) or zero load (weighted at 0 per cent) for the period fiscal 2019 to fiscal 2021, depending on whether the closure risk is assessed as being low or high.
- Where the main risk factor is start-up likelihood, only high likelihood projects are included at their full expected load in the period fiscal 2019 to fiscal 2021. For these highly likely projects we also consider project schedule risk as part of the binary assessment. For example, there may be uncertainty on when a project actually comes into service relative to the customer requested in-service date. In these situations we will exercise our professional judgement in deciding whether to reflect the full expected load at a later date than that requested by the customer. If we determine that there is a reasonable likelihood the actual in-service date will occur beyond the customer requested in-service date, the full expected load (i.e., weighted at 100 per cent) will be reflected at that later date in the forecast and at zero load (i.e., weighted at 0 per cent) prior to that date.

On an aggregate sector total basis, this binary approach may or may not improve load forecast accuracy over the test period since positive variances in one sub-sector may offset negative variances in another. However, we believe this approach will improve load forecast accuracy for specific segments since it addresses why the most recent variances occurred. Over the long- term, we believe a probabilistic based approach continues to be the best method for developing the large industrial sector forecast on an aggregate basis. Our view is supported by our load forecast audit findings.

- **New Consultant Services:** Previously we had not relied on external subject matter experts to provide a comprehensive analysis of B.C. shale gas development. However, for this forecast we recognized the shale gas segment of the oil and gas sub-sector as the fastest growing area of our sales, and retained the services of an oil and gas consulting company. Their Western Canadian expertise served to provide industry intelligence to improve the accuracy of our assumptions, with a focus on:
  - Montney shale gas development in B.C. and individual customer well plant property evaluation (to improve new plant probability weightings and reduce load forecast uncertainty);
  - Oil and gas and gas liquids price forecasting; and
  - Oil sands development (which will consume much of B.C.'s natural gas and gas liquids).
- **Price elasticity:** As in the other sectors, price elasticity was updated from -0.05 to -0.10 as discussed previously in section 3.2.6.2.

3.2.9 Other Sector Methodology Incorporates Tailored Methods

The Other sector currently represents approximately 3 per cent of the total sales demand in the Load Forecast. Demand in this sector comes from irrigation and street light customers, sales to other inter utility sales (City of New Westminster and FortisBC Electric), and firm exports (Seattle City Light and Hyder). Specifically:

- **Irrigation and Street Lighting**: The forecast is based on historical growth trends. BC Hydro is in the process of approving its business case to replace street lights with LED technology. The potential roll-out of this program will not have a material impact on the total load and revenues during the test period (expected to be about 20 GWh/year), but will be monitored for impacts to future load forecasts.

- **FortisBC Electric**: The forecast is based on information provided by FortisBC Electric as well as projections from our internal model that considers the forecast of electricity market prices relative to the cost of purchases from BC Hydro under Rate Schedule 3808.
- **The City of New Westminster**: The forecast is based on historical load as well as information provided by the City of New Westminster regarding new residential and commercial loads.
- **Seattle City Light**: This forecast is determined by the Skagit River Valley Treaty which prescribes sales of approximately 310 GWh per year.
- **Hyder, Alaska:**[86] The forecast is based on historical load.

Load reductions are then applied for rate impacts. However, this step does not apply to Seattle City Light's or FortisBC Electric's loads. Sales to Seattle City Light loads are established under the Skagit River Valley Treaty. As such, there is no rate to which Seattle City Light revenues and sales are calculated. Sales to FortisBC Electric have the elasticity impact implicitly built into the methodology. The methodology considers the cost of purchases from BC Hydro which are subject to rate increases versus the cost of purchases from the market.

The aggregated results constitute the Other Sector Load Forecast.

3.2.9.1 Changes to the Other Sector Methodology

Price elasticities were revised from -0.05 to -0.10 across all customers in this sector, except for Seattle City Light and FortisBC Electric for the reasons described above.

[86] Also referred to Tongass Power in BC Hydro's Revenue Forecast in section 3.4 and Appendix A, Schedule 14.

3.2.10 Aggregating the Load Forecast and Establishing Uncertainties: The Mid Forecast with Low and High Bands

There is uncertainty in forecasting, which is accounted for by using a band around the Mid Load Forecast. The band is developed using a recognized statistical methodology that was endorsed in the recent audit.

3.2.10.1 There Are Several Sources of Uncertainty Reflected in the Band

Our Mid Load Forecast for the test period is an aggregation of the individual sector forecasts, including an adjustment for codes and standards overlap, as well as further load additions and load reductions.

The mid forecast prior to DSM savings is developed by analyzing and modeling the relationships between energy sales and the predictors of future sales, which are referred to as load drivers. Drivers consist of both economic variables and non-economic variables. Economic variables include GDP, housing starts, retail sales, employment, commodity production and commodity prices. Non-economic variables include temperature and average stock efficiency of various electricity end-uses. All of these load drivers are themselves forecasts and these forecasts lead to increases or decreases in electricity sales.

There are also uncertainties associated with the various models used to develop load forecasts, such as the accuracy of using statistically determined relationships between drivers and load to forecast loads at a point in time where the nature of those relationships may be changing. Understanding the changing relationships between economic drivers and electricity demand is challenging many North American utilities.

3.2.10.2 The Recent Audit Endorsed Monte Carlo Analysis

To address load forecast uncertainty, BC Hydro produces low and high uncertainty bands using Monte Carlo simulation analysis. The uncertainty bands produced by the Monte Carlo analysis are before DSM savings. The Monte Carlo analysis involves the sampling of distributions for key load uncertainty variables such as temperature (i.e., heating degree days), economic activity (i.e., GDP), electric vehicles, and distributions of sales for each of the large industrial sub-sectors. The distribution of sales for these sub-sectors includes the expected forecast as well as discrete low and high sub-sector forecasts. The Load Forecast Audit confirmed that simulation analysis is the best approach for developing uncertainty bands since it is statistically based, can include multiple input variables, and produces a probabilistic forecast based on input probability distributions.

To demonstrate the range of forecast uncertainty, we use the p-90 and p-10[87] forecast outcomes from the probability distribution of all possible forecast outcomes that center around our mid forecast before incremental DSM. Given the p-90 and p-10 forecast outcomes, the range of uncertainty represents an 80 per cent confidence interval.

As discussed above, our Mid Load Forecast is our expected sales after adjusting for codes and standards overlap, load additions (e.g., electric vehicle load), DSM, rate impacts and loss reductions. The uncertainty bands produced by the Monte Carlo analysis are before incremental DSM. More information on DSM savings is provided in Chapter 10, section 10.5.

3.2.11 BC Hydro’s Methodology Compared Well Against an Alternative Methodology

In the Decision from the Previous Application, the BCUC noted that “other utilities such as Pacific Northern Gas Ltd., FortisBC Energy Inc., and FortisBC Inc. use a different load forecast methodology for their short term forecast for setting rates as compared to its long term forecast for resource planning.”[88] In light of the BCUC’s

[87] P-10 means there is a 10 per cent chance that forecast outcomes will be below the values shown as the p-10. P-90 means that there is a 90 per cent chance that forecast outcomes will be below the value shown as p-90.

[88] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Appendix B, page 11.

observation, we reviewed the other utilities' short-term forecast methodologies and developed an alternative forecast based on the methodology used by FortisBC Inc., the other major electric utility in B.C.

Results of our alternative forecast comparison showed BC Hydro averaged a billed sales variance of -0.3 per cent (residential sector) and -0.4 per cent (commercial sector) for fiscal 2016 to fiscal 2018 using our load forecasting methodology, while the average billed sales variance using FortisBC Electric's methodology was 2.4 per cent (residential sector) and 0.8 per cent (commercial sector) for the same time period.

Considering the recent performance of our own methodology, the results of our comparison using an alternative short-term forecast methodology, and the improvements outlined previously that we made, we concluded that it was appropriate to use our forecast methodology for this Load Forecast.

3.2.11.1 The Recent Strong Performance of BC Hydro's Methodology Makes Outperformance Difficult

As described above, actual sales since May 2016 have closely tracked our May 2016 Load Forecast used in the Previous Application. The total load variance for fiscal 2017 was 0.1 per cent within forecast and for fiscal 2018 was 0.5 per cent within forecast. Further variance analysis information is available in Appendix G, section 2 (Variance Explanations).

3.2.11.2 Residential and Commercial Forecasts Are the Main Differences from FortisBC

Although we reviewed the short term-load forecast methodologies of FortisBC Energy Inc. (gas operation), FortisBC Inc. (electric operations), Pacific Northern Gas West Ltd. (gas operations), and Pacific Northern Gas Northeast Ltd (gas operations), we focused on FortisBC Inc.'s (**FortisBC Electric**) electric load forecast as a potential alternative methodology, since FortisBC Electric is the other major regulated electric utility in BC.

Table 3-2 below compares BC Hydro's existing load forecast methodologies to the FortisBC Electric methodology by customer sector. The mechanics of BC Hydro's and FortisBC Electric's large industrial sector methodologies are substantially the same. However, the methods each utility uses to develop their residential and commercial sector load forecasts are different. BC Hydro's residential and commercial sector methods incorporate a larger set of economic and end-use efficiency variables that can impact load compared to FortisBC Electric.

Table 3-2 Comparison of BC Hydro's Existing and FortisBC Electric's Short-Term Load Forecast Methodologies

Sector	BC Hydro	FortisBC Electric
Residential	A SAE model is used to forecast average use per residential account in each of BC Hydro's four major service regions. Refer to section 3.2.6.1 for more information on the SAE model. The accounts forecast is based on historical ratio of account growth to housing growth and housing growth forecasts, which are provided by the Conference Board of Canada.	The forecast of average use per account is established with a three year historical trend line of temperature-normalized use per account. The time trend is assumed to continue into the future to develop the forecast. The accounts forecast is based on a regression of historical accounts and population statistics which are provided by BC Statistics.
Commercial	SAE models are used to forecast electricity sales for both small commercial customers and large commercial customers in each of BC Hydro's four major service regions. Refer to section 3.2.6.1 for more information on the SAE model.	The commercial sector forecast is based on a regression analysis of load to provincial GDP. The GDP forecast is provided by the Conference Board of Canada.

Sector	BC Hydro	FortisBC Electric
Large Industrial	BC Hydro has approximately 190 large industrial customers, and forecasts load for this sector on an account by account basis. Forecast load for each account is developed using a probabilistic assessment of future customer sales. This assessment relies on intelligence from external consultants who are industry and/or plant experts, as well as third-party market subscription services. The assessment also relies on information provided by BC Hydro's key account managers who liaise directly with our customers. Based on the probability weighting for each customer, BC Hydro makes "in or out" call on the viability of each account for the test period years. This methodology is explained in more detail in section 3.2.8.	FortisBC Electric has approximately 50 industrial customers. Forecast load for these customers is developed based on confidential updates shared by customers through surveys conducted by FortisBC Electric. Where customer information is not available, FortisBC Electric applies GDP growth rates to each of its customers.

We used FortisBC Electric's short-term methodology to generate a load forecast from fiscal 2016 through fiscal 2018 to compare against our May 2016 Load Forecasts used in the Previous Application for the residential and commercial sectors. The results showed that our variance on average is more favorable compared to the average variance when we developed a load forecast using the FortisBC Electric's methodology applied to same input data used in the May 2016 Load Forecast. Specifically, BC Hydro averaged a billed sales variance of -0.3 per cent (residential sector) and -0.4 per cent (commercial sector) for fiscal 2016 to fiscal 2018 using our load forecasting methodology. The average billed sales variance using FortisBC Electric's methodology was 2.4 per cent (residential sector) and 0.8 per cent (commercial sector) for the same time period.

3.3 Load Forecast Results

The results of the Load Forecast are described in aggregate and then by customer sector in sections 3.3.1 through 3.3.5, with the risks and uncertainties that accompany the results outlined in section 3.3.6. As discussed below, BC Hydro is forecasting more modest growth relative to the May 2016 forecast used in the Previous Application.

3.3.1 Overall Load Forecast Shows Only Modest Growth

Overall, the BC Hydro's Load Forecast shows demand for electricity is forecast to increase by approximately 650 GWh or 1.2 per cent from fiscal 2019 to fiscal 2021. The Load Forecast results are summarized for the test years in Table 3-3 and the years fiscal 2019 to fiscal 2023 in Figure 3-10.

Table 3-3 provides the three components of the Load Forecast: the Mid Load Forecast and low band and high band, which represent the range of demand uncertainty. For a discussion on the low and high uncertainty bands, refer to section 3.3.6.

Table 3-3 Electricity Sales Summary after Rates after DSM Savings

	Forecast[89] (GWh)	Forecast (GWh)	Forecast (GWh)
Residential	18,049	18,258	18,330
Commercial and Light Industrial	18,976	18,973	19,030
Large Industrial	14,003	14,702	14,243
Other	1,575	1,634	1,650
Low Band	51,716	52,244	51,364
Mid Load Forecast[90]	52,604	53,567	53,253
High Band	53,507	54,907	55,189

Characterizing the Load Forecast using the Mid Load Forecast as an anchor, it shows a total increase in electricity sales by approximately 650 GWh over the test period. However, that growth is not linear with:

- Forecast demand increasing from fiscal 2019 to fiscal 2020 by approximately 960 GWh, driven primarily by growth in the oil and gas sub-sector and residential sector; and then

[89] Mid Load Forecast for fiscal 2019 includes six months of actuals, and six months of forecast data.

[90] Electricity sales do not include line losses or sales to BC Hydro. This is captured in Total Domestic Sales as show on line 14 of Schedule 4 of Appendix A.

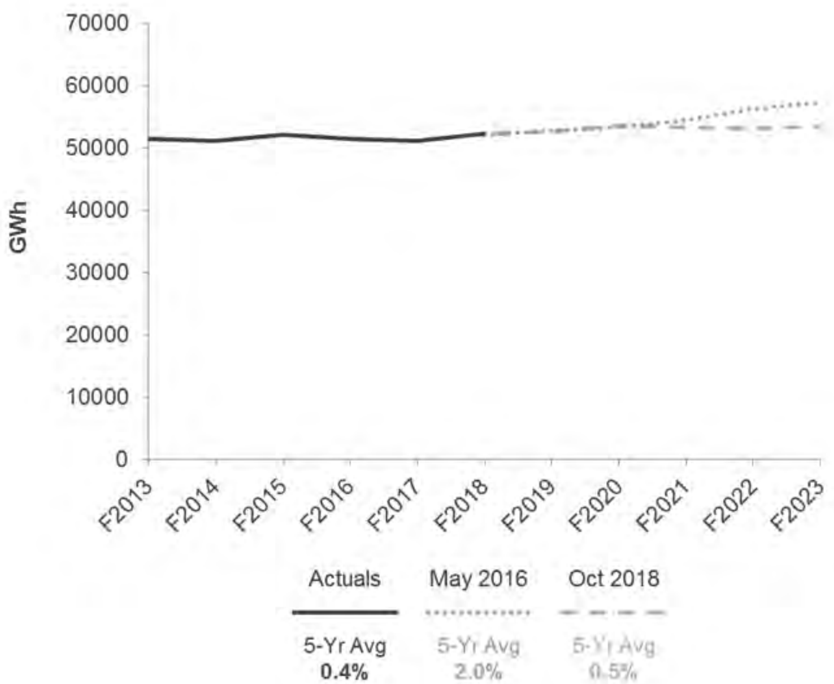
- Forecast demand declining from fiscal 2020 to fiscal 2021 by approximately 310 GWh. This decrease comes substantially from an expected decline in sales to the pulp and paper sub-sector in line with historical trends.

Figure 3-10 provides a summary of comparison between the October 2018 Load Forecast and the May 2016 Load Forecast for fiscal 2018 to fiscal 2023. It shows that over this period, the October 2018 Load Forecast's growth is a more moderate 0.5 per cent per year compared with the May 2016 Forecast of 2 per cent per year.

The October 2018 Load Forecast is growing slower than May 2016 Load Forecast because of changes in factors that impact load growth in the residential and commercial sectors which make up two thirds of our of total load. The lower forecasts for these sectors reflects the impact of a slower growth in the economic forecast, the recalibration of relationships between economic variables and electricity sales, and updated (i.e., higher) efficiency projections of various end uses of electricity and revised calibration period used in estimating the SAE models.

The slower growth in the residential sector and decline in commercial sector sales do not offset the increase in large industrial and light industrial sectors, as described below.

Figure 3-10 Electricity Sales Summary – October 2018 Load Forecast vs. May 2016 Load Forecast[91]



3.3.2 Residential Sector Load Forecast

The Residential Sector Load Forecast shows a total increase in demand of approximately 280 GWh over the test period. The increase in sales over the test period is primarily due to an expected increase in the number of residential accounts, increased estimated overlap in codes and standards, and increased load from electric vehicles.

The percentage growth in number of residential accounts shown in Table 3-4 equates to approximately 29,600 accounts between fiscal 2019 and fiscal 2020 and a further 24,400 accounts between fiscal 2020 and fiscal 2021. The forecast of accounts reflects a continuation of the strong growth in recent years in housing

[91] Figure 3-10 is the same as Figure 3-1, which was presented in section 3.1 (Introduction).

starts which is anticipated to continue over the test period as per the projections from the Conference Board of Canada, June 2018 Economic Forecast.

Table 3-4 Growth in Number of Residential Accounts

	F2017 Actual	F2018 Actual	F2019 Forecast	F2020 Forecast	F2021 Forecast
Annual Residential Account Growth[1] (%)	1.4	1.5	1.6	1.6	1.3

1. Residential accounts forecast and history is the number of accounts for all integrated and non-integrated customers.

The overall residential average use per account projection is expected to remain flat over the test period. As such, it is not a strong driver in the overall growth in sales over the test period.

In terms of the Electric Vehicle (**EV**) Load Forecast, Table 3-5 shows the contribution of electric vehicle load to the residential sector is expected to be about 89 GWh by the end of the test period. This equates to a forecast number of a total number of electric vehicles of approximately 24,300 in fiscal 2020 and 33,500 in fiscal 2021. The forecast of the number of electric vehicles and their associated load was developed using BC Hydro's in-house EV model. The EV model incorporates a number of drivers, such vehicle capital and operating costs, including incentives; as well as constraints, such as electric vehicle range and consumer adoption.

Table 3-5 Electric Vehicle Forecast – Residential Sector

	F2018 Actual[1]	F2019 Forecast[2]	F2020 Forecast[2]	F2021 Forecast[2]
Electric Vehicle Load[3] (GWh)	29	47	66	89

1. Actual residential EV load is based on percentages stated below.
2. Forecast is before reductions for rate impacts.
3. Total electric vehicle forecast split between residential (85 per cent) and commercial (15 per cent) sectors.

3.3.3 Commercial and Light Industrial Sector Load Forecast

Total electricity sales to the commercial and light industrial sector show an increase of 54 GWh between over the test period. This represents approximately 234 GWh decline in demand from the commercial sector and an increase of approximately 288 GWh in demand from the light industrial sector.

3.3.3.1 Commercial Sector Load Forecast

Over the test period, forecast sales to the commercial sector are expected to decline by about 234 GWh. This decline is a result of an update to the model calibration period, slower projected growth in economic drivers, increases in the efficiency of how commercial customers use electricity as well as the impacts of BC Hydro's DSM savings.

Forecasts of the economic factors that are inputs to our commercial SAE models are summarized in Table 3-6. They predict slower growth relative to the recent past, resulting in lower growth in commercial and light industrial sector demand.

Table 3-6 Economic Drivers of the Commercial Sector

Commercial Sales Drivers[1] (Annual Growth %)						
Economic Driver	F2016 (Actual)	F2017 (Actual)	F2018 (Actual)[1]	F2019 (Forecast)	F2020 (Forecast)	F2021 (Forecast)
Employment	1.3	3.1	3.7	1.5	1.2	1.4
Retail Sales	5.3	6.1	8.5	3.6	2.1	2.3
Commercial GDP	4.3	3.8	3.7	2.7	2.6	2.6

Notes:

1. The values are the actual and forecast growth in employment, retail sales and commercial GDP as provided by the Conference Board of Canada, June 2018 Economic Forecast. All of these values are at the BC Hydro wide service area while regional forecasts of these variables are used in developing sales forecasts which comes from the commercial SAE models.

3.3.3.2 Light Industrial Sector Load Forecast

Over the test period, the light industrial sector forecast shows an increase of 288 GWh. The majority of this increase is from cannabis and cryptocurrency loads. These loads represent customer requested loads that are considered highly probable based on their advanced stage of progress in BC Hydro's interconnection process. The remainder of the growth can be largely attributed to the natural gas sector loads, and construction loads in sales to other light industrial customers.

Demand growth from other light industrial customers is driven by projected provincial GDP which shows lower growth over the test period relative to past load forecasts. Table 3-7 shows the September 2018 forecast of provincial GDP growth from the B.C. Ministry of Finance.

Table 3-7 Real GDP Growth – British Columbia

Calendar Year	2015 (Actual)	2016 (Actual)	2017 (Actual)	2018 (Forecast)	2019 (Forecast)	2020 (Forecast)
Real GDP Growth (%)	3.5	3.5	3.6	2.2	1.8	2.0

Source: B.C. Ministry of Finance First Quarter Report Issued September 7, 2018.

3.3.4 Large Industrial Sector Load Forecast

The forecast for the Large Industrial sector and its respective sub-sectors is shown in Table 3-8.[92]

Table 3-8 Large Industrial Sales by Sub-Sector after Rates after DSM Savings

Fiscal Year	Mining (GWh)	Forestry (GWh)	Oil and Gas (GWh)	Other Large Industrial (GWh)	Total Sales (GWh)
F2013 (Actual)	3,102	8,351	961	1,117	13,530
F2014 (Actual)	3,529	8,234	1,032	1,177	13,972
F2015 (Actual)	3,808	7,959	1,116	1,173	14,055
F2016 (Actual)	3,883	7,390	1,276	1,149	13,698
F2017 (Actual)	3,884	6,723	1,373	1,126	13,106
F2018 (Actual)	3,880	6,954	1,507	1,171	13,513
F2019 (Forecast)	3,796	6,668	2,334	1,205	14,003
F2020 (Forecast)	3,884	6,541	2,740	1,537	14,702
F2021 (Forecast)	3,935	5,761	2,958	1,588	14,243

[92] Actual values in the table above are on billed sales basis because data for the large industrial sub-sector collected and forecasted on a billed basis. Forecast for fiscal 2019 includes six months accrued sales and six months forecast.

Over the test period, large industrial sector sales are expected to increase 730 GWh. As is shown in Table 3-8, this represents an increase of 699 GWh from fiscal 2019 to fiscal 2020 and then a decrease of 459 GWh from fiscal 2020 to fiscal 2021.

The forecast increase in electricity sales for the large industrial sector from fiscal 2019 to fiscal 2020 is primarily driven by growth in the oil and gas sub-sector and the other large industrial sub-sector. The forecast decrease from fiscal 2020 to fiscal 2021 is mainly from the decline in electricity sales to the pulp and paper segment which is consistent to the historical long-term trend in sales.

Descriptions of the forecasts for the large industrial sub-sectors are provided below:[93]

3.3.4.1 Mining

Over the test period, sales to the mining sub-sector are expected to increase by 139 GWh. This increase is primarily driven by expectations that our customers will undertake equipment upgrades in their existing operations. The forecast does not anticipate any new mines or the restart of operations at any mines.

For the years from fiscal 2019 to fiscal 2024, sales to mining are projected to revert to close to the level of fiscal 2018, as increases are offset by customers reaching end of mine life.

The following provides additional information on the metal and coal mining market outlook over the forecast period to fiscal 2024.

Metal Mines

Global copper demand is expected to continue to grow at a moderate rate driven by construction activity in China and global electrification of transportation and manufacturing. Trade conflicts are expected to have an effect in the short-term, but

[93] Additional descriptions of large industrial sub sectors and forecasts beyond fiscal 2021 can also be found in Appendix O, section 7.8.

are not expected to drive the global economy into a recession. For gold, the anticipated geopolitical environment and corresponding US dollar fluctuations suggest gold prices are expected to remain stable in the next few years.

Over the forecast period, at these price levels for copper and gold, existing customers are expected to operate normally, but have little incentive to bring new mines into production.

On January 7, 2019 Imperial Metals announced the suspension of operations at the Mt. Polley mine due to market conditions, and that operation will resume "once the economics of mining at Mt. Polley improve." As a result, BC Hydro expects reduced sales from Mt. Polley relative to the above mid forecast starting in fiscal 2020.

Coal Mining

The price for metallurgical coal has increased sharply over the last two years following a downturn from 2013 through 2016. Looking forward to fiscal 2024, the restarting of shuttered global operations is expected to reduce current coal prices. At these prices, we expect existing coal operations to continue normal operations, and that no new mines will start operations over the next six years.

The metallurgical coal load forecast expects some of our current customers to initiate equipment and production upgrades. This will be offset by the recent shutdown of the Coal Mountain operation by Teck resulting in a small increase over the test period.

3.3.4.2 Forestry

Over the test period, sales to the forestry sub-sector are expected to decline by 907 GWh. The decline is due mainly to the pulp and paper segment. The pulp and paper industry is expected to experience volatile but generally favourable commodity prices. Nevertheless, plant closure risk still exists because of underlying market and mill expectations facing publication paper mills.

The following provides additional information on the pulp and paper, wood product, and chemical segments market outlook and anticipated impact to sales. The forecast results of the segments are found in Table 7-24 of Appendix O, section 7.8.

Pulp and Paper

Over the test period, sales to the pulp and paper segment are expected to decline by about 782 GWh. Nearly the entire decline is due to publication paper mills, which are facing a number of challenges. Examples include aging equipment, fibre supply issues, and declining markets for their product. The decline in the test period reflects a continuation of declining sales to this segment in recent years. The factors that contributed to the decline were mill and mill line closures; more specifically, they include:

- Aging capital equipment;
- Declining fibre availability due to impacts from mountain pine beetle infestation and wildfires;
- Strong competition from new kraft mills in South America;
- Displacement of newspaper by digital media; and
- Increased use of electronic media by advertisers.

Over the Load Forecast period from fiscal 2019 to fiscal 2024, sales to the pulp and paper segment are projected to decline by about 30 per cent for the reasons stated above.

For pulp producers, favourable prices and fibre availability are expected over the forecast period from fiscal 2019 to fiscal 2024; which is the primary reason for a relatively flat sales forecast for these customers.

Wood Products

Over the test period, sales to the wood products segment are forecast to remain relatively stable with a small decline by 7 GWh. While sales have declined in recent years, sales increased between fiscal 2017 and fiscal 2018 due to record lumber prices which is reflected in the relatively stable sales over test period.

Over the forecast period from fiscal 2019 to fiscal 2024, we expect U.S. housing starts will continue to rise, however, the wood products segment faces ongoing uncertainties related to the U.S.-Canada softwood lumber dispute and BC fibre shortage (caused by the mountain pine beetle losses compounded by recent record wildfires). These issues will likely increase mill production costs and put downward pressure on sales.

Chemical

Over the test period, sales to the chemical segment (industries providing bleaching and cleaning agents) are expected to remain stable.

3.3.4.3 Oil and Gas

Over the test period, sales to the oil and gas sub-sector are expected to increase by 624 GWh. This increase is primarily driven by the growth in the shale gas segment from projects that recently started commercial operations or are currently under construction, and by the growth in propane terminals. This growth during the test period reflects a continued expected increase in sales of 827 GWh from fiscal 2018 to fiscal 2019. BC Hydro is not expecting electricity sales to LNG customers over the test period beyond sales to the FortisBC Tilbury plant, which is in operation.

Over the forecast period from fiscal 2019 to fiscal 2024, the load forecast for the oil and gas sub-sector expects sales to increase by approximately 2,465 GWh. Most of this growth is expected to continue to come from shale gas production as B.C.'s Montney shale basin remains a low cost producer of natural gas and natural gas liquids supplying North American and, increasingly, global markets. The remaining sales forecast is largely made up of demand growth in propane terminals and other oil and gas customers described below.

The following provides additional information on the major oil and gas segment sales market outlook and anticipated impact to sales. The forecast results of the segments are found in Appendix O, section 7.8, Table 7-24.

Shale Gas

Over the test period, the increase in sales to the shale gas segment is expected to be approximately 517 GWh. The shale gas segment represents about 50 per cent of the oil and gas sub-sector's sales. Customers in this segment are plants that recover and process natural gas and natural gas liquids. These customers operate in the Montney shale basin, which is located in northeast B.C. (around the Dawson Creek area). Historically, sales to these customers increased by about 500 per cent from fiscal 2013 through fiscal 2018.

Over the forecast period from fiscal 2019 to fiscal 2024, sales to the shale gas segment is expected to increase by approximately 1,333 GWh of which most of this is not related to LNG terminal development.

Other Large Oil and Gas Operations

Over the test period, sales to the other large oil and gas operations are expected to increase by about 122 GWh. Currently, sales to this segment represent about 50 per cent of the oil and gas sub-sector's sales. Customers in this segment include the conventional natural gas processing plants, pipelines (oil, condensates, natural gas), propane terminals and LNG terminals.

Over the forecast period from fiscal 2019 to fiscal 2024, sales to the other large oil and gas operations segment is expected to increase by approximately 1,133 GWh.

This growth is attributed to sales to LNG terminals, propane terminals, pipelines and conventional natural gas processing customers.

Publically available information on LNG projects which informed our load forecast included:

- LNG Canada Inc. recently made a positive final investment decision. Only construction-related load from this LNG facility is expected within the window of our load forecast;
- Woodfibre LNG announced that it intends to make a final investment decision this winter. We included a probability weighted sales forecast from this facility in its load forecast; and
- FortisBC Tilbury is in operation and we included forecast sales to this LNG facility.

3.3.4.4 Other Large Industrial

Over the test period, sales to the other large industrial customers are expected to increase by 383 GWh. The primary driver of this increase is forecast sales to new cannabis and cryptocurrency customers connected at the transmission voltage service level.

In addition to cannabis and cryptocurrency, a small amount of growth over the test period (approximately 80 GWh) is led by upgrades and expansions made by our existing customers.

Over the load forecast period from fiscal 2019 to fiscal 2024, sales to this sub-sector are expected to increase by 398 GWh. This growth is led by incremental cannabis and cryptocurrency loads which are well advanced in our inter-connection process.

3.3.5 Other Sector Load Forecast

Sales that make up the Other sector load includes electricity sales to FortisBC Electric, City of New Westminster, Hyder Alaska, street lighting customers and irrigation customers. Over the test period, the projected increase in sales to the other sectors loads is 75 GWh, where most of this increase is attributed to the forecast of electricity sales to FortisBC Electric from BC Hydro.

3.3.6 Many, but Not All, Uncertainties and Risks Are Reflected in the High and Low Bands

BC Hydro's recent forecast performance has been good, with the May 2016 forecast tracking within 0.1 per cent to 0.5 per cent of actuals per year for the first two years of the last test period. However, as summarized in section 3.2.10, there is uncertainty in developing load forecasts. Load forecasts are sensitive to many input variables that drive the forecast, which have varying degrees of uncertainty associated with them. These uncertainties influence the risk that future loads will be lower or higher than forecast. They can exist at a customer-specific level, sector-wide level or economy-wide level. Many uncertainties and risks are accounted for in the high and low bands, although some other uncertainties and risks remain unaccounted for.

3.3.6.1 Uncertainty and Risks Reflected in the High and Low Bands

Specific risks and uncertainties reflected in the high and low bands include:

- Economic risk continues to be a key uncertainty driver, particularly as it relates to future economic and housing growth forecasts. While the United States – Mexico - Canada trade agreement has been reached, there remains considerable downside uncertainty in world trade;
- Customer and project-specific uncertainties in the large industrial sector remain, particularly with the mining and forestry sub-sectors;
- While there is a high probability of growth in the upstream natural gas sector, the potential for even more exists;
- There is the possibility of a large and rapid increase in electrification;

- Little consensus exists about the future of emerging sectors of cryptocurrency and cannabis within British Columbia; and
- Predicting the trajectory of electric vehicle sales remains challenging.

To quantify the various uncertainties in the factors that increase or decrease load, BC Hydro develops a high and a low uncertainty bands around our mid load forecast.

The summary results from the Monte Carlo analysis, after load reductions for the mid DSM savings, are included in Table 3-3 above. The results show a symmetric distribution around the Mid Load Forecast where the band width increases further into the forecast period due to greater uncertainty.

Mathematically, the results of Monte Carlo analysis tend to produce a symmetrical distribution around the Mid Load Forecast. Despite this statistical result, there are a number of sectors for which the risk profile is asymmetrical wherein the potential for higher load relative to the Mid Load Forecast is greater than the potential for lower load. In particular, this asymmetry applies to growth industries such as the natural gas production. The asymmetry also applies to new loads such as LNG, electric vehicles, cannabis and cryptocurrency where there is minimal existing load and significant, albeit, uncertain growth potential. In contrast, for mature industries such pulp and paper, the potential for lower load relative to the Mid Load Forecast is greater than the potential for higher load. These asymmetrical risk profiles are captured in discrete low and high sub-sector load forecasts which are incorporated in the Monte Carlo analysis.

3.3.6.2 Uncertainty and Risks Not Fully Reflected in the High and Low Bands

For the test period, there are also risks that load will be higher or lower than forecast, where some of these are not fully captured within the uncertainty bands. Some of these risks include the following.

Potential upside risks to the Load Forecast:

- The CleanBC Plan, released by government in December 2018, is not reflected in the Load Forecast which was finalized in October 2018 but will be incorporated in future load forecast updates. By 2030, the CleanBC Plan could require approximately an incremental 4,000 GWh of energy over and above currently projected demand growth to electrify key segments of the economy. Some of the implications of this include a further commitment to electric vehicle incentives which may mean more electric vehicle sales and associated loads, increased building load and increased natural gas sector load.
- There are several idled mines and pulp mills that could re-start. While we develop a high load forecast for each of the large industrial sub-sectors by undertaking plant-specific assessments, we cannot anticipate all potential high load scenarios.
- Estimates of the overlap in codes and standards are based on our internal work on the extent of the overlap over the various diverse set of electrical appliances and uses of electricity. Further work in this area may lead to revised overlap projections.
- The forecast assumes historical average temperature trends. If temperatures are colder than normal this can led to higher sales.

Potential downside risks to the Load Forecast:

- The Load Forecast over the entire short-term period does not reflect any specific period of an economic recession or recovery. The timing and duration of these events cannot be forecasted with certainty; although recessions may lead to reduced loads as was the case with the 2008/2009 recession. The Conference Board of Canada, which provided the economic forecasts used to develop BC Hydro’s Load Forecast, does not attempt to forecast recessions. Even so, BC Hydro monitors economic reports and near term trends. Since our

Load Forecast was completed there has been an increase in reported concerns regarding the state of the economy. For example, the Business Council of B.C.'s January, 2019 news release points to a number of external and domestic risk factors that may adversely impact economic activity. Nevertheless, the Business Council of B.C. is still projecting the BC economy to expand in fiscal 2020 (2.2 per cent real GDP), which is consistent with the Conference Board of Canada's and B.C. Ministry of Finance forecast.[94,95]

- Specific customer sites could curtail operations or shut down. While we develop a Low Load Forecast for the large industrial sector by undertaking plant-specific assessments, we cannot anticipate all potential low load scenarios.
- Housing starts and growth in housing stock may vary from Conference Board of Canada forecasts as a result of various factors impacting the housing market such as new taxes and higher interest rates. This could result in lower sales to the residential sector over the test period.
- Warmer than anticipated temperatures. For example, sales to the residential sector declined by close to 5 per cent between fiscal 2014 and fiscal 2015 mainly due to warmer temperatures.

3.4 Revenue Forecast Methodology is Unchanged

The Revenue Forecast is used to determine the revenue shortfall and the proposed rate increases to meet BC Hydro's forecast revenue requirements. The forecast methodology uses load and customer projections from the Load Forecast in section 3.3 above and applies approved fiscal 2019 tariff rates to calculate revenue. The Revenue Forecast is a straightforward calculation, relative to the preparation of the Load Forecast, and the method is unchanged from the last Application.

[94] British Columbia Business Council News Releases and Op-Eds. Finlayson Column: Four questions on the B.C. economy in 2019. January 21, 2019.

[95] As noted in section 3.2.7.3, BC Hydro's supplants the Conference Board's GDP forecast with the B.C. Ministry of Finance GDP forecasts for the first five years of the forecast period.

3.4.1 Revenue Forecast Focusses on Domestic Revenues

Domestic revenues are comprised of revenues from the sale of electricity to BC Hydro's customers within the province and to certain customers outside of the province under treaty or long-term contract with BC Hydro (specifically, the Skagit Valley Treaty commitment and sales to Tongass Power and Light in Hyder, Alaska). Domestic revenues do not include any Open Access Transmission Tariff revenues, which are addressed in Chapter 9. The Domestic Energy Sales and Revenue Forecast is provided in Appendix A, Schedule 14. Note that miscellaneous revenues are not included in Domestic Revenues. Refer to Chapter 8, section 8.7, for details of miscellaneous revenues.

The method used to forecast revenue from each customer sector is discussed below.

3.4.2 Residential Sector Revenue Forecast Methodology is Unchanged

The Residential Sector Revenue Forecast methodology is unchanged from the Previous Application. The Residential Sector Revenue Forecast is the sum of revenue from basic charges and energy charges. Basic charge revenue is the product of forecast number of accounts and residential basic charge. Energy charge revenue is the product of forecast consumption for the residential class and residential energy charges.

3.4.3 Light Industrial/Commercial Sector Revenue Forecast Methodology is Unchanged

The Light Industrial/Commercial Sector Revenue Forecast methodology is also unchanged from the Previous Application.

The Light Industrial/Commercial Sector Revenue Forecast includes the Small General Service, Medium General Service, and Large General Service customer classes, and the Revenue Forecast is the sum of revenue from these three general service customer classes.

The Small General Service Revenue Forecast is the sum revenue from basic charges and energy charges. Basic charge revenue is the product of forecast number of accounts and Small General Service basic charge. Energy charge revenue is the product of forecast consumption and Small General Service energy charge.

The Medium General Service and Large General Service Revenue Forecasts are the sum of revenue from basic charges, demand charges and energy charges. Basic charge revenue is the product of the forecast number of accounts and Medium General Service and Large General Service basic charge. Demand charge revenue is the product of projected demand and Medium General Service and Large General Service demand charge. Energy charge revenue is the product of forecast consumption and Medium General Service and Large General Service energy charge.

3.4.4 Large Industrial Sector Revenue Forecast Methodology is Unchanged

The Large Industrial Revenue Forecast methodology is also unchanged from the Previous Application and now includes the forecast revenue from LNG customers. In October 2018, as described in Chapter 2, section 2.5.9, the Government of B.C. removed a previous provision that prevented LNG customers from receiving service under BC Hydro’s transmission rate schedules. This means that revenue from LNG customers is now recorded as generate rate revenue and not as a separate line item.

The Large Industrial Revenue Forecast is the sum of the Revenue Forecast for each transmission customer, comprised mostly of transmission service stepped rate customers and transmission service exempt rate customers The Revenue Forecast for each customer is the sum of energy charge revenue and demand charge revenue. The energy charge revenue for transmission service stepped rate customers is calculated by comparing the forecast consumption for each customer to the customer's fiscal 2018 interim Customer Baseline Load. Forecast consumption for each customer up to and including 90 per cent of the customer's Customer Baseline Load is priced at the Tier 1 energy charge, and the balance of forecast consumption above the customer's Customer Baseline Load is priced at the Tier 2 energy charge. The energy charge revenue for transmission service exempt rate customers is the product of forecast consumption and transmission service exempt rate energy charge. The demand charge revenue is the product of projected demand and large industrial demand charge.

3.4.5 Other Sector Revenue Forecast Methodology is Unchanged

The Other Sector Revenue Forecast methodology is also unchanged from the Previous Application.

The Other Sector Revenue Forecast for the other sector is the sum of revenue for irrigation, street lighting customers, and sales to other utilities including the City of New Westminster, FortisBC Electric, City of Seattle, and Tongass Power and Light (in Hyder, Alaska).

The Revenue Forecasts for irrigation and street lighting customers are the products of forecast sales to irrigation and street lighting customers and the average revenue rates applicable for the respective customer classes.

The Revenue Forecast for City of New Westminster is the sum of energy charge revenue and demand charge revenue. Energy charge revenue is the product of forecast sales to the City of New Westminster and the transmission service exempt rate energy charge. Demand charge revenue is the product of projected demand and the transmission service rate demand charge.

The Revenue Forecast for FortisBC Electric is the sum of energy charge revenue and demand charge revenue. Energy charge revenue is product of forecast sales to FortisBC Electric and the transmission service FortisBC Electric energy charge.

Demand charge revenue is the product of the projected demand and the transmission service FortisBC Electric demand charge.

The Revenue Forecast for the City of Seattle is the product of forecast sales to the City of Seattle and the price per MWh committed in the Skagit River Valley Treaty. The adoption of IFRS 15, *Revenue from Contracts with Customers*, effective for fiscal 2019, resulted in an increase in the price per MWh for fiscal 2019 onwards as described in Chapter 8, section 8.13.

The Revenue Forecast for Tongass Power and Light is the product of forecast sales to Tongass Power and Light and the average revenue rate for the customer class.

3.5 Test Period Revenue Forecast

Table 3-9 below summarizes the domestic Revenue Forecast as shown on Appendix A, Schedule 14.0.

Table 3-9 Fiscal 2017 to Fiscal 2021 Domestic Revenues

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Residential	14.0 L11	1,914.8	1,916.2	1,991.4	1,996.8	2,067.9	2,037.8	2,072.8	2,082.0
2	Light Industrial and Commercial	14.0 L12	1,703.2	1,714.7	1,758.4	1,770.6	1,821.9	1,832.5	1,835.9	1,840.8
3	Large Industrial	14.0 L13+L19	748.5	732.9	774.6	772.5	840.9	841.0	895.3	874.6
4	Other	14.0 L14:L18	120.3	122.2	124.4	122.4	129.1	141.0	144.2	144.9
5	Subtotal	14.0 L20	4,486.8	4,486.0	4,648.9	4,662.3	4,859.8	4,852.3	4,948.2	4,942.4
6	Revenue from Deferral Rider	14.0 L21	223.5	223.7	231.3	233.2	268.1	241.6	0.0	0.0
7	Total	14.0 L22	4,710.3	4,709.7	4,880.2	4,895.5	5,127.9	5,093.9	4,948.2	4,942.4

The Revenue Forecast for fiscal 2020 to fiscal 2021 is based on fiscal 2019 rates approved by the Decision from the Previous Application, and excludes the proposed rate increases sought in this application and the impact of any future rate structure changes.

In fiscal 2020, total revenue is forecast to decrease by $145.7 million or 2.9 per cent over the fiscal 2019 Forecast, largely due to the elimination of the deferral rider, as discussed in Chapter 1. Before revenue from the deferral account rate rider, revenue is higher by $95.9 million or 2.0 per cent, consistent with energy sales which are forecast to increase by 1.8 per cent, as discussed in section 3.3.

In fiscal 2021, total revenue is forecast to decrease by $5.8 million or 0.1 per cent, consistent with energy sales which are forecast to decrease by 0.6 per cent over the fiscal 2020 Plan, as discussed in section 3.3.

Fiscal 2020 to Fiscal 2021
Revenue Requirements Application

Chapter 4

Cost of Energy

Table of Contents

List of Figures

List of Tables

4.1 Introduction

This chapter discusses BC Hydro's energy costs. BC Hydro is not, as part of this application, proposing any generation projects or seeking acceptance of any Electricity Purchase Agreements (**EPAs**). Rather, this chapter provides the necessary information to demonstrate that the forecast Cost of Energy is reasonable for the purpose of setting rates in the test period. The forecast Cost of Energy is used in determining our total revenue requirements for the purpose of this application, however, customers ultimately only pay the actual Cost of Energy through the use of regulatory accounts.

This Chapter is organized around the following key points:

- Section 4.2 provides background information on how BC Hydro's Cost of Energy is categorized. In light of the elimination of the Heritage Contract, BC Hydro has restructured the presentation of the Cost of Energy in our revenue requirements model to improve clarity of the accounting treatment of our Cost of Energy.[96] The presentation change has no operational or financial impact.
- Section 4.3 describes BC Hydro's approach to managing future energy supply, which includes a number of steps to reduce IPP energy costs. This section also discusses the impacts of the Comprehensive Review on BC Hydro's Cost of Energy.
- Section 4.4 discusses how BC Hydro maximizes the expected value of its energy supply portfolio through its use of monthly Energy Studies. The

96 The costs of Market Electricity Purchases, Surplus Sales, Net Purchases (Sales) from Powerex and Domestic Transmission - Export were previously distributed into Heritage and Non Heritage Energy costs, based on the Heritage Contract threshold of 49,000 GWh. As discussed in Chapter 2 section 2.2.1, as part of the Comprehensive Review, the Government of B.C. repealed Direction No. 7 to the BCUC, which included the Heritage Contract. The repeal of the Heritage Contract has no impact on BC Hydro or ratepayers; however, it provides BC Hydro with the flexibility to re-categorize its Cost of Energy for this application by creating a third category, Market Energy, which includes the four components – Market Electricity Purchases, Surplus Sales, Net Purchases (Sales) from Powerex and Domestic Transmission - Export.

methodology has been endorsed by independent experts as part of a recent audit.

- Section 4.5 provides BC Hydro's forecast Cost of Energy for the test period, and explains the treatment of variances between the forecast Cost of Energy and actual Cost of Energy. While the forecast Cost of Energy is used in determining our revenue requirements, the BCUC approved regulatory accounts ensure that customers ultimately only pay for the actual energy costs.
- Sections 4.6, 4.7 and 4.8 provide a more detailed breakdown of the Cost of Energy by category (Heritage, Non-Heritage and Market). The amounts shown in these sections are presented in the Gross View (i.e., total costs before any forecast transfers to, or recoveries from, regulatory accounts). Overall, by fiscal 2021, BC Hydro's Cost of Energy is forecast to increase by $157 million from the fiscal 2019 RRA amount. This forecast increase is primarily driven by an increase in costs related to IPPs and Long-Term Commitments. These forecast costs are primarily associated with existing EPAs, and because the terms of these agreements are already set, the forecast costs for these EPAs are largely prescribed. With few exceptions, BC Hydro is not acquiring new resources from IPPs and those exceptions represent only a very small portion of the forecast Cost of Energy.

4.2 BC Hydro Has Clarified the Presentation of Cost of Energy

This section provides background information on how BC Hydro's Cost of Energy is categorized. In its Decision on the Previous Application the BCUC directed BC Hydro to explain, in a Compliance Filing, the accounting treatment of surplus energy costs and recoveries.[97] As a result of some of these questions, in this application, BC Hydro has restructured the presentation of Cost of Energy in the

97 BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 RRA (March 1, 2018), page 112.

revenue requirements model for clarity purposes. The financial treatment of energy costs, and the way the system is operated remain unaffected by the change in presentation.

4.2.1 The Repeal of the Heritage Contract has Facilitated an Improved Presentation

BC Hydro's Cost of Energy was previously categorized into Heritage Energy and Non-Heritage Energy. This practice stems from the Heritage Contract, which was recently repealed as a result of the Government of B.C.'s Comprehensive Review. The Comprehensive Review is discussed further in Chapter 1, section 1.4 and the report on the Comprehensive Review is provided as Appendix C.

The repeal of the Heritage Contract has no impact on BC Hydro's planning or operations as BC Hydro manages all sources of energy supply as a single portfolio. However, without the Heritage Contract, BC Hydro now has the flexibility to categorize its Cost of Energy differently in its revenue requirements model for this application. In Schedule 4.0 of Appendix A to this application, which sets out BC Hydro's Cost of Energy, BC Hydro has re-categorized its Cost of Energy into:

- Heritage Energy;
- Non-Heritage Energy; and
- Market Energy.

These categories are for presentation purposes only and are intended to provide better clarity on the presentation of our Cost of Energy. We believe that these categories will make it easier to understand BC Hydro's energy costs. Further details on the costs in each category are provided in the sections below.

4.2.2 Heritage Energy Costs: Related to Heritage Assets

Heritage Energy costs are the energy costs related to the operation of heritage assets listed in the *Clean Energy Act*[98]. Heritage Energy costs include the following:

- **Water Rentals:** This includes water rental fees paid on the generation output and capacity of the heritage assets, including BC Hydro's one-third interest in the Waneta generation facility.[99] It also includes water rental fees paid on storage as well as miscellaneous water licences for the use of water for purposes other than power generation, including domestic use and irrigation.
- **Natural Gas for Thermal Generation:** This includes the natural gas purchases, gas transportation, carbon tax, motor fuel tax and other related costs associated with BC Hydro's Prince Rupert and Fort Nelson generation facilities.
- **Domestic Transmission – Other:** This includes transmission costs associated with BC Hydro's obligations under the Skagit River Valley Treaty.[100]
- **Columbia River Treaty Related Agreements:** This includes costs or recoveries associated with the Non-Treaty Storage Agreement[101] and a short-term coordination agreement related to the Libby Coordination Agreement.[102]

---

98 Heritage assets are set out in Schedule 1 of the *Clean Energy Act*. Under the *Clean Energy Act*, BC Hydro must not sell or otherwise dispose of the heritage assets unless a heritage asset is no longer used or useful for its intended purpose or is to be replaced with one or more assets that will perform similar functions, and with the approval of the BCUC.

99 Consistent with BCUC Order No. G-130-18, water rental fees paid on the generation output and capacity of BC Hydro's two-thirds interest in the Waneta Generation Facility, purchased in 2017 and now leased to Teck, are considered Non-Heritage Energy. Please refer to section 4.7.

100 As explained in Chapter 2, section 2.5.6, the Government of B.C. and the City of Seattle signed an agreement in 1984 concerning the supply of electricity to the City of Seattle (the Skagit River Valley Treaty). The Government of B.C. subsequently assigned certain rights and obligations under this agreement to BC Hydro. BC Hydro's domestic customers receive the benefit of revenues from sales to Seattle City Light, offset by the costs of serving this obligation. These revenues are included as Other Sector revenue as shown in Appendix A, Schedule 14, line 18.

101 The Non-Treaty Storage Agreement is a coordination agreement between BC Hydro and the Bonneville Power Administration to operate non-treaty storage at Kinbasket Reservoir (Arrow Lakes).

102 A short-term coordination agreement, related to the Libby Coordination Agreement, between BC Hydro and Bonneville Power Administration and the U.S. Army Corps of Engineers.

- **Remissions and Other:** The *Water Sustainability Act* specifies remissions that are available to be applied against water rental payments. These remissions are compensation for new restrictions or regulations imposed on the licensee arising from water use plans. Remissions are capped at $50 million per calendar year, with any excess associated with physical works requirements carried forward into future years.
- **Exchange Net:** This is primarily the transfers of energy that are related to BC Hydro's entitlement obligations under the Canal Plant Agreement and the Keenleyside Entitlement Agreement. [103] These energy transfers are not financial transactions, but may result in reimbursement or payment of water rental fees. The financial impact of such reimbursements and payments are recorded with Water Rentals. For reporting of actuals, Exchange Net also includes energy that is used to reconcile the total sources of supply to the total recorded load, for financial statement purposes.

4.2.3 Non-Heritage Energy Costs: Related to Energy Other than Heritage Energy or Market Energy

Non-Heritage Energy costs are the energy costs not categorized as Heritage Energy costs or Market Energy costs, and include the following:

- **IPPs and Long-Term Commitments:** This includes BC Hydro's EPAs with IPPs connected to BC Hydro's integrated system, including gas transportation and commodity costs associated with the Island Generation facility.
- **Non-Integrated Area:** Communities in the Non-Integrated Area are not connected to BC Hydro's integrated system and are served by local generating

[103] The Canal Plant Agreement is a "one-operator" coordination agreement where BC Hydro dispatches generating plants on the Kootenay and Pend-d'Oreille rivers that are owned by parties to the agreement (Fortis BC, Teck, Brilliant Power Corp, Brilliant Expansion Power Corp and Waneta Expansion Ltd. Partnership) and BC Hydro in order to obtain optimum generation. The plant owners make the actual generation available to BC Hydro in exchange for a fixed monthly energy and capacity entitlement. Similarly, the Keenleyside Entitlement Agreement provides the project owner (Arrow Lakes Power Corporation) – with an energy and capacity entitlement associated with the Arrow Lakes Hydro project on the Columbia River.

facilities and distribution networks. Generating capacity in these areas is provided by a combination of BC Hydro owned diesel generating stations, as well as hydro and biomass IPP facilities (and one BC Hydro owned hydro facility[104] in the Bella Coola region).

- **Gas and Other Transportation:** This includes costs related to upstream gas transportation contracts entered into by BC Hydro and external electricity transmission charges incurred to serve domestic load in the Fort Nelson, Goodlow (Boundary Lake), Rogers Pass, and Duck Lake areas.
- **Water Rentals (Waneta Two-Thirds):** In 2017, BC Hydro entered into a purchase agreement with Teck for the remaining two-thirds interest of the Waneta generation facility. The BCUC approved this purchase by Order No. G-130-18. The 2017 Waneta transaction includes a long-term lease agreement with Teck. Under the arrangements with Teck, BC Hydro continues to use its one-third interest in Waneta to serve its domestic load obligations. The remaining two-third interest is leased back to Teck and Teck is responsible for the water rental payments in relation to its leased interest. These costs are shown as an offset in Miscellaneous Revenues (Appendix A, Schedule 15.0, line 22).

4.2.4 Market Energy Costs and Revenues: Related to Electricity Purchased or Sold Outside of B.C.

Market Energy is electricity purchased from or sold to Powerex through transfer pricing arrangements between Powerex and BC Hydro. The costs or revenues associated with these transactions are allocated to the following categories:

- **Market Electricity Purchases:** This is often referred to as domestic purchases and represents market purchases of electricity from Powerex by BC Hydro to

[104] Actual water rental costs for the Clayton Falls Generating Station, which are approximately $67,000 per year, are included with Water Rentals for ease of reporting.

meet domestic load requirements. This does not include purchases included in Net Purchases (Sales) from Powerex.

- **Surplus Sales:** This is often referred to as domestic sales and represents sales of electricity to Powerex, when BC Hydro has generation in excess of its domestic load requirements. This does not include sales included in Net Purchases (Sales) from Powerex.
- **Net Purchases (Sales) from Powerex:** This is often referred to as trade purchases (sales) and represents Powerex purchases/sales from/to BC Hydro for the purpose of trade related activities, provided that the BC Hydro system has the ability to accommodate those transactions. These are not purchases (sales) for domestic purposes.
- **Domestic Transmission – Export:** This represents transmission costs within B.C. related to Surplus Sales.

4.3 Managing Our Future Energy Supply

BC Hydro's approach to managing its future energy supply incorporates the following two components which are discussed in the sections below:

1. We have an investment strategy in place to support appropriate capital planning for the heritage assets.
2. We are managing our energy costs from IPPs by, among other things, reducing the volume of IPP energy where there are cost savings to BC Hydro and pursuing the renewal of some existing IPP contracts to meet future long-term energy needs.

As explained in section 4.3.3 below, the opportunities to manage supply costs are more limited in the Non-Integrated Areas.

4.3.1 BC Hydro is Optimizing the Heritage Assets

In its Decision on the Previous Application, the BCUC expressed concern that the heritage assets may not be providing optimal value to BC Hydro customers, and that actual energy delivered by BC Hydro's heritage assets for distribution has been reduced below availability due to energy supplied by IPP energy.[105]

BC Hydro is optimizing the use of heritage assets through our approach to both operations and capital investment.

- Our monthly Energy Studies optimize our operational management of all sources of energy supply on BC Hydro's integrated system. Further information is provided in section 4.4 below.
- Our capital planning process seeks to optimize our investment strategy for generation resources by categorizing our heritage assets as "Key", "Strategic" or "Available", according to the significance of the facility to BC Hydro's system. BC Hydro's Generation Strategic Asset Management Plan sets out a 10-year strategy for each category. Further information is provided in Chapter 6, section 6.4.2.1.

4.3.2 BC Hydro is Proactively Managing IPP Energy Costs

BC Hydro's forecast increases to our Cost of Energy are primarily driven by increasing IPP energy costs under existing agreements. BC Hydro is not acquiring new resources from IPPs, with the exception of a small number of new First Nations energy projects and some EPA renewals,[106] such as new contracts under the Biomass Energy Program. The forecast increase in IPP energy costs from fiscal 2019 to fiscal 2021 is in large part due to pre-determined factors, including price escalation terms and other terms in existing EPAs, and new IPP projects from

105 BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 25.

106 EPA renewals are new contracts that replace existing EPAs, and are not extensions of existing agreements.

existing EPAs reaching commercial operation. Further information is provided in section 4.7.1 below.

BC Hydro and the Government of B.C. have taken the following steps related to IPP power acquisitions:

- **No active energy procurement programs:** BC Hydro does not have any active programs for the procurement of new energy resources from IPPs. Other than EPA renewals, the only expected new EPAs are a small number of new First Nations energy projects.
- **SOP is indefinitely suspended:** The SOP (which also includes the Micro-Standing Offer Program) is an indefinitely suspended program that was for small, permit ready, clean energy projects. In February 2017, BC Hydro initiated a review of the SOP and stopped assigning annual target volumes for 2020 and beyond. Subsequently, BC Hydro announced that the SOP was suspended while the Government of B.C.'s Comprehensive Review was underway. In February 2019, as part of the Comprehensive Review, the Government of B.C. issued a regulation which allowed BC Hydro to indefinitely suspend the SOP.[107] BC Hydro will not be executing any other SOP EPAs, with the exception of five[108] First Nations' clean energy projects that are part of Impact Benefit Agreements with BC Hydro and/or are mature projects that have significant First Nations involvement.
- **Terminations and other volume reductions:** In its Decision on the Previous Application, the BCUC observed that there is a potential for cost savings if additional IPP contracts are canceled or amended to reduce the volume of IPP

[107] Refer to Appendix C, page 27.
[108] As of October 1, 2018, BC Hydro had executed one of the five agreements.

purchases.[109] BC Hydro continually manages its rights and obligations under existing EPAs with IPPs, for example:

- As reported in the Previous Application, from fiscal 2014 to fiscal 2015, BC Hydro:
  - Terminated 14 EPAs;
  - Deferred 11 EPAs; and
  - Downsized and/or deferred two EPAs.
- As of the date of this application, since fiscal 2015, BC Hydro has:
  - Terminated an additional three EPAs[110]; and
  - Not renewed three other EPAs that expired.[111]

In addition, BC Hydro actively enforces its rights and obligations in EPAs to reduce cost commitments, such as exercising turn down rights when it is cost effective to do so.

- **Selective renewals at lower prices, subject to BCUC acceptance in section 71 applications:** In its Decision on the Previous Application, the BCUC also recommended that BC Hydro consider the timing of its existing IPP contracts and contract renewals.[112] Generally, BC Hydro pursues the renewal of expiring EPAs to meet future long-term energy needs where it is cost-effective. Through bilateral negotiations, BC Hydro has renewed contracts with IPPs at lower prices than under their original contracts. As discussed in Chapter 2, section 2.4.4, BC Hydro is not seeking approval of any EPA

[109] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 26.
[110] Conifex Mackenzie - Combined Heat and Power Project, Fries Creek, and Septimus Creek Wind Farm.
[111] As of October 1, 2018, the EPA for McDonald Ranch was expired and not renewed. Since this date, two additional EPAs (Seaton Creek Hydro and Morehead Creek Hydro) have expired and have not been renewed; however, these two EPAs were included in the forecast for the purpose of this application because the decision to not renew was made after the forecast was finalized.
[112] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 28.

renewals in this application and BC Hydro has filed separate applications, pursuant to section 71 of the *Utilities Commission Act*, seeking acceptance of each energy supply contract.

Since fiscal 2016, BC Hydro has renewed six run-of-river hydro EPAs and one storage hydro EPA. Four of the run-of-river hydro EPAs have been accepted by the BCUC as being in the public interest. The remaining two run-of-river hydro EPAs and the storage hydro EPA are the subject of an application that is currently being reviewed by the BCUC.[113]

BC Hydro also entered into short-term extension agreements for two biomass EPAs that were due to expire prior to April 2018, extending their respective terms up to September 2019. These short-term extension agreements were a bridging mechanism while BC Hydro, in consultation with the Government of B.C., was developing a longer term strategy for biomass facilities. As required under section 71 of the *Utilities Commission Act*, these extension agreements have been filed with the BCUC for acceptance. The BCUC suspended its proceedings on these agreements pending the completion of the first phase of the Comprehensive Review.

- **Biomass Energy Program:** As part of the Comprehensive Review, the Government of B.C. announced the Biomass Energy Program. As discussed in the Comprehensive Review, the Biomass Energy Program is a cost and volume limited, transitional measure to provide for the continued operation of biomass generating facilities with EPAs expiring over the next three years. The intent of the program is to allow time for the forest sector to develop and implement new product lines to diversify and become more competitive while also providing optionality should BC Hydro require additional supply resources in the future.

[113] Sechelt Creek IPP and Walden North IPP are run-of-river hydroelectric generating facilities, and Brown Lake IPP is a storage hydroelectric project.

Under the Biomass Energy Program, BC Hydro will potentially renew up to 80 per cent[114] of the historical aggregate energy deliveries from biomass IPPs whose EPAs are expiring in the next three years. BC Hydro will procure this energy through a combination of load offset[115] and/or energy purchases with a priority given first to load offset.[116]

The price paid for biomass energy under this program will be lower than current contracts to reflect changed market conditions for electricity. The Government of B.C. has indicated that it intends to provide a direction to the BCUC with respect to the approval of the program documentation and to require the costs associated with the program to be recovered from ratepayers.

4.3.3 Opportunities to Reduce Supply Cost Commitments in Non-Integrated Area are More Limited

BC Hydro serves 14 non-integrated areas.[117] Non-Integrated Area communities are not connected to BC Hydro's integrated system and are served by local generating facilities, primarily diesel, and distribution networks. In support of CleanBC, and BC Hydro's clean energy commitment, we actively look for opportunities to displace diesel generation with clean or renewable resources in Non-Integrated Area communities when it is cost-effective to do so.

There are two types of energy costs related to serving these communities: costs from BC Hydro diesel generating facilities and IPP costs.[118] Given the remoteness of

[114] The 2013 Integrated Resource Plan assumed that 50 per cent of the aggregate energy volume of expiring biomass contracts would be renewed. As a result of the Biomass Energy Program, as outlined in the Comprehensive Review, the aggregate renewal energy volume will be up to 80 per cent.

[115] A load offset is energy generated by a BC Hydro customer at its customer site to offset the energy purchased from BC Hydro to serve the load at this same site.

[116] The total estimated impact of the cost and energy volumes for the load offset and energy purchase contracts are included in the Application under Cost of Energy. However, BC Hydro is currently assessing the accounting treatment of the load offset component and the allocation of costs and energy volume may change to reflect the appropriate accounting treatment.

[117] Non-Integrated Areas: Zone IB is Bella Bella and Zone II is Anahim Lake, Atlin, Bella Coola, Dease Lake, Elhlateese, Fort Ware, Good Hope Lake, Haida Gwaii, Hartley Bay, Jade City, Telegraph Creek, District of Toad River and Tsay Keh Dene.

[118] There are no forecast energy costs for Clayton Falls Generating Station, as they are quite small. Actual costs are captured in Water Rentals, as noted in footnote 104.

these communities and the lack of connection to the integrated system, there are limited opportunities to reduce supply costs.

There are currently five non-integrated IPPs in operation.[119] BC Hydro has been pursuing the renewal of its EPA with the Ocean Falls IPP which serves the Non-Integrated Area of Bella Bella. BC Hydro and the IPP have not been able to reach agreement and have been operating under short-term extensions of the original EPA because BC Hydro has no other options to serve the region besides operating our diesel generation facility. In August 2017, BC Hydro filed an application for a service rate from the IPP with the BCUC. This application is currently before the BCUC.

4.4 Maximizing the Value of Our Energy Supply

This section explains the role of our monthly Energy Studies in optimizing our operational management of all sources of energy supply on BC Hydro's integrated system, including the heritage assets.

4.4.1 Energy Studies Inform Dispatch Decisions and Forecast Cost of Energy

The primary objectives of the Energy Study are to forecast:

- The marginal value of water in BC Hydro's two largest reservoirs (Williston and Kinbasket) that is used to inform operational dispatch decisions; and
- The Cost of Energy for financial reporting.

The forecast monthly marginal value of water provides BC Hydro with a relative measure that guides the operation of these reservoirs in the context of market and system conditions (i.e., when domestic energy resources should be dispatched versus purchases made from Powerex or when additional domestic resources

[119] Non-integrated Area IPPs: Hluey Lake (Dease Lake), Moresby Lake (Haida Gwaii), Ocean Falls (Bella Bella), Pine Creek (Atlin) and Kwadacha Bioenergy Project (Fort Ware) are operational facilities and Gabion River EPA (Hartley Bay) has not reached commercial operation.

should be dispatched to facilitate sales to Powerex). This output of the monthly Energy Study allows us to manage our integrated system to maximize the value for ratepayers.

The forecast Cost of Energy is used for financial reporting purposes. This forecast cost is based on outputs from the Energy Study, which develops an optimal set of reservoir and generation station operations and market transactions, given the current forecasts of water inflow, market prices, and weather adjusted load.

4.4.2 Independent Experts Endorsed BC Hydro's Energy Study Methodology

In fiscal 2019, BC Hydro undertook an internal audit of our monthly Energy Studies process. The internal audit relied on two subject matter experts from SINTEF[120], an independent energy research organization that conducts contract research and development projects. These experts are specialized in load forecasting, risk management, hydrothermal market modelling and hydropower scheduling models.

The internal audit concluded that BC Hydro has a well-established Energy Studies process in place, that key models are appropriate and that the methodologies applied are in line with leading industry practices. The Energy Studies Process Internal Audit Report is provided as Appendix DD.

4.4.2.1 Energy Study Inputs

The following list outlines the various inputs used by the Energy Study:

- **The Load Forecast:** The Load Forecast, net of demand-side management savings, including a potential range based on historic weather variability. The Load Forecast is set out in Chapter 3.
- **Forecast of IPP supply:** The forecast of supply from IPPs and Long-Term Commitments including a potential range based on historic supply and

[120] The Foundation for Scientific and Industrial Research at the Norwegian Institute of Technology

seasonal variability. IPPs and Long-Term Commitments are discussed in section 4.7.1.

- **The range of water inflow conditions:** Inflows to BC Hydro reservoirs are inputs to the Energy Study and are the largest drivers of energy production and reservoir operation. Inflows are driven by a combination of rainfall, snow pack and glacier meltwater. Once the snowpack has melted, usually towards the end of summer, rainfall becomes the primary driver of reservoir inflows.

  Seasonal inflow forecasts are made at the beginning of every month for each of 25 basins which contribute to BC Hydro's energy supply. Each inflow forecast incorporates the historical variability observed in meteorological conditions since 1973. The Energy Study accounts for this range of potential inflow scenarios in its forecast of generation and reservoir operations.

- **Electricity and gas market prices:** Surplus sales, market electricity purchases and the cost to run thermal generation all depend on forecasts of electricity and gas market prices. Electricity and gas prices tend to follow a seasonal cycle with higher prices during the colder winter months and hotter summer months, and lowest prices during the spring freshet.

  At the beginning of each Energy Study, Powerex provides BC Hydro with forward market price curves for electricity at Mid-C and gas prices at Sumas. The Energy Study uses these forward curves as a starting point and then adds variability to these prices to capture an expected range of price uncertainty.

  During fiscal 2020 and fiscal 2021, Sumas gas forward prices are expected to range from $1.50 to $3.07 USD/MMBtu with an average price of $2.10. Mid-C forward monthly electricity prices are expected to range from $7.85 USD/MWh in light load hours during the freshet to $49.95 USD/MWh in heavy load hours.

  System, market and weather conditions can significantly affect market prices. Large snowpack, windy and wet conditions act to depress the Mid-C electricity price, while hot, dry summer or cold winter conditions act to raise Mid-C prices.

For example, the October 2018 rupture of the Enbridge T-South pipeline and subsequent gas curtailment resulted in Sumas spot gas prices reaching $66 USD/MMBtu in November 2018.

- **Generation unit availability:** Energy production and plant capacity is affected when generation units are taken offline for maintenance, de-rated or forced out of service. The Energy Study accounts for unit and plant maintenance schedules as well as outages required for BC Hydro's capital plan. In addition, historic reliability data is used to account for the risk of forced outages.

4.4.3 BC Hydro's Objective is to Maximize Consolidated Net Revenue to Benefit Customers

As part of minimizing costs to ratepayers, BC Hydro's objective is to maximize "expected consolidated net revenue from operations". "Consolidated" refers to the combined activity of both BC Hydro (domestic) and forecast Powerex (trade). "Net revenue from operations"[121] includes both revenues and costs that are variable and forecast through the Energy Studies. By managing the system as a whole to maximize forecast consolidated net revenue, BC Hydro is able to optimize our portfolio of resources to achieve the best value for ratepayers.

The following list outlines the components of consolidated net revenue.

- **Domestic revenue from accrued sales:** These sales depend on consumption by BC Hydro's customers. They are not impacted by system dispatch decisions.
- **Cost of IPPs and Long-Term Commitments:** These costs arise from payments made to IPPs in accordance with their agreements. Other than Island Generation and certain biomass facilities, most IPPs are not directly impacted by system dispatch decisions.

[121] Net Revenues from Operations = domestic revenue from accrued sales plus revenue from surplus (domestic) sales plus revenue from Columbia River Treaty related agreements less cost of IPPs and long-term commitments less cost of market electricity (domestic) purchases less cost of water rentals less cost of natural gas for thermal generation less cost of net purchases (sales) from Powerex.

- **Revenue from surplus sales (domestic sales):** These sales depend on system storage, generating unit availability, energy availability as well as market conditions. They are impacted by system dispatch decisions.
- **Cost of market electricity purchases (domestic purchases):** These purchases depend on system storage, generating unit availability, energy availability as well as market conditions. They are impacted by system dispatch decisions.
- **Revenue from Columbia River Treaty related agreements:** These revenues depend on non-Treaty water release decisions, Columbia system dispatch decisions, hydrological conditions in the Columbia basin, and market conditions. They are impacted by system dispatch decisions.
- **Cost of water rentals:** These costs depend on the generation output of the heritage assets. They are impacted by system dispatch decisions.
- **Cost of natural gas for thermal generation:** These costs depend on the generation output at BC Hydro’s Prince Rupert and Fort Nelson generation facilities. They are impacted by system dispatch decisions.
- **Cost of Net Purchases (Sales) from Powerex:** These purchases (sales) represent modeled market energy transactions based on a forecast of trade opportunities, which are allocated to Powerex.

4.4.4 The Energy Study Optimizes the Use of System Storage

The Energy Study optimizes the use of System Storage with imports and exports to meet load requirements.

BC Hydro’s primary sources of seasonal and multi-year operational flexibility are Kinbasket reservoir on the Columbia River and Williston reservoir on the Peace River. The total storage capacity in these two reservoirs represents approximately 90 per cent of the total storage in BC Hydro’s system, and together are referred to as System Storage.

These large reservoirs typically reach their minimum storage levels near the end of April, after the annual drawdown to serve winter load and prior to spring freshet. In some years water is withdrawn from System Storage and in other years water is stored. As a result the System Storage, expressed as an energy equivalent, can vary at the end of each fiscal year as shown in Table 4-1 below.

The Energy Study optimization accounts for the efficiency gains made by operating our generating stations at higher reservoir levels. It also models dispatch decisions in response to a range of inflows, market prices, and loads.

Table 4-1 End of Fiscal Year System Storage

GWh	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
End of Period System Storage[122]	11,918	13,208	10,746	9,736	10,576	7,293	9,354	10,649

4.5 Overall Cost of Energy Forecast

This section provides BC Hydro's forecast Cost of Energy, presented in the Gross View, for the test period. Sections 4.6, 4.7 and 4.8 below provide a more detailed breakdown of energy costs by category (Heritage, Non-Heritage and Market) to help clarify the drivers and facilitate comparisons to the previous test period.

BC Hydro's Cost of Energy forecast is shown in Table 4-2 below.

122 System storage is the energy equivalent storage available at the end of each fiscal year at Williston and Kinbasket reservoirs. The system storage forecast is calculated by taking the fiscal 2018 ending storage and adding the forecast net changes in storage year over year.

Table 4-2 Cost of Energy Forecast (Integrated System and Non-Integrated Areas)

Cost of Energy ($millions)	Schedule Reference[123]	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast[124]	F2020 Plan	F2021 Plan
Heritage Energy	4.0 L28	363.8	354.4	341.5	309.0	349.0	299.3	350.9	350.8
Non-Heritage Energy	4.0 L33	1,269.6	1,249.7	1,407.2	1,351.1	1,476.5	1,365.1	1,576.3	1,641.1
Market Energy	4.0 L38	(84.1)	(98.7)	(90.8)	(121.5)	(62.6)	9.0	(40.2)	(71.7)
Total	4.0 L39	1,549.3	1,505.5	1,657.8	1,538.7	1,762.9	1,673.4	1,887.0	1,920.2

Overall, by fiscal 2021, BC Hydro's total Cost of Energy is forecast to increase by $157 million from the fiscal 2019 RRA amount. This forecast increase is primarily driven by an increase in Non-Heritage Energy costs related to IPPs and Long-Term Commitments. Section 4.7.1 describes these cost forecast increases in more detail.

4.5.1 Regardless of Forecast Cost of Energy, Customers Only Pay the Actual Cost

BC Hydro's revenue requirements are based on a forecast Cost of Energy but customers only pay the actual costs. It is recognized that BC Hydro's costs of energy will vary from planned amounts for a number of reasons including weather, water inflows, timing of delivery, and market conditions. Accordingly, the BCUC has approved mechanisms to address variances and ensure that customers only pay for the actual energy costs.

Regulatory accounts are in place to manage the expected variances. Variances between planned and actual costs of energy are deferred to either the Heritage Deferral Account or the Non-Heritage Deferral Account. The Non-Heritage Deferral account also captures the variances between planned and actual domestic customer load, referred to as the Domestic Revenue Variance. The balances in these accounts are amortized into rates in subsequent years in a manner approved by the

[123] Schedule Reference for all tables refers to the location of the original source of the data in Appendix A.
[124] Fiscal 2019 Forecast refers to BC Hydro's forecast values expected at the end of fiscal 2019 as forecast in the October 2018 Energy Study. The Application is submitted prior to the conclusion of the fiscal year, so actual values are not available.

BCUC. The scope of the Heritage and Non-Heritage Deferral Accounts are discussed further in Chapter 7, section 7.7.1.

As a result of BC Hydro's request to refund the fiscal 2019 closing balance in the Heritage Deferral Account and the Non-Heritage Deferral Account to ratepayers in fiscal 2020 and fiscal 2021, the Cost of Energy to be recovered in rates (i.e., the Current View) is forecast to be approximately $152 million lower in each year of the test period.

The one exception to the management of these expected variances is water rentals related to BC Hydro's two-thirds interest in Waneta, which is subject to a lease agreement with Teck as discussed in section 4.2.3. Consistent with BCUC Order No. G-130-18, these variances are not deferred as Teck is responsible for the water rental payments. As a result, ratepayers are not responsible for variances between actual and planned water rental costs related to the two-thirds interest in Waneta during the term of the lease agreement.

4.6 Cost of Heritage Energy

Table 4-3 below provides a detailed breakdown of the forecast Cost of Heritage Energy. These cost components are expected to be relatively steady during the test period.

Table 4-3 Cost of Heritage Energy

($ millions)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Water Rentals	4.0 L23	386.7	387.0	356.8	361.6	356.4	361.8	343.1	349.1
Natural Gas for Thermal Generation	4.0 L24	14.9	9.5	10.5	3.4	10.7	7.6	8.1	8.5
Domestic Transmission - Other	4.0 L25	22.6	22.5	22.3	22.5	22.1	22.6	22.5	22.4
Columbia River Treaty Related Agreements	4.0 L26	(23.1)	(23.3)	(10.4)	(40.6)	(7.2)	(59.5)	3.3	(2.5)
Remissions and Other	4.0 L27	(37.3)	(41.3)	(37.8)	(38.0)	(33.1)	(33.3)	(26.1)	(26.8)
Total	4.0 L28	363.8	354.4	341.5	309.0	349.0	299.3	350.9	350.8

Each item in Table 4-3 is discussed in more detail below. Please refer to Appendix G, section 4 for an explanation of historical variances.

4.6.1 Water Rentals Are a Function of Generation

Water rental fees on the generation of energy are calculated as the actual energy output of the licence holder from the prior calendar year multiplied by the current year water rental rates. The current year rates are calculated as the previous year rate times the annual percentage change in B.C.'s Consumer Price Index. There are two tiers of water rental rates charged by the Government of B.C., which vary depending on the volume of energy produced.

Plant capacity charges are fees paid on the operating capacity and construction capacity of a plant. Water rental fees on operating capacity are calculated as the maximum sustained capacity observed for the current year times the current year rate. These rates are calculated as the previous year rate times the annual percentage change in B.C.'s Consumer Price Index.

For new projects, the nameplate capacity of the generation facility's turbine units is used until a higher peak capacity is observed over a reporting year. Nameplate capacity is the designed maximum output of a generating unit.

Construction capacity is a portion of the nameplate or increased capacity that has not been placed in service. Fees are calculated based on the observed/nameplate capacity for the current year times the current year rate.

Table 4-4 below provides a detailed breakdown of actual and forecast water rental rates.

Table 4-4 Water Rental Rates

Water Rental: General Power Use	Calendar Year				
	Actual		Forecast		
	2017	2018	2019	2020	2021
Output (Tier 1) ($/MWh) < 160,000 MWh	1.339	1.367	1.404	1.436	1.465
Output (Tier 2) ($/MWh) < 3,000,000 MWh	6.243	6.374	6.546	6.697	6.831
Output (Tier 3)[125]	6.560	N/A	N/A	N/A	N/A
Operating Capacity ($/kW)	4.461	4.555	4.678	4.786	4.882
Construction Capacity ($/kW)	0.446	0.455	0.467	0.478	0.488
B.C. CPI (%)	2.1	2.7	2.3	2.0	2.0

Total water rental fees are forecast to be $343.1 million in fiscal 2020 and $349.1 million in fiscal 2021. This includes water rental fees paid on the generation output and capacity of the heritage assets, including BC Hydro's one-third interest in the Waneta generation facility.

Table 4-5 Water Rentals

($ millions)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Water Rentals	4.0 L23	386.7	387.0	356.8	361.6	356.4	361.8	343.1	349.1

4.6.2 Natural Gas for Thermal Generation is Forecasted to Decrease

Table 4-6 provides a detailed breakdown of the forecast costs of natural gas, gas transportation, carbon tax, motor fuel tax and other costs associated with BC Hydro's Prince Rupert and Fort Nelson generation facilities.

125 The Tier 3 rate was eliminated on January 1, 2018. The Tier 3 rate for calendar 2017 was $7.511/MWh for January 1, 2017 to March 31, 2017 and $6.243/MWh for April 1, 2017 to December 31, 2017, charged on a pro-rated basis for the calendar year as $6.560/MWh.

Table 4-6 Natural Gas for Thermal Generation

($ millions)	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Fort Nelson	9.0	2.9	10.5	3.0	10.7	7.0	8.1	8.5
Rupert	0.1	0.7	0.0	0.5	0.0	0.6	0.0	0.0
Burrard[126]	5.9	5.9	0.0	0.0	0.0	0.0	0.0	0.0
Total	14.9	9.5	10.5	3.4	10.7	7.6	8.1	8.5

Total costs of natural gas for thermal generation are forecast to be $8.1 million in fiscal 2020 and $8.5 million in fiscal 2021, compared to $10.7 million for fiscal 2019. This decrease is primarily due to lower forecast gas prices at Station 2[127], which BC Hydro uses to forecast natural gas costs at Fort Nelson.

Total costs of natural gas for the Prince Rupert facility are forecast to be zero in fiscal 2020 and fiscal 2021. This is because the Prince Rupert facility only runs for testing or to supply area load when the transmission line to Prince Rupert is out of service. Therefore, it is not modelled in the Energy Study and its actual costs will vary from forecast.

4.6.3 Domestic Transmission – Other: Forecast Costs are Stable

Table 4-7 Domestic Transmission – Other

($ millions)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Domestic Transmission - Other	4.0 L25	22.6	22.5	22.3	22.5	22.1	22.6	22.5	22.4

The costs included under Domestic Transmission – Other are only for transmission costs related to the delivery of energy to the City of Seattle under the Skagit River Valley Treaty. The costs are quite stable from year to year, and include approximately $16 million per year for wholesale transmission in British Columbia, to deliver energy to the B.C./U.S. border, and approximately $6 million per year for

126 Burrard Thermal Generating Station’s costs are forecast during the test period to be zero. This facility is now only used for grid reliability purposes as a synchronous condense facility, and is not used as a generating resource.

127 Station 2 is a gas transportation hub near Chetwynd, and is the nearest liquid market to Fort Nelson with valid forward gas pricing.

wholesale transmission in the United States, to deliver energy from the B.C./U.S. border to the City of Seattle.

These domestic transmission costs to deliver energy to the BC/US border (i.e., $16 million per year) are included in BC Hydro's Transmission Revenue Requirement (**TRR**) and are recovered under the Open Access Transmission Tariff (**OATT**). These costs represent BC Hydro's use of point-to-point transmission service for the Skagit River Valley Treaty. In the TRR, these costs are allocated to Cost of Energy via intersegment revenues which are reported in Appendix A, Schedule 3.4, line 18. This allocation of intersegment revenues ensures that costs are only recovered from ratepayers once.

4.6.4 Columbia River Treaty Related Agreements Revenue is Driven by Coordinated Operations

Table 4-8 Columbia River Treaty Related Agreements

($ millions)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Columbia River Treaty Related Agreements	4.0 L26	(23.1)	(23.3)	(10.4)	(40.6)	(7.2)	(59.5)	3.3	(2.5)

The Non-Treaty Storage Agreement[128] and a short-term coordination agreement related to the Libby Coordination Agreement[129] are coordination agreements related to the operation of the Columbia River Treaty reservoirs in Canada. These agreements are water coordination agreements that provide for the release and storage of water to create mutual operational benefits in both Canada and the United States. The agreements are designed to create an average annual positive financial benefit to BC Hydro. The forecast revenue in fiscal 2020 and fiscal 2021 is less than the fiscal 2019 forecast because of high water releases that occurred in July and August 2018 to take advantage of high market prices.

[128] See footnote 101.
[129] See footnote 102.

4.6.5 Remissions and Other Serve to Offset Water Rental Costs

In cases where Water Use Planning requirements[130] are incremental to the requirements under BC Hydro's existing water licences, BC Hydro is entitled to recover the associated incremental costs through a reduction in water rentals. This amount is referred to as Remissions. The Government of B.C. caps Water Use Planning Remissions at $50 million per calendar year, with any excess associated with physical works carried into a future year.

Table 4-9 Water Use Planning Remissions

($ millions)	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Remissible portion for Monitoring and Physical Works (Offset in Operating Costs)	(15.3)	(12.1)	(18.4)	(11.2)	(10.7)	(13.7)	(10.2)	(8.2)
Remissible portion for Value of Foregone Energy (Offset in Cost of Energy)	(37.3)	(41.3)	(37.8)	(38.0)	(33.1)	(33.3)	(26.1)	(26.8)
Total Credited Remissions	(52.6)	(53.4)	(56.2)	(49.2)	(43.8)	(47.0)	(36.4)	(35.1)

Water Use Planning Remissions include:

- Remissions associated with the value of foregone energy, which are shown as a credit under Cost of Energy; and
- Remissions associated with the delivery of monitoring and physical works programs, which are shown as a credit under operating costs (see Chapter 5B, section 5B.6.2.5).

Total forecast Remissions associated with the value of foregone energy (offset in Cost of Energy) are forecast to be around $26 million for fiscal 2020 and fiscal 2021. The forecast decrease for Water Use Planning Remissions in the test period, as compared to fiscal 2019 RRA Plan, is largely due to lower remissions collected at Bridge River and John Hart. The re-development project at John Hart resulted in a

[130] The Water Use Planning program was initiated by BC Hydro in November 1998. Delivery of BC Hydro's Water Use Plan requirements are included in Orders by the Comptroller of Water Rights.

change to licence conditions, and the anticipated water license renewal[131] at Bridge River is expected to result in a change to BC Hydro's eligibility for Remissions.

Remissions are shown in Schedule 4.0, line 27 of Appendix A. The Other items included within line 27 are the funds paid annually to the Skagit Environment Endowment Fund (approximately $0.07 million), consistent with commitments related to the Skagit River Valley Treaty.

4.7 Cost of Non-Heritage Energy

Table 4-10 below provides a detailed breakdown of the Cost of Non-Heritage Energy. The cost increases over the test period are driven by increases in the forecast cost of IPPs and Long-Term Commitments. Each element of the cost of Non-Heritage Energy is discussed in the sections that follow.

Table 4-10 Cost of Non-Heritage Energy

Cost of Energy	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F202 Plan
IPPs and Long-Term Commitments[132]	4.0 L29	1,234.4	1,213.1	1,369.7	1,311.6	1,439.3	1,326.6	1,538.5	1,601.1
Non-Integrated Area	4.0 L30	24.6	25.0	27.4	26.5	31.1	26.9	31.6	33.6
Gas & Other Transportation	4.0 L31	10.6	11.7	10.1	13.1	6.1	9.2	2.8	2.7
Water Rentals (Waneta Two-Thirds)	4.0 L32	0.0	0.0	0.0	0.0	0.0	2.4	3.5	3.7
Total	4.0 L33	1,269.6	1,249.7	1,407.2	1,351.1	1,476.5	1,365.1	1,576.3	1,641.1

The cost of Non-Heritage Energy includes cost associated with EPAs for the integrated system and the non-integrated area. As of October 2018, BC Hydro has 133 active EPAs with IPPs.[133] This includes 124 projects that are in commercial operation and delivering energy as well as nine projects that are in various phases of development and have not yet reached commercial operation.

131 BC Hydro is in the process of renewing several water licenses that expire or are set to expire at Bridge, Alouette and Wilsey dams. BC Hydro has submitted a renewal application and a Project Development Plan to the Comptroller of Water Rights.

132 These values are after accounting adjustments.

133 Since October 2018, two more EPAs have expired and not been renewed. Please refer to footnote 15.

4.7.1 IPPs and Long-Term Commitments Costs are Largely Prescribed

For the integrated system, there are 119 projects in commercial operation and eight projects in development with existing EPAs. Costs for EPAs on the integrated system are categorized under “IPPs and Long-Term Commitments”.

Table 4-11 IPPs and Long-Term Commitments

Cost of Energy	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
IPPs and Long-Term Commitments[134]	4.0 L29	1,234.4	1,213.1	1,369.7	1,311.6	1,439.3	1,326.6	1,538.5	1,601.1

These forecast costs are primarily associated with existing EPAs, and because the terms of these agreements are already set, the forecast costs for these EPAs are largely prescribed. With few exceptions, BC Hydro is not acquiring new resources from IPPs. Those exemptions represent only a very small portion of the forecast Cost of Energy.

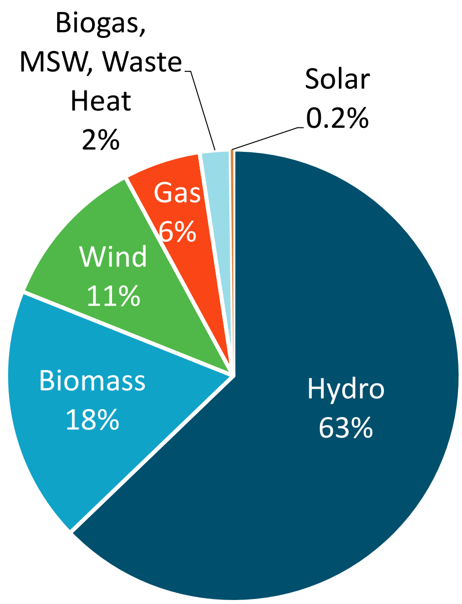
4.7.1.1 Cost of IPP Energy Reflects Long-Term Acquisitions Undertaken Over Many Years

The forecast cost of IPP energy in the test period reflects long-term EPA commitments that occurred over a number of years. BC Hydro has purchased electricity from IPPs since the mid-1980s and the average contract term for an EPA is 28 years.

The electricity supplied by IPPs on BC Hydro’s integrated system is approximately 25 per cent of BC Hydro’s electricity supply and helps to meet BC Hydro’s load requirements. IPP projects are developed by companies specializing in power production, as well as by municipalities, First Nations and BC Hydro customers, using resources such as wind, water, biomass, solar and waste heat. Figure 4-1 provides a breakdown of fiscal 2021 forecast energy volumes by resource type for the integrated system.

[134] These values are after accounting adjustments.

Figure 4-1 Breakdown of IPP Purchase Volumes by Resource Type (Percentage, F2021 Plan, Integrated System)



BC Hydro has entered into EPAs with IPPs through competitive calls, standing offers and bilateral negotiations. These various procurement processes have enabled BC Hydro to acquire resources to meet energy need identified at the time of the procurement. Table 4-12 below outlines BC Hydro's EPA volumes from each procurement process. As discussed in section 4.3.2, BC Hydro has been pursuing the renewal of expiring EPAs to meet future long-term energy needs and has renewed contracts with IPPs at lower prices than under their original contracts, through bilateral negotiations. The volume associated with each EPA renewal is included in the total for its original procurement call process.

Table 4-12 IPP and Long-Term Purchase Volumes for the Integrated System (October 2018 Forecast)

Call Process GWh	Number of EPAs[1]	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Pre 2003 EPAs[2]	31	3,307	3,498	3,350	3,315	3,139	3,289	3,301	3,350
2003 Green Power Generation Call	6	562	591	562	557	562	565	566	566
2006 Open Call	17	2,129	2,235	2,135	2,132	2,135	2,136	2,178	2,178
2008 Bioenergy Call - Phase 1	2	188	199	188	191	188	161	204	216
2008/10 Standing Offer Program	26	295	293	431	338	517	407	486	522
2010 Bioenergy Call - Phase 2	4	282	151	725	209	725	568	680	680
2010 Clean Power Call	20	1,818	1,649	2,705	2,414	2,863	2,647	2,779	2,867
2010 Integrated Power Offer	7	1,022	1,040	1,064	1,012	1,074	1,052	1,175	1,145
Negotiated EPAs[3]	14	3,700	3,989	3,712	4,185	3,703	3,801	4,010	4,369
Expected SOP Projects and other First Nations Commitments[4]	7	71	-	130	-	291	6	70	149
Total	134	13,375	13,644	15,002	14,354	15,199	14,631	15,449	16,040

1 Number of EPAs with IPPs on the integrated system (as of October 1, 2018).
2 The volumes in this row also include miscellaneous energy purchases, such as energy purchases for border accommodations.
3 The volumes in this row also include two other energy supply contracts which are not considered to be IPP EPAs. These are the Surplus Power Rights Agreement between Teck and BC Hydro and the Residual Capacity Agreement between FortisBC and BC Hydro.
4 The volumes shown are expected volumes for future EPAs. Once an EPA is executed, the volumes are included in the appropriate call process. BC Hydro notes that the F2017-F2019 Plan values include forecast costs from the Standing Offer Program, and one co-generation project. This co-generation project is no longer going ahead and is not included as part of the forecast for the test period.

As shown in Figure 4-1, BC Hydro's EPA portfolio includes a significant amount of hydro generation. The amount of generation under these contracts is driven by water inflows and other operational factors which may cause actual energy deliveries to vary significantly from year to year. Appendix G provides a description of IPP volume and cost variances for fiscal 2017 and fiscal 2018.

To provide reporting consistency with previous Revenue Requirement applications, Table 4-13 provides the cost of IPP energy before and after accounting adjustments.

Table 4-13 Breakdown of IPP and Long-Term Commitments for the Integrated System (October 2018 Forecast)

Call Process ($ millions)	Number of EPAs[1]	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Pre 2003 EPAs[2]	31	277.2	287.3	281.0	276.1	261.6	261.9	268.5	276.3
2003 Green Power Generation Call	6	33.3	34.9	33.7	32.9	34.1	34.0	34.6	35.0
2006 Open Call	17	188.4	187.5	190.8	187.2	192.7	184.5	196.9	199.0
2008 Bioenergy Call - Phase 1	2	22.7	22.0	23.0	25.0	23.3	21.7	24.4	20.1
2008/10 Standing Offer Program	26	28.9	28.2	43.8	33.2	52.6	41.8	50.5	54.4
2010 Bioenergy Call - Phase 2	4	39.2	20.2	99.7	29.6	100.9	83.0	98.3	99.6
2010 Clean Power Call	20	242.0	213.0	336.0	296.4	358.3	318.6	353.7	367.6
2010 Integrated Power Offer	7	126.5	128.4	131.2	127.1	135.1	138.0	156.9	149.8
Negotiated EPAs[3]	14	346.5	353.2	357.1	374.2	359.9	349.9	381.2	416.0
Expected SOP Projects and other First Nations Commitments[4]	7	7.8	-	13.6	-	29.2	0.7	8.1	16.4
Total IPP Purchase Costs	134	1,312.5	1,274.7	1,509.9	1,381.7	1,547.9	1,434.3	1,573.2	1,634.3
Accounting Adjustments		(78.1)	(61.6)	(140.2)	(70.1)	(108.6)	(107.8)	(34.7)	(33.2)
IPPs and Long-Term Commitments	134	1,234.4	1,213.1	1,369.7	1,311.6	1,439.3	1,326.6	1,538.5	1,601.1

1 Number of EPAs with IPPs on the integrated system (as of October 1, 2018).

2 The costs in this row also include miscellaneous energy purchases, such as energy purchases for border accommodations.

3 The costs in this row also include two other energy supply contracts which are not considered to be IPP EPAs. These are the Surplus Power Rights Agreement between Teck and BC Hydro and the Residual Capacity Agreement between FortisBC and BC Hydro.

4 The costs shown are expected costs for future EPAs. Once an EPA is executed, the costs are included in the appropriate call process. BC Hydro notes that the F2017-F2019 Plan values include forecast volumes from the Standing Offer Program, and one co-generation project. This co-generation project is no longer going ahead and is not included as part of the forecast for the test period.

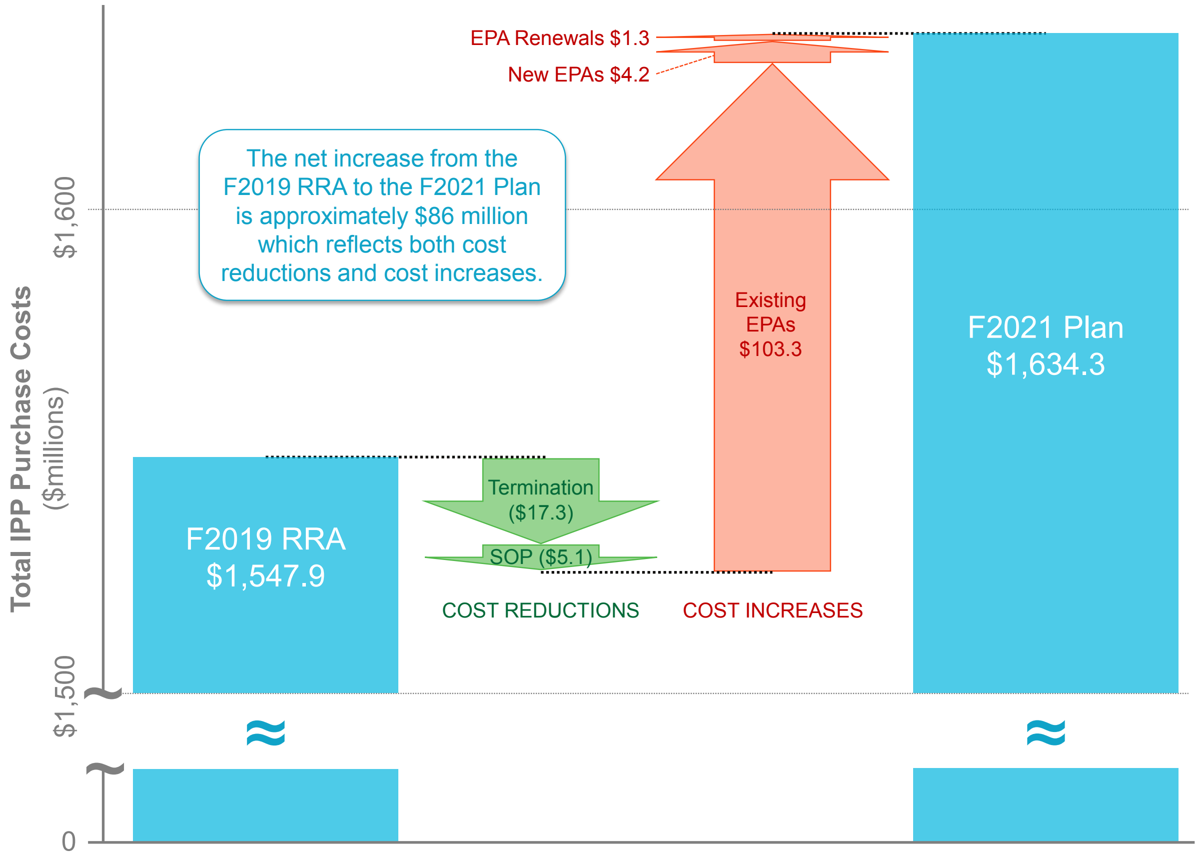
The Accounting Adjustments shown in Table 4-13 largely reflect energy costs for EPAs which are accounted for as capital leases under the current accounting standards. For those EPAs that are deemed to be capital leases, for accounting purposes, their costs are recorded as operating costs, taxes, amortization, finance charges as well as Cost of Energy. The decrease in Accounting Adjustments from the fiscal 2019 forecast is due to a new accounting standard effective for fiscal 2020 (as further discussed in Chapter 8, section 8.12.1 and 8.13.3). Prior to this new accounting standard, three EPAs were recognized as capital leases. As of fiscal 2020, under the new accounting standard, these three EPAs are no longer accounted for as leases, and one EPA, previously included in Cost of Energy, will be accounted for as a lease.

4.7.1.2 Increase in IPP Costs is Largely Associated With Existing Contracts, Not New Resource Acquisitions

The majority of IPP forecast cost increases from fiscal 2019 to fiscal 2021 are related to existing EPAs. BC Hydro is not acquiring new resources from IPPs (other than a small number of new First Nations energy projects and some EPA renewals).

The increase in total IPP purchase costs from fiscal 2019 RRA to fiscal 2021 Plan is forecast to be 5.6 per cent. During the test period, for each EPA, there may be a number of factors which may cause the forecast costs to either increase or decrease, such as a change in operation as may be allowed under the EPA and price escalation. As shown in Figure 4-2, on a net basis, the total forecast IPP cost (for the integrated system and before accounting adjustments) is increasing by approximately $86 million by fiscal 2021.This estimate reflects both cost increases and cost reductions, as more fully described below.

Figure 4-2 Breakdown of Total IPP Purchase Cost Forecast Increases from Fiscal 2019 RRA to Fiscal 2021[135]



The forecast net cost increases during the test period are generally attributed to the following factors:

- **Existing EPAs:** This net increase takes into consideration operational changes at IPP facilities or other changes, as permitted under existing agreements, which may impact the forecast cost of IPP energy. For example, these types of changes would include price escalation, capacity increases, and forecast delivery changes resulting from a partial-year forecast becoming a full-year forecast. BC Hydro notes that variances in historical energy deliveries can be

[135] The increase of $86 million as shown in Figure 4-2 is before accounting adjustments. As show in Table 4-13, the increase after accounting adjustments during the test period is $161.8 million (fiscal 2021 when compared to F2019 RRA). Section 4.7.1.1 describes the accounting adjustments during the test period.

positive or negative and such variances may impact forecast IPP energy volumes. Of the $103.3 million increase, more than half can be attributed to increased forecast deliveries from two IPP facilities as permitted under their respective agreements.

- **New EPAs:** This represents the forecast costs from IPPs with new EPAs signed since the Previous Application (e.g., under the SOP) that are forecast to achieve commercial operation prior to the end of the test period.
- **EPA Renewals:** This represents the net change in cost (i.e., certain new EPAs to replace existing expiring EPAs are forecast to increase in cost and others are forecast to decrease) from the fiscal 2019 RRA to the fiscal 2021 Plan of those EPAs that have been renewed since the Previous Application and those EPAs that are assumed to be renewed during the test period. This net increase includes the costs of expiring EPAs, the costs for hydro renewals and the costs associated with the Biomass Energy Program.

The forecast net cost reductions in IPP costs during the test period are generally attributed to the following factors:

- **Terminations:** This includes terminations of EPAs, EPAs which have expired and have not been renewed, and one cogeneration project that is no longer going ahead and has been removed from the forecast.
- **SOP Reductions:** This reflects the reduction in forecast energy volumes for the SOP due to the indefinite suspension of the program.

4.7.2 Non-Integrated Area Forecast Increases Are Driven by Diesel Costs

Non-Integrated Area communities are served by local generating facilities and distribution networks. There are two types of costs in serving these communities: costs for BC Hydro's diesel generating facilities and IPP costs for five hydro facilities[136] and one biomass facility.

Table 4-14 Non-Integrated Area Generation Costs

Non-Integrated Area ($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
NIA – BC Hydro Diesel Generating Stations		15.4	15.0	18.5	16.3	22.0	18.0	21.3	23.5
NIA - IPPs		9.2	9.9	8.8	10.2	9.2	8.8	10.2	10.1
Total	4.0 L30	24.6	25.0	27.4	26.5	31.1	26.9	31.6	33.6

As compared to fiscal 2019 RRA Plan, during the test period, energy volumes are relatively stable. Variations in forecast costs for fiscal 2020 and fiscal 2021 are largely driven by fluctuations in fuel prices for BC Hydro's diesel generation facilities. Fuel prices are based on the Annual Energy Outlook Report issued by the U.S. Energy Information Administration. To the extent that diesel prices ultimately depart from the forecast prices, the variance will be captured in a regulatory account.

In Non-Integrated Area communities, existing and planned IPPs may displace a portion of diesel generation. However, diesel generation facilities must be in place for reliability purposes in all 14 Non-Integrated Areas.

4.7.3 Gas and Other Transportation Costs Have Decreased

Gas and other transportation costs are forecast to diminish significantly for the test period.

136 Four of the five hydro facilities have reached commercial operation and one is forecast to reach commercial operation.

Table 4-15 Gas and Other Transportation

Cost of Energy	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Gas & Other Transportation	4.0 L31	10.6	11.7	10.1	13.1	6.1	9.2	2.8	2.7

Gas transportation costs include upstream gas transportation contracts entered into by BC Hydro (not included with IPP and Long-Term Commitments or as part of BC Hydro's Cost of Heritage Energy) and fuel costs related to a dispatch agreement for firm capacity and associated energy. In fiscal 2019, BC Hydro had only one upstream gas transportation contract included in Gas and Other Transportation (Schedule 4.0, line 31 of Appendix A). This contract was assigned to Powerex in November 2018 as the need for gas supply has greatly diminished due to the change in operation of thermal generating facilities, primarily related to the decommissioning of Burrard Thermal.

BC Hydro also incurs external electricity transmission costs, including those related to the service of domestic load in Fort Nelson from energy imported from Alberta, as well as wheeling charges to serve the domestic load in the Goodlow (Boundary Lake), Rogers Pass, and Duck Lake areas.

Total forecast gas and external transmission costs for fiscal 2020 and fiscal 2021 are $2.8 million and $2.7 million respectively, compared to the fiscal 2019 Plan of $6.1 million. This decrease largely reflects the assignment of BC Hydro's gas transportation contract to Powerex.

4.7.4 Water Rentals (Waneta Two-Thirds) are Paid by Teck

Table 4-16 Water Rentals (Waneta (Two-Thirds)

Cost of Energy	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Water Rentals (Waneta Two-Thirds)	4.0 L32	0.0	0.0	0.0	0.0	0.0	2.4	3.5	3.7

As discussed in section 4.2.4, BC Hydro's two-third interest in Waneta is leased to Teck. Teck is responsible for all operating costs, including paying for its share of water rentals. These costs are shown as an offset in Miscellaneous Revenues (Appendix A, Schedule 15.0, line 22).

4.8 Cost of Market Energy

Cost of Market Energy includes domestic and trade energy purchases and sales. Domestic purchases and sales fall under Market Electricity Purchases and Surplus Sales respectively; and trade purchases and sales fall under Net Purchases (Sales) from Powerex. The use of BC Hydro's transmission system for export related to Surplus Sales is referred to as Domestic Transmission – Export.

Table 4-17 Cost of Market Energy

($ millions)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Market Electricity Purchases	4.0 L34	8.6	3.4	30.2	3.7	35.9	89.1	40.0	18.2
Surplus Sales	4.0 L35	(118.1)	(132.8)	(150.4)	(139.4)	(129.2)	(115.0)	(97.1)	(111.4)
Net Purchases (Sales) from Powerex	4.0 L36	(6.5)	2.3	(6.0)	(10.9)	0.7	16.4	(0.5)	0.5
Domestic Transmission – Export	4.0 L37	31.8	28.3	35.4	25.2	29.9	18.5	17.4	21.0
Total	4.0 L38	(84.1)	(98.7)	(90.8)	(121.5)	(62.6)	9.0	(40.2)	(71.7)

4.8.1 Market Electricity Purchases

Table 4-18 Market Electricity Purchases

($ millions)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Market Electricity Purchases	4.0 L34	8.6	3.4	30.2	3.7	35.9	89.1	40.0	18.2

Market Electricity Purchases are the amount of electricity purchases allocated to BC Hydro to serve domestic load in a given year, and vary depending on reservoir inflows, market prices, and customer demand. These purchases are performed exclusively with Powerex, and the energy is provided to BC Hydro in accordance with the applicable transfer price. While BC Hydro is in an energy surplus position, Market Electricity Purchases are required, at certain times during the year, to meet domestic load requirements during short-term operational constraints.

The cost of planned market electricity purchases for fiscal 2020 and fiscal 2021 are based on forward market prices as of October 15, 2018. Total market electricity purchases are based on the results of BC Hydro's Energy Study described in section 4.4.2.1, and are expected to be 1,504 GWh in fiscal 2020 and 648 GWh in fiscal 2021.

Unlike Powerex's trade activity, which is captured under Net Purchases (Sales) from Powerex, Market Electricity Purchases are not net of Surplus Sales, which is discussed in the next section.

4.8.2 Surplus Sales

Table 4-19 Surplus Sales

($ millions)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Surplus Sales	4.0 L35	(118.1)	(132.8)	(150.4)	(139.4)	(129.2)	(115.0)	(97.1)	(111.4)

Surplus Sales are sales of electricity when BC Hydro has energy that is surplus to domestic load requirements. BC Hydro may also sell energy to the market in response to system conditions, such as excess freshet energy. As with Market Electricity Purchases, these sales are performed exclusively with Powerex, and the energy is provided to Powerex in accordance with the applicable transfer price.

Surplus Sales are expected to be 2,409 GWh in fiscal 2020 and 3,087 GWh in fiscal 2021. These amounts are lower than the fiscal 2019 RRA Plan amount due to expected filling of system storage in the test period as shown in Table 4-1 as well as increased load requirements, as shown in the Load Forecast discussed in Chapter 3.

4.8.3 Net Purchases (Sales) from Powerex

Table 4-20 Net Purchases (Sales) from Powerex

($ millions)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Net Purchases (Sales) from Powerex	4.0 L36	(6.5)	2.3	(6.0)	(10.9)	0.7	16.4	(0.5)	0.5

As discussed in section 4.2.4, Powerex may elect to purchase energy from BC Hydro when the system has flexibility for energy to be drawn from storage, and to sell energy to BC Hydro when the system has flexibility for energy to be stored. Such transactions are undertaken to take advantage of market trading opportunities.

When Powerex acquires energy from BC Hydro, it seeks to maximize value of this energy in external markets. The difference between the transfer price paid by Powerex to BC Hydro for that energy and the revenue (net of operating costs) ultimately received by Powerex for that energy is included in Powerex's net income. Powerex's net income is applied as an offset to BC Hydro's overall revenue requirements.[137]

However, for the purposes of this application, Net Purchases (Sales) from Powerex are based on the modelling results of BC Hydro's Energy Study described in section 4.4.2.1 and are net of the quantities assigned to Market Electricity Purchases and/or Surplus Sales. They are modelled to be 177 GWh in fiscal 2020 and 90 GWh in fiscal 2021. Although for fiscal 2020 and fiscal 2021 the Net Purchases from Powerex (GWh) indicates a net import of energy for each fiscal year, the net dollar value may be positive (cost to BC Hydro) or negative (revenue to BC Hydro) because of variations in the forecast market value of energy.

[137] BC Hydro forecasts Powerex's net income based on its historical five year average. The difference between forecast Powerex net income and actual Powerex net income is deferred to the Trade Income Deferral Account. However, if Powerex's net income is less than zero, the amount deferred to the Trade Income Deferral Account is the difference between zero and the forecast amount.

4.8.4 Domestic Transmission – Export

Table 4-21 Domestic Transmission – Export

($ millions)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Domestic Transmission – Export	4.0 L37	31.8	28.3	35.4	25.2	29.9	18.5	17.4	21.0

The use of BC Hydro's transmission system for export related to Surplus Sales pursuant to the OATT is referred to as Domestic Transmission – Export. These costs are determined based on the forecast percentage of domestic energy exports relative to the total domestic and trade exports, using the historical average unit cost for domestic exports.

Domestic Transmission - Export costs are expected to be $17.4 million in fiscal 2020 and $21.0 million in fiscal 2021. These amounts are lower than the fiscal 2019 RRA Plan amount due to a lower volume of Surplus Sales, as described in section 4.8.2.

Domestic Transmission - Exports costs are included in BC Hydro's TRR and are recovered under the OATT. These costs represent BC Hydro's use of point-to-point transmission service for domestic exports. In the TRR, these costs are allocated to Cost of Energy via intersegment revenues which are reported in Appendix A, Schedule 3.4, line 18. This allocation of intersegment revenues ensures that costs are only recovered from domestic customers once.

Fiscal 2020 to Fiscal 2021

Revenue Requirements Application

Chapter 5

Operating Costs

Table of Contents

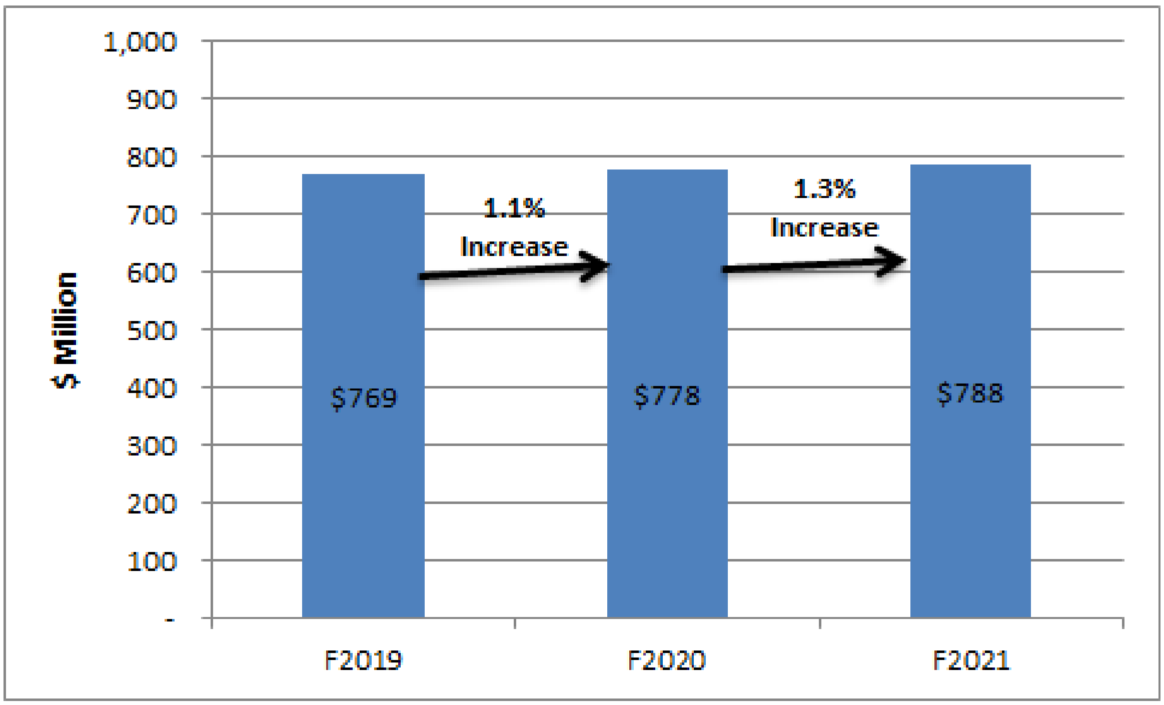
List of Figures

List of Tables

5.1 Introduction

This chapter describes our planned operating costs and full time equivalents (**FTEs**) for the fiscal 2020 to fiscal 2021 test period. As shown in Figure 5-1 below, BC Hydro is limiting base operating cost increases[138] below the forecast rate of inflation[139] over the test period.

Figure 5-1 Base Operating Cost Increases Are Below Forecast Inflation



BC Hydro has been able to limit base operating cost increases to below the forecast rate of inflation for the test period by partially offsetting non-controllable cost increases with reductions to controllable costs.

138 BC Hydro explains in section 5.5.1 why base operating costs should be the focus.

139 BC Hydro uses the B.C. Consumer Price Index measure for the forecast rate of inflation. The forecast rate of inflation for fiscal 2019, fiscal 2020 and fiscal 2021 is 2.7 per cent, 2.3 per cent and 2.0 per cent, respectively.

Detailed support for BC Hydro's forecast operating costs, by Business Group, are provided in Chapters 5A through 5G. In response to commentary from the BCUC about needing to better understand BC Hydro's operating cost budget, these chapters provide significantly more information than the Previous Application on the operating costs and FTEs for each of BC Hydro's six Business Groups and 39 Key Business Units (**KBUs**). The composition of the entire budget of each KBU, not just the incremental costs, is addressed in these chapters.

This chapter is organized around the following key points:

- Section 5.2 summarizes how BC Hydro has considered and responded to the BCUC's comments and recommendations about BC Hydro's operating costs in its Decision.[140]
- Section 5.3 describes changes to BC Hydro's organizational structure since the Previous Application. We have completed the transition to a centralized and functionally-aligned structure.
- Section 5.4 explains that BC Hydro has a robust budgeting process, with both top-down and bottom-up elements.
- Section 5.5 provides an overview of BC Hydro's operating costs during the test period:
  - ▶ Controllable cost pressures were absorbed within existing budgets, which means that after accounting for Standard Labour Rate increases, most KBUs were held to their current level of spend; [141] and

[140] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 33.

[141] Operating costs for some KBUs may increase or decrease from fiscal 2019 forecast to fiscal 2020 plan, due to budget transfers related to re-organizations. Overall, these transfers are cost neutral.

  - ▶ BC Hydro has achieved reductions in controllable costs through a variety of means, including vacancy factor savings, lease consolidations, and a reduction to advertising costs.
- Section 5.6 provides an overview of BC Hydro's FTEs and Standard Labour Rates:
  - ▶ The Workforce Optimization Program has reduced BC Hydro's total costs by replacing contractors with internal employees;
  - ▶ The repatriation of services previously provided by Accenture has resulted in higher than expected cost savings;
  - ▶ Apart from growth in the workforce directly related to increased capital investment, BC Hydro's FTEs have remained relatively flat since fiscal 2012 and will remain flat during the test period; and
  - ▶ A 2017 assessment by Morneau Shepell concluded that on a total cash basis, BC Hydro's employee compensation is 11 per cent below median market rates. After factoring in the value of pension benefits and time off programs, employee compensation is comparable to median market rates.
- Section 5.7 addresses benchmarking:
  - ▶ A report prepared by The Brattle Group shows that BC Hydro's operating costs[142] benchmark favourably against a peer group of U.S. utilities;
  - ▶ An internal analysis provides an indicative assessment that BC Hydro's operating costs compare well against those of other major Canadian utilities;
  - ▶ Recent benchmarking on maintenance delivery costs has demonstrated that BC Hydro's costs are consistent with or better than its utility peers; and

[142] The Brattle Group Benchmarking Study focused on operations and maintenance costs, excluding the costs of fuel and water rental that are used in the power production process. The Brattle Group Benchmarking Study refers to these costs as "non-fuel operations and maintenance expenses", or by the acronym "NFOM". The costs of fuel and water rentals that are used in the power production process are excluded because they are reflected in BC Hydro's cost of energy. Cost of Energy is addressed in Chapter 4 of the Application.

- ▶ Benchmarking used throughout BC Hydro provides additional comfort that we are managing operating costs appropriately;

- Section 5.8 explains how BC Hydro is optimizing the level of Power System maintenance, successfully mitigating increases in maintenance expenditures in recent years despite a growing Power System asset base, aging assets, and increased regulatory requirements.
- Section 5.9 outlines the content of Chapters 5A to 5G, which provide the composition, drivers and outcomes of each KBU budget in more detail than in the Previous Application.

5.2 We have Addressed the BCUC's Recommendations and Comments on Operating Costs

The BCUC accepted BC Hydro's forecast fiscal 2017 to fiscal 2019 operating costs in its Decision. However, the BCUC also made a number of recommendations and comments related to operating costs, to which BC Hydro has responded in this chapter.

Table 5-1 below sets out the BCUC's recommendations and comments on operating costs, and summarizes our response. It also indicates where further information on BC Hydro's response can be found.

Table 5-1 Response to BCUC Recommendations and Comments on Operating Costs

Topic	BCUC Recommendations / Comments[143]	Location of BC Hydro's Response
Comfort in Cost "Starting Point"	The Panel notes that BC Hydro states that test period increases in base operating costs are forecast to be below the rate of inflation at an average of 1.2 per cent per annum (excluding Smart Metering and Infrastructure Program costs). The Panel recognizes that in some cases, comparing forecast cost increases to the rate of inflation may be considered an appropriate measure for evaluating the reasonableness of forecast cost increases in the test period. This method is likely suitable in situations where a regulator has consistently been empowered to oversee all aspects of the utility's forecast and historical expenditures through proceedings in which the underlying base costs were initially established. However, given the Commission's limited involvement in the approval of BC Hydro's recent revenue requirements, the Panel does not have a high degree of comfort in BC Hydro's starting point, being the 2016 base operating cost.	• Section 5.4 discusses BC Hydro's budgeting process, which incorporates both top-down and bottom-up elements. • Chapters 5A through 5G provide significantly more information on our operating costs and FTEs, relative to the Previous Application. We address the composition, drivers and outcomes of the overall budget of each KBU, not just incremental amounts. • Section 5.7 (and the last row in this table) discusses benchmarking, including independent benchmarking studies on our overall operating and maintenance costs. Compensation benchmarking is addressed in section 5.6.5.

143 BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), pages 34-35 and 87.

Topic	BCUC Recommendations / Comments[143]	Location of BC Hydro's Response
FTE Increases	In the 2011 review of BC Hydro, it was recommended that there be a reduction of staff from the current 6,000 employees to 4,800[144]. In the Application, BC Hydro indicated it had a net reduction of approximately 650 positions in response to the 2011 review recommendations. However at this time, BC Hydro indicates it still has over 5,500 employees and estimates total FTE staffing at 6,296 in fiscal 2017, 6,344 in fiscal 2018 and 6,365 in fiscal 2019.	• Section 5.4.3 sets out BC Hydro's vacancy management process. • Section 5.6.1 explains that BC Hydro's total labour costs have declined. The growth in FTEs in recent years has actually been a source of cost savings. The Workforce Optimization Program, discussed in section 5.6.1, has replaced higher cost contractors with internal FTEs. The Accenture repatriation, discussed in section 5.6.2, has exceeded the anticipated cost savings. • Section 5.6.3 explains that apart from growth in the workforce directly related to increased capital investment, BC Hydro's FTEs have remained relatively flat since fiscal 2012. Section 5.6.4 shows that, excluding the Site C Project, FTEs will remain flat during the test period.
Long-Term Costs of Workforce Optimization	In July 2015, BC Hydro launched the Workforce Optimization Program to examine its resourcing model to determine the right mix of internal and external resources. BC Hydro submits that increased labour costs are supposed to be more than offset by a reduction in capital labour costs associated with contractors. Although BC Hydro reported the elimination of 900 positions, its Workforce Optimization will actually add an additional 170 FTEs through to fiscal 2019. Although short-term savings are anticipated by BC Hydro, there does not appear to be an assessment of the long-term effects and costs of hiring contractors as employees.	• Section 5.6.1.3 explains how long-term effects and costs are taken into consideration in the workforce adjustment request document that is required for any conversions of contractors to internal FTEs under the Workforce Optimization Program.

144 BC Hydro notes that while the panel that conducted the Government of B.C.'s 2011 review of BC Hydro believed that 4,800 employees was a more reasonable staffing level, the actual recommendation in the panel's report was to "accelerate the pace and magnitude of change to develop an organizational structure that reflects the reasonable level of internal and external staffing that reduces costs passed on to ratepayers".

Topic	BCUC Recommendations / Comments[143]	Location of BC Hydro's Response
Work Smart (Use of Capacity Savings)	BC Hydro initiated a Work Smart program which uses Lean methodology to examine internal processes for opportunities to make them more efficient. BC Hydro states these initiatives were implemented across the organization and are reported to have generated an estimated additional employee capacity of 22,500 hours annually. Given these initiatives, in the Panel's view, it should be expected that further efficiency savings should be identifiable in an organization as large as BC Hydro and that there should be incremental cost savings in fiscal 2018 and fiscal 2019. However, the Panel notes that BC Hydro states it has not completed a cost benefit analysis for the initiatives but will instead monitor as it is rolled out to evaluate its effectiveness. The Panel recognizes that while BC Hydro states it is not the intention of Work Smart to reduce costs but rather to allow for the reallocation of staff to more productive purposes, in our view a measured increase in productivity should result in costs savings.	• Section 5.4.5 discusses how capacity has gained through BC Hydro's Work Smart program have exceeded expectations. We also explain that using this capacity to avoid incremental costs by managing workload and absorbing new work is beneficial and consistent with the practice at other companies.
Total Rewards Program	BC Hydro states that based on its 2015 survey, salaries for electric utility jobs are 15 per cent below market rates and general industry jobs are at market. On a total cash (salary plus short term incentives pay) basis, electricity utility jobs are 25 per cent below market rates and general industry jobs are 7 per cent below market rates. To compensate, BC Hydro states that it provides benefits such as time off and the pension program to reduce the gap to market on a total rewards basis. The Panel notes that both the costs and benefits of these initiatives are unclear and should be further examined.	• Section 5.6.5 addresses the value delivered by BC Hydro's Total Rewards Program. Our Total Rewards offer is designed to attract and retain qualified employees and is working. Our voluntary turnover rate is 1.3 per cent, which is below the 3.8 per cent average for the Power and Utilities industry as reported by the Conference Board of Canada. A 2017 assessment by Morneau Shepell concluded that on a total cash basis, BC Hydro employees earn 11 per cent below median market rates. After factoring in the value of pension benefits and time off programs, BC Hydro's employee compensation is comparable to median market rates.

Topic	BCUC Recommendations / Comments[143]	Location of BC Hydro's Response
Use of Benchmarking and Metrics	The Panel is concerned with the lack of metrics used by BC Hydro for productivity or benchmarking purposes.	• Section 5.7.1 summarizes the independent benchmarking study prepared by The Brattle Group for this proceeding, which confirms that BC Hydro's operating costs compare well against an appropriate peer group of U.S. utilities. This study is provided as Appendix T. • Section 5.7.2 shows the results of a comparison of our operating costs against those of other major electric utilities in Canada, which indicates that BC Hydro's operating costs compare well against major Canadian utilities. The data used for this review is provided as Appendix U. • Section 5.7.3 provides the results of recent independent benchmarking on maintenance delivery costs by Navigant and First Quartile, which demonstrates that BC Hydro's costs are consistent with or better than its utility peers. • Section 5.7.4 summarizes the benchmarks provided to support the operating costs and FTEs for various KBUs as discussed in Chapters 5A through 5G.

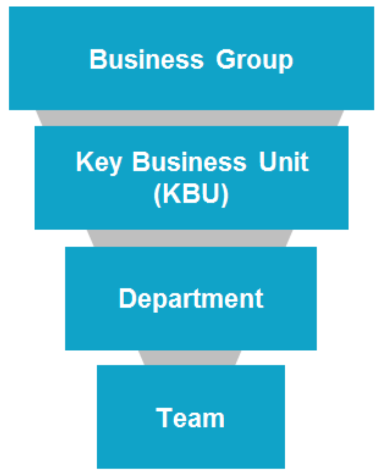
5.3 Overview of How BC Hydro is Organized

BC Hydro has six Business Groups, made up of 39 KBUs. We have completed our re-organization from an organization divided according to lines of business to a centralized organizational structure that aligns with the work functions that we perform – planning, building, operating and supporting.

5.3.1 Organizational Nomenclature

Figure 5-2 below provides a simplified diagram of our organizational structure, for the purpose of clarifying nomenclature used in this Application.

Figure 5-2 Organizational Nomenclature



5.3.2 The Move to a Centralized and Functionally Aligned Organization Is Complete

In October 2017, BC Hydro took the last step in moving to a centralized and functionally-aligned organizational structure. This final, incremental change completes the shift towards centralizing functions that BC Hydro has pursued over time. This functional alignment encourages consistent adoption of best practices used across the company and facilitates stronger collaboration and cooperation in similar functions across our business.

In recent years, BC Hydro had centralized its Finance, Safety and Supply Chain functions. The most significant part of the recently completed final step was to:

- Bring together the KBUs responsible for Power System planning into a Business Group called Integrated Planning; and
- Bring together the KBUs responsible for Power System operations into a Business Group called Operations.

This final step was not intended to drive specific cost reductions, but we believe that the intangible benefits of improved collaboration and consistent adoption of best practices can only assist the efficient management of the company. Our Safety

Business Group provides a good illustration of the benefits of functional alignment. Safety functions were previously distributed throughout the business and in its Decision on BC Hydro's Fiscal 2009 to Fiscal 2010 Revenue Requirements Application, the BCUC encouraged BC Hydro to implement a comprehensive safety management program.[145] Since centralizing, we have been able to improve consistency of and clarity on safety requirements throughout the company. This promotes improved safety performance and a stronger safety culture.[146]

The centralized organizational structure aligns our Business Groups to the lifecycle of our work delivery. Our Business Groups are now organized under our four major work functions – Plan, Build, Operate, and Support. This is shown in Figure 5-3 below.

Figure 5-3 Plan-Build-Operate-Support Model

The change brings together groups with similar functions that were previously separated by our different lines of business - Generation, Transmission, and Distribution. In addition, KBUs within these Business Groups have aligned their work to our main asset types – station assets (generation plants and substations) and line assets (transmission and distribution lines).

Our Business Groups and their respective KBUs are summarized in Table 5-2 below. Table 5-2 is followed by a brief synopsis of our Plan, Build, Operate, and

145 British Columbia Utilities Commission Decision and Order No. G-16-09, BC Hydro Fiscal 2009 to Fiscal 2010 Revenue Requirements Application (March 13, 2009), page 49.

146 BC Hydro 2017/18 Annual Service Plan Report, pages 18 to 20, 'Goal 4: Safety Above All, Safety Performance Measures.

Support functions. Chapters 5A to 5G provide detailed information on the operating costs and FTEs for each Business Group and KBU.

Table 5-2 Business Groups and KBUs[147]

	Business Group	Key Business Unit
Plan	Integrated Planning	Energy Planning and Analytics
		Dam Safety
		Stations Asset Planning
		Line Asset Planning
		Interconnections and Shared Assets
		Engineering
Build	Capital Infrastructure Project Delivery	Project Delivery
		Indigenous Relations
		Environment
		Properties
Operate	Operations	Program and Contract Management
		Line Field Operations
		Stations Field Operations
		Distribution Design and Customer Connect
		Construction Services
		Generation System Operations
		Transmission and Distribution System Operations
Support	Safety	Safety System and Assurance
		Learning and Development
		Field Safety Services
		Security and Emergency Management
	Finance, Technology, Supply Chain	Finance
		Technology
		Supply Chain
	People, Customer, Corporate Affairs	Human Resources
		Customer Service
		Conservation and Energy Management
		Power Acquisitions and Contract Management
		Communications and Community Engagement
		Regulatory and Rates
		Ethics and Merit Office
	Other[148]	Office of the General Counsel[149]
		Office of the President and Chief Operating Officer

147 Each Business Group also includes a Business Unit Support KBU. These KBUs are relatively small and primarily include funding for BC Hydro's Executive Team members and their support staff.
148 The Other category was created to support the presentation of information and is not a Business Group.
149 The Office of the General Counsel reports directly to the President and Chief Operating Officer.

- **Plan (Integrated Planning Business Group):** The Integrated Planning Business Group is responsible for system planning. It brings together our asset planning functions which are performed by the Dam Safety, Stations Asset Planning, and Line Asset Planning KBUs. It also includes the Engineering KBU, the Interconnections and Shared Assets KBU, and Energy Planning and Analytics KBU. These KBUs work together to develop short and long-term maintenance and capital investment plans. The plans are then implemented by either the Capital Infrastructure Project Delivery Business Group or the Operations Business Group.
- **Build (Capital Infrastructure Project Delivery Business Group):** The Capital Infrastructure Project Delivery Business Group brings together the Project Delivery KBU with the other KBUs that are integral for the successful delivery of capital projects: the Indigenous Relations KBU, the Environment KBU and the Properties KBU. This Business Group is responsible for delivering our major capital projects on time and on budget while also balancing our environmental commitments, managing our land and properties, and developing and sustaining meaningful relationships with Indigenous communities.
- **Operate (Operations Business Group):** The Operations Business Group brings together the operations functions of our previous Transmission and Distribution Business Group and Generation Business Group. These functions have been re-aligned to our asset types, with the creation of the Stations Field Operations KBU (overseeing our generation and transmission station asset operations) and the Line Field Operations KBU (overseeing our distribution and transmission line operations). This Business Group also includes other operations-focused KBUs – the Transmission and Distribution System Operations KBU, the Generation System Operations KBU, the Program and Contract Management KBU, the Distribution Design and Customer Connections KBU, and the Construction Services KBU. These KBUs collaborate to implement work, maximize the value of the system, and connect our customers.

- **Support** – Three Business Groups provide services that support the planning, building and operation of BC Hydro's electricity system. Specifically:
  - **Safety Business Group** – This Business Group includes the Safety System and Assurance KBU, the Learning and Development KBU, the Field Safety Services KBU and the Security and Emergency Management KBU. It supports safety leadership across the organization. It is responsible for setting direction, training and oversight of our safety and security programs for our employees, contractors, and the public;
  - **Finance, Technology Supply Chain Business Group** – This Business Group includes the Finance KBU, the Technology KBU and the Supply Chain KBU. It is responsible for financial oversight and strategic business support for the company, the planning, design, delivery, operations, support and management of BC Hydro's information, operations and telecommunications technologies, and procuring and delivering materials, vehicles, and services; and
  - **People, Customer, Corporate Affairs Business Group** – This Business Group includes the Human Resources KBU, the Customer Service KBU, the Conservation and Energy Management KBU, the Power Acquisitions and Contract Management KBU, the Communications and Community Engagement KBU, the Regulatory and Rates KBU and the Ethics and Merit Office KBU. It supports and develops personnel, is responsible for customer service, and manages key relationships with stakeholders including governments and regulators.

5.4 BC Hydro has Used a Robust Budgeting Process

The forecast operating costs presented in this Application are the product of a robust budgeting process that involves top-down and bottom-up elements. The approach goes beyond a simple examination of incremental changes from the prior year. It requires Business Groups and individual KBUs to consider, and articulate to the Executive Team, their overall responsibilities, cost drivers, FTEs and targeted outcomes.

5.4.1 BC Hydro has Reviewed More than just Incremental Requirements

In its Decision on the Previous Application, the BCUC expressed that, in reviewing the incremental cost changes sought by BC Hydro in the Previous Application, it did not have a high degree of comfort in BC Hydro's starting point, being the 2016 base operating cost.

In this Application, we have made deliberate efforts to present the full cost picture rather than focusing only on incremental changes. The detailed cost and FTE information provided by Business Group and by KBU in Chapters 5A through 5G represents the culmination of the budgetary process undertaken throughout the organization.

5.4.2 Budgeting Approach Involves Bottom-Up and Top-Down Elements

BC Hydro's budgeting process includes both bottom-up and top-down elements.

From a bottom-up perspective, each KBU conducts an in-depth review of their operating costs, considering current operational and project related needs based on forecast work plans, resourcing requirements and legislative and compliance requirements. Through this process, cost pressures and savings opportunities are identified and consolidated at a Business Group level.

From a top-down perspective, BC Hydro's Executive Team reviews the identified cost pressures and savings opportunities and considers the Mandate Letter from the

Government of B.C. as well as the goals and targets in the Service Plan to inform an overall top-down target.

During the budgeting process for this Application, which occurred in conjunction with the Comprehensive Review, the Executive Team determined that, with the exception of certain uncontrollable costs and Standard Labour Rate increases, all cost pressures would be managed within the existing (i.e., fiscal 2019 forecast) operating cost budget. We identified savings throughout the organization in order to offset the cost pressures. This outcome is described further in section 5.5.2 below.

5.4.3 BC Hydro has a Vacancy Management Governance Process

BC Hydro has an established governance process to manage vacancies, which assists in managing within budget targets. The governance process has two main elements.

First, filling vacancies requires the prior review and approval by an Executive Team member or Director of a KBU. Each Executive Team member or KBU Director reviews and approves requests, which detail the reason for the vacancy as well as the job title, job level, affiliation and employment status of each position.

Second, any request to create a new position that is not within BC Hydro's established FTE and budget plans must be supported by a business case and be accommodated with offsetting cost reductions or incremental cost savings.

5.4.4 Appropriate Budget Oversight and Reporting Is in Place

BC Hydro has appropriate financial oversight processes in place so that operating cost budgets determined through the budgeting process described above are maintained.

The Finance KBU provides ongoing oversight through financial and management reporting throughout the year. Managers receive monthly reporting outlining their monthly and year-to-date results so that KBUs are tracking and comparing actual spending to budgeted amounts. On a monthly basis, each Executive Team member reviews these results along with a dashboard of performance metrics for their Business Group with their direct reports. In addition, the Executive Team reviews the consolidated financial results each month.

The Finance KBU also identifies, quantifies, and explains any variances to the management teams of each KBU and to the Executive Team. Year-end forecasts are prepared and updated monthly to identify any expected challenges in meeting annual targets. Emerging cost pressures are identified, and if necessary, corrective actions are implemented so that BC Hydro remains on track to achieve its targets.

5.4.5 The Work Smart Program has Created Capacity to Manage Workload and Absorb New Work

Work Smart is BC Hydro's program for continuous process improvement and is based upon Lean principles. Lean is a business philosophy focusing on streamlining work as well as identifying and eliminating non-value-added activities.

5.4.5.1 The Benefits of the Work Smart Program Have Exceeded Expectations

As of the end of fiscal 2018, BC Hydro has realized an estimated 80,000 annual capacity hours gained as a result of Work Smart program initiatives. The estimated realized hours gained exceed the forecast amount of 46,550 hours provided by BC Hydro in the Previous Application.[150] Capacity hours gained is the difference between the work effort of the process before the Work Smart initiative is undertaken and after the implementation of the Work Smart recommendations.

An example of a successful Work Smart initiative is the Project Scaling initiative.

In 2016, BC Hydro’s project delivery method was independently assessed using the global standard, Organizational Project Management Maturity Model, and was rated 91 per cent, which is considered world-class. However, for smaller and lower risk

[150] Refer to BC Hydro’s Response to BCUC IR 2.213.04 in the Previous Application proceeding.

projects, such as projects with low design complexity and limited stakeholder impact, BC Hydro identified an opportunity to scale down the project delivery activities to reduce time and gain capacity. BC Hydro undertook a Work Smart review of the process and developed three accelerated scaling models, which are now being deployed in the organization. These models enable the project team to combine stages and deliverables into a single set, reducing the number of design reports, project estimates, and wait time between stages.

Approximately 12 projects are currently piloting one of the accelerated scaling models. A successful example is the Mica Townsite Schoolhouse and Staff House Improvement project, which gained approximately 1,100 hours in capacity and reduced its schedule by six months by using an Accelerated Scaling model.

5.4.5.2 Using Work Smart Gains to Address Workload and Absorb New Work is Valuable and Consistent with Practices at Other Companies

In its Decision, the BCUC expressed its belief that the efficiency savings generated by BC Hydro's Work Smart program should result in incremental cost savings.[151] We believe that our approach of using these gains to address workload issues and absorb new work, so that new costs can be avoided, is beneficial. Efficiency gains through the Work Smart program are an important part of our efforts to keep operating cost increases below the rate of inflation.

Work Smart relies on front-line employees to identify opportunities to make processes more efficient and effective as well as to save time and resources. We believe that using the gains from these opportunities to address workload issues and allow employees to focus on higher value work is the most effective way to encourage employees to bring forward ideas and participate in the Work Smart process.

[151] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 34.

BC Hydro's approach of using Work Smart gains to address workload issues is also consistent with practices at other companies. For example:

- Washington State operates a successful Lean program known as "Results Washington", which is consistent with BC Hydro's Work Smart program. Its January 2018 Annual Progress Report indicates that its initiatives focus on avoided costs rather than cost savings;[152] and
- The Insurance Corporation of British Columbia operates a successful Lean program known as Operational Excellence. Its 2017 Revenue Requirements Application indicates that cost savings are not an objective of this program.[153]

5.5 Fiscal 2020 to Fiscal 2021 Operating Costs Increases have been Held Below Forecast Inflation

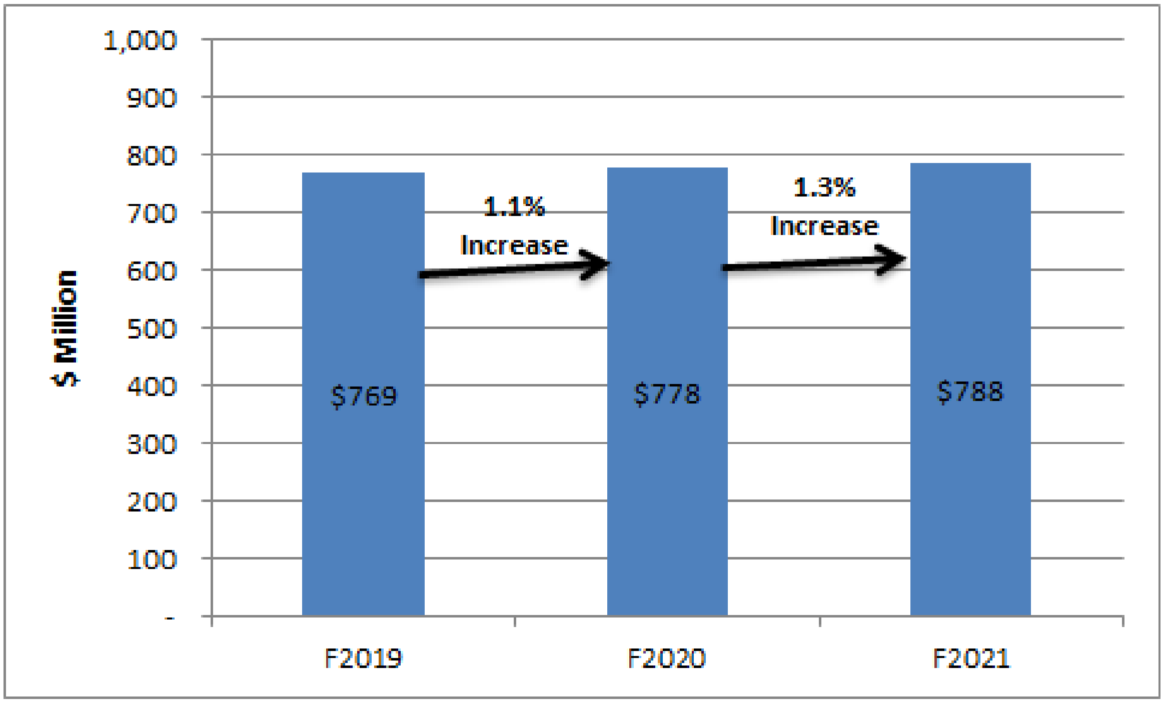
This section summarizes the fiscal 2020 to fiscal 2021 forecast operating costs. BC Hydro expects to be able to limit base operating cost increases to below the forecast rate of inflation[154] over the test period. Base operating costs are forecast to increase by 1.1 per cent in fiscal 2020 and 1.3 per cent in fiscal 2021 for an average increase of 1.2 per cent per year. This is shown in Figure 5-4 below.

[152] Results Washington Report: https://www.results.wa.gov/sites/default/files/2018%20Results%20WA%20report%20final.pdf

[153] ICBC 2017 Revenue Requirements Application, 6-2 https://www.bcuc.com/Documents/Proceedings/2017/DOC_49993_B-1_ICBC-2017-Revenue-Requirements-Application.pdf

[154] BC Hydro uses the B.C. Consumer Price Index measure for the forecast rate of inflation. The forecast rate of inflation for fiscal 2019, fiscal 2020 and fiscal 2021 is 2.7 per cent, 2.3 per cent and 2.0 per cent, respectively.

Figure 5-4 Base Operating Costs Increases Are Below Inflation



5.5.1 Base Operating Costs Should be the Focus when Assessing BC Hydro's Cost Management

We use various terminologies when describing BC Hydro's operating costs. Table 5-3 below helps to explain the various operating cost views. Base operating costs are, in BC Hydro's view, the relevant measure for the assessment of our efforts to control operating costs because they exclude costs that, among other things,[155] vary according to changes in accounting rules and the mechanisms in place to recover regulatory account balances. BC Hydro reports its base operating costs as part of its Annual Service Plan.

[155] Base operating cost also exclude operating costs related to the BC Hydro's purchase of Teck's two-thirds interest in Waneta and the Customer Crisis Fund. These costs are excluded because they are offset by revenues, resulting in a net zero impact.

Table 5-3 Explanation of Operating Cost Views

Cost Components	Base Operating Costs	Net Operating Costs	Gross Operating Costs	Current Operating Costs
Normal day to day operations of BC Hydro including costs such as Labour, Materials and Services.	√	√	√	√
Recoveries Capitalized Costs Re-Classification Adjustment	√	√	√	√
IPP Capital Leases Capital overhead that can no longer be capitalized under IFRS Costs related to BC Hydro's purchase of Teck's two-thirds interest in Waneta[156] Customer Crisis Fund		√	√	√
Costs incurred in the current period but recovered in rates in future years consistent with the recovery mechanisms established for each regulatory account.			√	
Costs incurred in prior periods to be recovered in the current period consistent with the recovery mechanisms established for each regulatory account.				√

5.5.2 Controllable Cost Reductions Are Offsetting Increases in Non-Controllable Costs

BC Hydro has been able to limit base operating cost increases to below the forecast rate of inflation for the test period by offsetting increases to non-controllable costs with reductions to controllable costs.

5.5.2.1 Overview of the Change in Base Operating Costs

Table 5-4 below provides a continuity table that summarizes the changes to BC Hydro's base operating costs.

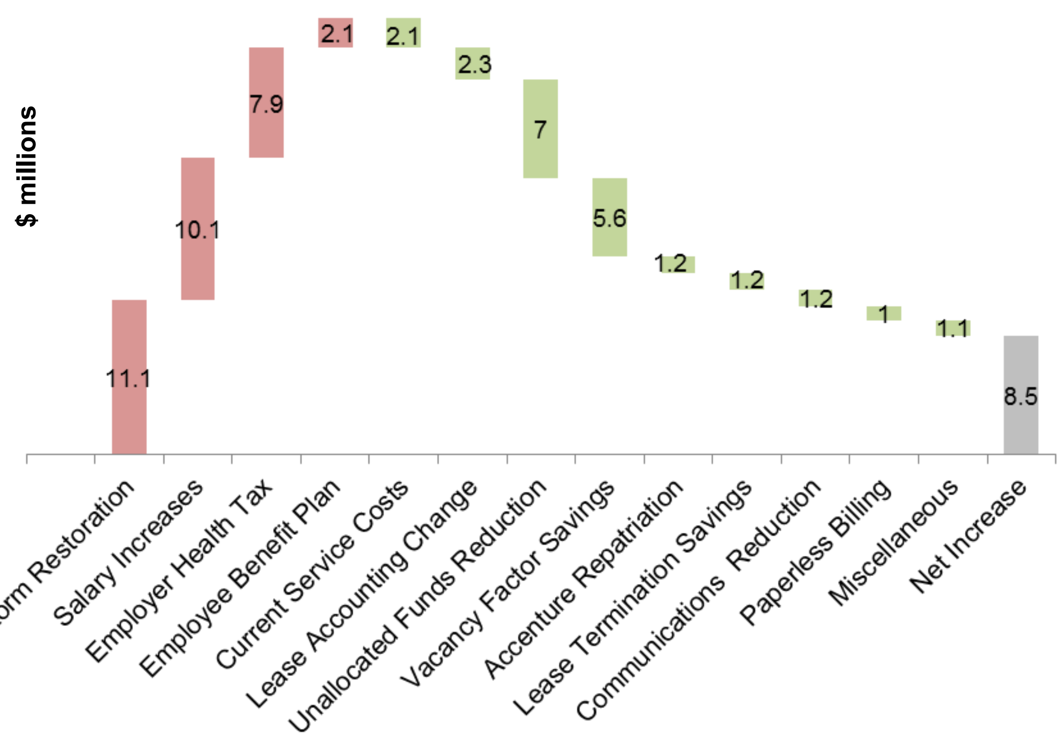
[156] Further information on BC Hydro's purchase of Teck's two-thirds interest in Waneta is provided in Chapter 4, section 4.2.3.

Table 5-4 Summary of Changes to BC Hydro's Base Operating Costs

	($ million)		F2020 Plan	F2021 Plan
1	F2019 Revenue Requirement Application Plan		961.1	
2	Compliance Filing Adjustment (Schedule 5.0, line 8)		10.4	
3	F2019 Revenue Requirement Application Compliance Filing Plan (Schedule 5.0, line 15)		971.5	
4	F2019 Forecast Operating Cost Increases:			
5	Waneta 2/3rd Operating Costs (Schedule 5.0, line 12)		3.8	
6	Customer Crisis Fund Operating Costs (Schedule 5.0, line 13)		4.0	
7	F2019 Forecast Operating Cost (Schedule 5.0, line 15)		979.3	
8	Less:			
9	IFRS Ineligible Capital Overhead (Schedule 5.0, line 10)		(147.7)	
10	Independent Power Producer Capital Leases (Schedule 5.0, line 11)		(54.3)	
11	Waneta 2/3rd Operating Costs (Schedule 5.0, line 12)		(3.8)	
12	Customer Crisis Fund Operating Costs (Schedule 5.0, line 13)		(4.0)	
13	Base Operating Costs (Carry Forward) (Schedule 5.0, line 9)	A	769.5	777.9
14	Test Period Savings	B	(13.6)	(0.4)
15	Test Period Cost Increases			
16	Labour		11.0	10.3
17	Storm restoration		11.1	
18	Total Test Period Cost Increases	C	22.1	10.3
19	Test Period Net Increase/(Decrease)	D=B+C	8.5	9.9
20	Base Operating Costs (Current Year) (Schedule 5.0, line 9)	E=A+D	777.9	787.8
21	Total Percentage increase	(E-A)/A	1.1%	1.3%

Figure 5-5 below provides a visual breakdown of cost increases and savings for fiscal 2020. The first four red bars show the factors that are increasing costs. The green bars show offsetting savings, culminating in the net change of $8.5 million (the grey bar).

Figure 5-5 Summary of Changes to BC Hydro's Base Operating Costs (Fiscal 2020)



5.5.2.2 The Forecast Base Operating Cost Increase is Primarily Driven by Non-Controllable Factors

As depicted in the figure above, three factors are driving most of BC Hydro's forecast base operating cost increases. Two of these factors – storm restoration and the employer health tax – are non-discretionary and are beyond BC Hydro's control. The third – Standard Labour Rate increases – is tied to the bargaining mandate for union staff provided to BC Hydro by the Public Sector Employers Council. BC Hydro considers management and professional compensation increases, which are essentially cost of living increases, to be a priority akin to non-controllable costs given how BC Hydro's employee compensation compares to median market. BC Hydro has had limited ability to increase management and professional salaries since 2012, due to the Public Sector Employers Council prior salary freeze policy.

Table 5-5 below provides a more detailed breakdown of Test Period Cost Increases.

Table 5-5 Test Period Cost Increases

Item	Description	Fiscal 2020 Incremental ($ million)	Fiscal 2021 Incremental ($ million)
Storm Restoration	BC Hydro continues to budget for storm restoration costs using a five-year average of normal weather years. In recent years, we have experienced higher levels of storm related damage, which has caused the five-year average of storm restoration costs to increase. Variances between planned and actual storm restoration costs are deferred to the Storm Restoration Costs Regulatory Account, which is discussed in Chapter 7, section 7.8.1.	11.1	0
Labour Costs			
Salary Increases	The Public Sector Employers Council provides all provincial public sector employers a common bargaining mandate for negotiating union collective agreements. It specifies the term of the agreement and general wage increases that employers can provide. The collective agreements at BC Hydro expire March 31, 2019 and the Public Sector Employers Council bargaining mandate specifies a three-year term (fiscal 2020 to fiscal 2022) with a 2.0 per cent general wage increase each year. The cost increase for this test period includes a 2.0 per cent general wage increase for union employees and a 2.5 per cent general wage increase for Management and Professional employees. Since 2012, due to the Public Sector Employers Council salary freeze policy, salary increases for Management and Professional employees have been limited and below the amount provided to unionized employees over the same period.	10.1	8.9
Employer Health Tax	The Government of B.C.'s Budget, released in February 2018, announced the implementation of the Employer Health Tax. Cost increases related to the Employer Health Tax are partially offset by the elimination of Medical Service Plan premiums.	7.9	(1.9)

Item	Description	Fiscal 2020 Incremental ($ million)	Fiscal 2021 Incremental ($ million)
Employee Benefit Plan	The forecast increase in employee benefits is primarily due to defined rates and inflationary increases which are largely uncontrolable. Benefit costs include the employer portion of Canada Pension Plan, employment Insurance, health and dental premiums, long term disability and workers' compensation premiums.	2.1	2.0
Current Service Costs	The resulting savings in fiscal 2020 are primarily due to the elimination of Medical Service Plan premiums. In fiscal 2021, the current service costs increase due to forecast salary increases which have a corresponding impact on current service costs. Please refer to Chapter 5G, section 5G.9.1 for more information on current service costs.	(2.1)	1.3
Unallocated Funds Reduction	The 2013 10 Year Rates Plan prescribed certain operating cost and rate increase targets. To manage unanticipated cost pressures within these targets, BC Hydro maintained a budget of unallocated funds. Going forward, this budget is being repurposed, in part, to offset the labour cost increases listed above, resulting in net labour cost increase of $11.0 million in fiscal 2020. For further information, please see Chapter 5G, section 5G.7.2	(7.0)	0
Labour Costs Sub-Total		**11.0**	**10.3**
Total		**22.1**	**10.3**

5.5.2.3 Cost Savings Have Been Identified Across the Organization to Offset the Cost Pressures

Table 5-6 below provides a more detailed breakdown of Test Period Savings that have been identified across the organization to offset the cost pressures identified in section 5.5.2.2 above.

1 **Table 5-6 Test Period Savings**

Item	Description	Fiscal 2020 Incremental ($ million)	Fiscal 2021 Incremental ($ million)
Vacancy Factor Savings	In previous years, some KBUs have reduced their labour budgets to recognize that positions will not remain filled 100 per cent of the time. The exact approach for identifying these reductions for each KBU has varied. In the test period, BC Hydro has taken a consistent approach to assessing each KBU and identifying any budget reductions associated with unfilled positions. Across all KBUs, labour budgets have been reduced by an additional $5.6 million in total.	(5.6)	0
Lease Accounting Change	As identified in Chapter 8, section 8.13.3, a new accounting standard on leases, International Financial Reporting Standards (**IFRS**) 16, is effective for fiscal 2020. IFRS 16 eliminates the classification of leases as either operating or capital for lessees and, instead, introduces a single lessee accounting model. The new standard will impact Energy Purchase Agreements, property lease/rental agreements, vehicle leases, and other agreements. This impact will result in a reduction in operating costs with corresponding increases in finance charges and amortization costs.	(2.3)	0
Accenture Repatriation	As discussed in section 5.6.2, BC Hydro's decision to repatriate services previously provided by Accenture has resulted in an annual cost savings of $8.2 million. $7.0 million in annual savings were achieved prior to the test period and the remaining $1.2 million in annual savings will be achieved in fiscal 2020.	(1.2)	0
Lease Termination Savings	BC Hydro consolidated its lease at Central Park Place, eliminating three floors of office space.	(1.2)	0
Communications Reduction	The advertising budget in the Communications and Community Engagement KBU has been reduced.	(1.2)	0
Paperless Billing and Customer Correspondence	BC Hydro has continued to reduce postage and printing costs by increasing the number of paperless bills and other forms of correspondence.	(1.0)	0
Miscellaneous		(1.1)	(0.4)
Total		**(13.6)**	**(0.4)**

Base operating costs are a component of net operating costs. Net operating costs also include capital overhead that can no longer be capitalized under IFRS, costs related to the 2017 Waneta Transaction and the Customer Crisis Fund.

- Net operating costs, combined with costs incurred in the current period that are to be recovered in rates in future years through the recovery mechanisms established for each regulatory account, represent BC Hydro's total gross operating costs.
- Net operating costs, combined with costs incurred in prior periods to be recovered in the current period through the recovery mechanisms established for each regulatory account, represent BC Hydro's total current operating costs.

Table 5-7 below provides a continuity table that summarizes the changes to BC Hydro's net operating costs.

Table 5-7 Summary of BC Hydro's Operating Costs[157]

	($ million)		F2020 Plan	F2021 Plan
1	F2019 Revenue Requirement Application Plan		961.1	
2	Compliance Filing Adjustment (Schedule 5.0, line 8)		10.4	
3	F2019 Revenue Requirement Application Compliance Filing Plan (Schedule 5.0, line 15)	A	971.5	
4	Reorganization Impact	B	-	
5	Budget Transfers Between Business Groups	C	-	
6	Waneta 2/3rd Operating Costs (Schedule 5.0, line 12)	D	3.8	
7	Customer Crisis Fund Operating Costs (Schedule 5.0, line 13)	E	4.0	
8	F2019 Revenue Requirement Application Forecast / carry forward plan (Schedule 5.0, line 15)	F=Σ A to E	979.3	959.0
9	Current Year Incremental Adjustments:			
10	Independent Power Producer Capital Leases		(54.3)	-
11	IFRS Ineligible Capital Overhead		22.4	22.4
12	Waneta 2/3rd Operating Costs		1.9	0.2
13	Customer Crisis Fund Operating Costs		1.3	-
14		G	(28.8)	22.6
15	Current Year Budget Transfers Between Business Groups	H	-	-
16	Test Period Savings	I	(13.6)	(0.4)
17	Test Period Cost Increases			
18	Labour		11.0	10.3
19	Storm Restoration		11.1	
20	Total Test Period Cost Increases	J	22.1	10.3
21	Test Period Net Increase/(Decrease)	K=I+J	8.5	9.9
22	Net Operating Costs (Schedule 5.0, line 15)	G+H+K	959.0	991.4

Table 5-8 below shows the reconciliation of base operating costs to the net operating costs as shown in the financial schedules in Appendix A.

[157] Row 2 relates to the current pension cost adjustment corresponding with BCUC Order No. G-47-18, Directive 18, which directed BC Hydro to use the discount rate in effect at the time the forecast, was prepared to calculate current service costs;

Rows 4, 5 and 15 of relate to restructuring impacts and budget transfers between Business Groups. These rows have a zero balance because on a consolidated basis, by themselves, they net to zero. The continuity schedules for each Business Group are shown later in this chapter. These schedules show the specific restructuring impacts and budget transfers for each Business Group.

Rows 6 and 12 are costs related to BC Hydro's purchase of Teck's two-third interest in Waneta, per BCUC Order No. G-130-18

Rows 7 and 13 are costs related to the Customer Crisis Fund, approved by BCUC Order No. G-166-17;

Row 10 relates to the impact of the new accounting standard on leases, IFRS 16 which is further explained in Chapter 5G, section 5G.6 Independent Power Producers Capital Leases;

Row 11 represents IFRS ineligible capital overhead costs that are being phased in to operating costs over a ten-year period. Please refer to Chapter 5G, section 5G.8 for further information on IFRS ineligible capital overhead.

Table 5-8 Reconciliation of Base Operating Costs to Net Operating Costs

	($ million)	F2020 Plan	F2021 Plan
1	Base Operating Cost	777.9	787.8
2	IFRS Ineligible Capital Overhead (Schedule 5.0, line 10)	170.1	192.5
3	Independent Power Producer Capital Leases (Schedule 5.0, line 11)	-	-
4	Waneta 2/3rd Operating Costs (Schedule 5.0, line 12)	5.7	5.9
5	Customer Crisis Fund Operating Costs (Schedule 5.0, line 13)	5.3	5.3
6	**Net Operating Costs (Schedule 5.0, line 15)**	**959.0**	**991.4**

5.6 FTE Increases are Driven by Capital Investment and have Reduced BC Hydro's Overall Costs

This section reviews BC Hydro's FTEs[158] in previous fiscal years and during the test period. It also discusses BC Hydro's Standard Labour Rates. In this section, we make the following points:

- By replacing contractors with internal FTEs, the Workforce Optimization Program has increased the number of FTEs while decreasing BC Hydro's total costs by an estimated $18.5 million annually.
- The repatriation of services previously provided by Accenture has also increased BC Hydro's FTEs while generating $8.2 million in annual savings, exceeding BC Hydro's original expectations.
- Apart from growth in the workforce directly related to increased capital investment, BC Hydro's FTEs have remained relatively flat since fiscal 2012 and are forecast to remain flat over the test period.[159]

[158] FTEs are calculated by taking the total number of hours (regular and overtime) worked in a given year, divided by the average number of hours a full time employee would work per year. These averages differ by affiliation. For the fiscal 2020 to fiscal 2021 test period, these averages are 1,621 hours for Management and Professional employees (including Executive), 1,535 hours for MoveUp employees and 1,461 hours for International Brotherhood of Electrical Workers employees.

[159] FTEs are increasing by from 7,405 (fiscal 2019 forecast) to 7,477 (fiscal 2020 plan), for a net increase of 72 FTEs. The Site C Project is increasing by 71 FTEs from fiscal 2019 forecast to fiscal 2020 plan. Labour costs associated with FTEs working on the Site C Project are capitalized to the project, which means that they do not affect the test period revenue requirements. If FTE increases for the Site C Project are factored out, the overall increase in FTEs from fiscal 2019 forecast to fiscal 2020 plan is just one FTE.

- Over the test period, Standard Labour Rates are expected to increase due to BC Hydro's bargaining mandate, increases to employee benefits, and the employer health tax. A 2017 assessment by Morneau Shepell concluded that on a total cash basis, BC Hydro's employee compensation is 11 per cent below median market rates. After factoring in the value of pension benefits and time off programs, employee compensation is comparable to median market rates.

5.6.1 Replacing Contractors with Internal FTEs Has Decreased Total Costs

The Workforce Optimization Program, which was created in fiscal 2016, has decreased BC Hydro's total costs by an estimated $18.5 million annually. Table 5-9 below provides a summary of annual net (i.e., operating, capital and deferred) savings from the Workforce Optimization Program for fiscal 2020, by Business Group.

Table 5-9 Workforce Optimization Program Annual Net Savings (Fiscal 2020)

Business Group	Costs ($ millions)	Savings ($ millions)	Net Savings ($ millions)
Integrated Planning	9.7	12.7	3.0
Capital Infrastructure Project Delivery	31.2	34.3	3.0
Operations	16.9	24.7	7.9
Safety	4.0	5.3	1.3
Finance, Technology, Supply Chain	24.4	26.6	2.2
People, Customer, Corporate Affairs	6.1	6.4	0.3
Other	1.2	1.9	0.8
Total	**93.5**	**112.0**	**18.5**

The Workforce Optimization Program supports decisions on how work should be allocated and ensures those decisions are cost-effective. It primarily allows BC Hydro's KBUs to replace external contractors with internal FTEs when it is beneficial to do so. As discussed in section 5.6.1.2 below, we apply specific principles when making work allocation decisions and these decisions require a workforce adjustment request document that provides both quantitative and qualitative support for converting a contractor to an employee.

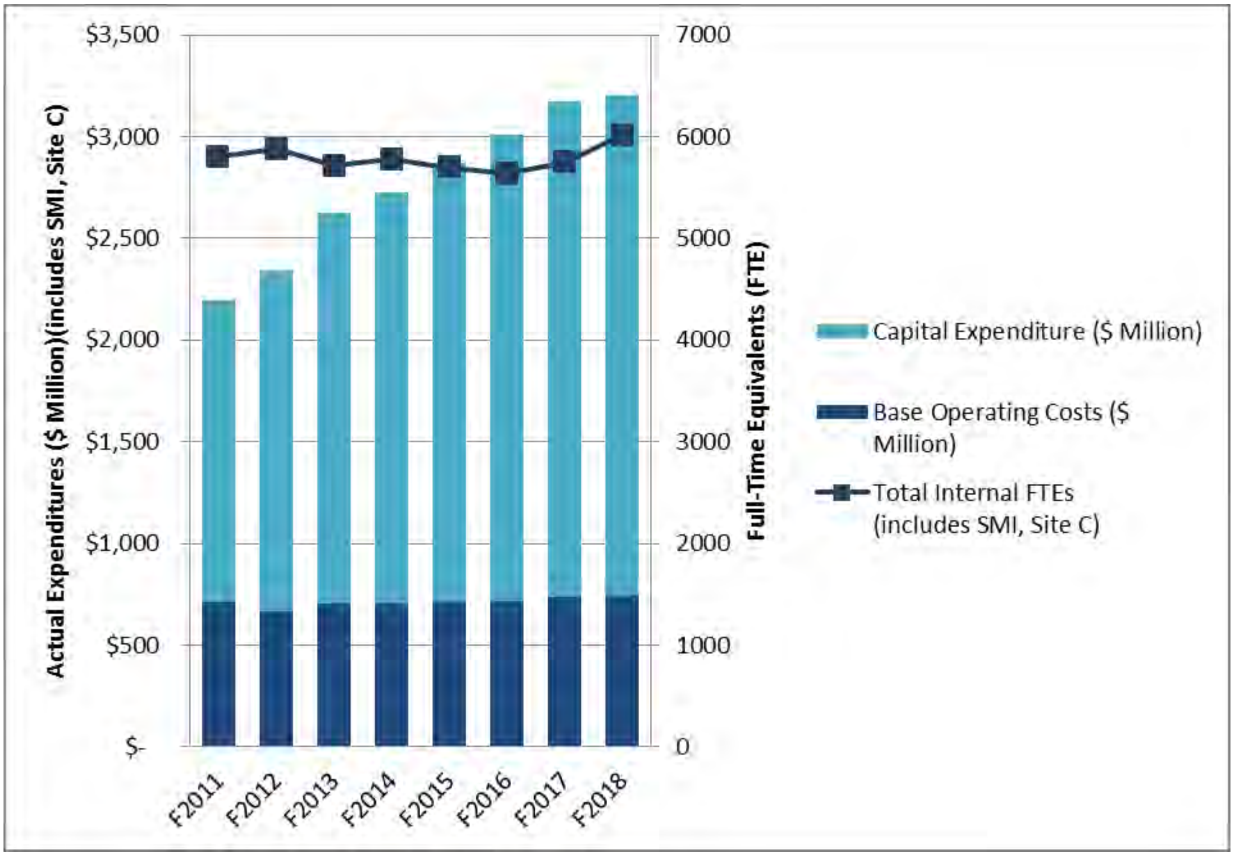
5.6.1.1 Focusing on Total Labour Costs, Rather than Number of FTEs, is Beneficial for Customers

The Workforce Optimization Program was developed in response to changing business requirements that, in many instances, made it more cost-effective to hire FTEs on a long-term basis rather than continuing to use contractors.

The 2011 Government Review had recommended that BC Hydro reduce the number of FTEs. Acting upon that recommendation, BC Hydro reduced its employee population and eliminated unfilled positions. From fiscal 2012 to fiscal 2016, BC Hydro managed to a FTE maximum, as directed by the Government of B.C., as part of an effort to provide affordable rates for customers.

However, BC Hydro’s labour requirements also increased significantly during these years, due to an increase in capital expenditures. As a result of the FTE maximum, BC Hydro’s FTEs did not keep pace with labour requirements. BC Hydro’s annual capital expenditures increased by 66 per cent from $1.48 billion in fiscal 2011 to $2.47 billion in fiscal 2018. Over the same period, BC Hydro’s FTEs increased by 4 per cent. This is shown in Figure 5-6 below.

Figure 5-6 Capital Expenditures and FTEs (Fiscal 2011 to Fiscal 2018)



In order to resource growing work volumes against a flat employee base, BC Hydro increased the contracting out of work that employees had insufficient capacity to perform.

While external suppliers are generally more expensive on a per-hour basis compared to employees, hiring internal employees represents an ongoing commitment and additional costs such as pension, benefits, facilities and training are considered. BC Hydro's fiscal 2013 to fiscal 2022 Capital Plan expected capital expenditures to peak in fiscal 2017 and return to fiscal 2013 levels by fiscal 2022. Since the work volume was not expected to be long-term, it was appropriate to hire contractors to resource this peak and avoid the ongoing costs associated with internal employees.

The annual capital planning process updates and prioritizes capital investments to respond to the latest information on system risks and needs. As capital plans were updated[160], the expected fiscal 2017 peak was replaced with more sustained levels of investment over time. BC Hydro's current fiscal 2020 to fiscal 2024 Capital Plan shows sustained volumes of work that will require both internal FTEs and external contractors.

In fiscal 2016, BC Hydro raised concerns with the Government of B.C., with regards to the costs of resourcing a sustained increase in capital plan work volumes with external contractors. In response, the Government of B.C. authorized BC Hydro to remove its internal FTE restrictions and transition to a "total cost" labour model. This shift was primarily intended to provide BC Hydro with the flexibility to replace external contractors with internal FTEs to improve quality, safety and reliability outcomes and reduce costs.

5.6.1.2 Decisions to Insource Are Based on Consistent Principles

The Workforce Optimization Program is BC Hydro's approach to optimizing the mix of internal labour and external contractors. BC Hydro uses a principles-based approach when deciding on whether to use employees or contractors that considers the ongoing nature of work, availability and skills of workers, and the total cost of employment.

The decision to perform work internally by employees or externally by contractors is guided by BC Hydro's Resource Allocation Principles, which are shown in Figure 5-7 below.

160 BC Hydro reviews and updates its Capital Plan on an annual basis to reflect changes in energy demand, asset risk, customer requirements, and other factors.

Figure 5-7 Resource Allocation Principles

	Work Characteristics	Workforce Characteristics
Completed Primarily Internally	• Base work • Frequent and complex • High business risk	• High internal capacity and capability • High internal efficiency
Completed Primarily Externally	• Peak work • Infrequent and time-limited • Niche expertise	• High external capacity and capability • High external efficiency

The following examples illustrate how these principles are applied to decisions made through the Workforce Optimization Program:

- BC Hydro has adopted a new Technology Delivery Model, which brings critical cybersecurity monitoring and response capability in-house. Contractors performing these functions were replaced with internal employees. The impact of these changes was cost neutral and aligns with the principle that work involving high business risks should be completed internally. Further information is provided in Chapter 5E, section 5E.5.1.
- BC Hydro employs a team of in-house lawyers with expertise in a range of subjects, since in-house lawyers are less costly than external lawyers. Through the Workforce Optimization Program, BC Hydro has replaced external legal counsel with internal lawyers, where feasible. BC Hydro continues to retain external counsel for specialized legal expertise, large regulatory filings, litigation, and to provide support for large transactions and projects. Further information is provided in Chapter 5G, section 5G.3.2.

5.6.1.3 The Decision to Hire FTEs to Replace Contractors Considers Long-Term Effects and Costs

Decisions to replace external contractors with internal FTEs, through the Workforce Optimization Program, must be supported by a workforce adjustment request document. These documents are reviewed by the requesting KBU, as well as the Finance KBU, Properties KBU, Human Resources KBU and the Executive Team

Member of the requesting Business Group. The documents provide both quantitative and qualitative support for converting a contractor to an employee.[161]

In its Decision, the BCUC expressed concern that there did not appear to be an assessment of the long-term effects and costs of hiring contractors as employees.[162] The documentation required by the Workforce Optimization Program accounts for both the short-term and long-term effects and costs of hiring contractors as employees. Specifically, workforce adjustment request documents consider:

- The costs of hiring internal employees against the costs of contracting out work to an external supplier. The costs of internal employees, measured by using Standard Labour Rates, includes base salary and wages, premiums, overtime, vacation/flex time, pension, employer-paid premiums, insurance, supplemental benefits and training.
- Other implications of employing internal resources such floor space requirements.
- Non-financial benefits such as maintaining knowledge about assets or programs in-house and establishing strong succession plans for potential retirements.

In addition, BC Hydro uses resource forecasts to determine our long-term labour needs. This includes assessing our current internal resources and external suppliers' abilities to meet the needs of our capital and maintenance plans. These long-term forecasts allow BC Hydro to:

- Plan for apprenticeship and trainee intakes;

[161] FTE additions through the Workforce Optimization Program Plan must be fully funded through an equivalent cost reduction. In most cases, this means a reduction in funding for external contractors; however, in some cases, FTE additions may be funded through reductions to other expenditures (e.g., materials, building and equipment, etc.), or by re-purposing other vacant positions.

[162] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 34.

- Model the potential impacts of changes in attrition; andf
- Identify potential resource-related risks to our work plans (where demand may not match supply) and provide enough time to develop strategies to mitigate these risks.

5.6.1.4 Workforce Optimization Program Has Increased Total FTEs

The savings generated by the Workforce Optimization Program have caused BC Hydro's total FTEs to increase.

In our Previous Application, filed in July 2016, we identified 170 additional FTEs as a result of the Workforce Optimization Program and noted that additional Workforce Optimization Program positions would continue to be implemented in cases where cost savings and/or improved outcomes could be achieved.[163]

The 170 additional FTEs forecast in our Previous Application were based on confirmed conversions of contractors to internal FTEs, at the time that the forecasts for that application were finalized. Since that time, the total number of FTEs added as a result of the Workforce Optimization Program has increased by approximately 535 to a total of approximately 706 FTEs, as additional conversions were confirmed for the fiscal 2017 to fiscal 2019 period as well as the upcoming fiscal 2020 to fiscal 2021 period.

Table 5-10 below provides further details on the additional 535 FTEs confirmed since the Previous Application, by KBU.

[163] BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, Chapter 5, section 5.3.1.3.

Table 5-10 Workforce Optimization FTEs by KBU (Fiscal 2019 RRA Plan to Fiscal 2020 RRA Plan)

KBU	FTE Increase	Primary Drivers
Project Delivery	94.0	• Improved workforce continuity. • Strengthened contract management, governance and oversight procedures. • Addressed union grievances. • Reduced costs. • Reduced contract administration. These conversions were primarily related to the Capital Construction and Project Services departments.
Technology	59.5	• Moved critical functions in-house. • Reduced risk of losing institutional knowledge. • Reduced the number of management roles being performed by contractors. Areas where contractors were replaced with internal FTEs included service governance, vendor integration management, cybersecurity, application services and project management.
Line Field Operations	59.0	• Reduced costs. 44 FTEs were field trade positions and 15 FTEs were administrative positions, primarily assigned to the Operations Support Processing Center team.
Engineering	56.0	• Reduced costs. • Maintained a sufficient level of internal knowledge within BC Hydro. These FTEs were added throughout the KBU.
Supply Chain	40.0	• Reduced risk of losing institutional knowledge. • Reduced turnover to enable consistent and efficient work. 28 FTEs were added to the Procurement Department and primarily included procurement analysts and category management professionals as well as an administrative/clerical pool, as described in Chapter 5E, section 5E.5.3. Eight FTEs were added in Fleet Services, mainly for mechanics in the field and four FTEs were added in Materials Management, primarily for material demand planners.

KBU	FTE Increase	Primary Drivers
Distribution Design and Customer Connections	35.0	• Reduced design work costs. • Increased internal capacity to meet the unprecedented volume of customer connections, as discussed further in Chapter 5C, section 5C.7.2. The positions added were all frontline staff and consisted of 28 Designers and seven Electric Service Coordinators.
Indigenous Relations	21.6	• Ownership of our relationships with First Nations leading to improved relationships and increased internal knowledge of individual First Nation community interests, perspectives and objectives.
T&D System Operations	21.0	• Conversion of three contractors to internal FTEs to perform NERC CIPv5 roles. These roles are required to sustain mandatory compliance with NERC CIPv5 standards. Further information is provided in Chapter 5C, section 5C.10.3. • Thirteen FTEs reflect the BCUC's anticipated appointment of BC Hydro as the Reliability Coordinator for B.C. This role was previously contracted out to Peak Reliability, which has notified BC Hydro and other entities that it will no longer provide this service. Further information is provided in Chapter 5C, section 5C.10.1.7. • The remaining five FTEs represent conversions undertaken to reduce labour costs.
Communications and Community Engagement	18.0	• Reduced costs. • Increased consistency and oversight. These conversions were primarily related to BC Hydro's Community Outreach team.
Finance	14.6	• Reduced costs • Increased internal knowledge These conversions were primarily related to the Change Management team. Replacing external change management contractors with internal FTEs enables a consistent approach, understanding of important organizational context and knowledge retention.
Customer Service	14.1	• Seven FTEs are associated with the delivery of the Customer Crisis Fund Pilot. These costs are offset by the Customer Crisis Fund Rate Rider. Further information is provided in Chapter 5F, section 5F.5.1.1. • The primary drivers for the remaining conversions were reduced costs and reduced turnover.

KBU	FTE Increase	Primary Drivers
Construction Services	14.0	• Reduced costs. These conversions were primarily related to project support staff.
Stations Field Operations	13.0	• Reduced costs. These conversions were primarily related to positions created for newly-graduated Communications Protection and Control Technologists.
Other KBUs	75.8	The remaining 75.8 FTEs are spread across 16 KBUs, averaging approximately five conversions per KBU.
Total	**535.6**	

5.6.2 The Recent Accenture Repatriation is Expected to Deliver Benefits

In May 2018, BC Hydro successfully transitioned important services previously performed by Accenture back into BC Hydro. The repatriation of work from Accenture, along with hiring many employees previously working for Accenture, is expected to deliver benefits to customers including approximately $8.2 million in annual savings as well as more flexible customer service.

5.6.2.1 Accenture Repatriation Restores Direct Control Over Key Support and Customer-facing Functions

The Accenture repatriation restores direct control over key support and customer-facing functions.

In fiscal 2003, BC Hydro outsourced certain work to Accenture, including services in Customer Service, Human Resources, Finance, Purchasing, Office Services and Information Technology. Over the years, adjustments were made to the services provided. In fiscal 2011, BC Hydro's contract with Accenture was restructured, with the following services included:

- Customer Service (Mass Market and Transmission Billing, Credit and Collection, Payment Processing, Contact Centre);
- Finance (Accounts Payable);

- Human Resources (Employee Service Centre, payroll, recruiting services, Tempworks, benefits administration); and
- Office Services (graphic design, mailroom, switchboard, records management).

Between fiscal 2003 and fiscal 2018, BC Hydro and Accenture maintained a strong working relationship and achieved many successes that benefitted BC Hydro's customers and our operations.

The agreement with Accenture was due to expire on April 30, 2018. We considered three options:

- Go to market via public procurement process;
- Renew the agreement with Accenture for another three years to 2021; or
- Repatriate the services back to BC Hydro.

BC Hydro's research indicated there was a limited market for the full scope of our outsourced services. While the relationship with Accenture was strong, there were a number of factors that made repatriation the best option:

- The Contact Centre and other services were performing well, having undergone operational improvements over the years;
- Customer needs and expectations were evolving and BC Hydro wanted to own the end-to-end customer service experience;
- Cost savings were expected (for further information, please refer to Table 5-11);
- There was an opportunity to partner with MoveUp, the union that represents certain employees at both Accenture and BC Hydro, to provide employment opportunities for existing Accenture employees and obtain more favourable terms and conditions of employment to 2024;

- Repatriation provided operational flexibility, particularly in Customer Service, by allowing BC Hydro to have direct control and set team priorities. For example, BC Hydro is currently:
  - Working closely with consolidated billing customers to promote and support their transition to paperless billing following the completion of the Enterprise Billing Infrastructure Project; and
  - Improving escalation processes by restructuring Contact Centre roles to allow more customers to reach a work leader immediately rather than waiting for a call back.

  These changes would have been more difficult and costly to implement if BC Hydro had to negotiate change orders and statements of work with Accenture; and
- Repatriation also eliminated the requirement to share with Accenture future operational savings achieved through efficiency initiatives and eliminated the need for day to day management of Accenture.

5.6.2.2 Accenture Repatriation Benefits Have Exceeded Expectations

The net savings from repatriation have exceeded BC Hydro's original projections by $1.2 million and now total $8.2 million annually. Approximately 80 per cent of Accenture unionized employees accepted jobs at BC Hydro and there was a total FTE increase of 423 associated with the repatriation of staff and services.

Table 5-11 below shows the current forecasted annual net savings from the repatriation of services back to BC Hydro.

Table 5-11 Summary of Accenture Repatriation Savings and FTE Impact

KBU/Function	Services - ABS F2019 RRA ($ million) (1)	Services - ABS Reduction ($ million)	Incremental Operating Costs ($ million) (2)	Annual Operating (Costs) Savings ($ million) (3 = 1 - 2)	FTEs
Customer Service	27.8	(27.8)	21.9	5.9	281
Human Resources	5.1	(5.1)	3.5	1.6	32
Properties	1.8	(1.8)	0.4	1.4	7
Supply Chain	2.5	(2.5)	2.4	0.1	23
Technology	0.0	0.0	0.5	(0.5)	5
Communications and Community Engagement	0.0	0.0	0.7	(0.7)	7
Finance	0.0	0.0	0.3	(0.3)	2
Sub-Total	**37.2**	**(37.2)**	**29.8**	**7.4**	**357**
Tempworks[164]	4.2	(4.2)	4.2	0.0	0
Field Service Representatives[165]	7.9[166]	(7.9)	7.1	0.8	66
Total	**49.3**	**(49.3)**	**41.1**	**8.2**	**423**

5.6.3 FTE Increases since Fiscal 2012 have been Driven by BC Hydro's Capital Plan

In its Decision, the BCUC reviewed BC Hydro's FTE's over time.[167] Figure 5-8 below shows that apart from growth in the workforce directly related to increased capital investment, BC Hydro's FTEs have remained relatively flat since fiscal 2012. This

[164] Accenture previously provided Tempworks (i.e., temporary administrative and clerical support) services to BC Hydro. Rather than repatriating this function, BC Hydro decided to manage this function as part of its overall Contingent Labour Resource Augmentation Solution which will provide BC Hydro with a centralized, automated and standardized process for securing all contingent labour resource augmentation services and will provide greater visibility into the use of contingent labour across the whole organization.

[165] Accenture provided manual meter reading services to BC Hydro starting in fiscal 2003. Starting in fiscal 2011, these services were provided under a separate time and materials contract that was renewed until automated meter reading, enabled by Smart Metering Infrastructure (SMI), stabilized. BC Hydro brought this function back in-house in fiscal 2017.

[166] At the time the forecast for the Previous Application was prepared, BC Hydro had not yet made a decision on how to manage the manual meter reading function. As Accenture had been providing manual meter reading services at that time, the ongoing cost of manual meter reading was budgeted as Accenture contract costs and not as internal labour.

[167] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), pages 34 to 35 and 87.

includes additions related to the Workforce Optimization Program, which have generated an estimated $18.5 million in cost savings, as discussed in section 5.6.1 above.

Figure 5-8 FTEs [168,169] (Fiscal 2012 to Fiscal 2021)

	Fiscal 2012 Actual	Fiscal 2013 Actual	Fiscal 2014 Actual	Fiscal 2015 Actual	Fiscal 2016 Actual	Fiscal 2017 Actual	Fiscal 2018 Actual	Fiscal 2019 Actual	Fiscal 2020 Actual	Fiscal 2021 Actual
Operating	4,415	4,096	4,089	4,089	4,042	4,082	4,209	4,051	4,047	4,043
Capital	1,527	1,662	1,752	1,872	1,828	1,905	2,013	2,378	2,383	2,370
Deferred	309	250	258	223	188	161	162	165	164	164
Total FTEs	**6,251**	**6,007**	**6,099**	**6,131**	**6,058**	**6,148**	**6,385**	**6,593**	**6,594**	**6,577**

As discussed in sections 5.6.1 and 5.6.2 above, the savings generated by the Workforce Optimization Program and the Accenture repatriation have caused

[168] Figure 5-8 shows total FTEs by work function (operating, capital or deferred), excluding FTEs related to the Accenture Repatriation, the Smart Metering Infrastructure Project and the Site C Project. These FTEs were removed to avoid skewing the trend line. All FTEs related to the Workforce Optimization Program, are included. The numbers for Fiscal 2012 to Fiscal 2018 are actuals. Fiscal 2019 numbers are forecast and fiscal 2020 and 2021 numbers are plan.

[169] "Deferred" FTEs, refers to FTEs whose work is charged to regulatory accounts. Almost all of BC Hydro's current deferred FTEs are charged to the DSM Regulatory Account.

BC Hydro's total FTEs to increase in recent years. Table 5-12 below provides a continuity schedule which highlights changes from the Previous Application.

Table 5-12 Continuity Schedule of Planned FTEs (Fiscal 2019 RRA Plan to Fiscal 2020 Plan to Fiscal 2021 Plan) [170, 171, 172, 173]

FTE's (including Regular and Overtime Hours)	Operations	Integrated Planning	Capital Infrastructure Project Delivery	Finance, Technology, Supply Chain	People, Customer, Corporate Affairs	Safety	Other	Total
F2019 RRA Plan FTEs (Schedule 16, line 52)	2,893	802	607	795	463	565	241	6,365
Workforce Optimization	146	74	136	114	46	14	5	536
Accenture Repatriation	-	-	7	30	387	-	-	423
Site C Project							240	240
F2019 Customer Metering adjustment					(1)			(1)
F2019 Safety - Business Continuity business case						2		2
Reduction in Appentice Intakes and Graduations						(107)		(107)
Impact of organization changes since F2017-F2019 RRA	(75)	74	(12)	7	(9)	17	(2)	-
Miscellaneous changes for overtime FTEs	24	(4)	(1)	1	3	(29)	21	13

F2020 RRA Plan (Schedule 16, line 52)	2,984	952	739	946	887	464	505	7,477
Site C Project							12	12
Reduction in Appentice Intakes						(13)		(13)
Miscellaneous changes for overtime FTEs						(5)		(5)
F2021 RRA Plan (Schedule 16, line 52)	2,984	952	739	946	887	447	516	7,471

5.6.4 FTEs Are Expected to Remain Flat During the Test Period

Figure 5-9 below shows that, including overtime and excluding the Site C Project, total FTEs are expected to remain flat during the test period.[174]

170 Labour costs associated with FTEs working on the Site C Project are related to the natural progression of the work and are capitalized to the project, which means that they do not affect the test period revenue requirements.

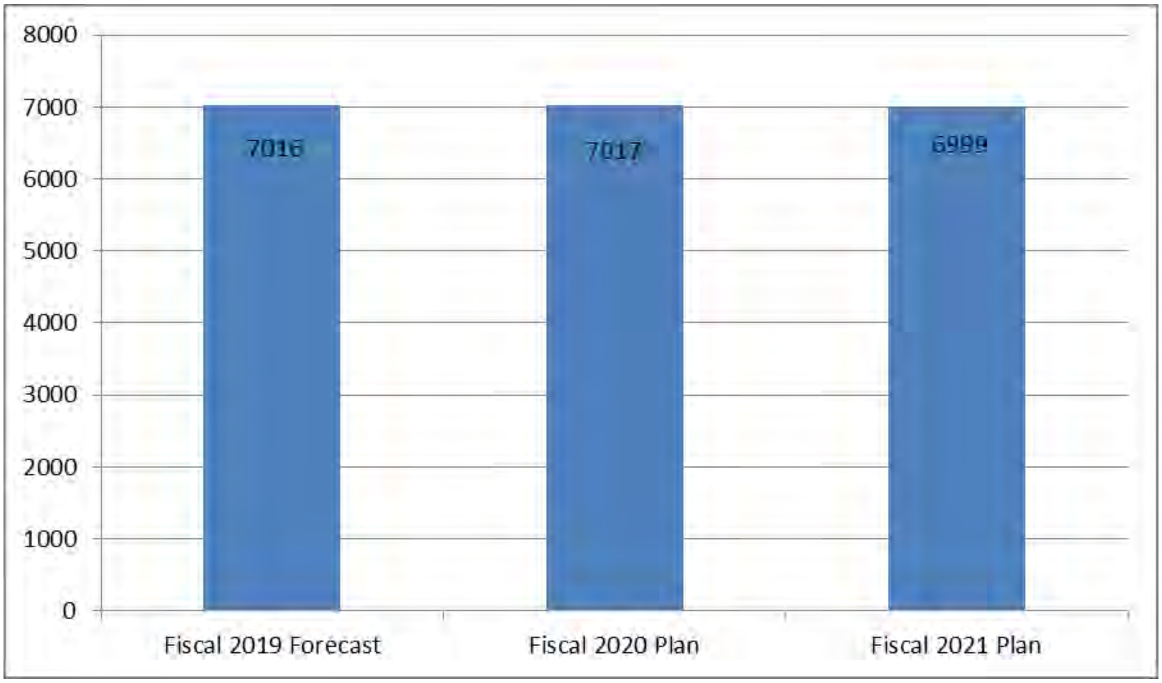
171 Miscellaneous changes for overtime FTEs are primarily related to increased FTEs in the Line Field Operations KBU from the Workforce Optimization Program as well as the Accenture repatriation and a ramp-up of the Site C Project. These increases are partially offset by reduction in forecast apprentice intakes and graduates in training.

172 The organization changes in Operations Business Group and Integrated Planning Business Group reflect the September 2018 re-organization discussed further in Chapter 5C, section 5C.6.2. This re-organization occurred after the fiscal 2019 forecast was finalized.

173 Apprentice intakes reduced by 107 from fiscal 2019 RRA plan to fiscal 2020 RRA plan due to a reduction in forecast resourcing requirements.

174 FTEs are increasing from 7,405 (fiscal 2019 forecast) to 7,477 (fiscal 2020 plan), for a net increase of 72 FTEs. The Site C Project is increasing by 71 FTEs from fiscal 2019 forecast to fiscal 2020 plan. Labour costs associated with FTEs working on the Site C Project are capitalized to the project, which means that they do not affect the test period revenue requirements. If FTE increases for the Site C Project are factored out, the overall increase in FTEs from fiscal 2019 forecast to fiscal 2020 plan is just one FTE.

Figure 5-9 Total FTEs (including overtime, excluding Site C)



Planned FTEs, including the Site C Project, are 7,477 for fiscal 2020 and 7,471 for fiscal 2021.[175, 176] Further detail is provided in Table 5-13 below.

[175] Total FTEs are not equivalent to the total number of people actually employed by BC Hydro at a point in time as the annual FTE budget is based on total hours planned for the year, divided by the annual standard labour hours by affiliation. The total hours planned include full time, part time and temporary staff (i.e., seasonal hires) as well as overtime. As at January 31, 2019, BC Hydro's total active headcount was 6,681.

[176] Total planned Site C FTEs are 460 in fiscal 2020 and 472 in fiscal 2021.

Table 5-13 Summary of FTE Changes (Fiscal 2019 Forecast to Fiscal 2020 Plan)

Item	FTEs
Fiscal 2019 Forecast FTEs	7,405
Workforce Optimization Program	61
Reduction to Apprentices and Trainees (see Chapter 5D, section 5D.5.2)	(32)
Reduction in planned overtime	(29)
Site C Project	71
Fiscal 2020 Plan FTEs	7,477[177]

FTEs represent the employee workforce which performs operating, capital and deferred work across BC Hydro. Table 5-14 below provides a breakdown of FTEs by these work functions.[178]

[177] Numbers do not add exactly due to rounding.

[178] FTEs related to capital overhead are shown within the Operating category. For further details on FTEs, please see Appendix A, Schedule 16.0.

Table 5-14 Total FTEs by Function

FTEs (including Overtime)	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Operating

5.6.5 Our Total Rewards Package Helps to Retain Employees and is Consistent with Market Rates

Labour costs are one of BC Hydro’s largest operating costs, and reflect the compensation paid to employees. BC Hydro’s total rewards offer includes salary, pension, benefits and time off. In its Decision, the BCUC stated that the costs and benefits of BC Hydro's total rewards initiatives were unclear.[179] BC Hydro has provided additional information in the following sections to improve clarity in this regard. The information shows that customers are getting good value from BC Hydro's total rewards offer.

5.6.5.1 Attracting and Retaining Employees Is Critical

BC Hydro's total rewards offer includes salary, pension, benefits and time off (i.e., vacation days). It is designed to attract and retain qualified employees. A low turnover rate is important because some of the skillsets required by BC Hydro are specialized, and the complexity of our assets and operations require an experienced workforce. These skills and experience are difficult to find in the market and require significant time and costs to develop.

5.6.5.2 Benchmarking Shows Wages are Below Market, While Total Rewards are at the Market

A 2017 assessment by Morneau Shepell concluded that, on an average total cash basis, BC Hydro employees earn 11 per cent less than median market rates. After factoring-in the value of pension benefits and time off programs, BC Hydro's compensation package is comparable, at 2 per cent below median market rates.

The design of our total rewards offer has proven to be effective in attracting and retaining employees. For example, our voluntary turnover rate is 1.3 per cent, which is below the 3.8 per cent average for the Power and Utilities industry as reported by the Conference Board of Canada.[180]

---

[179] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 34.

[180] MacLean, Kathryn, and Allison Cowan. *Compensation Planning Outlook 2019*. Ottawa: The Conference Board of Canada, 2018.

5.6.5.3 Standard Labour Rates in the Test Period Impacted by Employer Health Tax and BCUC-Directed Pension Adjustment

As in the Previous Application, the test period revenue requirements reflect Standard Labour Rates and Standard Labour Hours calculated by BC Hydro. The Standard Labour Rates in the test period are impacted by BC Hydro's bargaining mandate, the implementation of the Employer Health Tax, and the allocation of the compliance filing adjustment on current service pension costs in accordance with the BCUC's Decision on our Previous Application.

As part of the budgeting process and for actual cost distribution, BC Hydro uses Standard Labour Rates and Standard Labour Hours to assign payroll, benefits, and current service pension costs to departments, work activities, projects, and work orders. These rates are calculated at the beginning of each budgeting cycle and are based on forecasts of wage and salary increases, employee benefits, current service pension costs, gainsharing under our union contracts, sick days, annual vacation, and flex day entitlements. Table 5-15 below provides the weighted average Standard Labour Rate and the Standard Labour Hours for each affiliation. The increases to these rates reflect the cost increases described in section 5.5.2.2 above.

Table 5-15 Standard Labour Rates by Affiliation

Affiliation	Standard Labour Hours	F2019 Forecast ($)	F2020 Plan ($)	F2021 Plan ($)
MoveUp	1,535	56.55	59.28	60.31
International Brotherhood of Electrical Workers	1,461	77.16	81.67	83.15
Management and Professionals	1,621	97.66	100.69	102.48

The increase in Standard Labour Rates from fiscal 2019 forecast to fiscal 2020 plan is higher than the increase from fiscal 2020 plan to fiscal 2021 plan. This is primarily due to the implementation of the Employer Health Tax (which is effective January 1, 2019) and the allocation of the compliance filing adjustment on current service pension costs to KBUs, through the Standard Labour Rates, in fiscal 2020.

The Employer Health Tax is partially offset by the elimination of Medical Services Plan premiums (which is effective January 1, 2020). As discussed in Chapter 7, section 7.8.11, the elimination of Medical Services Plan Premiums significantly reduced the balance in the Non-Current Pension Costs Regulatory Account.

5.7 Benchmarking Support the Reasonableness of BC Hydro's Operating Costs

In its Decision on our Previous Application, the BCUC noted the absence of evidence that BC Hydro uses benchmarking. BC Hydro does use benchmarking internally in areas of the business where it makes sense to do so, while recognizing the inherent limitations of benchmarking in many cases. We have also undertaken additional benchmarking on operating costs in specific response to the BCUC's observation. This section focuses on the following:

- An independent benchmarking study prepared by The Brattle Group for this proceeding, which confirms that BC Hydro's operating costs compare well against an appropriate peer group of U.S. utilities. This study is provided as Appendix T;
- The results of a comparison of our operating costs against those of other major electric utilities in Canada, which suggests that BC Hydro's operating costs also compare favourably against major Canadian utilities;
- The results of recent independent benchmarking on maintenance delivery costs, which demonstrates that BC Hydro's costs are consistent with or better than our utility peers; and
- A summary of benchmarks and metrics provided to support the operating costs and FTEs for various KBUs as discussed in Chapters 5A through 5G.

5.7.1 BC Hydro Benchmarks Well Against U.S. Peer Group (Brattle Group Report)

In response to the BCUC's comments about benchmarking in its Decision, we retained The Brattle Group to conduct an independent benchmarking study on BC Hydro's operating costs (Brattle Group Benchmarking Study). The Brattle Group Benchmarking Study found that BC Hydro benchmarks favourably against a U.S. peer group that The Brattle Group had selected. While The Brattle Group determined that the level of depth in its study was appropriate for general cost comparisons, it also cautioned that definitive conclusions should not be drawn from benchmarking studies of this nature.

5.7.1.1 The Brattle Group has Significant Experience in Benchmarking

BC Hydro selected The Brattle Group to perform the study because of The Brattle Group's considerable experience in benchmarking. William P. Zarakas, a Principal of The Brattle Group, led the study. In the report, included as Appendix T, Mr. Zarakas certifies his independence and his duty to the BCUC. He explains that the analysis he and his team undertook was peer reviewed by others in The Brattle Group.

5.7.1.2 The Brattle Group Benchmarked Total Operating Costs, Costs by Function and Costs by Sub-Function

The Brattle Group Benchmarking Study compared BC Hydro's operating costs at a higher level, and at a more granular level by function and sub-function.

The study focused on operations and maintenance costs, excluding the costs of fuel and water rentals that are used in the power production process. The study refers to these costs as "non-fuel operations and maintenance expenses", or by the acronym "NFOM". Costs of fuel and water rentals used in the power production process were excluded from the study because they are reflected in BC Hydro's Cost of Energy, not operating costs. For simplicity, we refer to non-fuel operating and maintenance costs as "operating costs" in the remainder of this section. We have addressed BC Hydro's Cost of Energy in Chapter 4 of this Application.

The Brattle Benchmarking Study benchmarked operating costs as follows:

- Total operating costs.
- By function:
  - Operating costs not related to power production operations; and
  - Operating costs related to power production operations.

The Brattle Group considered the more granular functional analysis to be more informative than benchmarking at the level of overall operating costs. As a further test, The Brattle Group then broke down the non-power production costs into transmission, distribution, administrative and customer costs.

In terms of process, The Brattle Group identified an appropriate peer group of U.S. utilities. The decision to look at U.S. utilities, rather than Canadian utilities, was due to the availability of consistent data. U.S. utilities, unlike Canadian utilities, report annually using the Federal Energy Regulatory Commission's Uniform System of Accounts. The Brattle Group adjusted the presentation of BC Hydro's cost data where necessary to ensure that it was comparable with how the peer utilities were reporting their costs. The Brattle Group also identified the appropriate metrics for use in this type of benchmarking as being costs per MWh[181] and costs per customer, which are standard metrics for this type of benchmarking.

5.7.1.3 BC Hydro Benchmarks in the Top (i.e. Best) Quartile

The Brattle Group Benchmarking Study concludes that BC Hydro's operating costs compare favourably to the peer group on an overall basis, as well as at the more granular level. This is true regardless of which metric is used.

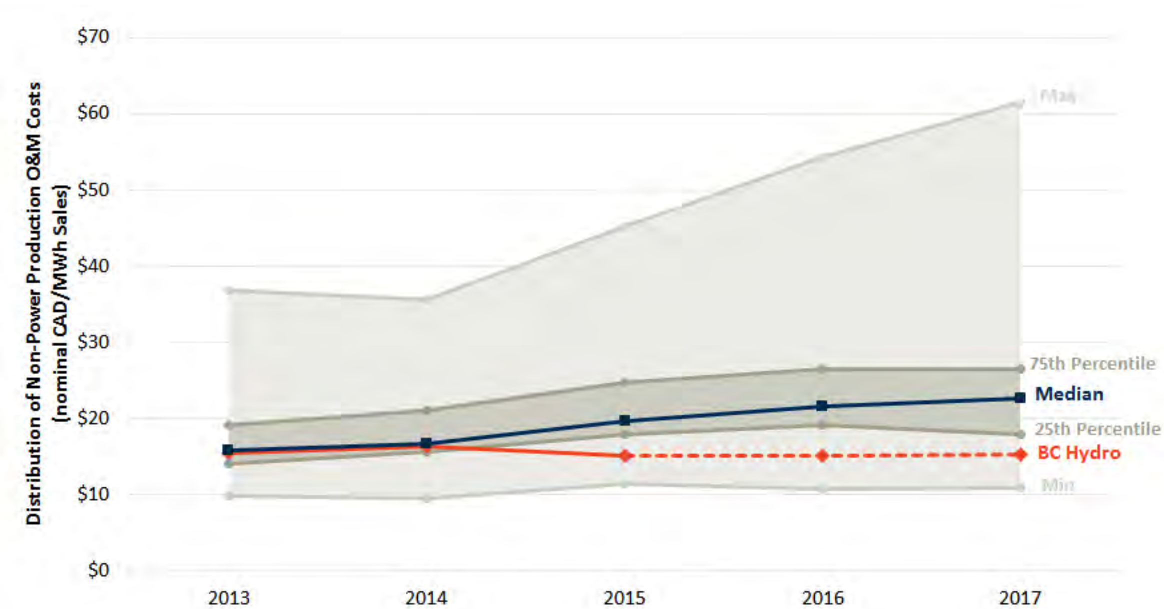
As an owner of large hydroelectric generation, BC Hydro has some inherent cost advantages over utilities more reliant on small hydro or thermal generation.

[181] In the case of power production, the focus is on costs per MWh generated, whereas it is MWh delivered for non-power production costs.

Therefore, the non-power production costs, which The Brattle Group benchmarked overall at the functional level as well as by sub-function (transmission, distribution, administrative) provide the most useful indication of BC Hydro's relative cost performance, as they are far less affected by the nature of power production at a particular utility.

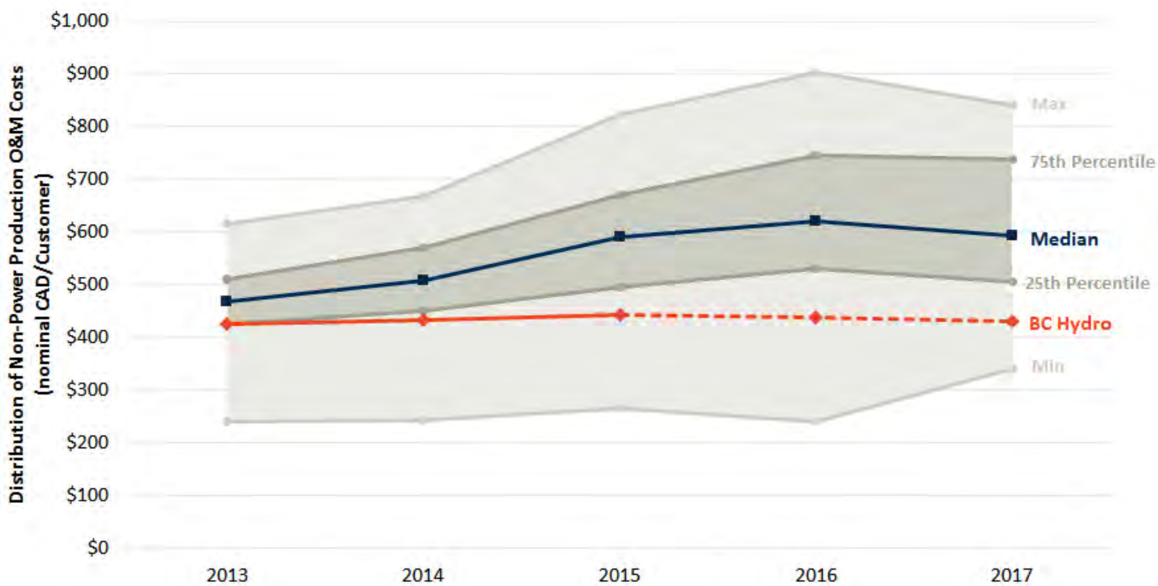
As shown in Figure 5-10 and Figure 5-11 below, BC Hydro is in the top (i.e., best) quartile for non-power production costs (e.g., transmission, distribution, administrative), and our relative performance appears to have improved in recent years.

Figure 5-10 Non-Power Production NFOM ($ per Customer) [182]



[182] Appendix T, page 19.

Figure 5-11 Non-Power Production NFOM ($ per Delivered MWh) [183]



Based on the results of the benchmarking study, The Brattle Group concludes:

> "Excluding power production from NFOM provides a meaningful indicator for BC Hydro's comparative cost performance…
> BC Hydro was in the 2nd quartile of unit cost performance for this metric in the early years of this study (2013) and improved to the 1st quartile by 2015, mainly due to improvements in its cost performance in transmission and distribution."

5.7.2 BC Hydro Has Also Provided an Indicative Comparison to Major Canadian Electric Utilities

As indicated above, The Brattle Group Benchmarking Study used a peer group of U.S. utilities, largely due to the availability of consistent data. Whereas U.S. utilities report costs on a consistent basis, Canadian utilities do not report in the same way. That said, we wanted to provide the BCUC with some indication of how BC Hydro's operating costs compare relative to those of other major Canadian utilities.

BC Hydro conducted a review internally to compare our operating costs against

[183] Appendix T, page 19.

those of FortisBC Inc., Manitoba Hydro, and Hydro Quebec. The comparison, which should be treated as a high-level indication only, suggests that BC Hydro's operating costs compare favourably against the costs of other major Canadian utilities.

5.7.2.1 The Canadian Utility Comparison Is Indicative

In terms of process, BC Hydro conducted a limited review of recent years of published annual reports and rate applications, where applicable, of:

- Manitoba Hydro;
- Hydro Quebec; and,
- FortisBC Inc.

The process involved reviewing and assessing each entity's operating costs, number of customers, and sales volume and making assumptions in order to align these items to ensure some degree of consistency. The operating cost basis for each of the entities compared may be subjective as the detailed breakdown was not provided in the published reports. We have used our best efforts to provide a comparable basis for each item included in the calculation of the metrics shown in Figure 5-12 and Figure 5-13 below. Other challenges in comparing financial data relate to the use of different accounting standards (IFRS versus U.S. GAAP), the use of regulatory accounting, and whether entities are consolidated or not. This review may not have identified all of the relevant documents as different entities have different regulatory application formats and different financial statement and annual report formats, and different online locations of their information.

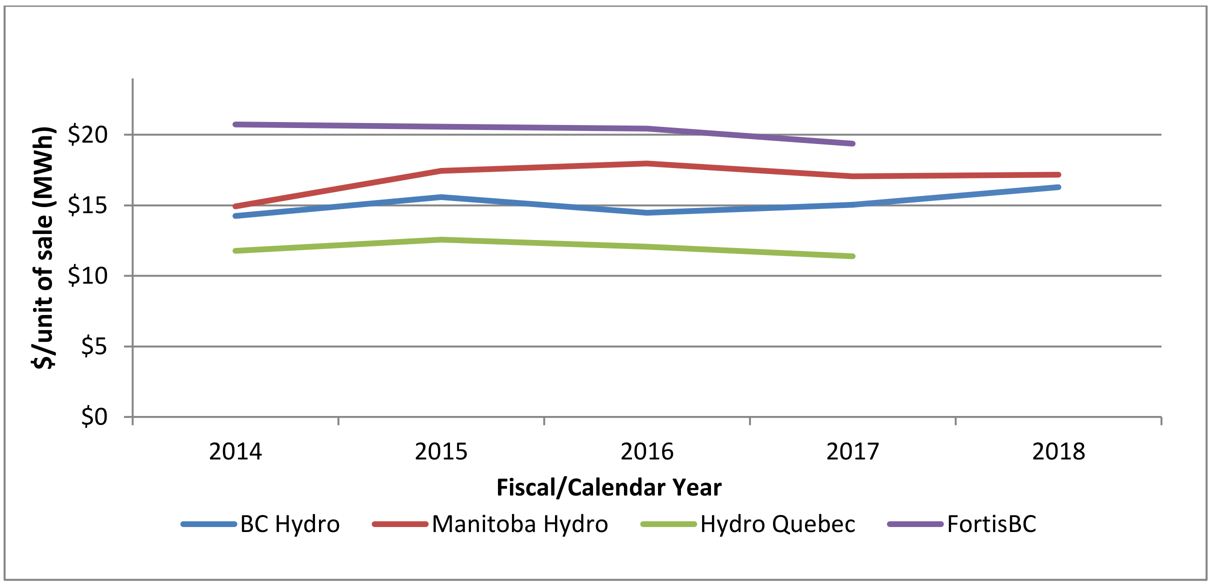
BC Hydro performed the comparison using the metrics identified as appropriate by The Brattle Group Benchmarking Study, which are dollars per customer and dollars per MWh. Data for Hydro Quebec and FortisBC Inc. was not available for 2018 as these entities report on a December 31 calendar year-end basis.

5.7.2.2 The Results Suggest that BC Hydro Compares Favourably

As shown in Figure 5-12 and Figure 5-13 below, this internal review indicates that BC Hydro's operating costs are in line with those of other Canadian utilities on both a per MWh and a per customer basis.[184]

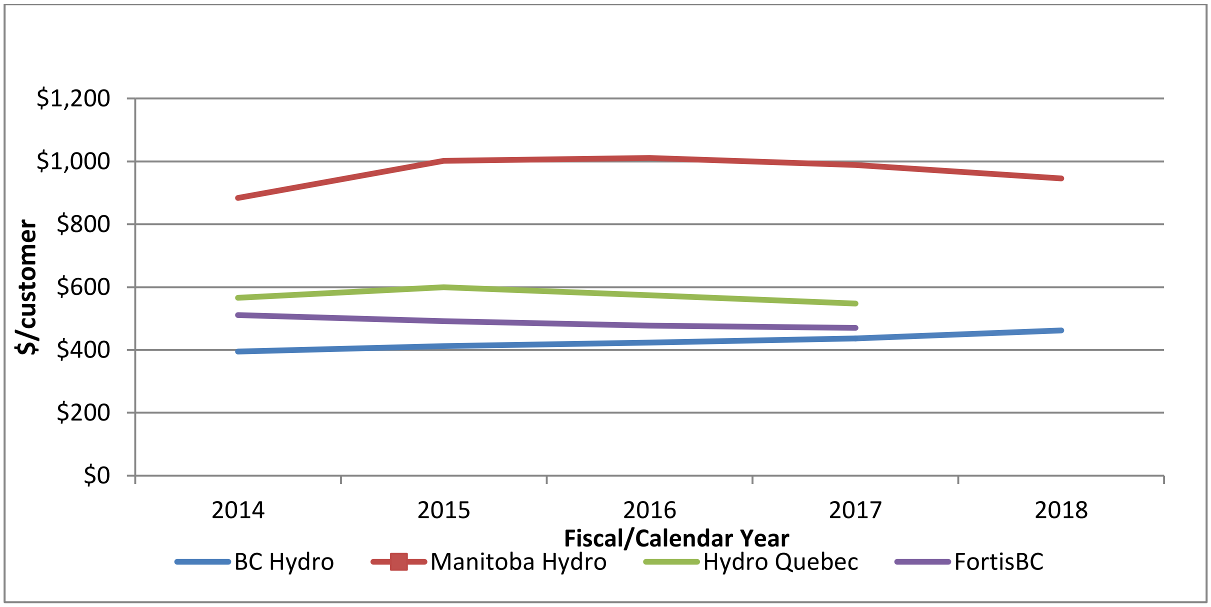
Consistent with the caution by The Brattle Group about the limits of benchmarking, we recognize that extraneous factors can influence these metrics. For instance, the rank order of the utilities changes depending on the metric used. To some degree, this would likely be a product of the fact that Manitoba Hydro and FortisBC Inc. have relatively few customers, but have significant generation output (Manitoba Hydro in particular exports a significant portion of its energy output). As such, when evaluating these results, we look more to the fact that BC Hydro is within the same range as these utilities when it comes to operating costs, as opposed to any particular rank ordering.

Figure 5-12 Total Operating Costs per MWh of Sales (BC Hydro Review)



184 For purposes of this analysis, BC Hydro's operating costs refer to net operating costs, which are described in section 5.5.1. Total operating costs for Manitoba Hydro, Hydro Quebec, and FortisBC are sourced from their publicly available annual reports.

Figure 5-13 Total Operating Costs per Customer (BC Hydro Review)



5.7.3 BC Hydro Benchmarks Well on Maintenance Costs

Maintenance costs are well suited to benchmarking between companies, since cost data can be compared relative to common industry performance indicators. External benchmarking studies on maintenance costs, undertaken by Navigant and First Quartile, are used as part of BC Hydro’s routine business practices. The studies provide a more granular view of maintenance costs than the Brattle Benchmarking Study discussed above. Recent benchmarking results have shown that BC Hydro’s maintenance and operating cost performance is either consistent with or better than our utility peers.

5.7.3.1 Maintenance Benchmarking is Completed Regularly by Independent Experts

BC Hydro retains two independent experts in utility benchmarking, Navigant and First Quartile, to provide maintenance benchmarking services:

- **First Quartile (transmission and distribution):** First Quartile Consulting offers benchmarking services to help utilities compare performance and identify areas of opportunity in comparison to industry peers. Using benchmarks from 41 operating companies, First Quartile provides normalized comparisons between companies across various maintenance categories including distribution, transmission, vegetation and stations; and

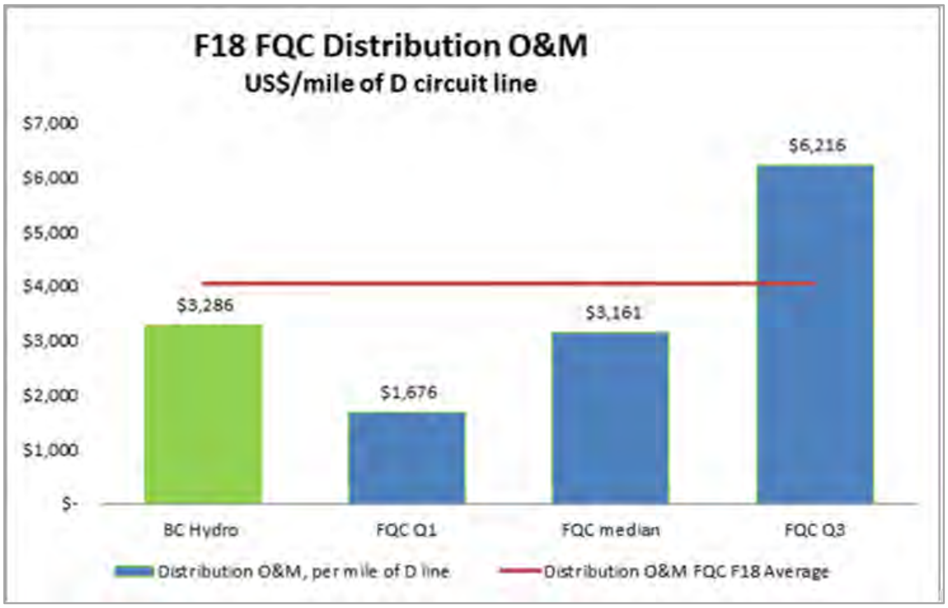
- **Navigant (generation):** Navigant's GSK Hydro Benchmarking program is focused on generation. BC Hydro has been participating in this program for 20 years. The benchmarking peer group includes over 500 generation stations, comprised of about 1,800 units that represent approximately 106,000 MW of installed capacity. Participants in the program are predominately from the United States and Canada, but also include companies from around the globe including Europe, New Zealand and South America. The stations included are diverse in size, type of facility and age, and include a mix of run-of-river, reservoir, pumped storage and pumping stations. Accordingly, the stations are grouped into approximately 300 station groups and study results are presented on a group basis for comparability.

5.7.3.2 Our Transmission and Distribution Lines Costs are Below Average

In the benchmarking studies performed annually by First Quartile, the experts compare the transmission and distribution line maintenance costs of approximately 40 utilities.

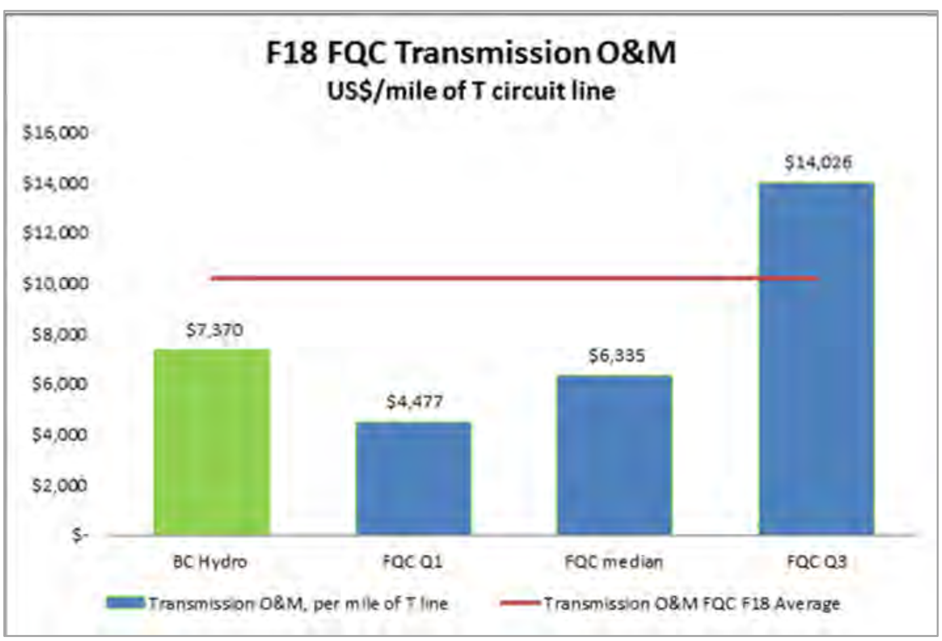
As shown in Figure 5-14 below, First Quartile has found that BC Hydro's operations and maintenance costs were below the average for the utilities included in the distribution category.

Figure 5-14 Distribution Line Operations and Maintenance Costs



Similarly, as shown in Figure 5-15 below, BC Hydro's operations and maintenance costs were below the average for utilities included in the transmission category.

Figure 5-15 Transmission Line Operations and Maintenance Costs

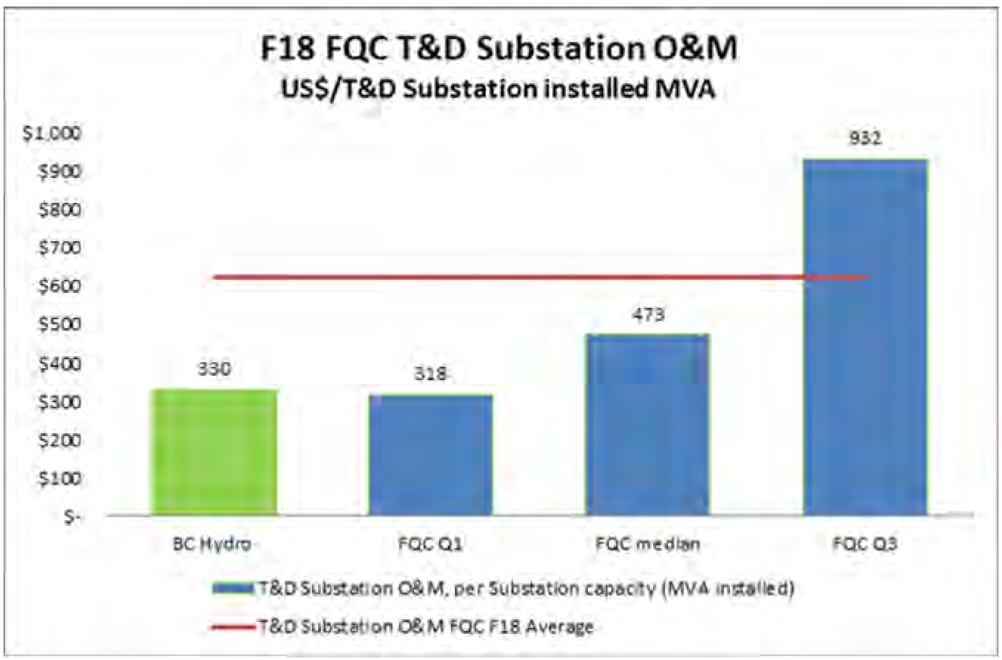


It is important to note that the distribution and transmission peer groups included some U.S. utilities with less challenging terrain and climate than BC Hydro's service area. BC Hydro's mountainous terrain and colder climate could be expected, other things being equal, to increase maintenance costs.

5.7.3.3 Our Transmission and Distribution Stations Costs are Below Average

The annual First Quartile benchmarking results also showed that BC Hydro's operations and maintenance costs were below average (i.e., favourable) for Transmission and Distribution Stations. In fact, as shown by Figure 5-16 below, BC Hydro is only slightly above the first (i.e., best) quartile of the peer group.

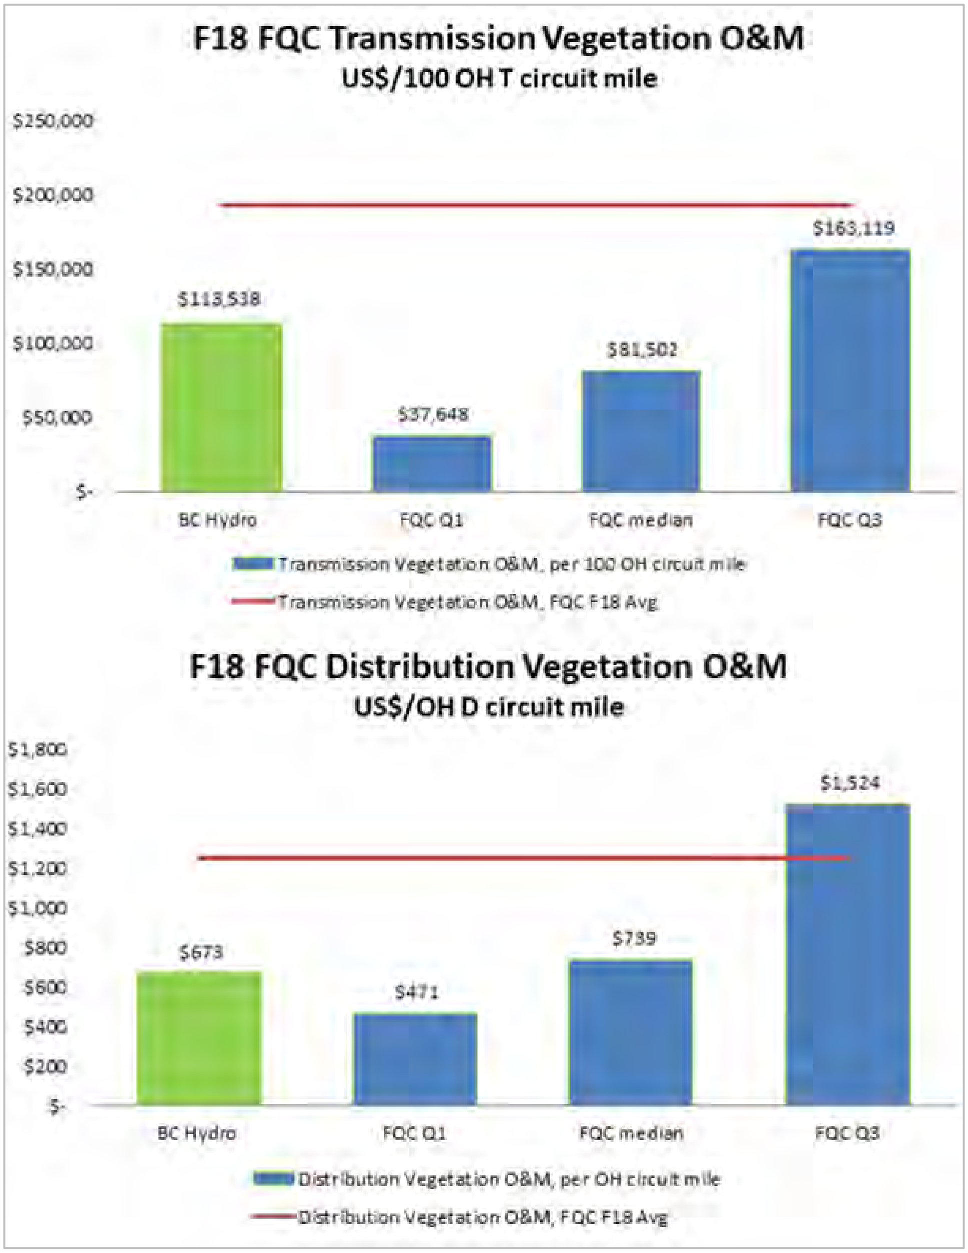
Figure 5-16 Transmission and Distribution Stations Operations and Maintenance Costs



5.7.3.4 Our Transmission and Distribution Vegetation Maintenance Costs Are Below Average

As shown in Figure 5-17 below, the annual First Quartile benchmarking results also show that BC Hydro's vegetation operations and maintenance costs are below average when compared to our utility peers. Many of the utilities included in this peer group have less challenging terrain and geography than BC Hydro's service area.

Figure 5-17 Transmission and Distribution Vegetation Operations and Maintenance Costs



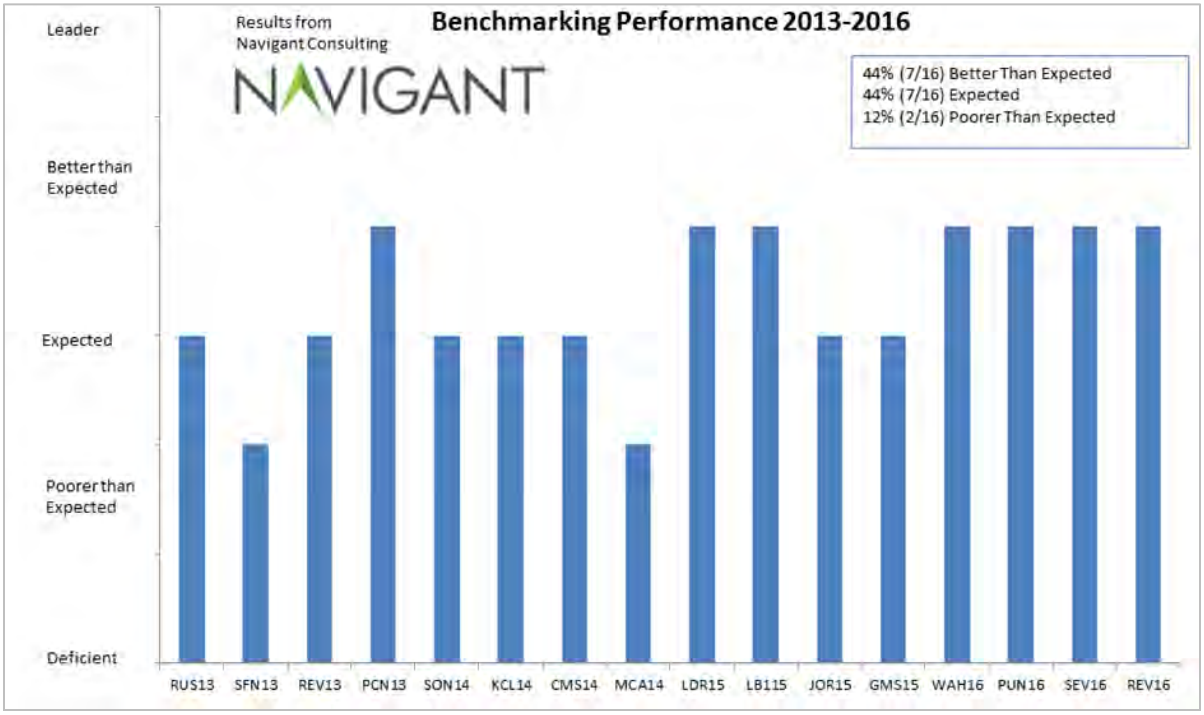
5.7.3.5 Our Generation Station Maintenance Costs Are Favourable

Benchmarking of generation station maintenance costs reveals a similar pattern, with BC Hydro being low cost relative to other hydroelectric stations of a similar age and size.

BC Hydro participates in Navigant Consulting's GSK Hydro Benchmarking program each year, using four generation stations to compare maintenance and operating costs against a designated peer group of hydroelectric generating stations. The stations selected change from year to year and are periodically re-examined to provide historical cost progression comparisons. Navigant performs an in-depth cost review on each station, and produces a report comparing BC Hydro's stations to other hydroelectric stations within the designated peer group. In order to provide the BCUC with a representative sample of BC Hydro's generation station performance, we have assembled the results of the 16 most recent Navigant reviews in Figure 5-18 below.

As shown in Figure 5-18, Navigant's reviews of these 16 stations showed that 88 per cent of BC Hydro's stations sampled were performing as expected or better in maintenance and operations costs, where "better" represents lower costs than expected.

Figure 5-18 Generation Stations Benchmarking Performance – 2013 to 2016 [185]



These results confirm that BC Hydro's generation station maintenance costs are favourable when compared to our utility peers. The Navigant studies control for type, size and age of generation facilities which means that this comparison is not as influenced by the inherent economies of scale associated with our large hydroelectric generation.

Navigant noted that leading performers adopt business practices that include the following:

- Management of the generation fleet using asset management principles;
- Plant automation and centralized dispatch (operation and control) of generating stations;

[185] The lower cost performance for Stave Falls (**SFN**) and Mica (**MCA**) were related sizeable capital investments in the benchmark year including spillway projects at Stave Falls and the Mica Unit 5 and Unit 6 project.

- Operation of generating units in efficient load zones;
- Workforce flexibility in medium and small stations (i.e., the workforce operates and maintains multiple stations); and
- Improved work planning and cost visibility.

BC Hydro has adopted these business practices to manage our maintenance costs effectively.

5.7.4 KBUs Use Various Benchmarks for Internal Purposes

The evidence that BC Hydro put forward in the Previous Application did not include information on benchmarks used internally by BC Hydro for management purposes. As a result, there may be an impression that BC Hydro does not use benchmarking for internal purposes. While not all KBUs lend themselves to the use of benchmarks, many KBUs do use benchmarks to help inform management decisions.

The Morneau Shepell compensation benchmarking discussed in section 5.6.5.2 above and the Navigant and First Quartile maintenance benchmarking, discussed in section 5.7.3 above, are three notable examples of our regular use of benchmarking. A number of additional examples as summarized in Table 5-16 below.

Table 5-16 Summary of KBU Benchmarks and Metrics

KBU	Benchmark	BC Hydro Position	Peer Group
Finance (Chapter 5E, section 5E.4)	Number of internal staff in Accounting and Finance	181[186]	180 (median)[187]
Finance (Chapter 5E, section 5E.4)	Cost of internal staff in Accounting and Finance as a percentage of overall revenues	0.49%[188]	0.5% (bottom (best) quartile) 0.8 (median)[187]
Safety System and Assurance (Chapter 5D, section 5D.4)	Operating Costs per Visitor Day for public use management areas	$1.03 per visitor day[189]	$2.17 or $1.16 after accounting for revenues from user fees[190]
Supply Chain (Chapter 5E, section 5E.6)	Number of Invoices Processed per FTE Annually	6,086[191]	4,706[191]
Supply Chain (Chapter 5E, section 5E.6)	On-Time Invoice Payment	92%[192]	90%[192]
Supply Chain (Chapter 5E, section 5E.6)	Service Fill Rates	97%	96%[193]
Human Resources (Chapter 5F, section 5F.4)	Ratio of Human Resources FTEs to Overall FTEs	1:59[194]	1:54[194]
Human Resources (Chapter 5F, section 5F.4)	Ratio of Recruiters to Recruitment Requisitions	1:34	1:25[195]
Human Resources (Chapter 5F, section 5F.4)	Sick Days per Employee	7.0	9.0[196]

186 The Finance KBU has 204 FTEs. However, this total includes 23 FTEs that perform business planning, change management and enterprise risk management functions which are not traditional finance and accounting functions. Excluding these FTEs, the total number of FTEs in the Finance KBU is 181.

187 Companies with annual revenue of $5 billion and higher.

188 The Finance KBU has a base operating cost budget of $30.8 million which equates to approximately 0.49 per cent of BC Hydro's total fiscal 2018 revenues of $6.237 billion.

189 Based on fiscal 2019 numbers.

190 BC Parks operating costs/visitor days in most recent annual report. http://www.env.gov.bc.ca/bcparks/research/statistic_report/statistic-report-2015-2016.pdf?v=1547851037669.

196 MacLean, Kathryn, and Allison Cowan. *Compensation Planning Outlook 2019*. Ottawa: The Conference Board of Canada, 2018.

KBU	Benchmark	BC Hydro Position	Peer Group
Human Resources (Chapter 5F, section 5F.4)	Return to Work Duration	4 Weeks	6.6 Weeks[197]
Human Resources (Chapter 5F, section 5F.4)	Voluntary Turnover Rate	1.3	3.8[196]

Further discussion of these benchmarks are provided as part of the operating costs and FTEs discussion for various KBUs in Chapters 5A through 5G. Overall, these benchmarks provide additional comfort that we are managing operating costs appropriately.

5.8 BC Hydro Is Optimizing Power System Maintenance

Ongoing maintenance of the Power System is necessary for assets to achieve their expected performance throughout their lifecycle. The Integrated Planning Business Group, discussed in Chapter 5A, holds the Power System maintenance budget and is responsible for maintenance investment decisions. The Operations Business Group, discussed in Chapter 5C, is responsible for executing maintenance work.

5.8.1 Aging and Growing Asset Base, Increased Severe Weather Events, Outstanding Needs, and Additional Requirements are Driving Increased Costs

Power System maintenance is budgeted at approximately $235 million per year during the test period, representing approximately 30 per cent of BC Hydro's forecast base operating costs. BC Hydro is planning to increase the budget for Power System maintenance during the test period.

This increase is partially offset by re-purposing unallocated funds, as discussed further in Chapter 5G, section 5G.7.2. Unallocated funds have often been used to fund unanticipated maintenance needs during the year. Re-purposing unallocated funds to support an increase in the Power System maintenance budget will allow additional maintenance work to be proactively planned and prioritized. Unanticipated

[197] Sun Life Financial Canadian Benchmark for fiscal 2018.

maintenance requirements will be funded through re-allocations within the existing budget.

The planned budget increase for Power System maintenance reflects an aging and growing asset base, increased severe weather events, higher delivery costs, outstanding condition-based and corrective maintenance needs and additional regulatory and compliance requirements.

BC Hydro has mitigated these cost pressures through a number of improvements to grid intelligence and control, system automation, crew utilization and business processes as well as through strategic asset management and capital investment planning.

Table 5-17 below shows actual and planned maintenance costs by category. These costs are included in the KBU budgets in the Integrated Planning Business Group, discussed in Chapter 5A[198], but are consolidated below to provide an aggregate view.

198 As the fiscal 2019 forecast numbers pre-date the September 2018 re-organization, fiscal 2019 forecast maintenance costs are included in KBU budgets in both the Integrated Planning Business Group (Chapter 5A) and the Operations Business Group (Chapter 5C). The September 2018 re-organization centralized all maintenance budgets under the Integrated Planning Business Groups and is reflected starting in the fiscal 2020 plan. Further information is provided in Chapter 5C, section 5C.6.2.

Table 5-17 Maintenance Costs by Category[199, 200, 201, 202]

($ million)	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
	1	2	3	4	5	6	7	8
Maintenance								
Line Asset Maintenance	95.9	92.4	95.9	101.4	95.0	100.5	105.2	105.7
Stations Asset Maintenance	72.7	74.8	73.2	78.4	73.8	75.1	85.4	86.4
Distribution Emergency Response	31.4	31.0	31.4	33.0	31.4	30.6	42.5	42.9
Total Maintenance	200.0	198.3	200.5	212.8	200.2	206.1	233.1	235.0

Table 5-18 below shows the drivers of the budget increase from fiscal 2019 forecast to fiscal 2020 plan. The most significant cost driver is an uncontrollable increase to the rolling five-year average used to budget for storm restoration costs, which reflects increased storm damage in recent years.

Table 5-18 Maintenance Cost Increases (Fiscal 2019 Forecast to Fiscal 2020 Plan)

($ million)	Line Asset Maintenance	Stations Asset Maintenance	Distribution Emergency Response	Total
Storm Restoration Five Year Average [203]	0	0	11.1	11.1
Standard Labour Rate Increases [204]	2.5	1.3	0.8	4.6
Net Re-organization impacts [205]	0.3	3.2	0	3.5
Re-purposing of unallocated funds [206]	3.1	4.7	0	7.9
Total	4.7	10.3	11.9	27.0 [207]

199 Line Asset Maintenance is equivalent to the total fiscal 2019 forecast number shown on line 1 of Chapter 5A, Table 5A-10 (Line Asset Maintenance Department of the Line Asset Planning KBU).

200 Stations Asset Maintenance is included in the total fiscal 2019 forecast number shown on line 1of Chapter 5A, Table 5A-8 (Stations Asset Maintenance Department of the Stations Asset Planning KBU).

201 Distribution Emergency Response is included in the total fiscal 2019 forecast number shown on line 4 of Chapter 5C, Table 5C-6 (Trouble Line Field Operations and Operations Support Department of the Line Field Operations KBU).

202 Increases to Distribution Emergency Response maintenance are primarily due to an increase in the five-year average used to calculate storm restoration costs, as described in section 5.5.2.2.

203 Discussed further in section 5.5.2 above.

204 Discussed further in section 5.5.2 above.

205 These increases are cost neutral and are offset by reductions of $1.5 million to the Business Unit Support KBU (see Chapter 5C, section 5C.11.3) of the Operations Business Group and $2.0 million to the Engineering KBU (see Chapter 5A, section 5A.9.3).

206 Discussed further in Chapter 5G, section 5G.7.2.

207 Numbers may not add exactly due to rounding.

5.8.2 The Budget for Asset Maintenance Must Address Preventative, Condition-Based and Corrective Maintenance

When developing a budget for maintenance work, we must account for three broad categories of maintenance, which are summarized in Figure 5-19 below. All of these activities are essential for the Power System to function safely and reliably.

Figure 5-19 Maintenance Work Types

Preventative	Condition-Based	Corrective
• Inspections, testing, calibration, and condition assessments • Planned Work	• Prioritized work based on current condition • Repair or replace in-service assets • Planned Work	• In-service asset damage or failure • Emergent work

The Power System asset maintenance programs also include two additional work categories which are required for safe and reliable asset operation:

- **Facility Maintenance:** work required to maintain the facilities and properties associated with the Power System. This includes items such as roofs, roads, fences, landscaping and snow removal; and
- **Engineering Services:** engineering support required for equipment maintenance. This includes activities such as developing and updating maintenance standards as well as performing failure investigations or specialized inspections or testing.

5.8.3 Determining the Appropriate Maintenance Investment Level Requires Consideration of Many Factors

While the trigger for spending on corrective maintenance - a failure or an emergent issue – is generally intuitive, the timing and prioritization of preventative and condition-based maintenance considers a number of factors.

- **Timing of preventative maintenance:** The frequency and timing of preventative maintenance activities are determined by factors such as asset criticality, component age and current condition, component failure modes, failure costs, and the duration required for repairs in the case of failure. Preventive maintenance programs are also influenced by manufacturers' recommendations, regulatory requirements, engineering judgement, field experience, historical reviews, and industry practices. As a result, preventative maintenance requirements and frequencies are cyclical and can vary by asset, which means that preventative maintenance work is not uniform year over year.

- **Timing and prioritization of condition-based maintenance:** The majority of condition-based maintenance work consists of annually planned repairs or replacements of defective or damaged components of the system and occurs before equipment fails. Condition-based maintenance is triggered by the condition of equipment as determined by preventative maintenance inspections, tests, maintenance standards, manufacturer notices and/or operational readings or alarms. Condition-based maintenance is prioritized based on risk, considering factors such as asset criticality, component age and condition, and the consequence of failure. These considerations are analysed to determine when work should be undertaken or if the component condition should continue to be monitored.

5.8.4 BC Hydro Conducts Maintenance Activities on a Broad Range of Assets

BC Hydro's maintenance activities are categorized into line asset maintenance, stations asset maintenance and distribution emergency response. The following sub-sections provide a summary of actual and planned maintenance expenditures, by category. These planned expenditures are the result of the budgeting process that considers all of the factors identified above.

5.8.4.1 Line Asset Maintenance Expenditures

Table 5-19 Line Asset Maintenance Expenditures

($ million)	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
	1	2	3	4	5	6	7	8
Transmission Maintenance	39.5	35.5	39.5	36.3	38.8	36.1	37.3	37.4
Distribution Maintenance	46.5	45.2	46.5	43.9	46.3	46.9	48.6	48.9
Telecom Protection & Control Maintenance	9.9	11.8	9.9	21.2	10.0	17.5	19.3	19.4
Total Line Asset Maintenance	95.9	92.4	95.9	101.4	95.0	100.5	105.2	105.7

- **Transmission Maintenance:** Annual transmission maintenance expenditures are primarily made up of transmission line maintenance and transmission vegetation management:
  - Transmission line maintenance includes inspecting and assessing the transmission system, test and treat inspections of wood poles as well as performing planned and unplanned repairs. All transmission structures are inspected at least once a year; and
  - Transmission vegetation management is required to manage vegetation along transmission corridors so that the system is reliable and safe and so that BC Hydro is in compliance with regulatory requirements.
- **Distribution Maintenance:** Annual distribution maintenance expenditures are made up of distribution line maintenance, distribution vegetation management and distribution meter maintenance:
  - Distribution line maintenance includes inspections and repairs of the overhead and underground system, test and treat inspections of wood poles as well as inspections and repairs of distribution assets such as manholes, cables, reclosers and voltage regulators and switches;
  - Distribution vegetation management includes routine maintenance to prune trees growing in proximity to power lines to reduce outages and damage caused by trees falling onto the distribution system; and

- Distribution meter maintenance includes programs to sample and test meters and exchange failed and time-expired meters, so that BC Hydro is in compliance with the requirements of the *Electricity and Gas Inspection Act* and with Measurement Canada's sampling regulations.

- **Telecommunications Protection and Control Maintenance:** Protection and control assets protect energized transmission equipment from being damaged from unplanned electrical events. They also provide system stability and reliability during disturbances, assist with the control of energy flows throughout the electrical grid and provide information to control centres through an integrated telecommunications system. Also included in this category are maintenance expenditures related to smart metering infrastructure telecommunications. These assets are maintained through a combination of preventative, condition-based and corrective maintenance work.

5.8.4.2 Stations Asset Maintenance Expenditures

Table 5-20 Stations Asset Maintenance Expenditures

($ million)	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
	1	2	3	4	5	6	7	8
Generation Maintenance	49.9	51.9	50.4	52.9	51.0	52.7	58.0	58.6
Substations Maintenance	17.6	18.5	17.6	20.3	17.6	17.2	22.4	22.6
Non-Integrated Area Maintenance	5.2	4.4	5.2	5.2	5.2	5.2	5.1	5.2
Stations Asset Maintenance	72.7	74.8	73.2	78.4	73.8	75.1	85.4	86.4

- **Generation Maintenance:** BC Hydro's generation assets include 83 generating units at 30 hydroelectric generating facilities as well as 81 dams located at generating stations and at additional locations to provide water storage and water diversion functions. Generation assets also include three gas fired units at BC Hydro's two thermal generating stations and four synchronous condenser units at a dedicated synchronous condenser station. These assets are maintained through a combination of preventative, condition-based, corrective, and facility maintenance work;

- **Substations Maintenance:** BC Hydro has over 300 transmission and distribution substations across the province. Substations are maintained to minimize the lifecycle cost of the equipment, support safe and reliable operation, and mitigate environmental impacts. These assets are maintained through a combination of preventative, condition-based, corrective, and facility maintenance work; and
- **Non-Integrated Area Maintenance:** BC Hydro has 17 diesel generating stations and one hydroelectric generating station in areas not connected to the integrated electric system. Maintenance on these assets consists of routine, scheduled and corrective work.

5.8.4.3 Distribution Emergency Response Maintenance Expenditures

Table 5-21 Distribution Emergency Response Maintenance Expenditures

($ million)	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
	1	2	3	4	5	6	7	8
Routine Trouble	22.4	21.0	22.4	22.7	22.4	21.6	22.4	22.7
Storm	6.7	6.7	6.7	6.7	6.7	6.7	17.8	17.9
Damage to Plant	2.3	3.3	2.3	3.6	2.3	2.3	2.3	2.4
Total Distribution Emergency Response	31.4	31.0	31.4	33.0	31.4	30.6	42.5	42.9

- **Routine Trouble** refers to maintenance expenditures for day-to-day restoration of power outages.
- **Storm** refers to maintenance expenditures for events causing outages over a large geographic area, affecting a large number of customers or of extended duration. As discussed in section 5.5.2.2 above, BC Hydro continues to budget for storm restoration costs using a five-year average of normal weather years. In recent years, we have experienced higher levels of storm related damage, which has caused the five year average of storm restoration costs to increase. Variances between planned and actual storm restoration costs are deferred to

the Storm Restoration Costs Regulatory Account, which is discussed in Chapter 7, section 7.8.1.

- **Damage to Plant** refers to events where a third-party may be liable for the cost of system repairs. These costs are partially offset by miscellaneous revenues.

5.9 Operating Costs by Business Group and by KBU

In Chapters 5A through 5G, BC Hydro provides detailed support for the forecast operating costs, by Business Group.

In response to commentary from the BCUC about its comfort level with BC Hydro's operating cost budget, these chapters provide significantly more information than the Previous Application on the operating costs and FTEs for each of BC Hydro's six business groups and 39 KBUs. They provide the full cost picture rather than focusing only on incremental changes.

Figure 5-20 and Figure 5-21 below provide a summary of operating costs and FTEs by Business Group. Additional details are provided in Table 5-22 and Table 5-23.

When reviewing the summaries provided below, it is important to note the following:

- The Integrated Planning Business Group holds the budget for all maintenance work while the Operations Business Group holds the FTEs associated with all maintenance work and is responsible for executing this work;
- The Safety Business Group includes the Learning and Development KBU, which includes the FTEs related to apprentices and trainees, which are distributed throughout the organization; and
- The Site C Project has been included in the Other category. The project has FTEs but no operating costs as all project costs are charged to capital and to the Site C Regulatory Account.

Figure 5-20 Net Operating Costs by Business Group (Fiscal 2020) [208]

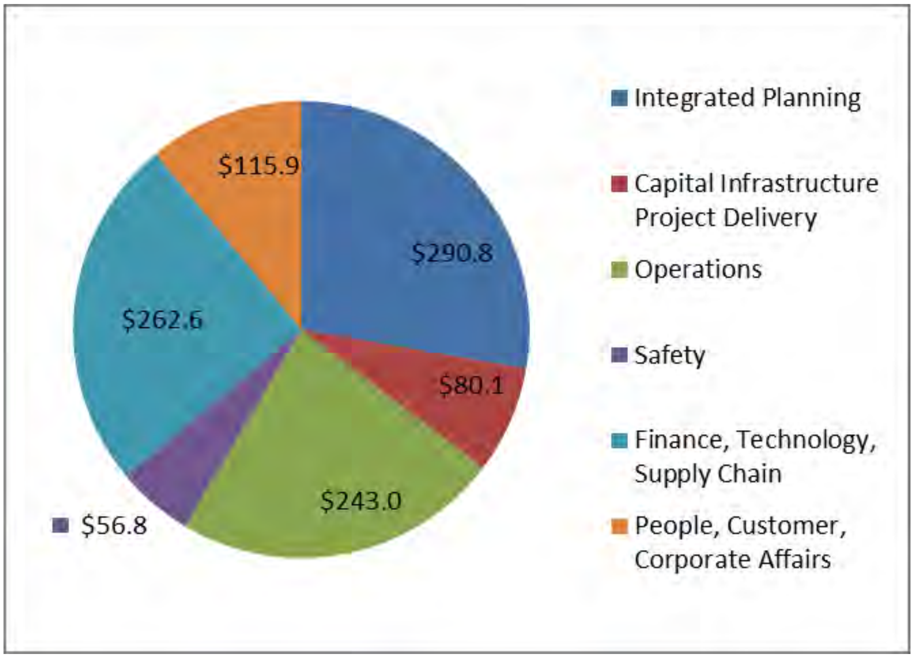

Figure 5-21 FTEs by Business Group (Fiscal 2020)

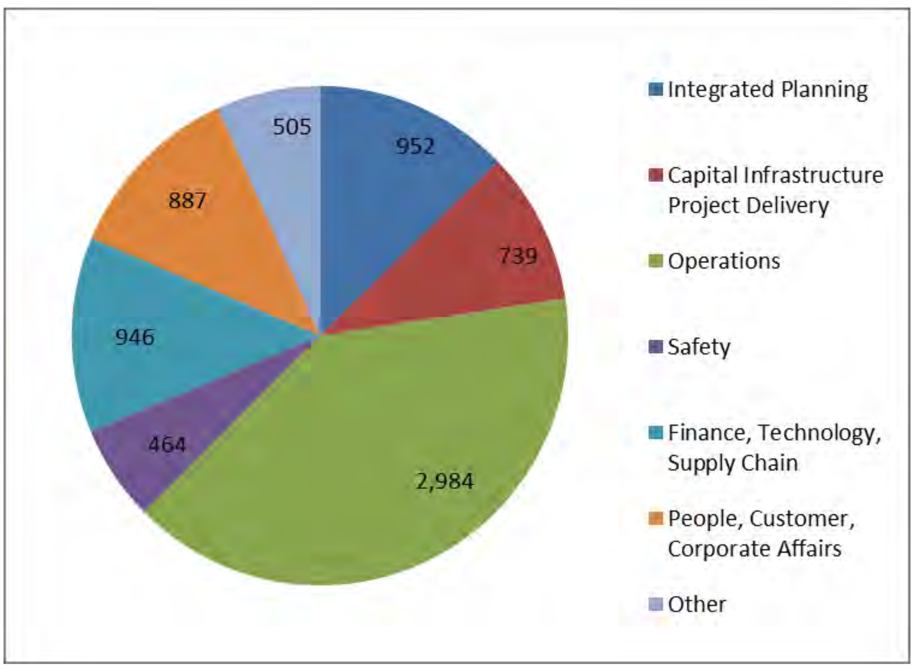

208 The Other category is not included in this figure because it includes a credit for capitalized costs which cannot be displayed correctly in a pie chart.

Table 5-22 Net Operating Costs by Business Group and by KBU

5A.1 Introduction – Integrated Planning Business Group

Chapter 5A provides and explains in detail the composition of, and rationale for the operating costs of the Integrated Planning Business Group. The Integrated Planning Business Group is one of six business groups in the organization and is responsible for planning BC Hydro's Power System. It serves as the Plan function of the Plan-Build-Operate-Support model.

The Integrated Planning Business Group budget was developed as part of the budgeting process outlined in Chapter 5, section 5.4. The information provided in this Chapter 5A demonstrates the basis for the entirety of the Business Group and KBU budgets, rather than focussing only on incremental cost requirements.

Chapter 5A is organized as follows:

- Section 5A.2 provides an overview of the organization and responsibilities of the Integrated Planning Business Group;
- Section 5A.3 provides the operating costs and FTE information for the Integrated Planning Business Group as a whole[209];
- Sections 5A.4 to 5A.10 provide more detailed information on the responsibilities, cost and FTEs for each KBU within the Integrated Planning Business Group. The operating costs and FTE information for each KBU is broken out into two sections:[209]
  - Overview of Operating Costs and FTEs – This chapter explains the starting operating costs and FTEs based on the fiscal 2019 forecast; and
  - Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs – This chapter explains any incremental changes between fiscal 2019 forecast and fiscal 2020 and fiscal 2021 plan.

[209] Please note the amounts presented in the tables in these sections may not add due to rounding.

5A.2 Overview of Integrated Planning Business Group Organization and Responsibilities

The Integrated Planning Business Group brings together our main planning, asset management and engineering functions to plan and design a safe, efficient and reliable system that drives the most value from our investments, and meets the needs of our customers.

More specifically, Integrated Planning is responsible for:

- Developing the load forecast and the Integrated Resource Plan;
- Determining when and where to invest in our system;
- Governing the safe management of reservoir containment and water conveyance;
- Producing the Capital Plan and fulfilling the role of project initiator;
- Managing customer requests to interconnect, supply, or receive electrical services from our system; and
- Providing engineering services to the organization.

The Integrated Planning Business Group was created subsequent to the filing of the Previous Application. The planning functions of the former Transmission and Distribution and Generation Business Groups are now combined into the Integrated Planning Business Group.

The Integrated Planning Business Group consists of the following KBUs:

Business Group	Key Business Unit
Integrated Planning	Energy Planning and Analytics Dam Safety Stations Asset Planning Line Asset Planning Interconnections and Shared Assets Engineering Business Unit Support

5A.3 Fiscal 2020 and Fiscal 2021 Plan Operating Cost and FTE Summaries

This section addresses planned operating costs and FTEs for the Integrated Planning Business Group. The following are some key points of note with respect to the information provided in Figure 5A-1, Table 5A-1 and Figure 5A-2, Table 5A-2 and Table 5A-3:

- Approximately $190 million or 66 per cent of the operating costs for Integrated Planning Business Group are directly attributable to power system maintenance programs. The majority of this work is performed by internal workers;
- Over 67 per cent of the FTEs in this Business Group are represented by the Engineering KBU. Over 75 per cent of the labour costs for these FTEs are not included in the operating costs budget as these costs are charged primarily to capital projects; and
- Operating costs are increasing in the Integrated Planning Business Group, primarily due to increased Power System maintenance expenditures (as discussed in Chapter 5, section 5.8) and Standard Labour Rate increases (as discussed in Chapter 5, section 5.5.2).

Planned operating costs for the Integrated Planning Business Group are approximately $290.8 million in fiscal 2020 and approximately $293.0 million in fiscal 2021. The operating costs for the Integrated Planning Business Group are summarized by KBU in Figure 5A-1. Additional cost details are provided in Table 5A-1 below.

Figure 5A-1 Integrated Planning Net Operating Costs by KBU (Fiscal 2020 Plan) ($ million)

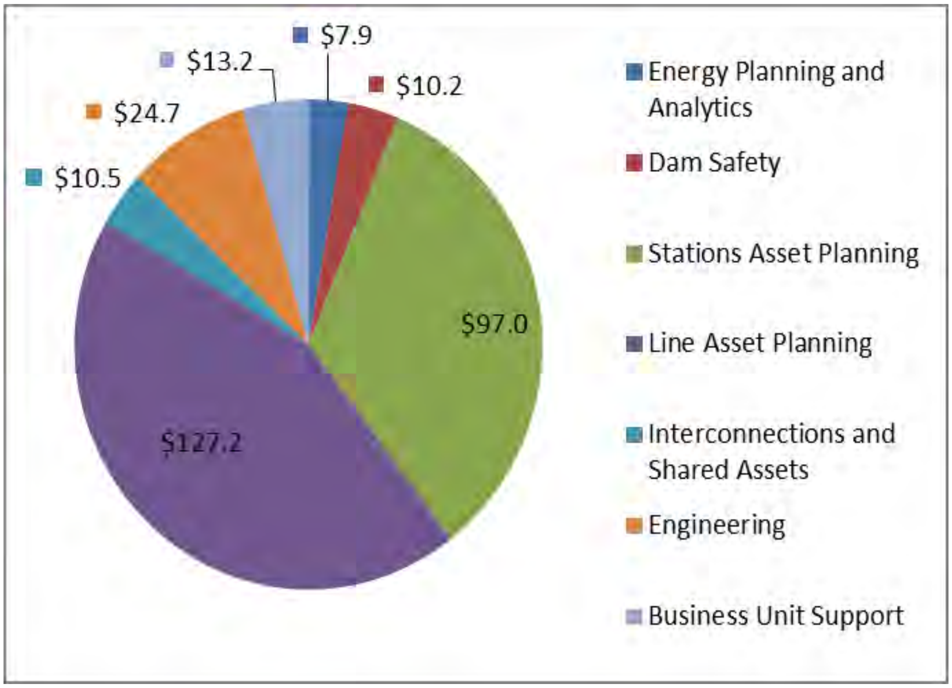

Table 5A-1 Integrated Planning Net Operating Costs by KBU

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8

Table 5A-3 below provides a continuity table which highlights changes to the Integrated Planning Business Group from the Previous Application. An overall discussion of these changes, at a company-wide level, is provided in Chapter 5, section 5.5.2. Further details, by KBU, are provided in the sections below.

Table 5A-3 Integrated Planning Operating Costs Continuity Schedule

	($ million)		F2020 Plan	F2021 Plan
1	F2019 Revenue Requirement Application Plan (Training, Development and Generation)		146.2

5A.4 Energy Planning and Analytics KBU

5A.4.1 Responsibilities

The Energy Planning and Analytics KBU is responsible for the development of BC Hydro’s energy plans, the delivery of integrated planning and analytics services, and the prioritization of investments within BC Hydro’s capital and maintenance plans.

This KBU was created subsequent to the filing of the Previous Application. It combines the Reliability and Performance Assessment and Portfolio Optimization and Management departments, previously part of the former Asset Management and Distribution Engineering KBU, with the Energy Planning department, previously part of the Corporate Affairs KBU.

The Energy Planning and Analytics KBU is comprised of the following two departments:

- Energy Planning Department; and
- Reliability and Performance Assessment Department.

5A.4.1.1. Energy Planning Department

The Energy Planning department consists of five teams:

- Resource Planning Team - Integrated Resource Planning;
- Resource Planning Team - Modelling;
- Load Forecasting;
- Network Integration; and
- Portfolio Optimization and Management.

The two Resource Planning teams facilitate the development of BC Hydro's long-term resource strategy as well as short-term actions to respond to provincial energy policy objectives and to support customer reliability. The teams are responsible for BC Hydro's Integrated Resource Plan (**IRP**) and for engagement with the public and First Nations on the development of the IRP. These teams undertake analysis to identify the need and timing for new generation and transmission resources on the integrated system as well as cost-effective options to meet those needs. These teams also conduct system contingency analysis, scenario planning, and structured evaluation of high-level alternatives to manage the uncertainties that are inherent in long-term planning. In addition, these teams are responsible for maintaining BC Hydro's resource options database and developing the Long Run Marginal Cost and Reference Price indices, as well as providing support to regulatory applications and business decisions related to these areas.

The Load Forecasting team produces a 20-year forecast for energy and peak load as well as a five-year forecast on an annual cycle. The five-year load forecast is an important input to the Revenue Requirements Application, while the 20-year load forecast is important for capital planning and long-term resource planning. BC Hydro's five-year load forecast is discussed in Chapter 3.

Transmission service requests define BC Hydro's domestic transmission capacity requirements. The Network Integration team manages the development and submission of transmission service requests to the Market Policy and Operations department in the T&D System Operations KBU. This team also represents BC Hydro's transmission interests as a transmission customer at the Western Electricity Coordinating Council (**WECC**). In addition, the team is responsible for integrated resource planning for the Fort Nelson area. The Fort Nelson area is not connected to BC Hydro's integrated system, but is grid connected to local generation resources and to Alberta's grid through a radial transmission line.

The Portfolio Optimization and Management team coordinates the annual capital planning process for all Integrated Planning investments and leads the integration of Stations, Line, Interconnection and Dam Safety investments into a cohesive portfolio of projects and programs. This includes the prioritization of investments within BC Hydro's overall capital portfolio, and aligning the overall capital plan with BC Hydro's strategic direction and objectives within available financial and labour resources. BC Hydro's capital plan is discussed in Chapter 6.

5A.4.1.2. Reliability and Performance Assessment Department

The Reliability and Performance Assessment department provides Asset Health and Reliability reporting and analytics to the Lines Asset Planning and Stations Asset Planning KBUs to support customer reliability. The department is responsible for the sustainment of an asset registry of over 4 million BC Hydro assets, as well as the accompanying business applications and analytics to enable data-driven operational and management decision making. In addition, this team works with asset management business groups to ensure the asset data is current and consistent with business requirements, which includes setting up preventative maintenance work orders and ensuring they are completed in compliance with maintenance standards.

5A.4.2 Overview of Operating Costs and FTEs

Table 5A-4 Energy Planning and Analytics KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Energy Planning	4.3	0.0	0.6	0.2	0.2	0.0	0.0	**5.2**	26
2	Reliability and Performance Assessment	1.5	0.0	0.2	0.0	0.0	0.0	0.0	**1.7**	12
3	**Total (Sch 5.1 L1, Sch 16.0 L1)**	**5.8**	**0.0**	**0.7**	**0.2**	**0.2**	**0.0**	**0.0**	**6.8**	**38**

5A.4.2.1. Energy Planning Department

Since fiscal 2016, the overall operating budget for the Energy Planning department has remained constant despite the increased complexity of the planning environment. For example, BC Hydro’s 20-year load forecast must build detailed models of reliable predictors of future sales such as GDP or industrial activity. In recent years, the relationship between these predictors and energy sales at a point in time appears to be changing, requiring more detailed analysis and investigation. In addition, resource planners must now take into account the potential for emerging supply technologies such as solar generation or battery storage, which will impact the way energy is produced in future. All of this activity drives an increased demand for load forecasting and resource planning analysis.

Approximately 83 per cent of the Energy Planning department budget is related to labour and represents 26 FTEs as follows:

- Two FTEs representing the Director of Energy Planning and Analytics and an Administrative Assistant;
- Six FTEs on the Load Forecasting team. In fiscal 2018, an internal audit of BC Hydro’s Load Forecasting function recommended that “additional staff members should be considered to assist with the preparation of forecasts for the industrial class sectors, analysis of high volume of data, preparation of documents for regulatory hearings, and to minimize employee succession

risk”[210]. To advance this recommendation, one FTE was transferred from the Network Integration team and one additional FTE will be added to the team in fiscal 2020;

- Three FTEs on the Network Integration team;
- Seven FTEs on the Resource Planning team for integrated resource planning. Since the last Integrated Resource Plan in 2013, this group has produced analyses of regional load-resource balances, reference prices and resource options to support a range of business decisions and regulatory proceedings. Examples include analysis related to the Site C Inquiry, Electricity Purchase Agreement renewal applications, regional supply plans, and the design of new rate structures;
- Three FTEs on the Resource Planning team execute up to 250 system portfolio modelling runs per year to inform internal business decisions and regulatory proceedings, while supporting resource planning initiatives in partnership with stakeholders such as the City of Vancouver, the Government of B.C. and the Government of Canada; and
- Five FTEs in the Portfolio Optimization and Management department are responsible for coordinating the annual capital planning process for the Power System portfolio including the prioritization of more than 1,400 discrete investments and managing in-year adjustments to a capital portfolio which was forecasted at approximately $1.4 billion in fiscal 2019. BC Hydro must be flexible and responsive to the investment needs of the system. As part of the annual capital planning cycle, more than 50 per cent of the investments within the capital portfolio require detailed review, revision and prioritization so that the Capital Plan is updated and prioritized to respond to the latest information on the system risks and needs.

[210] See Appendix P, BC Hydro Load Forecast Audit.

The $0.6 million in Services expenditures for this department are primarily related to professional consulting services to inform the development of BC Hydro's load forecasts. The $0.2 million in Materials expenditures are for subscriptions to research services, also to inform the development of load forecasts. The $0.2 million in Buildings and Equipment expenditures are primarily related to subscriptions for capacity expansion and market price forecast modelling software.

5A.4.2.2. Reliability and Performance Assessment Department

This department consists of 12 FTEs who are responsible for:

- Maintaining asset registry records for over 4 million BC Hydro assets;
- Processing approximately 80,000 work orders annually;
- Creating and modifying asset management programs in response to updates or additions to a library of over 20,000 maintenance standards; and
- Providing support for NERC compliance for thousands of assets critical to the BC Hydro system.

The $0.2 million in Services expenditures for this department are primarily related to Information Technology contractors and research memberships that support ongoing efforts to automate the setting up and processing of maintenance work orders that are currently processed manually.

5A.4.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5A-5 Energy Planning and Analytics KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.1 L1	6.5	5.7	6.2	5.9	6.3	6.8	7.9	8.4
2	FTEs	16.0 L1	27	29	27	31	27	38	44	44

Operating costs are increasing by approximately $1.1 million from fiscal 2019 forecast to fiscal 2020 plan due to:

- Standard Labour Rate increases;
- The transfer of four FTEs from the Stations Field Operations KBU and one FTE from the Project Delivery KBU;
- The addition of one FTE to support NERC CIPv5 compliance, as discussed in Chapter 5C, section 5C.10.3; and
- The addition of one FTE on the Load Forecasting team to respond to the internal audit recommendation, as discussed above.

Operating costs are increasing by approximately $0.5 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases as well as $0.3 million in additional one-time funding for the development of the 2021 IRP, which is being provided through a transfer from the Business Support KBU of the Integrated Planning Business Group.

The increase in FTEs from fiscal 2019 RRA to fiscal 2019 forecast primarily reflects the addition of the Portfolio Optimization and Management team to the Energy Planning department.

5A.5 Dam Safety KBU

5A.5.1 Responsibilities

The primary function of the Dam Safety KBU is to administer and implement BC Hydro's Dam Safety Program.

BC Hydro currently owns, operates, and maintains 81 dams at 41 sites throughout B.C. as a major part of our generating system. As a dam owner, BC Hydro is accountable to the Government of B.C. for overseeing the safety of BC Hydro dams in accordance with the British Columbia Dam Safety Regulation. BC Hydro representatives communicate regularly with the Comptroller of Water Rights, who represents the Government of B.C. on dam safety matters.

Through our Dam Safety Program, BC Hydro manages the risks associated with our dams, reservoirs and water passages to protect against any impacts from their misoperation or failure and to support continued reliability of electricity supply.

There have been no material changes to the Dam Safety KBU since the Previous Application.

The Dam Safety KBU includes the following departments:

- Regulatory and Risk Management Department;
- Asset Management Department; and
- Surveillance Department.

5A.5.1.1. Regulatory and Risk Management Department

The Regulatory and Risk Management department is responsible for establishing the dam safety governance framework, overseeing compliance with the requirements of the Dam Safety Regulation as well as documenting, tracking, rating and reporting all dam safety issues. Key activities in the department include:

- Developing strategies and objectives for dam safety risk reduction;
- Communicating with the Comptroller of Water Rights to confirm compliance with the Dam Safety Regulation;
- Developing, reviewing and updating expectations and procedures in the Dam Safety Program Governance and Implementation Manuals;
- Managing the Dam Safety Reviews, including scheduling of reviews in accordance with the requirements of the Dam Safety Regulation, procuring and assigning independent external reviewers, compiling background reference

documents and drawings for the reference of the reviewers, and coordinating the production and distribution of the Dam Safety Review reports;

- Updating the Operation, Maintenance and Surveillance Manuals for all of BC Hydro's dams in accordance with the Dam Safety Regulation;
- Overseeing the assignment of risk ratings to the issues documented and tracked in the Dam Safety issues database; and
- Providing oversight and audits for dam safety gate and water conveyance-related matters.

5A.5.1.2. Asset Management Department

The Asset Management department is responsible for the prioritization, initiation, implementation and management of the Dam Safety Investigations Program and the Dam Safety Capital Plan. Key activities in the department include:

- Managing the Dam Safety Investigations Program, including the development of prioritized short-term and long-term plans for Dam Safety investigations based on risk level as well as initiating the Investigations, developing and approving the Investigations' scope, and providing oversight of Investigations until completion and acceptance;
- Developing and updating the Dam Safety component of BC Hydro's Capital Plan so that Dam Safety risk reduction targets are achieved and are aligned with other asset management strategies;
- Initiating capital projects, including approving the project scope, and providing oversight of the project risk reduction objectives until completion and acceptance; and
- Updating the Dam Safety issues database to reflect findings from the Dam Safety Investigations and risk reductions achieved by capital projects.

5A.5.1.3. Surveillance Department

The Surveillance department is responsible for performing or overseeing all dam safety related activities at the dams and reservoirs including inspections, instrumentation monitoring and maintenance, and reporting of any unusual conditions. Key activities in the department include:

- Conducting and documenting the semi-annual and annual inspections of the dams and reservoir slopes;
- Reviewing the results of weekly and monthly dam safety inspections completed by site operations staff;
- Providing dam safety training for site operations staff;
- Conducting increased or enhanced surveillance in response to unusual conditions at dams, such as during floods or other high reservoir events;
- Monitoring and collecting data from the various dams' performance monitoring instrumentation and ensuring the quality and integrity of the data;
- Establishing warning and alarm thresholds for all instrumentation;
- Identifying unusual observations, conditions, or instrumentation readings and documenting them in the Dam Safety issues database as required;
- Overseeing the implementation and approval of Interim Dam Safety Risk Management Plans in response to circumstances where construction or maintenance activities have potential to damage the dam or impede critical functions, or where risks that are above established targets must be retained until upgrades have been completed;
- Liaising with site management employees in the Operations Business Group to provide information on current dam safety issues and to arrange for required support from the Operations Business Group for routine weekly and monthly inspections;

- Participating in and providing input to Emergency Preparedness exercises; and
- Staffing the Dam Safety on-call process to provide 24/7 coverage of alarms and other dam safety related matters.

5A.5.2 Overview of Operating Costs and FTEs

Table 5A-6 Dam Safety KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Regulatory and Risk Management	1.5	0.0	1.0	0.0	0.0	0.0	0.0	**2.5**	8
2	Asset Management	1.5	0.0	2.0	0.0	0.0	0.0	0.0	**3.5**	4
3	Surveillance	3.2	0.0	0.6	0.1	0.0	0.0	0.0	**4.0**	25
4	**Total (Sch 5.1 L2, Sch 16.0 L2)**	**6.2**	**0.0**	**3.6**	**0.1**	**0.0**	**0.0**	**0.0**	**10.0**	**37**

The Dam Safety KBU is resourced to the level required to administer and implement the Dam Safety Program in accordance with accepted Canadian and international practices.

No two dam owners organize and delegate responsibilities relating to their dam safety programs in the same manner, nor do any two dam owners hold the same level of risk and complexity within their fleets of dams. As a result, direct comparisons of costs and assigned workforces on dam safety are difficult, if not impossible, to make. Therefore, BC Hydro considers assessments and audits of the Program’s performance to be the best means available to demonstrate whether staffing and monetary resources assigned to the Dam Safety KBU are sufficient and appropriate.

Since fiscal 2017, BC Hydro has conducted an internal audit as well as an internal review of its Dam Safety Program. BC Hydro believes that these assessments demonstrate that the staffing and monetary resources assigned to the Dam Safety KBU are sufficient and appropriate:

- The Dam Safety Program is audited every five years. The most recent audit was completed in September 2018 and was conducted by a team that included international subject matter experts in dam safety management and hazardous process industries. The audit found that "BC Hydro has a well-established Dam Safety Program that is in line with international practices with some aspects operating at best practice levels." The audit also included recommendations for improvements to some aspects of the Program where issues and opportunities for improvement had been identified; and

- Similar findings resulted from a self-assessment performed by the Dam Safety KBU in 2017 to 2018, using a methodology that was developed by the Dam Safety Interest Group of CEATI International and is being used by a number of dam owners from across North America. This assessment was facilitated by an international dam safety consulting firm that is familiar with the methodology, and assessed levels were supported by evidence and documentation to the satisfaction of the facilitator.

5A.5.2.1. Regulatory and Risk Management Department

The majority of this department's budget is related to labour costs for eight FTEs.

The department's Services budget includes $0.7 million to procure engineering services required to comply with the British Columbia Dam Safety Regulation. The department engages consultants to perform independent Dam Safety Reviews of, on average, five different dam sites each year. It also makes occasional use of contractors to supplement internal staff in preparing major updates to various dams' Operations, Maintenance and Surveillance Manuals, again at an average rate of five per year.

The remaining $0.3 million of Services procured by this department is for outreach and development activities to improve BC Hydro's Dam Safety Program, reinforce best practices, and influence the development of industry practices so that BC Hydro's Dam Safety Program remains relevant and adaptable to changing conditions.

5A.5.2.2. Asset Management Department

The Asset Management department consists of four FTEs. These FTEs account for approximately $0.6 million of the total $1.5 million of labour costs in this department and are responsible for:

- Planning, managing and overseeing a program of investigations to identify deficiencies and issues and their means of remediation. BC Hydro tracks approximately 250 deficiencies and 1,000 other ongoing issues each year; and
- Planning, initiating and overseeing capital projects to remediate identified deficiencies. At any given time, BC Hydro typically has more than 20 active Dam Safety projects.

The remaining $0.9 million in labour costs for this department and the $2.0 million in Services represent costs expended by other BC Hydro KBUs (e.g., Engineering and Construction Services), engineering consultants and contractors to perform Dam Safety investigations. The balance between the use of internal and external resources is based on resource availability and the need for specific expertise, varying slightly from year-to-year depending on the investment requirements.

5A.5.2.3. Surveillance Department

The majority of this department's budget is related to labour costs for 25 FTEs, primarily made up of instrumentation technologists and dam safety engineers. This department's labour costs also include:

- Approximately $0.2 million in overtime for staffing the Dam Safety on-call process to provide 24/7 coverage and adequate response to alarms on key dam performance monitoring instruments and to address other dam safety related matters; and
- Approximately $0.3 million for work performed by other KBUs in BC Hydro such as surveying.

This department's services budget includes approximately $0.6 million to support the surveillance component of the Dam Safety Program. This is primarily related to helicopter services for dam and reservoir slopes inspections and surveying by external contractors.

This department's materials budget provides funding for the repair and maintenance of the performance monitoring instrumentation and data acquisition systems.

5A.5.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5A-7 Dam Safety KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.1 L2	8.8	8.4	8.9	8.6	9.0	10.0	10.2	10.3
2	FTEs	16.0 L2	35	34	35	34	35	37	37	37

Operating costs are increasing by approximately $0.2 million from fiscal 2019 forecast to fiscal 2020 plan and by approximately $0.1 million from fiscal 2020 plan to fiscal 2021 plan, due to Standard Labour Rate increases. FTEs are planned to remain constant.

5A.6 Stations Asset Planning KBU

5A.6.1 Responsibilities

The primary role of the Stations Asset Planning KBU is the development and management of the maintenance and capital investment plans for the generating station and substation assets. The portfolio of assets managed by Stations Asset Planning consists of:

- 30 hydroelectric generating facilities;
- Two thermal generating facilities;
- One synchronous condenser facility;

- 317 substations; and
- 17 diesel and one hydroelectric generating stations that are not connected to the integrated electric system as well as three standby diesel generating stations.

This KBU was created subsequent to the filing of the Previous Application and consists of a number of departments that were previously part of the former Asset Investment Management KBU, Generation Asset Management KBU and Generation Maintenance KBU.

The Stations Asset Planning KBU consists of the following departments:

- Substations Growth and Sustainment Department;
- Generation Asset Management Department;
- Generating Stations Maintenance Planning Department; and
- Non-Integrated Area Planning Department.

5A.6.1.1. Substations Growth and Sustainment Department

The Substations Growth and Sustainment department is responsible for substation area planning and acts as the asset manager for the electrical, mechanical and civil substation assets. The department develops the capital and maintenance investment plans and facility asset plans for the substation assets and takes on the initiator role for the subsequent capital projects. The various roles on capital projects are discussed further in Chapter 6, section 6.4.7.10.

The department is also responsible for conducting detailed area studies to determine area and substation configurations to serve new and existing loads and to interconnect new generation.

5A.6.1.2. Generation Asset Management Department

The Generation Asset Management department is responsible for developing the long-term investment strategies for the generating station assets, producing and updating the Facility Asset Plans, developing the 10-Year Capital Plan for the generating station assets and assuming the initiator role for the subsequent capital projects.

5A.6.1.3. Generating Stations Maintenance Planning Department

The Generating Stations Maintenance Planning department develops and oversees the $58 million maintenance work plan associated with the generating station assets. This includes developing maintenance programs to preserve equipment functionality, manage asset risk, and comply with regulatory requirements as well as identifying and planning integrated maintenance and short term capital investments for these assets.

5A.6.1.4. Non-Integrated Area Planning Department

The Non-Integrated Area Planning department is responsible for developing and managing the overall maintenance program, the annual maintenance work program and the capital investments for the generating station assets in the 17 Non-Integrated areas.[211]

5A.6.2 Overview of Operating Costs and FTEs

Table 5A-8 Stations Asset Planning KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Stations Asset Maintenance	50.9	0.0	25.9	8.0	0.8	0.0	0.0	**85.7**	-
2	Stations Asset Planning, Director	0.3	0.0	0.0	0.0	0.0	0.0	0.0	**0.3**	1
3	Substations Growth and Sustainment	2.2	0.0	0.2	0.0	0.0	0.0	0.0	**2.4**	20
4	Generation Asset Management	1.5	0.0	0.3	0.0	0.0	0.0	0.0	**1.8**	8
5	Generating Stations Maintenance Planning	1.7	0.0	1.8	0.0	0.0	0.0	0.0	**3.5**	10
6	NIA Planning	0.2	0.0	0.1	0.0	0.0	0.0	0.0	**0.3**	7
7	**Total (Sch 5.1 L3, Sch 16.0 L3)**	**56.9**	**0.0**	**28.3**	**8.0**	**0.8**	**0.0**	**0.0**	**94.0**	**46**

[211] Overall maintenance program refers to the overarching set of activities required to maintain an asset or set of assets over their lifecycle. A maintenance work program refers to the funded set of discrete work items which will be performed on the asset or assets in a defined period of time, usually annually.

In September 2018, 12 FTEs from the Stations Field Operations KBU and one FTE from the Engineering KBU were transferred to the Stations Asset Planning KBU, as part of a re-organization. These FTEs are not reflected in the fiscal 2019 forecast numbers in Table 5A-8 above but are reflected in the fiscal 2020 and fiscal 2021 plan numbers in Table 5A-9.

5A.6.2.1. Stations Asset Maintenance Department

This department holds the budget for the required maintenance work on BC Hydro's generating station and substation assets. Stations Asset Maintenance is discussed further in Chapter 5, section 5.8.

5A.6.2.2. Stations Asset Planning Director Department

This department contains the labour costs for the Director of Stations Asset Planning. In September 2018, one FTE was transferred from the Stations Field Operations KBU to the Stations Asset Planning KBU and one FTE was transferred from the Engineering KBU as part of the re-organization. The labour costs associated with these two transferred positions are reflected in the department's fiscal 2020 budget.

5A.6.2.3. Substations Growth and Sustainment Department

The majority of this department's budget relates to labour costs for 20 FTEs.

There are eight FTEs on the Stations Strategy and Standards team. This team develops the sustaining capital plan and manages the $22 million annual substation maintenance work plan as well as the substation component of the asbestos management and PCB remediation work plans. In addition, this team reviews and accepts 60 to 70 maintenance standards, maintains 17 asset class strategies and produces 10 to 15 asset plans each year.

There are nine FTEs on two regional planning teams. Each year these teams conduct 40 to 60 substation planning studies to address load, sustainment and system needs, three to five annual area planning studies to review substation capability to meet long-term area growth, and 40 system impact studies for customer and generation interconnections.

The remaining three FTEs represent the department manager as well as two FTEs on the analytical studies team who conduct approximately 30 studies each year on the interaction between equipment specifications and system operating performance.

5A.6.2.4. Generation Asset Management Department

The majority of this department's budget relates to labour costs for eight FTEs. Activities conducted by this department include:

- Updating eight to 10 Facility Asset Plans each year;
- Reviewing and accepting 90 to 100 Equipment Health Ratings per year; and
- Developing the portfolio of generating station capital expenditures and initiating approximately 10 to 20 capital projects each year with a total value of approximately $550 million.

5A.6.2.5. Generating Stations Maintenance Planning Department

The Generating Stations Maintenance Planning Department's budget consists of $1.8 million of services costs for external resources and $1.7 million in labour costs for 10 FTEs. In September 2018, an additional 10 FTEs were transferred to this department from the Stations Field Operations KBU. The labour costs associated with these FTEs will be transferred to this department in fiscal 2020.

These FTEs and external resources are organized into the following teams:

- Six FTEs on the Maintenance and Reliability Strategy team. Each year, this team develops approximately 80 equipment level maintenance programs and updates approximately 15 generating station maintenance standards. External resources are used to augment the internal workforce to meet peak workload demands;

- Four FTEs on the Maintenance Planning team who manage six primary asset condition strategies and methodologies, eight asset performance monitoring and equipment programs and compliance with 25 North American Reliability Corporation Mandatory Reliability Standards;
- Seven FTEs on the Investment Planning team who develop and oversee the $58 million annual generating station maintenance work plan, identify regional capital needs and provide field input for capital projects; and
- Three FTEs on the Civil Maintenance team who develop and sustain 15 maintenance standards and identify and deliver 40 civil maintenance projects each year, totalling $4 million.

5A.6.2.6. Non-Integrated Area Planning Department

The majority of this department's budget relates to labour costs for seven FTEs. A significant portion of the costs associated with these positions are charged out to maintenance programs and capital projects.

This department develops and manages the $5 million annual maintenance work program for non-integrated areas and develops, manages and delivers the $14 million capital program for the non-integrated area assets. Further information on maintenance is provided in Chapter 5, section 5.8.

5A.6.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5A-9 Stations Asset Planning KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.1 L3	102.7	102.8	105.4	108.0	106.2	94.0	97.0	98.1
2	FTEs	16.0 L3	51	51	51	49	51	46	59	59

Operating costs are increasing by approximately $3.0 million from the fiscal 2019 forecast to the fiscal 2020 plan due to funding increases to maintenance programs, as described in Chapter 5, section 5.8, transfers related to the September 2018 re-organization described previously, and Standard Labour Rate increases. Operating costs are increasing by approximately $1.1 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases.

The FTE increase from fiscal 2019 forecast to fiscal 2020 plan reflects the September 2018 re-organization described previously. FTEs are planned to remain constant from fiscal 2020 plan to fiscal 2021 plan.

5A.7 Line Asset Planning KBU

5A.7.1 Responsibilities

The Line Asset Planning KBU is responsible for managing the transmission and distribution system line assets, including meter asset management. To perform these responsibilities, this KBU prepares an integrated asset management plan, which identifies and prioritizes growth and sustainment investment needs across the system. This plan is prepared in collaboration with a number of KBUs across BC Hydro and incorporates asset strategies, system information, planning studies, load forecasts and customer requirements.

The Lines Asset Planning KBU is also responsible for the management of grid telecommunications assets, supporting the telecommunications needs across the Power System.

This KBU was created subsequent to the filing of the Previous Application and consists of a number of departments that were previously part of the former Asset Investment Management KBU.

The Line Asset Planning KBU is organized into the following departments:

- Distribution Planning Department;
- Transmission Planning Department;
- Asset Sustainment Department; and

- Telecommunications, Protection and Control Department.

5A.7.1.1. Distribution Planning Department

The Distribution Planning department is responsible for planning distribution system improvements and growth, advancing the development of smart grid technologies and maintaining compliance requirements. This department also manages the planning, supply, testing, and maintenance of BC Hydro's revenue metering assets in compliance with Measurement Canada requirements.

5A.7.1.2. Transmission Planning Department

The Transmission Planning department is responsible for identifying the short-term and long-term needs and capital expenditures associated with the transmission system. It is also responsible for developing the operational limits and operating instructions for the secure and reliable operation of the Power System. In addition, the department is responsible for the technical planning required to interconnect new industrial loads and generation to the transmission system.

5A.7.1.3. Asset Sustainment Department

The Asset Sustainment department plans and initiates required maintenance work for existing in service lines assets, points of access and vegetation on BC Hydro's system.

This department is responsible for asset sustainment and end of life replacement strategies, asset condition assessment and analysis, asset life-cycle evaluation, end-of-life asset planning, maintenance planning, and maintenance standards review and acceptance.

5A.7.1.4. Telecommunications, Protection and Control Department

The Telecommunications, Protection and Control department is responsible for the development of asset strategies as well as the review and acceptance of standards and investment plans for BC Hydro's telecommunications, protection and control systems. These assets are an integral part of the Power System and provide operators and planners with the ability to monitor, control, and operate the electrical equipment on the system. These assets also provide telecommunications capability across BC Hydro.

This department is also responsible for the sustainment and maintenance of telecommunications, protection and control systems. This includes compliance with all applicable North American Electric Reliability Corporation (**NERC**) and Western Electricity Coordinating Council (**WECC**) standards.

5A.7.2 Overview of Operating Costs and FTEs

Table 5A-10 Line Asset Planning KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Line Asset Maintenance	23.6	0.0	75.5	3.0	6.8	0.0	-8.5	**100.5**	-
2	Distribution Planning	5.6	0.0	1.1	0.0	0.0	0.0	0.0	**6.7**	38
3	Transmission Planning	6.0	0.0	0.2	0.0	0.0	0.0	0.0	**6.3**	42
4	Asset Sustainment	3.0	0.0	2.0	0.0	0.0	0.0	0.0	**5.0**	16
5	Telecom, Protection and Control	2.3	0.0	0.3	0.0	0.0	0.0	0.0	**2.6**	15
6	Line Asset Planning, Director	0.4	0.0	0.1	0.0	0.0	0.0	0.0	**0.4**	2
7	**Total (Sch 5.1 L4, Sch 16.0 L4)**	**40.9**	**0.0**	**79.1**	**3.0**	**6.9**	**0.0**	**-8.5**	**121.4**	**113**

5A.7.2.1. Line Asset Maintenance Department

This department does not contain any FTEs. The budget for this department funds required maintenance work on transmission lines, distribution lines and telecommunications assets. This work is planned by the Lines Asset Planning KBU and delivered by KBUs in the Operations Business Group. A more detailed discussion of the Lines Maintenance programs is provided in Chapter 5, section 5.8.

5A.7.2.2. Distribution Planning Department

This department's budget primarily consists of labour costs for 38 FTEs. Key activities undertaken by these FTEs include:

- Developing and maintaining approximately 20 distribution system strategies, planning criteria, procedures, metering requirements, and guidelines;

- Managing plans for over 1,400 distribution feeders and over 1,500 distribution automation devices on the system;
- Developing approximately 30 feeder evaluations, three integrated planning studies and five distribution area plans annually;
- Evaluating approximately 600 distributed generation customer requests annually;
- Developing annual peak demand forecasts for approximately 220 substations based on load forecast guidelines;
- Planning, engineering, and performing quality assurance of over 2 million smart meters;
- Developing approximately 50 complex meter solutions each year for large industrial customers and IPPs;
- Developing the annual 10-Year Capital Plan to meet the sustainment and growth needs of the BC Hydro distribution system assets, initiating approximately 120 new capital projects each year, including system improvements such as distribution automation; and
- Plans system innovations including electric vehicle charging infrastructure.

The department’s non-labour budget is primarily used to fund distribution system planning studies.

5A.7.2.3. Transmission Planning Department

This department’s budget primarily consists of labour costs for 42 FTEs. Key activities undertaken by these FTEs include:

- Planning significant capital projects to maintain and expand the transmission system;

- Performing an average of 65 transmission customer load connection request studies annually based on external needs;
- Reviewing and updating operating orders as required; and
- Meeting NERC Mandatory Reliability Standards requirements for transmission planning. Each year, the department conducts an average of 14 transmission system planning performance assessments and over 15 operational planning and model verification studies.

The department's non-labour budget is primarily used to fund transmission planning studies.

5A.7.2.4. Asset Sustainment Department

This department's budget primarily consists of labour costs for 16 FTEs. Key activities undertaken by these FTEs include:

- Developing maintenance plans to maintain 900,000 distribution poles, 116,000 transmission poles, 18,000 kilometers of transmission lines and 58,000 kilometers of distribution lines, all within compliance of approximately 100 asset standards;
- Initiating approximately 20 transmission asset failure investigations each year;
- Initiating vegetation management for over 76,000 hectares of transmission right-of-way; and
- Initiating end-of-life or sustaining capital investment.

The department's non-labour budget is primarily used to fund asset failure studies.

5A.7.2.5. Telecommunications, Protection and Control Department

This department's budget primarily consists of labour costs for 15 FTEs. Key activities undertaken by these FTEs include:

- Planning the telecommunications requirements for approximately 150 capital projects and interconnection requests annually;
- Initiating approximately 55 projects and programs annually;
- Managing asset plans for telecommunications, protection and control system failures;
- Managing the annual maintenance programs;
- Producing self-reports and preparing for Western Electricity Coordinating Council onsite audits;
- Meeting telecommunications requirements to connect approximately 8,000 additional meters annually; and
- Managing lifecycle planning for telecommunications assets, including 168 microwave sites supporting the bulk electric system, 194 mobile radio sites supporting field staff, 2000 Cisco grid routers supporting 1.8 million smart meters, and protection and control systems in over 300 substations.

The department's non-labour budget is primarily used to fund planning studies.

5A.7.2.6. Line Asset Planning, Director Department

This department's budget is primarily made up of labour costs for the Director of the Line Asset Planning KBU and an Administrative Assistant.

5A.7.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5A-11 Line Asset Planning KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.1 L4	111.3	107.0	112.0	114.3	111.3	121.4	127.2	128.1
2	FTEs	16.0 L4	109	109	109	112	109	113	116	116

Operating costs are increasing by approximately $5.8 million from fiscal 2019 forecast to fiscal 2020 plan due to funding increases to maintenance programs as described in Chapter 5, section 5.8 as well as Standard Labour Rate increases. Operating costs are increasing by approximately $0.9 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases.

FTEs are planned to increase by three from fiscal 2019 forecast to fiscal 2020 plan primarily due to conversions of contractors to internal FTEs through the Workforce Optimization Program, which is discussed further in Chapter 5, section 5.6.1. FTEs are planned to remain constant from fiscal 2020 plan to fiscal 2021 plan.

5A.8 Interconnections and Shared Assets

5A.8.1 Responsibilities

The Interconnections and Shared Assets KBU is responsible for:

- Setting interconnections policies and strategies, including managing, revising and enforcing tariff requirements;
- Designing and implementing the process of interconnecting loads and generators, and modifications to BC Hydro's transmission and distribution infrastructure, resulting from third party requests;
- Setting business practices for the quality control, estimating, timelines, reporting and prioritization of interconnection activities;
- Managing the relationship and contract with Telus as Joint Owner of over 80 per cent of the distribution wood poles; and
- Managing third party telecommunication connections to distribution and transmission infrastructure.

The interconnection of residential and small commercial load customers on the distribution system is managed by the Distribution Design and Customer

Connections KBU within the Operations Business Group as discussed in Chapter 5C, section 5C.7.

There have been no material changes to the responsibilities of this KBU since the Previous Application. This KBU consists of the following departments:

- Customer Interconnections and Policy Department;
- Joint Use and Shared Assets Department; and
- Interconnections and Shared Assets Director Department.

5A.8.1.1. Customer Interconnections and Policy Department

The Customer Interconnections and Policy department manages customer requests to interconnect, supply, or receive electrical services from the transmission and distribution system. These requests are from new and existing generators, transmission loads and major distribution loads. In addition, the department manages third-party requests to relocate BC Hydro transmission and distribution infrastructure as well as pipeline proximity and crossing studies.

5A.8.1.2. Joint Use and Shared Assets Department

The Joint Use and Shared Assets department manages the joint ownership and use agreement with Telus (co-owner of approximately 800,000 of our distribution poles) as well as third-party co-location requests which generate additional revenue from our existing transmission and distribution infrastructure. Activities carried out to support these responsibilities include:

- Establishing contractual agreements;
- Managing agreements and billings;
- Co-ordinating the licensee application process;
- Maintaining joint ownership and licensee attachment records;

- Coordinating with other groups within BC Hydro so that the co-location of third-party assets does not compromise the effective operation of the BC Hydro system; and
- Working with other groups within BC Hydro to deliver on contractual obligations and resolve any issues that arise.

5A.8.1.3. Interconnections and Shared Assets Director Department

This department contains the Office of the Interconnections and Shared Assets Director. It is also responsible for managing specialized transmission contracts, technical and commercial agreements with the U.S., Alberta and intra-provincial utilities.

5A.8.2 Overview of Operating Costs and FTEs

Table 5A-12 Interconnections and Shared Assets KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Customer Interconnections and Policy	5.3	0.0	1.4	0.0	0.0	0.0	0.0	**6.8**	29
2	Joint Use and Shared Assets	2.0	0.0	1.6	0.0	0.0	0.0	-2.0	**1.6**	15
3	Interconnections and SA Director	0.5	0.0	0.3	0.0	0.0	0.0	0.0	**0.8**	3
4	**Total (Sch 5.1 L5, Sch 16.0 L5)**	**7.8**	**0.0**	**3.2**	**0.0**	**0.0**	**0.0**	**-2.0**	**9.2**	**47**

5A.8.2.1. Customer Interconnections and Policy Department

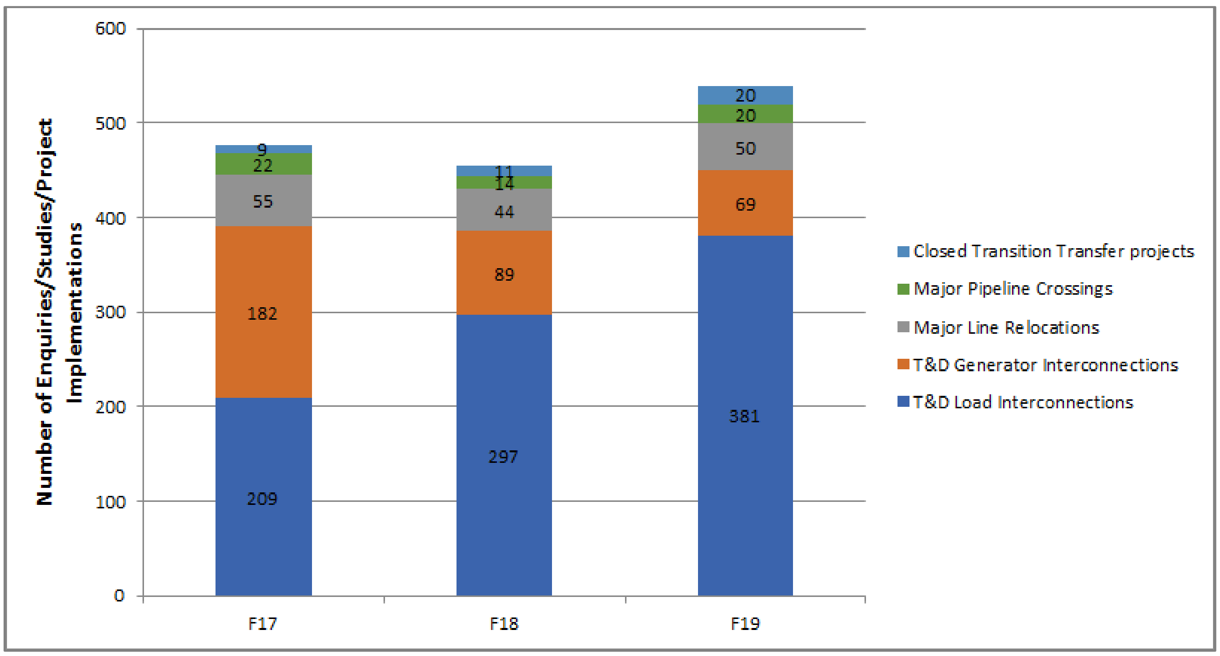
The majority of this department's budget relates to labour costs for 29 FTEs as follows:

- 22 FTEs manage over 500 new customer interconnection enquiries, studies and implementation projects each year; and
- Seven FTEs manage the development and application of distribution tariffs and policies as well as strategic commercial agreements, such as the Ministry of Transportation and Infrastructure protocol agreement.

The department's non-labour budget primarily funds external consultants for interconnection studies.

As shown in Figure 5A-3 below, despite a decrease in work associated with new generator interconnection requests, primarily due to the indefinite suspension of the Standing Offer Program (discussed further in Chapter 4, section 4.3.2), increases in new load interconnection requests and tariff work, such as responding to FERC Order 845[212], have increased the total volume of work managed by this department. The number of FTEs in this department has remained the same.

Figure 5A-3 Interconnections Project Activity



During the test period, BC Hydro expects that generator activities will remain similar to fiscal 2019 levels as existing projects will continue to move through the interconnection process and ongoing work will be required with BC Hydro generators, load displacement projects, and operating generators. BC Hydro also

[212] FERC Order No. 845 is the reform of the OATT Generator Interconnection Procedures and Agreements.

expects that new load interconnection requests and activities will remain consistent or increase during the test period.

5A.8.2.2. Joint Use and Shared Assets Department

The majority of this department's budget relates to labour costs for 15 FTEs as follows:

- Six FTEs on the Joint Use team, five of which are 50 per cent funded by TELUS through the Joint Use Office which administers the joint ownership and use agreement, maintains records, and manages financial recoveries from TELUS. The external recoveries shown in Table 5A-12 primarily relate to the TELUS contributions to joint pole construction and replacement; and
- Nine FTEs on the Shared Assets team. This team manages five different program offerings and processes over 500 applications annually. Eight FTEs on this team are 50 per cent funded through individual application fees related to processing new attachment requests on poles as well as project work to prepare and install licensee equipment on poles. The remaining 50 per cent of the labour costs associated with these FTEs are funded through commercially-agreed annual rental attachment rates. Shared assets annual revenue is included as a part of Miscellaneous Revenue as shown in Appendix A, Schedule 15, line 6 and line 11, and is forecast to be $7.0 million in fiscal 2019.

5A.8.2.3. Interconnections and Shared Assets Director Department

The majority of this department's budget relates to labour costs for three FTEs – the KBU Director, an administrative assistant and a contract specialist.

The department's non-labour budget primarily funds external resources to assist with various commercial negotiations and dispute resolution.

5A.8.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5A-13 Interconnections and Shared Assets KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.1 L5	9.0	10.3	9.1	8.8	9.2	9.2	10.5	10.6
2	FTEs	16.0 L5	40	36	40	43	40	47	47	47

Operating costs are increasing by approximately $1.3 million from fiscal 2019 forecast to fiscal 2020 plan due to Standard Labour Rate increases as well as the transfer of third-party recoveries associated with shared assets from the Interconnections and Shared Assets KBU to the Business Support KBU of the Integrated Planning Business Group. Operating costs are increasing by approximately $0.1 million from fiscal 2019 forecast to fiscal 2020 plan due to Standard Labour Rate increases. FTEs are planned to remain constant.

5A.9 Engineering

5A.9.1 Responsibilities

The Engineering KBU is responsible for providing:

- Engineering, estimating and quality management expertise to support capital projects for power system assets;
- Maintenance engineering and equipment expertise to support the generating stations, transmission substations and the transmission and distribution lines asset; and
- Engineering expertise associated with complex customer interconnection requests, the analysis of critical equipment failures and response to emergency outages involving critical asset and geotechnical failures.

The responsibilities of this KBU have changed since the Previous Application. Engineers responsible for Distribution Engineering and Standards, Generation

Maintenance and Generation Field Maintenance have been transferred into this KBU.

The Engineering KBU consists of the following departments:

- Engineering Department;
- Estimating, Project Engineering and Quality Management Department; and
- Drafting Department.

5A.9.1.1. Engineering Department

BC Hydro's delivery model for the provision of engineering services relies upon a combination of internal staff and external service providers. This model is internally known as the Owner's Engineer Plus model with a portion of the engineering work completed by external service providers and the review and oversight of that work being performed by internal BC Hydro resources (the Owner's Engineer). This department completes approximately 700 Owner's Engineer reviews each year.

As the Owner's Engineer, the Engineering department is accountable for verifying that the overall BC Hydro system is technically capable of safely meeting the operational requirements and demands of its stakeholders, customers, and employees.

This department provides engineering design and oversight to approximately 400 projects each year to ensure the system will meet the requirements of BC Hydro. The level of oversight provided varies depending on the contractual arrangement, type of project, project risk and phase of project implementation. The "Plus" part of the model requires that BC Hydro retains its capability as a knowledgeable owner through employees having the opportunity to build and maintain their skill sets by performing technical design, particularly in areas with high risk and complexity.

The work of the Engineering department is largely governed by engineering standards. It is critical that new standards are generated as needed and that existing standards are refreshed appropriately. Engineering currently has a database of over 4,800 design and maintenance standards. In fiscal 2018, approximately 400 of these standards were updated.

5A.9.1.2. Estimating, Project Engineering and Quality Management Department

This department consists of the Estimating, Project Engineering and Quality Management teams.

The Estimating team produces project cost estimates to support project planning and to aid in the selection of a preferred project alternative and obtain funding approval. This team also provides expertise to assist with project and construction planning, construction methodology, and sequencing. On average, the estimating team prepares over 150 estimates per year. The effort to prepare an estimate typically ranges from 100 to 1,000 hours depending on the level of complexity of the project. They review estimates prepared by external service providers, and provide support to proposal/bid evaluation, change orders and contract claims.

The Project Engineering team coordinates the engineering on the more complex, multi-disciplinary generating stations, transmission substations, and some transmission lines and distribution lines projects. This team has the overall responsibility for the engineering scope, schedule, and cost of a project through to completion, and is responsible for assessing whether end products are fit for purpose and meet the needs of BC Hydro.

The Quality Management team's primary responsibility is to assess whether the quality of equipment supplied from the marketplace meets BC Hydro's standards and requirements. Quality Management engineers and Quality Assurance representatives work directly with equipment manufacturers, engineering service providers, and contractors to perform these assessments.

Through audits, inspections, and tests, Quality Management and Engineering Departments engage with suppliers of equipment for approximately 400 projects each year. In addition, Quality Management and the Engineering Departments contribute to the Supply Chain KBU's Category Management procurement initiatives to support successful receipt of engineered equipment such as power transformers, switchgear and electrical components. On an annual basis, the Quality Management and engineering Departments team perform more than 6,000 inspections.

5A.9.1.3. Drafting Department

The Drafting department supports engineering and capital projects with the production of new drawings and the revision of existing drawings. Drafting also supports the development and application of drawing and drafting standards and processes. BC Hydro receives a large volume of drawings produced by external consultants and equipment suppliers and must assess the quality and compliance of these drawings to BC Hydro's drafting standard. This department also creates, maintains and updates drawings for the operation of BC Hydro's system, including the Geographic Information System. The Drafting department produces approximately 50,600 Computer-Aided Design and Drafting (**CADD**) drawings each year.

5A.9.2 Overview of Operating Costs and FTEs

Table 5A-14 Engineering KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs

4	Drafting	1.3	0.0	0.1	0.1	0.3	0.0	0.0	**1.8**	96
4	**Total (Sch 5.1 L6, Sch 16.0 L6)**	**17.9**	**0.0**	**2.6**	**0.4**	**0.9**	**0.0**	**0.0**	**21.8**	**586**

In September 2018, FTEs were transferred from the Stations Field Operations KBU to the Engineering KBU as part of a re-organization. These FTEs are not reflected in the fiscal 2019 forecast numbers in Table 5A-14 above but are reflected in the fiscal 2020 plan numbers in Table 5A-15.

5A.9.2.1. General Manager, Engineering Department

This department primarily consists of labour costs for two FTEs – The General Manager of Engineering and an Administrative Assistant. The FTE count for this department is negative because it reflects vacancy factor savings of 3.6 per cent (22 FTEs). For more information on vacancy factor savings, please see Chapter 5, section 5.5.2.3.

This department's non-labour budget of $0.2 million is primarily for generating stations, transmission lines and distribution lines standards development performed by contractors.

5A.9.2.2. Engineering Department

This department has 436 FTEs. Approximately 76 per cent of the labour costs for these FTEs are not included in this department's budget as these costs are charged primarily to capital projects. Non-chargeable time is spent on activities that cannot be capitalized (e.g., standards development, engineering studies, and the implementation of category management strategies to procure external resources and electrical and mechanical equipment) as well as other activities such as managing staff, team meetings, professional training and safety training.

The department's non-labour budget includes $0.9 million for Innovation and Technical memberships, $0.6 million in travel and training expenses, $0.3 million for engineering contractor time that cannot be capitalized and $0.2 million for professional dues and fees. The department's Building and Equipment budget primarily consists of software licensing and maintenance costs.

5A.9.2.3. Estimating, Project Engineering and Quality Management Department

This department consists of 73 FTEs, which reflects the level of resources required to deliver BC Hydro's capital plan and operational requirements. Approximately 80 per cent of the labour costs for these FTEs are not included in the operating costs budget as these costs are charged primarily to capital projects. Non-chargeable time is spent on activities that cannot be capitalized (e.g., quality manual development, engineering studies, and the implementation of category management strategies to procure external resources and electrical and mechanical equipment) as well as other activities such as managing staff, team meetings, professional training and safety training.

5A.9.2.4. Drafting Department

This department consists of 96 FTEs, which reflects the level of resources required to deliver BC Hydro's capital plan and operational requirements. Approximately 83 per cent of the labour costs for these FTEs are not included in the operating costs budget as these costs are charged primarily to capital projects. Non-chargeable time is spent on activities that cannot be capitalized (e.g., standards development and Geographic Information System improvements) as well as other activities such as managing staff, team meetings, professional training and safety training.

The Buildings and Equipment budget for this department is primarily for software licensing maintenance.

5A.9.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5A-15 Engineering KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.1 L6	19.9	19.2	20.2	20.5	20.5	21.8	24.7	25.1
2	FTEs	16.0 L6	536	540	536	558	536	586	646	646

Operating costs are increasing by approximately $2.9 million from fiscal 2019 forecast to fiscal 2020 plan due to the net impact of transfers related to the September 2018 re-organization of $2.1 million and due to Standard Labour Rate increases of $0.8 million. Operating costs are increasing by approximately $0.4 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases.

FTEs are increasing by 60 from fiscal 2019 forecast to fiscal 2020 plan due to the September 2018 re-organization and the addition of four positions to support NERC cyber security requirements for BC Hydro's protection and control equipment, as discussed further in Chapter 5C, section 5C.10.3. FTEs are expected to remain constant from fiscal 2020 plan to fiscal 2021 plan.

The increase in FTEs from fiscal 2019 RRA to fiscal 2019 forecast was primarily driven by the Workforce Optimization program, described in Chapter 5, section 5.6.1.

5A.10 Business Unit Support

5A.10.1 Responsibilities

The Business Unit Support KBU holds the budget for the Office of the Senior Vice President, Integrated Planning, for business group costs that are not specifically related to any single KBU, and for project pre-capitalization expenditures.

5A.10.2 Overview of Operating Costs and FTEs

Table 5A-16 Business Unit Support KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	SVP, Integrated Planning	0.7	0.0	0.2	0.0	0.0	0.0	0.0	**0.9**	3
2	Common Costs	0.0	0.0	2.3	0.7	0.0	0.0	0.0	**3.1**	-
3	Project O&M	6.3	0.0	5.7	0.0	0.0	0.0	0.0	**12.0**	-
4	**Total (Sch 5.1 L7, Sch 16.0 L7)**	**7.0**	**0.0**	**8.3**	**0.7**	**0.0**	**0.0**	**0.0**	**16.0**	**3**

5A.10.2.1. SVP, Integrated Planning Department

The majority of this department's budget relates to labour costs for three FTEs – the Senior Vice President of Integrated Planning, a strategic business advisor and an Administrative Assistant. The department's non-labour budget provides funding for contract services, employee travel and training.

5A.10.2.2. Common Costs Department

This department does not have any FTEs. Approximately $1.6 million of this department's budget is for First Nations Community Fund payments in lieu of taxation, approximately $0.6 million is a maintenance reserve to fund emerging and unplanned maintenance items, and approximately $0.7 million is for minor materials, such as nuts and bolts, used in maintenance programs.

5A.10.2.3. Project Operations and Maintenance Department

This department's budget includes expenses incurred to determine or confirm a need or opportunity for a capital project, and to develop, review and recommend conceptual alternatives for the potential project.

These costs are incurred by a project after its release but prior to the identification of a leading alternative solution and are referred to as Capital Project Investigation expenditures.

This department's budget may also fund chartered planning study costs for discrete study work to be completed prior to the release of a project. These chartered studies supplement and support the base study work done in the Integrated Planning KBUs.

Capital Project Investigation expenditures vary year-to-year depending on the size, complexity and volume of projects. Please refer to Chapter 6, section 6.4.7.5 for a further discussion of BC Hydro's capital project lifecycles.

5A.10.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5A-17 Business Unit Support KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.1 L7	13.1	31.3	7.6	17.6	7.6	16.0	13.2	12.5
2	FTEs	16.0 L7	4	4	4	3	4	3	3	3

Operating costs are decreasing by approximately $2.8 million from fiscal 2019 forecast to fiscal 2020 plan due to the transfer of third-party recoveries from shared assets from the Interconnections and Shared Assets KBU and due to a reduction of Capital Project Investigation expenditures.

Operating costs are decreasing by $0.7 million from fiscal 2020 plan to fiscal 2021 plan, primarily due to a transfer to the Energy Planning and Analytics KBU to provide additional funding for the development of the 2021 IRP.

FTEs for Integrated Planning Business Unit Support are planned to remain constant from fiscal 2019 forecast to fiscal 2020 and fiscal 2021 plan.

Chapter 5B

Operating Costs

Capital Infrastructure Project Delivery

Business Group

Table of Contents

List of Figures

List of Tables

5B.1 Introduction – Capital Infrastructure Project Delivery Business Group

Chapter 5B provides and explains in detail the composition of, and rationale for, the operating costs of the Capital Infrastructure Project Delivery Business Group. The Capital Infrastructure Project Delivery Business Group is one of six Business Groups in the organization and is responsible for building BC Hydro's assets. It serves as the Build function of the Plan-Build-Operate-Support model.

The Capital Infrastructure Project Delivery Business Group budget was developed as part of the budgeting process outlined in Chapter 5, section 5.4. The information provided in this Chapter 5B demonstrates the basis for the entirety of the Business Group and KBU budgets, rather than focussing only on incremental cost requirements.

Chapter 5B is organized as follows:

- Section 5B.2 provides an overview of the organization and responsibilities of the Capital Infrastructure Project Delivery Business Group;
- Section 5B.3 provides the operating costs and FTE information for the Capital Infrastructure Project Delivery Business Group as a whole;[213]
- Sections 5B.4 to 5B.8 provide more detailed information on the responsibilities, cost and FTEs for each KBU within the Capital Infrastructure Project Delivery Business Group. The operating costs and FTE information for each KBU is broken out into two sections.[213]
  - Overview of Operating Costs and FTEs – This section explains the starting operating costs and FTEs based on the fiscal 2019 forecast; and

[213] Please note the amounts presented in the tables in these sections may not add due to rounding.

- Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs – This section explains any incremental changes between fiscal 2019 forecast and fiscal 2020 and fiscal 2021 plan.

5B.2 Overview of Capital Infrastructure Project Delivery Business Group Organization and Responsibilities

The Capital Infrastructure Project Delivery Business Group is responsible for delivering BC Hydro's larger and more complex capital projects while also providing cross-company services relating to the management and support of Indigenous relations, environment, and properties. Given the intersection between lands, First Nations matters, environment, and capital projects, it makes sense to have the KBUs with responsibility for these key areas within the same Business Group. These KBUs work together to secure the necessary permitting and approvals, support, and land rights to successfully deliver BC Hydro's capital projects in an increasingly complex environment.

During the test period, the Capital Infrastructure Project Delivery Business Group plans to deliver approximately 50 per cent of BC Hydro's overall Capital Plan (excluding the Site C Project). This includes the majority of the generation, stations, dam safety, and transmission projects as well as some larger distribution and properties projects. These projects can be expected to give rise to the environmental, land, and First Nations considerations that are the responsibility of the KBUs in this Business Group.

The Capital Infrastructure Project Delivery Business Group consists of the following KBUs:

Business Group	Key Business Unit
Capital Infrastructure Project Delivery	Project Delivery Indigenous Relations Environment Properties Business Unit Support

Since the Previous Application, the Dam Safety and Engineering (formerly Generation and Transmission Engineering) KBUs have been transferred to the Integrated Planning Business Group.

5B.3 Fiscal 2020 and Fiscal 2021 Plan Operating Cost and FTE Summaries

This section addresses planned operating costs and FTEs for the Capital Infrastructure Project Business Group. The following are some key points of note with respect to the information provided in Figure 5B-1, Table 5B-1 and Figure 5B-2, Table 5B-1 and Table 5B-3:

- The majority of the FTEs in this Business Group charge a portion of their labour to capital projects. For example, the Project Delivery KBU charges out approximately 83 per cent of its labour costs to capital projects; and
- Approximately $37 million (47 per cent) of the total operating expenditures of this Business Group are non-labour expenditures, directly attributable to BC Hydro building maintenance and environmental programs such as the Fish & Wildlife Compensation Program, non-remissible Water Rights projects, and the Williston Dust Management Program.

Planned operating costs for the Capital Infrastructure Project Delivery Business Group are approximately $80.1 million in fiscal 2020 and approximately $81.1 million in fiscal 2021. The operating costs for the Capital Infrastructure Project Delivery Business Group are summarized by KBU in Figure 5B-1. Additional cost detail is provided in Table 5B-1 below.[214]

[214] Please note that a significant portion of costs in the Project Delivery KBU are charged out to capital projects and not included in the KBU's operating cost budget.

Figure 5B-1 Capital Infrastructure Project Delivery Net Operating Costs by KBU (Fiscal 2020 Plan) ($ million)

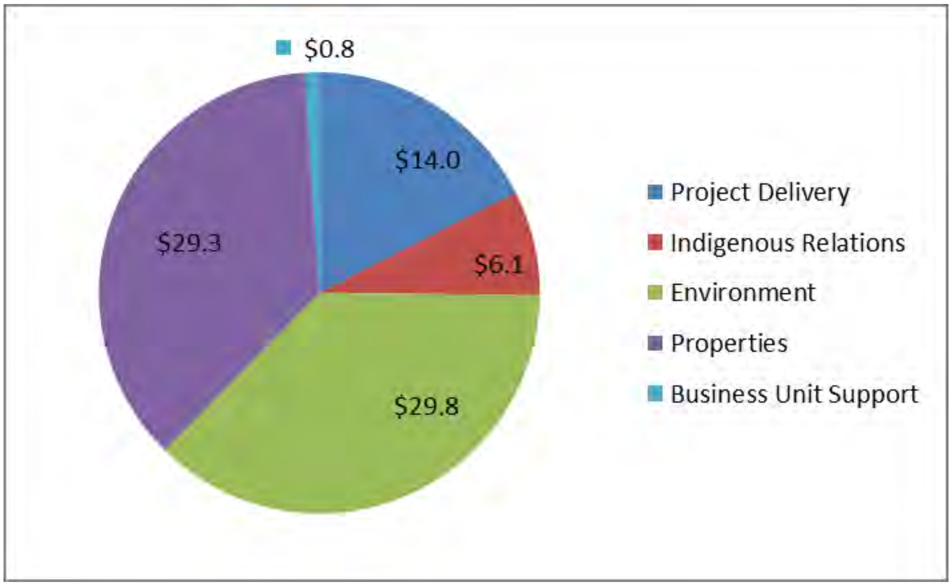

Table 5B-1 Capital Infrastructure Project Delivery Net Operating Costs by KBU

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8

Table 5B-3 below provides a continuity table which highlights changes to the Capital Infrastructure Project Delivery Business Group from the Previous Application. An overall discussion of these changes, at a company-wide level, is provided in Chapter 5, section 5.5.2. Further details, by KBU, are provided in the sections below.

Table 5B-3 Capital Infrastructure Project Delivery Operating Costs Continuity Schedule

	($ million)		F2020 Plan	F2021 Plan

5B.4 Project Delivery

5B.4.1 Responsibilities

The Project Delivery KBU is responsible for safely delivering a multi-billion dollar portfolio of Power System capital projects on time and on budget. During fiscal 2020 and fiscal 2021, this KBU will be managing approximately 400 dam safety, stations, lines and interconnection projects, which represent 54 per cent or $1.4 billion of BC Hydro’s Power System Capital Plan during the test period. Further information on this plan is provided in Chapter 6, section 6.4. Projects managed by this KBU typically range in cost from $1 million to $1 billion, with durations of one year to more than 10 years.

The Project Delivery KBU provides the following functions:

- Overall project and portfolio management;
- Project Services including project standards and controls, document management, cost and schedule management, and risk management; and
- Project construction and contract management.

Projects managed by the Project Delivery KBU require analysis of project alternatives, risks and methods of execution. For consistent management of project risk, scope, schedule and cost, this KBU uses the Project and Portfolio Management (**PPM**) System, which is discussed further in Chapter 6, section 6.4.7. This system aligns and integrates with work from other KBUs to deliver projects on time and on budget while also meeting our commitments from an environmental, Indigenous relations and stakeholder perspective.

Project Delivery's PPM System has been established following best practices from the Project Management Institute. In 2016, BC Hydro's practices were assessed against the Project Management Institute's Organizational Project Management Maturity Model, the globally-recognized, industry-practice standard for assessing and developing capabilities in portfolio, program and project management. BC Hydro received a maturity rating of 91 per cent out of a possible 100 per cent for Best Practices that were marked as applicable to project delivery. This positioned BC Hydro in the top-tier of organizations globally. Also in 2016, BC Hydro received the Project Management Office of the Year Award from the Project Management Institute.

A measure of BC Hydro's ability to deliver capital projects on budget is included in BC Hydro's Service Plan, with a target of actual costs falling within +5 per cent to -5 per cent of the original approved expected cost in aggregate, excluding project reserve amounts. For the five-year period of fiscal 2014 to fiscal 2018, the projects included in this metric had an aggregate original approved expected cost of $6.9 billion[215]. The actual aggregate costs for these projects were $27.9 million (or 0.40 per cent) over the original approved expected cost. Since fiscal 2014 when BC Hydro began measuring its capital delivery performance with a five-year aggregate, it has been within the target range. Chapter 6, section 6.2.1.2 provides further information on BC Hydro's performance in the delivery of capital projects.

[215] The majority of these projects were delivered by the Project Delivery KBU.

In 2018, the Project Delivery KBU consolidated its management team, resulting in a reduction of departments from nine to six. The purpose of this consolidation was to better align with how the Integrated Planning and Operations Business Groups are organized (i.e., by asset type) and to strengthen collaboration. Consolidating the Project Delivery Portfolio departments has reduced the number of direct reports to the Vice President of Project Delivery, by three.

There have been no material changes to the responsibilities of this KBU since the Previous Application.

The Project Delivery KBU consists of the following departments:

- Three Project Delivery Portfolio Departments (Dam Safety Projects and Programs, Stations Projects and Lines and Interconnection Projects);
- Capital Construction Department; and
- Project Services Department.

5B.4.1.1. Project Delivery Portfolio Departments

Each of the three Project Delivery Portfolio departments manage different types of projects. They all follow the PPM System to deliver capital projects safely, on time, on budget and to the project requirements. The Project Delivery portfolio departments’ responsibilities include the following key activities:

- Ensuring project alternatives are evaluated to best address the needs and objectives of the project and BC Hydro;
- Managing the scope, risk, schedule and cost of the project; and
- Delivering projects in accordance with approved policies and practices.

5B.4.1.2. Capital Construction Department

As projects move into the Implementation Phase, the Capital Construction department works with project managers and on-site contractors to deliver projects safely, on time, on budget and to project requirements. Capital Construction's responsibilities include the following:

- Mitigating project cost and schedule risk by delivering constructability reviews during the project lifecycle;
- Providing rigorous contract management during pre-award and post-award phases to ensure all contractual requirements are met by BC Hydro contractors;
- Planning and managing on-site project construction and commissioning activities;
- Overseeing the on-site safety of BC Hydro employees and contractors in accordance to applicable safety and technical standards; and
- Performing quality assurance, testing and acceptance to verify new equipment will perform as expected over the life of the asset.

This department primarily supports the Project Delivery KBU but also manages contracts for other KBUs involved in delivering the Power System Capital Plan.

5B.4.1.3. Project Services Department

The Project Services department is responsible for the PPM System that ensures practices and tools are used to consistently deliver capital projects. The department also provides centralized project support services for the planning, management and reporting of projects and portfolios following project management industry-standards. Project Services responsibilities include the following:

- Preparing financial, risk and resource management plans, as well as management and executive reports for the Project Delivery portfolio;
- Developing reliable project schedules, cost forecasts and analysis using industry-standard practices;

- Supporting project managers by preparing business cases, alternative analysis, and regulatory applications, and facilitating structured decision making;
- Managing documents and records for projects and contracts throughout the project lifecycle including project closure and evaluation reporting and archiving; and
- Developing and continuously improving the PPM System as well as providing training, and conducting conformance reviews.

5B.4.2 Overview of Operating Costs and FTEs

Table 5B-4 Project Delivery KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	VP, Project Delivery	0.2	0.0	0.1	0.0	0.0	0.0	0.0	**0.3**	(16)
2	Dam Safety Projects and Programs	0.8	0.0	0.1	0.0	0.0	0.0	0.0	**0.9**	32
3	Stations Projects	0.5	0.0	0.0	0.0	0.0	0.0	0.0	**0.6**	24
4	Lines and Interconnections Projects	0.8	0.0	0.1	0.0	0.0	0.0	0.0	**0.9**	34
5	Capital Construction	4.2	0.0	0.9	0.1	0.2	0.0	0.0	**5.4**	234
6	Project Services	5.1	0.0	0.6	0.1	0.0	0.0	0.0	**5.8**	144
7	**Total (Sch 5.2 L1, Sch 16.0 L9)**	**11.8**	**0.0**	**1.8**	**0.2**	**0.2**	**0.0**	**0.0**	**13.9**	**452**

Overall FTEs in the Project Delivery KBU are primarily driven by the size of the Power System Capital Plan. This KBU forecasts its human resource requirements using the Project Delivery Resource Management approach which involves:

- Determining labour demand for active projects based on resource-loaded schedules;
- Modelling and determining labour demand for planned projects using historic inputs from previous projects;
- Comparing labour demand, per discipline, with internal resource capacity;
- Determining the appropriate resource allocation strategy. To meet demand, projects are resourced by BC Hydro employees and are augmented by external

services providers. This provides flexibility to respond to changes in the size or complexity of the capital plan; and

- Monitoring resource needs and overtime to adjust resourcing as required.

Within the Project Delivery KBU, this approach is used to forecast demand for project managers, construction managers, contract managers, construction officers, schedulers, cost analysts and commercial managers. This approach covers approximately 70 per cent of the project resource demand from the Project Delivery KBU, and is continuing to be developed to cover additional disciplines.

Where this approach is not used (e.g., project standards and controls, document management, portfolio management, and administration), resource demand forecast based on expected workload, compared with available capacity and resource strategies are developed accordingly.

Approximately 83 per cent of total Project Delivery KBU labour costs are capitalized to capital projects and not included in the KBU’s operating costs. The remaining 17 per cent of labour costs make up approximately 84 per cent of the KBU’s overall operating costs. The remaining 16 per cent of the KBU’s operating costs are related to services, equipment and materials.

Under BC Hydro’s accounting guidelines, several activities required to deliver the BC Hydro’s Power System Capital Plan cannot be capitalized. Examples of non-capitalized project management related labour includes management and reporting, PPM System enhancement and sustainment, safety training, professional development and administrative support.

5B.4.2.1. Office of Vice President Project Delivery Department

This department contains the labour costs for the Vice President of Project Delivery and an administrative assistant. The FTE count for this department is negative because it reflects vacancy factor savings of 18 FTEs, which is discussed further in Chapter 5, section 5.5.2.3.

5B.4.2.2. Project Delivery Portfolio Departments

Project managers report to either a team lead or the Project Delivery Director for the delivery of the project against approved scope and objectives in accordance with approved policies and practices. More information is provided in Chapter 6, section 6.4.7.10.

Project managers are expected to manage one to eight projects at any one time (average is five projects per project manager). The number of projects varies based on project complexity, project size, project timing and experience of the project manager. The labour capitalization rate for project managers is 93 per cent. The capitalization rate for all positions across all three portfolios (Dam Safety Projects and Programs, Stations Projects and Lines and Interconnection Projects) is 81 per cent.

There are a total of 90 FTEs across the three Project Delivery portfolio departments. The current labour mix is approximately 85 per cent internal resources and 15 per cent external service providers and contractors (based on project count). This provides sufficient flexibility for BC Hydro to respond to changes to the capital plan.

5B.4.2.3. Capital Construction Department

The Capital Construction department workload is primarily driven by Power System capital projects in the Implementation Phase. At any one time, the department is supporting over 375 projects (including other KBUs involved in delivering the Power System Capital Plan), and is managing over 1,600 contracts with a total value of over $3.9 billion. These contracts cover over 500 vendors.

Construction managers and construction officers have a labour capitalization rate of 93 per cent. The blended labour capitalization rate for the department is 84 per cent.

There are 234 FTEs across the Capital Construction department, organized into the following teams:

- Office of the Director of Capital Construction –Two FTEs;
- Capital Construction Services – 40 FTEs provide contract administration services of over 1600 contracts;
- Specialist Services – 52 FTEs provide construction planning, constructability review, testing and commissioning, supply contract management, claims management, and construction practice management; and
- Construction and Contract Management – 140 FTEs provide on-site project construction and contract management.

Management targets a resource mix of 70 per cent internal and 30 per cent external resources. This provides sufficient flexibility to adjust for changes in the capital plan, as well as location and seasonality of work.

5B.4.2.4. Project Services Department

The Project Services department supports Power System capital projects throughout the project lifecycle. At any one time, the department is supporting approximately 400 projects. The labour capitalization rate for the overall Project Services department is 69 per cent. Resources, such as schedulers, commercial managers and cost analysts, have a higher capitalization rate of 85 per cent to 90 per cent.

This department consists of 144 FTEs organized into the following teams:

- Office of the Director of Project Services – Two FTEs;
- Portfolio Management – Eight FTEs provide monthly project and portfolio reporting for approximately 400 projects, coordinate the release of 40 projects from the Integrated Planning Business Group annually, model resource demand for 60 disciplines, and coordinate portfolio and business planning;
- Project Scheduling and Costing – 58 FTEs provide scheduling and cost planning, analysis and reporting for approximately 400 projects. Annually this

team leads over 4,200 project schedule and cost forecast updates annually for 7,500 work packages;

- Commercial Management – 14 FTEs provide support to approximately 150 more complex Project Delivery projects (typically over $10 million) by preparing business cases, conducting structured decision making and risk workshops and preparing financial analysis of project alternatives. This team also prepares approximately 10 regulatory applications and compliance filings annually;
- Document Management – 51 FTEs provide document control and archiving. Each year, these FTEs manage 900,000 project documents within the PPM document system, process 30,000 contract transmittals and submittals, and archive over 90,000 project documents; and
- Standards, Controls and Tools - 11 FTEs provide practices, tools and learning for the PPM System as well as prepare over 150 compliance, quality and project closure reports and conduct 48 conformance audits annually to ensure that the practices and process of the PPM System are be consistently applied.

5B.4.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5B-5 Project Delivery KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.2 L1	13.4	12.7	14.2	13.5	14.3	13.9	14.0	14.5
2	FTEs	16.0 L9	340	324	368	387	368	453	450	450

Operating costs are increasing by approximately $0.1 million from the fiscal 2019 forecast to fiscal 2020 plan and by approximately $0.5 million from the fiscal 2020 plan to fiscal 2021 plan, due to Standard Labour Rate increases.

FTEs are planned to decrease by two from the fiscal 2019 forecast to the fiscal 2020 plan. This reflects the consolidation of the Project Delivery management team, discussed above.

The increase in FTEs from the fiscal 2019 RRA to the fiscal 2019 forecast was primarily driven by the Workforce Optimization Program, described in Chapter 5, section 5.6.1.

5B.5 Indigenous Relations

5B.5.1 Responsibilities

The Indigenous Relations KBU is responsible for establishing and implementing a company-wide approach to develop and sustain positive long-term relationships with First Nations. This approach supports a company-wide understanding of First Nations interests so that they can be incorporated, where possible and appropriate, into BC Hydro's capital projects, programs and operations activities. This approach aligns with:

- BC Hydro's Statement of Indigenous Principles which guides how we engage with First Nations;
- our legal obligation to consult with First Nations; and
- First Nations' expectations on how we address their interests and perspectives.

Indigenous Relations' responsibilities with First Nations include:

- Developing and sustaining positive long-term relationships;
- Engaging and consulting on BC Hydro's projects, programs and operations;
- Developing and implementing agreements; and
- Pursuing opportunities for training and employment.

Through engagement and consultation with First Nations and the implementation of commitments to First Nations in agreements, the Indigenous Relations KBU works with subject matter experts across the company, such as the Environment and Human Resources KBUs.

While the general responsibilities of this KBU are unchanged since the Previous Application, a key area requiring increased focus is incorporating the United Nations Declaration on the Rights of Indigenous Peoples (**UNDRIP**) and Calls to Action of the Truth and Reconciliation Commission (**TRC**) into our business activities. BC Hydro is supporting the Government of B.C.'s commitment to reconciliation with First Nations, as directed by the Government of B.C. in its Mandate Letter to BC Hydro in fiscal 2018.[216]

A key performance indicator of BC Hydro's effectiveness in Indigenous relations is our attainment of a third consecutive gold-level certification for Progressive Aboriginal Relations (**PAR**), from the Canadian Council for Aboriginal Business[217]. PAR is a certification program that confirms corporate performance in Aboriginal relations at the Bronze, Silver or Gold level. It evaluates four areas of performance including: leadership actions, employment, business development and community relations. PAR certification provides a high degree of assurance to First Nations communities, as the designation is supported by an independent, third party verification and is determined by a jury comprised of Aboriginal business people. BC Hydro has attained gold level certification since 2012 and was recently awarded another gold level certification for a three year period to 2021.

The Indigenous Relations KBU consists of the following departments:

- Regional Relationship and Consultation Departments (Southwest, Southeast, and North);

[216] Appendix E provides BC Hydro's mandate letter from the Government of B.C.

[217] The Canadian Council for Aboriginal Business is a non-partisan / non-profit organization founded in 1984, to support the participation of Aboriginal Peoples in Canada's economy. There are approximately 36 Canadian organizations participating in the PAR program, at various levels of certification.

- Indigenous Employment, Training and Communications Department; and
- Business Operations and Negotiations Department.

5B.5.1.1. Regional Relationship and Consultation Departments

The three regional departments are responsible for managing BC Hydro's overall relationships and consultation with First Nation communities across the province. This ensures that BC Hydro meets its legal obligation to consult with First Nations, and that capital projects, programs and operating activities are effectively delivered.

The regional departments develop and implement agreements with First Nation communities who may be impacted by the operation of BC Hydro's Power System and upcoming capital projects.

5B.5.1.2. Indigenous Employment, Training and Communications Department

The Indigenous Employment, Training and Communications department enables BC Hydro to attract and retain Indigenous employees in its workforce, and to meet its commitments in agreements with First Nations. The department provides direct support to First Nations and Indigenous people at a community level. This support includes community engagement and awareness, training, work experience as well as scholarships/ bursary programs, and apprenticeships.

5B.5.1.3. Business Operations and Negotiations Department

The Business Operations and Negotiations department is responsible for developing and administering Indigenous Relations' engagement and consultation practices that support delivery of capital projects, programs and operations activities, so that these activities meet our legal obligation to consult with First Nations. This department is responsible for following emerging policy (e.g., UNDRIP and TRC) and case law and seeking legal counsel and perspectives to ensure that our engagement and consultation practices evolve.

The department is also responsible for leading agreement negotiations, managing the consultation and commitment tracking information system, and performance reporting.

5B.5.2 Overview of Operating Costs and FTEs

Table 5B-6 Indigenous Relations KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Indigenous Relations Director	0.4	0.0	0.2	0.0	0.0	0.0	0.0	**0.6**	2
2	Regions	2.3	0.0	0.9	0.0	0.0	0.0	0.0	**3.3**	42
3	Indigenous Employmt Training and Comm	1.0	0.0	0.3	0.0	0.0	0.0	0.0	**1.3**	13
4	Business Ops and Negotiations (BON)	1.1	0.0	0.0	0.0	0.0	0.0	0.0	**1.2**	12
5	**Total (Sch 5.2 L2, Sch 16.0 L10)**	**4.7**	**0.0**	**1.5**	**0.1**	**0.0**	**0.0**	**0.0**	**6.3**	**69**

This KBU consists of 69 FTEs. Approximately 47 per cent of the KBU's total labour costs are not shown in the operating cost budget as these costs are charged to capital projects.

Overall, operating labour costs make up 75 per cent of the Indigenous Relations KBU operating costs. The majority of the remaining non-labour portion is required to develop and implement agreements with First Nations and to attract and retain Indigenous employees.

Operating Costs for this KBU have remained flat since fiscal 2016. Increases in workload since fiscal 2016 include negotiating and implementing eight relationship agreements with First Nations, and increased involvement of First Nations in BC Hydro's activities where there are potential impacts to their interests. These increases have been resourced by converting external resources to internal employees through the Workforce Optimization Program, which is discussed further in Chapter 5, section 5.6.1.

The primary drivers for the number of FTEs in this KBU are:

- The number of capital projects and how BC Hydro's projects, programs and operations activities interact with First Nations interests;

- The number of agreements with First Nations in development or implementation;
- BC Hydro's ability to attract and retain Indigenous employees in its workforce; and
- Emerging changes in legal requirements and government direction that require changes to our engagement and consultation practices.

5B.5.2.1. Indigenous Relations Director Department

This department includes labour costs for the Director of Indigenous Relations and an administrative assistant. Non-labour costs include funding to support agreements with First Nations, and employee training, travel and expenses.

5B.5.2.2. Regional Relationship and Consultation Departments

The majority of the operating cost budget for the Indigenous Relations' regional departments is related to labour for 42 FTEs. These FTEs charge out 58 per cent of their labour costs directly to capital projects.

These FTEs are organized into three regions and include two primary roles – project leads or relationship leads. The project leads carry out consultation and oversee the implementation of commitments that are made throughout consultation and in project related agreements. The relationship leads facilitate relationships with 54 First Nation communities and develop and implement relationship agreements. Support roles in the regions include public affairs officers, records analysts, and managers.

Collectively, the FTEs in the three regional departments complete the following activities:

- Engagement and consultation on projects;[218]
- Implementation of finalized relationship agreements: BC Hydro has 11[219] finalized relationship agreements with First Nations in implementation; and
- Implementation of Impact Benefit Agreements (**IBAs**): BC Hydro has 14 finalized IBAs with First Nations in implementation.

The remaining non-labour costs in this department include funding to develop and implement agreements with First Nations, and employee training, travel and expenses.

5B.5.2.3. Indigenous Employment, Training and Communications Department

The majority of this department's budget relates to labour costs for eight FTEs. This department charges out 24 per cent of labour costs directly to capital projects.

Collectively, these FTEs complete the following activities:

- Implementation of finalized agreements: BC Hydro has 11 finalized relationship agreements with First Nations in implementation;
- Organize a range of skills building and work experience events with approximately 400 participants;
- Award over 20 provincial scholarships and bursaries across the province; and
- Recruit and manage approximately 20 youth through the annual Youth Hire Program.

[218] Engagement and consultation activities can include: meetings and correspondence with First Nations, coordinating their involvement in project activities such as field work and site visits, and documenting these activities in Indigenous Relations information tracking system.

[219] Includes eight relationship agreements finalized between fiscal 2016 and fiscal 2019, plus BC Hydro's agreements with St'at'imc, Tsay Keh Dene and Kwadacha.

5B.5.2.4. Business Operations and Negotiations Department

The majority of this department's budget relates to labour costs for 12 FTEs. This department charges out 43 per cent of their labour costs directly to capital projects.

Collectively, these FTEs complete the following activities:

- Tracking, quality control and reporting of finalized agreements with First Nations in implementation: BC Hydro has 11 finalized relationship agreements in implementation;
- Consultation adequacy assessments: approximately 100 consultation adequacy assessments for BC Hydro projects; and
- Project screening for First Nations interests: approximately 150 project screens for impacts to First Nations interests.

5B.5.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5B-7 Indigenous Relations KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.2 L2	6.1	7.3	6.1	6.1	6.1	6.3	6.1	6.3
2	FTEs	16.0 L10	47	57	47	59	47	69	69	69

Operating costs are decreasing by approximately $0.2 million from the fiscal 2019 forecast to the fiscal 2020 plan due to vacancy factor savings, which are discussed further in Chapter 5, section 5.5.2.3. The vacancy factor savings are partially offset by Standard Labour Rate increases. Operating costs are increasing by approximately $0.2 million from the fiscal 2020 plan to the fiscal 2021 plan due to Standard Labour Rate increases. FTEs are planned to remain constant.

The increase in FTEs from the fiscal 2019 RRA to fiscal 2019 forecast was primarily driven by the Workforce Optimization Program, described in Chapter 5, section 5.6.1.

5B.6 Environment

5B.6.1 Responsibilities

The Environment KBU's role is to provide a consistent company-wide approach to environmental management and governance. BC Hydro's infrastructure has a significant footprint on the landscape of British Columbia. Therefore, it is important that we build and operate our system in an environmentally responsible way.

The Environment KBU enables BC Hydro to build projects and operate in compliance with environmental requirements and in line with our regulatory and other commitments. Examples of our regulatory commitments include the:

- Water Licence Requirements Program associated with Water Use Plans;
- Fish & Wildlife Compensation Program;
- Fish Entrainment Strategy Program; and
- Williston Dust Management Program.

This KBU creates and implements policies, standards and procedures to avoid, minimize or mitigate impacts to the environment resulting from BC Hydro's capital projects and operations. The KBU manages a risk review process so that environment and related risks are systematically considered and addressed in decision making.

A company-wide Statement of Environmental Principles provides environmental guidance to all staff and contractors to ensure that actions and decisions made in delivering work are aligned with BC Hydro's compliance and regulatory requirements and our responsibility to respect the environment.

There have been no material changes to the responsibilities of this KBU since the Previous Application.

The Environment KBU consists of the following departments:

- Project Environmental Risk Management, Regulatory and Policy Department;
- Environmental Field Operations Department;
- Land Program Department;
- Water Program Department; and
- Fish & Wildlife Compensation Program Department.

5B.6.1.1. Project Environmental Risk Management, Regulatory and Policy Department

This department provides environmental services for the planning and execution of hundreds of generation, transmission, distribution and properties capital projects and programs in various phases of delivery. The department's role includes oversight of environmental compliance and risk management, and management of environmental and heritage components of projects including contract management. This department tracks environmental regulatory changes and prepares BC Hydro for new regulatory and compliance requirements.

This department also helps capital projects receive required environmental permits and authorizations, works with regulators to provide ongoing progress updates and management of project related issues, and facilitates understanding of future legislative requirements by providing information in advance and throughout BC Hydro, on regulatory changes.

5B.6.1.2. Environmental Field Operations Department

Through regionally based teams, the Environment Field Operations department services day-to-day environmental compliance requirements associated with operations and related Power System infrastructure in the field. For example, this department:

- Provides environmental instructions used by field crews for pole replacements;

- Implements environmental field responses to minimize impacts to fish resulting from generating station operating or maintenance activities;
- Ensures that field crews are trained in environmental requirements and responses to risks such as oil spill cleanup and hazardous waste management; and
- Provides emergency after-hours stand-by support to manage incidents and mitigate impacts (e.g., pole-top transformers oil spills from storm event damage).

This department works to achieve operational environmental compliance by developing work practices that fulfill compliance requirements. This is done by combining identified field needs with expert advice from the Land Program department, discussed in section 5B.6.1.3 and the Water Program department, discussed in section 5B.6.1.4. This department works directly with managers and crews in the field to implement environmental practices and to obtain local permits required for work. This avoids maintenance delays and possible enforcement action by environmental regulators.

In addition, this department is responsible for improving environmental performance by setting company-wide objectives and targets, monitoring and reporting on performance, and initiating preventive and corrective actions for environmental incidents. This department is also responsible for the Williston Dust Mitigation Program.

5B.6.1.3. Land Program Department

This department manages land-based environmental impacts and compliance requirements by developing corporate environmental standards[220] and providing expert advice and service to avoid or address land-based environmental risks. This

[220] Examples of Land Program corporate standards include the Sulphur Hexafluoride (SF_6) Environmental Standard, the Contaminated Sites Environmental Standard, and Management of Materials Containing PCB: WM-310.

department works to ensure that Project Environmental Risk Management, Regulatory and Policy and Environmental Field Operations departments are provided with effective standards for capital asset planning, capital projects, field programs and operational needs. This department manages programs in areas such as contaminated sites, pollution prevention, spill response, wildlife ecology and mitigation, archaeology and heritage, as well as greenhouse gas reporting and climate change mitigation.

5B.6.1.4. Water Program Department

This department manages water-based environmental impacts and compliance requirements by developing corporate environmental standards[221] and providing expert advice and service to avoid or address water-based environmental risks. In parallel with the Land Program department, this department works to ensure that the Project Environmental Risk Management, Regulatory and Policy department and the Environmental Field Operations department are provided with effective standards for all planning, project, program and operational needs for water-based subjects. This department delivers the Water Licence Requirements program, as well as programs and strategies to address legislative and regulatory requirements related to fish passage, fish entrainment,[222] total dissolved gas[223] and invasive aquatic species.

This department is responsible for keeping BC Hydro in compliance with the regulatory requirements of our *Water Sustainability Act* Orders, Water Licence conditions and *Fisheries Act* Authorizations to mitigate our impacts. By remaining compliant with these permits and authorizations, and through related regulatory agreements, we have been able to develop and implement actions that provide us with our regulatory licence to operate.

---

[221] An example of a Water Program corporate standard is the Approved Work Practices for Boat Launch Construction and maintenance of BC Hydro Managed Freshwater Systems

[222] Fish entrainment refers to fish diverted downstream through a man-made structure (usually a spillway, low level outlet, penstock or turbine) often with resulting harm.

[223] Total dissolved gas refers to the sum of gases in water expressed as a per cent of relative atmospheric pressure. Gas bubble trauma in fish occurs when total dissolved gas escapes bodily fluids as bubbles causing physical damage.

5B.6.1.5. Fish & Wildlife Compensation Program Department

BC Hydro has water licence compensation obligations in the Columbia and Peace regions to address the historical impacts to fish and wildlife associated with the construction of the dams. BC Hydro has made voluntary commitments to address similar impacts in the Coastal Region. These obligations are met through the work of the Fish & Wildlife Compensation Program. This department implements the project decisions of the program's three regional boards, which include representation from the Government of B.C., Fisheries and Oceans Canada, First Nations, public stakeholders and BC Hydro.

This department facilitates multi-party collaboration, decision making and compensation in watersheds where BC Hydro has a significant presence. This department ensures BC Hydro is able to comply with its Water Licence conditions for Columbia and Peace operations.

5B.6.2 Overview of Operating Costs and FTEs

Table 5B-8 Environment KBU
Fiscal 2019 Forecast Operating Costs
and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Director, Environment	0.2	0.0	0.0	0.0	0.0	0.0	0.0	**0.2**	(4)
2	Project Env Risk Mgmt, Reg and Policy	1.1	0.0	0.4	0.0	0.0	0.0	0.0	**1.5**	22
3	Environment Field Operations	3.9	0.0	4.2	0.0	0.0	0.0	0.0	**8.2**	34
4	Land Program	1.5	0.0	1.7	0.0	0.1	0.0	0.0	**3.4**	14
5	Water Program	2.6	0.0	17.9	0.0	0.0	0.0	-13.7	**6.8**	19
6	Fish & Wildlife Compensation Program	0.2	0.0	9.0	0.0	0.0	0.0	0.0	**9.2**	5
7	**Total (Sch 5.2 L3, Sch 16.0 L11)**	**9.5**	**0.0**	**33.1**	**0.1**	**0.1**	**0.0**	**-13.7**	**29.2**	**89**

The Environment KBU's operating costs and FTEs are primarily driven by three requirements:

- Overseeing environmental compliance across projects and operations;
- Delivering our regulatory commitments through programs such as the Water License Requirements and the Fish & Wildlife Compensation Program; and

- Providing input to and working with the Indigenous Relations KBU to increase First Nations participation in environmental components of projects, operations and programs.

In fiscal 2019, approximately 28 per cent of labour costs in this KBU were charged to capital and work programs and are not included in the labour costs provided in Table 5B-8 above. External recoveries (explained in section 5B.6.2.5) offset approximately 32 per cent of the operating costs in this KBU.

The Environment KBU's primary approach to work plan delivery is to retain an in-house oversight role and to contract on-the-ground requirements, such as environmental monitoring. The Environment KBU applies a consistent approach to evaluate and determine FTE and contractor requirements. This approach involves:

- Assessing the workload volume, complexity, and risk associated with capital projects and operations, and work plans to deliver environmental programs;
- Assessing current resource requirements in comparison with historic records or through expert assessment of requirements;
- Assigning work component resource estimates to internal staff, based on their expertise, experience and available time;
- Considering other options when FTE availability is insufficient to meet demands including the use of short term contractors to augment peaks in workload; and
- Monitoring delivery performance by tracking measures such as overtime, contractor spending patterns and milestone delivery and then modifying or reassigning resources as required to address priorities and improve delivery.

5B.6.2.1. Director, Environment Department

This department contains the labour costs for the Director of the Environment KBU and an administrative assistant, as well as vacancy factor savings, which are discussed further in Chapter 5, section 5.5.2.3.

5B.6.2.2. Project Environmental Risk Management, Regulatory and Policy Department

This department consists of 22 FTEs who charge out 76 per cent of their labour costs to capital projects. The majority of these FTEs are environmental professionals who provide capital project support.

Overall, this department is responsible for providing environmental work package requirements for approximately 450 Power System capital projects, Properties capital projects, and Distribution capital projects and programs each year. This means that each FTE in this department oversees work package requirements for approximately 20 capital projects.

In addition, this department provides environmental training to 24 teams throughout different KBUs in the organization each year, and reviews the requirements of and changes to six major federal acts, eight provincial acts, and over 100 regulations and related documentation, as well as maintains documentation for 22 *Fisheries Act* Authorizations.

This department's non-labour costs of $0.4 million fund professional and safety training and the delivery of post-project environmental commitments,[224] such as environmental permit conditions that extend beyond project completion.

5B.6.2.3. Environmental Field Operations Department

This department consists of 34 FTEs who provide the following key deliverables:

- Working directly with Operations managers and crews to implement best practices for fish and fish habitat, wildlife, archaeology and heritage sites and pollution prevention to meet compliance requirements and to avoid or minimize operational impacts to land, air and water;

[224] Examples of post-project commitments include compensation habitat construction, re-vegetation monitoring, fisheries compensation monitoring and other site restoration monitoring.

- Providing 24/7 emergency response to events such as fires, floods and oil spills from overhead and underground transformers and substation equipment;
- Developing and delivering environmental training to over 2,000 field staff through more than 170 annual sessions; and
- Conducting approximately 15 environmental compliance evaluations and 85 environmental observations (assessments to check procedures are followed) annually as well as investigating all significant incidents and developing corrective actions (16 investigations were conducted in fiscal 2018).

This department's non-labour costs of $4.2 million include $2.7 million for the Williston Dust Management Program.[225] The remainder supports reservoir fertilization, debris management, post-project and other monitoring, educational materials development, environmental compliance evaluations, and professional and safety training.

5B.6.2.4. Land Program Department

This department consists of 14 FTEs who provide the following key deliverables:

- Subject area expertise (i.e., pollution prevention, archaeology and heritage, wildlife, and greenhouse gas reporting), and development of corporate standards, programs,[226] procedures,[227] and environmental screening tools;[228]
- Compliance with Federal and Provincial pollution prevention regulations and reporting, and coordination of the Contaminated Sites Management Program with an inventory of 400 sites and active management of 30 contaminated properties; and

[225] The Williston Dust Management Program is a Contribution Agreement with the Tsay Keh Dene Nation to address air quality issues. The Tsay Keh Dene Nation conducts work that reduces the impact of dust emissions from the drawdown zone on their communities when the reservoir level is low.

[226] A corporate program example is the Contaminated Site Management Program.

[227] Some corporate procedure examples include the Oil Leak Identification and Mitigation, and the Procedure – Managing Cultural Heritage and Archaeological Risk on Capital Projects.

[228] A screening tool example is Indigenous Relations-Environment Integrated Screening Tool for Programs.

- Development of Cultural Heritage Information Plans, and delivery of the multi-year Reservoir Archaeology Program for 26 reservoirs to comply with and meet commitments under the B.C. *Heritage Conservation Act* and to provide support for First Nations relationships and agreements.

This department's non-labour costs of $1.7 million support the Reservoir Archaeology Program, Cultural Heritage Information Plans, pollution prevention compliance actions, wildlife compliance, greenhouse gas reporting and professional and safety training.

5B.6.2.5. Water Program Department

This department consists of 19 FTEs who provide the following key deliverables:

- 22 Water Use Plan orders and the associated 350 monitoring studies and physical works necessary for compliance under BC Hydro's Water Licences; and
- *Fisheries Act* Authorization requirements at 30 BC Hydro facilities, as well as other regulatory requirements and commitments including the Fish Passage Framework, Fish Entrainment Strategy responses at 15 facilities with high entrainment risks and the Invasive Aquatic Species program.

This department's non-labour costs of $17.9 million provides funding to deliver the Water License Requirements program as ordered by the Comptroller of Water Rights, and other regulatory commitments. The majority of these costs are offset by external recoveries, which totalled $13.7 million in fiscal 2019. External recoveries capture reimbursement of expenses credited against annual B.C. provincial water rental fees paid by BC Hydro. These Water Use Planning Remissions recoveries result when additional expenses are incurred as a result of projects or constraints ordered by the Comptroller of Water Rights and were not originally contemplated in BC Hydro's Water Licences (for further information see Chapter 4, section 4.6.5). The remaining costs not covered by external recoveries primarily support

Comptroller of Water Rights ordered projects which are not remissible, and support regulatory commitments to fisheries and invasive species programs.

5B.6.2.6. Fish & Wildlife Compensation Program Department

This department consists of five FTEs who manage all aspects of the Fish & Wildlife Compensation Program on a regional basis. The labour costs associated with regional managers are charged to the regional programs and are not captured in the labour costs for this department.

The Fish & Wildlife Compensation Program Department's fiscal 2019 forecast of $9.2 million includes $5.3 million for the Columbia region, $2.1 million for the Coastal region, $1.5 million for the Peace region and $ 0.2 million for management costs. Management costs include management labour, department training and other expenses of the department manager.

This department's budget fulfills BC Hydro's obligation to the Fish & Wildlife Compensation Program's three regions. The program and regional budgets are based on historical agreements negotiated with regulators. These agreements provide the three regions with annual funding increases tied to the Consumer Price Index and allow for any annual under spend to be carried forward to subsequent years.

5B.6.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5B-9 Environment KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.2 L3	27.2	26.2	27.5	27.0	27.8	29.2	29.8	30.0
2	FTEs	16.0 L11	83	86	83	90	83	89	94	94

Operating costs are increasing by approximately $0.6 million from the fiscal 2019 forecast to the fiscal 2020 plan due to an increase in Fish & Wildlife Compensation Program funding, additional Water Licence Requirements and Standard Labour Rate increases. Operating costs are increasing by approximately $0.2 million from the fiscal 2020 plan to the fiscal 2021 plan due to Standard Labour Rate increases.

FTEs are planned to increase by five from the fiscal 2019 forecast to the fiscal 2020 plan due to the Workforce Optimization Program, which is discussed further in Chapter 5, section 5.6.1. FTEs are planned to remain constant from the fiscal 2020 plan to the fiscal 2021 plan.

The increase in FTEs from the fiscal 2019 RRA to the fiscal 2019 forecast was primarily driven by the Workforce Optimization Program, as discussed in Chapter 5, section 5.6.1.

5B.7 Properties KBU

5B.7.1 Responsibilities

The Properties KBU is responsible for BC Hydro’s property and real estate assets province-wide and provides related expertise and services across BC Hydro to support operations and capital projects. This includes over 74,000 acres of land, made up of over 4,000 individual land parcels as well as extensive statutory rights of way in support of 86,000 kilometres of distribution and transmission lines and Crown land tenures for 26 generation reservoirs and 81 dams. In addition, BC Hydro’s corporate headquarters and field buildings total approximately three million square feet in size. The size, scope, complexity and importance of BC Hydro’s property and real estate interests to our operations and projects drives the main functions of the Properties KBU, which include:

- Managing existing property rights for BC Hydro’s Power System infrastructure (transmission and distribution lines, substations, reservoirs, dams, powerhouses, access roads);
- Managing the acquisition of land and property rights to facilitate the upgrades and expansion of the Power System and field facilities;

- Managing property leases and licences, and sales of surplus property;
- Developing asset management and capital plans for the 101 BC Hydro headquarters and field buildings that make up the Properties' managed building portfolio;[229]
- Managing the delivery of building replacement and upgrade capital projects for BC Hydro's headquarters and field buildings; and
- Operating and maintaining BC Hydro's headquarters and field buildings that house approximately 6,000 BC Hydro employees and contractors who work from these facilities. Services provided to support operations across the province also include work space planning and work location moves and mail distribution.

There have been no material changes to the responsibilities of the Properties KBU since the filing of the Previous Application with the exception of the addition of the mail services function, transferred to the Properties KBU as part of the Accenture Repatriation, which is discussed further in Chapter 5, section 5.6.2.

The Properties KBU is organized into the following departments:

- Real Estate Planning and Project Delivery Department;
- Facilities and Space Management Department;
- Property Rights Management Department; and
- Real Estate Services Department.

5B.7.1.1. Real Estate Planning and Project Delivery Department

The Real Estate Planning and Project Delivery department is responsible for long term and capital planning for BC Hydro's property and real estate assets, managing

[229] Facilities that house the Power System infrastructure (i.e., substations, generating stations) are the responsibility of the Integrated Planning Business Group and the Operations Business Group and are outside the portfolio managed by the Properties KBU, given the specific safety and operational requirements for the electrical assets.

capital project delivery, and delivering property information management services. This includes:

- Long-term planning and forecasting for BC Hydro's corporate and field office real estate across British Columbia, including properties surplus to BC Hydro's needs;
- Developing and managing the capital investment plans for the Properties' managed building portfolio. The department manages the asset (facility components) information, including asset condition and age, in order to identify those assets that are in need of replacement or refurbishment, and develops the prioritised capital plan to address these needs. Proactively identifying and planning for the replacement of building assets avoids the additional costs and operational disruption associated with completing emergency repairs and replacements;
- Executing the Properties' capital plan, through project delivery oversight, ensuring projects are completed to schedule and budget, meeting BC Hydro business needs and standards as well as regulatory, environmental, safety and building code requirements. The department establishes the construction and product standards for BC Hydro's buildings and determines the construction methodology. While this department completes the assessment of operational business needs, sets the standards and engages with key stakeholders, construction work is undertaken by external construction companies. In addition, the majority of projects are managed by contract project managers with experience in industrial building construction project delivery. The department's delivery of building renovation and development projects ensures that BC Hydro's operations are housed in safe, secure and seismically resilient facilities; and
- Maintaining the physical and electronic records for the entire portfolio of BC Hydro's property interests through a centralized information system. This

system captures key property information for every land parcel that BC Hydro owns (e.g., legal documents such as purchase and sale agreements, Right-of-Way agreements, leases and licences and facilities asset information). This database supports BC Hydro's oversight and management of its property interests in support of capital projects and operations.

5B.7.1.2. Facilities and Space Management Department

The Facilities and Space Management department is responsible for the maintenance and operations of BC Hydro's 101 field and office facilities, and provides business services and workspace management services (including workstation design, physical moves, and space reconfigurations) for BC Hydro's operations across the province. This includes:

- Ensuring buildings and facilities assets are efficiently operated, maintained and repaired to meet BC Hydro's expectations and needs, including business continuity (24/7 emergency response) as well as environmental, health, and safety standards. To achieve these outcomes BC Hydro contracts with a single outsourced provider for the larger facilities and multiple service providers for the smaller and more remote facilities. This department provides contract management and oversight as BC Hydro's representative and also plays an important role overseeing the interface between building occupants and contractors;
- Managing the operations and maintenance of facilities across the province. This centralized approach allows for coordinated and standardized maintenance, and investments across the facilities. If the facility component assets are not maintained, their deterioration would impact worker health and safety, productivity, emergency response capability and components would need to be replaced more often, increasing overall asset life cycle costs;
- Coordinating workspace moves for the majority of BC Hydro employees and contractors. This department ensures that work space designs and

reconfigurations maximize space usage and use standardized layouts and furniture to allow for maximum flexibility and reduced costs while meeting all code requirements for access and egress; and

- Sorting and distributing internal and external mail across all occupied BC Hydro facilities as well as managing the contracts for province-wide courier services, food services, and parkade management.

5B.7.1.3. Property Rights Management Department

The Property Rights Management department manages BC Hydro's property rights and interests over Crown, First Nations[230] and private lands, fulfilling an important support role that enables BC Hydro to reliably and safely operate, access and maintain our dams and reservoirs, generation facilities, and transmission and distribution systems. This includes:

- Working directly with land owners to secure BC Hydro's rights to access their land, access BC Hydro owned infrastructure, undertake our maintenance work, such as vegetation management, or to construct new infrastructure;
- Managing all interactions with third parties, such as land owners, community groups, municipalities and pipeline companies, who request use of or access through BC Hydro land and rights-of-way. These secondary use requests must be compatible with BC Hydro's operational, safety and security requirements, given the risk of damage, electrical safety and related liabilities; and
- Providing subject matter expertise to represent BC Hydro's interests during the Government of B.C.'s proposed Crown land dispositions with First Nations for Treaty Settlements or other government agreements. This representation is critical so that our rights to continue to operate our existing Power System on First Nations lands are maintained, and so that rights are in place for future lines and reservoir operations.

[230] First Nations lands include First Nations Reserve, Treaty, and Title Lands.

5B.7.1.4. Real Estate Services Department

The Real Estate Services department acquires land and property rights for BC Hydro's development of the Power System and field facilities, conducts surplus property sales, manages property leases and licences, and administers BC Hydro's property tax portfolio. This includes:

- Undertaking the acquisition of land and property rights for BC Hydro's capital projects, customer interconnection projects, and BC Hydro field facility development projects;
- Managing rights acquisition agreements in support of new distribution system connections across the province. The timely and legal acquisition of suitable property interests is necessary to enable BC Hydro to access and occupy sites as well as construct, operate and maintain system assets;
- Managing BC Hydro's surplus property sales including ensuring all due diligence, legal, environmental clearances and First Nations consultation activities are completed prior to property sales. This department has a target of achieving net sales of $100 million by the end of fiscal 2024, an important contribution to maintaining affordable rates, through sales proceeds and reduced holding costs on surplus properties. Variances between planned and actual surplus property sales are captured by the Real Property Sales Regulatory Account, which is discussed further in Chapter 7, section 7.8.7;
- Managing all property leasing and licencing agreements, representing BC Hydro as landlord for BC Hydro owned property and as a tenant for leased space. Leased space is required in various locations across the province to supplement owned space that may be at capacity, to provide short term space for project teams, or in locations where BC Hydro does not own facilities. Licence agreements relate to revenue-generating secondary use of and access to BC Hydro property (e.g., telecommunications infrastructure and film set locations); and

- Managing BC Hydro's property tax assessments and ensuring that BC Hydro is compliant with regulations to pay taxes and grants. BC Hydro is one of the largest property tax payers in the province with an annual property tax bill (Grants in Lieu and School Taxes) of approximately $250 million on assets assessed at over $11 billion. Given the significant size of this obligation, the department identifies opportunities to reduce current and future tax assessments. For example, in fiscal 2018 and fiscal 2019, combined annual savings of over $3 million were achieved through negotiations and appeals that will be reflected in reductions in future years' assessments.

5B.7.2 Overview of Operating Costs and FTEs

Table 5B-10 Properties KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Properties Director's Office	0.4	0.0	0.0	0.0	0.0	0.0	0.0	**0.4**	2
3	Real Estate Planning and Project Delivery	1.0	0.0	1.0	0.1	0.1	0.0	0.0	**2.3**	21
4	Facilities and Space Management	2.5	0.1	16.8	0.7	6.6	0.0	0.0	**26.7**	30
2	Property Rights Management	1.2	0.0	0.1	0.0	0.0	0.0	0.0	**1.3**	31
5	Real Estate Services	1.6	0.0	0.4	0.0	0.0	0.0	0.0	**2.0**	40
6	**Total (Sch 5.2 L4, Sch 16.0 L12)**	**6.7**	**0.1**	**18.3**	**0.8**	**6.7**	**0.0**	**0.0**	32.7	**124**

Overall, operating costs for the Properties KBU have decreased by $0.6 million since fiscal 2016, despite an increase in labour costs of approximately $1.0 million due to the repatriation of Accenture roles, the conversion of Facilities Management service provider contractors to internal staff and the increased FTEs required to manage higher work volume and complexity.

Approximately 48 per cent of the KBU's total labour costs are charged to projects and not included in this KBU's operating cost budget. The remaining 52 per cent of labour costs make up 20 per cent of the total operating costs for the Properties KBU.

Non-labour costs in the Properties KBU consist primarily of costs paid to contractors to manage and maintain the facilities. These costs have increased by $2.4 million since fiscal 2016 due to the transfer of five buildings to the Properties-managed portfolio, the substantial expansion of three buildings within the portfolio, and inflationary cost escalation associated with the Facilities Management service provider contract.

These increases have been offset by the following reductions:

- $1.7 million in lease cost reductions achieved by not renewing external office space leases and relocating staff into BC Hydro owned buildings through increased space utilization in those buildings;
- $0.9 million in reduced operating costs related to capital projects; and
- $1.4 million in annual operating cost savings related to the Accenture repatriation, which is discussed further in Chapter 5, section 5.6.2.

5B.7.2.1. Properties Director's Office Department

The budget for this department relates to labour costs for two FTEs – the Director of the Properties KBU and an Administrative Assistant.

5B.7.2.2. Real Estate Planning and Project Delivery Department

Approximately 40 per cent of this department's budget is related to labour costs. The 21 FTEs in this department charge approximately 50 per cent of their time to capital projects.

The workforce requirements for this department are mainly driven by the volume and complexity of Properties-managed capital projects as well as the volume of work in other departments in the Properties KBU. The majority of the capital project managers are contracted resources, with oversight provided by internal FTEs in this department. This resourcing approach allows for maximum flexibility as the volume and complexity of capital projects can vary significantly from year-to-year. This department also relies on subject matter experts from other KBUs (e.g., Safety, Environment, Indigenous Relations) to support project delivery.

The Real Estate Planning and Project Delivery department is responsible for:

- Planning for more than 12,000 assets at 101 facilities;
- Delivering an average of 75 property capital projects per year with a total capital budget of approximately $60 million; and
- Managing approximately 140,000 physical records and the creation or transfer of approximately 16,000 files per year.

The non-labour budget for this department is primarily related to operating costs for capital projects such as temporary lease costs and moving costs.

5B.7.2.3. Facilities and Space Management Department

Approximately 70 per cent of this department's budget is related to costs to service BC Hydro's 101 facilities across the province. These facilities comprise approximately 3 million square feet of office and industrial space. Service provider costs include facility services (e.g., janitorial, snow removal/yard sweeping, pest control, landscaping, waste collection services) as well as repairs and maintenance to building components (e.g., plumbing, electrical, overhead doors, fences and gates, generators, HVAC, sprinklers and fire extinguishers). Preventative maintenance is completed on critical building components and work is carefully managed to balance affordability with the reliability and safety of our facilities.

Approximately 20 per cent of this department's budget is related to rent paid to lease facilities. BC Hydro has reduced its lease costs by approximately 25 per cent since fiscal 2016, through the consolidation of lease space and increased utilization of space at BC Hydro owned facilities.

Approximately nine per cent of the Facilities and Space Management department's budget is related to labour for 30 FTEs. This department manages the contract for the single provider of outsourced facility management services, covering approximately 40 per cent of BC Hydro's facilities, and also manages more than

100 vendors who provide services to the remaining 60 per cent of facilities that are managed directly by the department. The department also coordinates workspace moves for BC Hydro employees and contractors. Workspace moves are required for various reasons, including the collapse of leases, renovations and capital projects, new hires and employee transfers. This department also handles more than 500,000 pieces of internal and external mail annually for all of BC Hydro's occupied facilities throughout the province.

As facility operations, maintenance and repair activities are contracted out, the department's size is commensurately small. When workload pressures occur, contractors are used on a short-term or project basis.

5B.7.2.4. Property Rights Management Department

Approximately 90 per cent of this department's budget relates to labour costs for 31 FTEs. The FTEs in this department charge approximately 60 per cent of their labour costs to projects in other KBUs.

The resourcing requirements of this department are driven by the volume and complexity of work requests received including capital projects that require rights acquisitions, secondary use and rights of way access requests by third-parties, as well as First Nations property rights acquisitions and Provincial Treaty settlement negotiations.

This department manages:

- More than 2,600 secondary use requests per year;
- Over 100 property rights acquisitions each year for distribution system connections on First Nations lands;
- Twenty-four current potential First Nations Treaty Settlement land disposition processes; and

- Approximately 7,000 agreements for Generation reservoir and dam related property rights and approximately 84,000 agreements for Transmission and Distribution property rights.

While the number of work requests has remained fairly stable in recent years, the mix and complexity of the requests has increased, adding to the workload of the department. This additional workload is managed through supplementing existing resources with temporary contractors, reassigning resources from other departments in the Properties KBU, and managing backlogs.

5B.7.2.5. Real Estate Services Department

Approximately 80 per cent this department's budget is related to labour costs for 40 FTEs. The FTEs in this department charge approximately two-thirds of their time to projects and programs in other KBUs.

The workforce requirements for this department are mainly driven by the volume and complexity of work activities and transactions processed. For example, the number and scale of capital construction projects that require land or rights acquisitions and the volume of distribution connection requests.

On an annual basis, this department manages approximately:

- 85 Power System capital projects;
- 1,600 distribution system requests;
- 1,200 leasing and licencing agreements;
- 35 active surplus sales processes; and
- 4,000 property tax assessments.

The workforce of this department is sized to deliver services responsively to capital project teams, and other parts of BC Hydro, such as the Distribution Design Customer Connections KBU. When additional resources are required, the department manages resources with planned reliance on overtime, reassigned resources from other departments in the Properties KBU and, in peak times, contractors, to manage workload and backlogs.

The remaining 20 per cent of the department's budget is for contract services and consultant fees including independent appraisals and additional contractor support for complex lease and sales files.

5B.7.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5B-11 Properties KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.2 L4	32.2	32.2	32.5	32.7	32.8	32.7	29.3	29.5
2	FTEs	16.0 L12	106	110	106	114	106	124	123	123

Operating costs are decreasing by approximately $3.4 million from the fiscal 2019 forecast to the fiscal 2020 plan due to IFRS 16 lease standards accounting changes (as described in Chapter 5, section 5.5.2 and Chapter 8, section 8.13), reduction in lease costs through consolidations (discussed in Chapter 5, section 5.5.2.3) and vacancy factor savings (also discussed in Chapter 5, section 5.5.2.3). These savings are slightly offset by Standard Labour Rate increases. Operating costs are increasing by approximately $0.2 million from the fiscal 2020 plan to the fiscal 2021 plan due to Standard Labour Rate increases.

FTEs are planned to decrease by one from the fiscal 2019 forecast to the fiscal 2020 plan due to a transfer of one FTE to the Customer Service KBU.

5B.8 Business Unit Support

5B.8.1 Responsibilities

The Capital Infrastructure Project Delivery Business Unit Support KBU includes the budget for the Office of the Senior Vice-President of Capital Infrastructure Project Delivery.

Since the Previous Application, the budgets for capital project investigation costs, First Nations community payments in lieu of taxation, and dam safety investigation costs have been transferred out of this KBU and into the Business Unit Support KBU within the Integrated Planning Business Group. In addition, capital overhead has been transferred to Capitalized Costs.

5B.8.2 Overview of Operating Costs and FTEs

Table 5B-12 Business Unit Support KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	SVP,Capital Infrastructure Proj Delivery	0.7	0.0	0.1	0.0	0.0	0.0	0.0	**0.8**	3
2	**Total (Sch 5.2 L5, Sch 16.0 L13)**	**0.7**	**0.0**	**0.1**	**0.0**	**0.0**	**0.0**	**0.0**	**0.8**	**3**

5B.8.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5B-13 Business Unit Support KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.2 L5	0.8	0.7	0.8	0.7	0.8	0.8	0.8	0.9
2	FTEs	16.0 L13	3	3	3	3	3	3	3	3

Operating costs are planned to increase slightly from the fiscal 2019 forecast to the fiscal 2020 and fiscal 2021 plan due to Standard Labour Rate increases.

Chapter 5C

Operating Costs
Operations Business Group

Table of Contents

List of Figures

List of Tables

5C.1 Introduction - Operations Business Group

Chapter 5C provides and explains in detail the composition of, and rationale for the operating costs of the Operations Business Group. The Operations Business Group is one of six business groups in the organization and is responsible for operating BC Hydro's facilities and assets. It serves as the Operate function of the Plan-Build-Operate-Support model.

The Operations Business Group budget was developed as part of the budgeting process outlined in Chapter 5, section 5.4. The information provided in this Chapter 5C demonstrates the basis for the entirety of the Business Group and KBU budgets, rather than focussing only on incremental cost requirements.

Chapter 5C is organized as follows:

- Section 5C.2 provides an overview of the organization and responsibilities of the Operations Business Group;
- Section 5C.3 provides the operating costs and FTE information for the Operations Business Group as a whole,[231] and
- Sections 5C.4 to 5C.11 provide more detailed information on the responsibilities, cost and FTEs for each KBU within the Operations Business Group. The operating costs and FTE information for each KBU is broken out into two sections[231]
  - Overview of Operating Costs and FTEs – This section explains the starting operating costs and FTEs based on the fiscal 2019 forecast; and
  - Fiscal 2020 and fiscal 2021 Plan Operating Costs and FTEs – This section explains any incremental changes between fiscal 2019 forecast and fiscal 2020 and fiscal 2021 plan.

[231] Please note the amounts presented in the tables in these sections may not add due to rounding.

5C.2 Overview of Operations Business Group Organization and Responsibilities

The Operations Business Group is a new business group, created subsequent to the filing of the Previous Application. It combines the operations functions of the former Transmission and Distribution and Generation Business Groups. The planning functions of these former Business Groups are now included in the Integrated Planning Business Group.

The Operations Business Group consists of the following KBUs:

Business Group	Key Business Unit
Operations	Program and Contract Management Line Field Operations Stations Field Operations Distribution Design Customer Connections Construction Services Generation System Operations Transmission and Distribution System Operations Business Unit Support

The role of the Operations Business Group is to:

- **Safely and Efficiently Execute Work:** Maintenance and smaller scale capital work identified by the Integrated Planning Business Group is directed to the Program and Contract Management KBU of the Operations Business Group for delivery. The Program and Contract Management KBU then develops annual program and project delivery plans and assigns work to the primary delivery groups of the Line Field Operations KBU, Stations Field Operations KBU, Construction Services KBU or external contractors;
- **Connect Customers to the Distribution System:** The Distribution Design and Customer Connections KBU provides design work, project coordination and work packages for new connections of distribution voltage customers (25 kV and under) as well as distribution system improvement and end of life asset replacement programs. The execution of this work is then assigned to the

primary delivery groups of the Line Field Operations KBU, the Construction Services KBU, or external contractors;

- **Operation of the Integrated System to Maximize Overall Value:** The Generation System Operations KBU is responsible for planning the operation of BC Hydro's reservoirs and generation facilities and for integrating other energy resources into those operations to meet BC Hydro's load obligations. The T&D System Operations KBU is responsible for managing the real time operation of the BC Hydro generation, transmission, distribution and telecommunication systems.

Larger and more complex capital projects are implemented by the Project Delivery KBU of the Capital Infrastructure Project Delivery Business Group, discussed in Chapter 5B, section 5B.4.

5C.3 Fiscal 2020 and Fiscal 2021 Plan Operating Cost and FTE Summaries

This section addresses planned operating costs and FTEs for the Operations Business Group. The following are some key points of note with respect to the information provided in Figure 5C-1, Table 5C-1 and Figure 5C-2, Table 5C-2 and Table 5C-3:

- The Line Field Operations KBU, Station Field Operations KBU and Construction Services KBU make up over 60 per cent of the Operations Business Group's operating budget. They are primarily comprised of trades staff, responsible for executing the operations, maintenance and capital work required on BC Hydro's Transmission, Distribution and Generation systems;
- The Operations Business Group makes up 40 per cent of BC Hydro's total FTEs, while only accounting for approximately 30 per cent of the base operating costs. This difference is primarily because large portions of the Operations Business Group's work are charged to the maintenance work

programs that are budgeted in the Integrated Planning Business Group, as well as to capital projects. This is described in further detail within the individual KBU sections in this Chapter 5C; and

- The increase in the Operations Business Group's operating budget from fiscal 2019 forecast to fiscal 2020 plan is largely driven by increases to Storm Restoration costs and to Standard Labour Rates, as discussed further in Chapter 5, section 5.5.2.2.

Planned operating costs for this Business Group are approximately $243.0 million in fiscal 2020 and approximately $246.0 million in fiscal 2021. The operating costs for the Operations Business Group are summarized by KBU in Figure 5C-1. Additional cost details are provided in Table 5C-1 below.

Figure 5C-1 Operations Net Operating Costs by KBU (Fiscal 2020 Plan) ($ million)

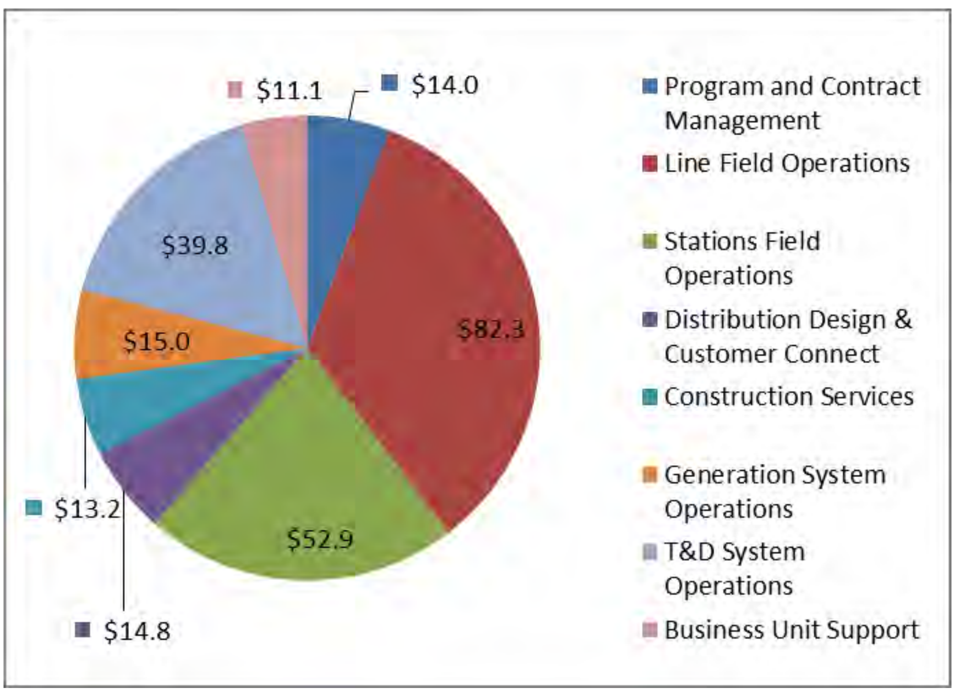

Table 5C-1 Operations Net Operating Costs by KBU

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Program and Contract Management	5.3 L1	13.8	11.6	14.1	11.9	14.3	12.8	14.0	14.2
2	Line Field Operations	5.3 L2	67.7	69.8	68.2	71.6	68.7	68.2	82.3	83.1

5C.4 Program and Contract Management KBU

5C.4.1 Responsibilities

The Program and Contract Management KBU is the single point of contact for the annual delivery of the maintenance and small capital investment portfolio that is developed and optimized by the Integrated Planning Business Group. This KBU is responsible for leading the development of delivery strategies that consider the volumes of work types in each region as well as the forecast internal and external resource capacity to deliver this work. During the test period, the Program and Contract Management KBU will deliver capital projects and programs totalling approximately $650 million and maintenance programs totalling approximately $350 million. More specifically, this KBU:

- **Develops annual program and project plans to deliver work:** Once the annual maintenance and small capital investment portfolio is received from the Integrated Planning Business Group, the Program and Project Managers in the Program and Contract Management KBU develop annual program and project plans to deliver the work in consultation with various KBUs across BC Hydro. Once internal resource commitments to deliver the work are obtained, the Program and Project Managers develop contracting plans to deliver the balance of the annual maintenance and small capital portfolio;
- **Assign work to internal groups and contractors, as appropriate:** Work is assigned to the internal and external Engineering and Design teams and to the field execution teams in Line Field Operations KBU, Stations Field Operations KBU, Construction Services KBU and to external contractors.

  More than half of the work is performed by internal staff. External contractors provide scalability and help respond to fluctuations in demand, including providing support for trouble and storm response work. The KBU seeks external contractors that are cost competitive, and are willing to work collaboratively through longer term relationships with BC Hydro. Contractors are identified through a competitive tendering process, with Program and Contract Management providing centralized management throughout the life of each contract;

- **Monitor progress and adjust as required:** On a monthly and quarterly basis, the Program and Project Managers monitor the progression of the program and project plans, manage change controls, manage external contractor performance and adjust work allocations to the field execution teams as necessary. The Program and Project Managers complete program and project Completion Reports annually or at the end of multi-year programs; and
- **Shares accountability for delivery of Power System capital:** The Program and Contract Management KBU is one of three KBU's accountable for the delivery of the Power System capital projects. The other KBUs responsible for delivering these projects are the Project Delivery KBU (discussed in Chapter 5B, section 5B.4) and the Distribution Design and Customer Connections KBU (discussed below in section 5C.7). Specifically, Program and Contract Management is responsible for delivering smaller scale system improvement projects and less complex capital projects, typically with a forecast capital cost of less than $1 million. Approximately 26 per cent of the planned capital investments in the Power System in fiscal 2020 to fiscal 2021 will be delivered by the Program and Contract Management KBU.

There has been one material change to the responsibilities of this KBU since the Previous Application. The Portfolio Services department of the former Asset Investment Management KBU, is now part of the Program and Contract Management KBU.

Program and Contact Management consists of the following departments:

- Portfolio Services Department;
- Transmission Capital and Maintenance Programs Department;
- Vegetation Management Department;
- Distribution Capital Projects Department;

- Distribution Program Delivery Department;
- Distribution Contract Management Department; and
- Distribution Contract and Operations Management Services (**D COMS**) Department.

5C.4.1.1. Portfolio Services Department

The Portfolio Services department provides scheduling, costing, and systems support to the delivery teams in Program and Contract Management.

Portfolio Services is responsible for forecasting operations labour and equipment resource demand and assessing any resourcing risk to the capital and operating and maintenance plans. The department also facilitates the development of mitigating strategies for the risk. These responsibilities balance two objectives: providing sufficient labour and equipment to execute planned work and optimizing planned use of resources for overall productivity, safety, and quality over both the short and long-term.

5C.4.1.2. Transmission Capital and Maintenance Programs Department

The Transmission Capital and Maintenance Programs department provides program and project management for the delivery of less complex transmission capital projects (typically less than $1 million) and repetitive maintenance and capital programs on transmission infrastructure. This includes transmission conductor lines, underground and submarine cables, steel towers, wood poles and all facilities within a substation as well as the telecommunication system. A key responsibility of the department is to coordinate the allocation of work between BC Hydro’s internal workforce and external contractors.

5C.4.1.3. Vegetation Management Department

The Vegetation Management department is responsible for the execution of all vegetation and access management on the transmission and distribution systems. This work includes:

- Transmission, substation, and distribution vegetation management maintenance programs as well as right of way access maintenance programs;
- Vegetation management, right of way clearing, and access management planning as well as construction in support of transmission and distribution capital projects;
- Storm response to aid in the removal of vegetation to reduce overall system restoration time; and
- Management of the contracts and relationships with vegetation management and access contractors.

5C.4.1.4. Distribution Capital Projects Department

The Distribution Capital Projects department delivers smaller scale system improvement projects and less complex distribution capital projects from the definition phase through to the implementation phase.

The distribution projects portfolio is made up of:

- Growth projects to provide increased system capacity;
- Sustainment projects that improve reliability;
- Distribution interconnection projects; and
- Distribution submarine cable projects.

5C.4.1.5. Distribution Program Delivery Department

The Distribution Program Delivery department is responsible for the management of high volume and repetitive distribution electrical equipment maintenance and replacement delivery programs. This equipment includes the conductor lines, underground cables, support structures such as wood poles, platforms, concrete poles, and associated equipment. A key responsibility of the department is to coordinate the allocation of work between BC Hydro's internal workforce and external contractors.

5C.4.1.6. Distribution Contract Management Department

The Distribution Contract Management department is responsible for contracting electrical and distribution line work to third-parties.

The department undertakes the following work related to external contracting:

- Pre-qualifying contractors to bid on BC Hydro work;
- Coordinating work allocation between various groups that execute the work, evaluating and awarding work packages, and onboarding contractors;
- Acting as the BC Hydro representative on contracts and providing change order management, customer contact and issues management, outage management and coordination, materials coordination, and coordination with the Distribution Design department; and
- Providing supplier relationship management including authorizing contractor employees to work on the BC Hydro system, providing quality management of work completed and ensuring corrective actions are taken as needed.

5C.4.1.7. Distribution Contract and Operations Management Services (D COMS) Department

D COMS is responsible for civil inspection and survey activities as well as inspections of work completed by internal crews and external line contractors to confirm that structures are built to engineering standards and that the quality of construction is acceptable. This department also supports the delivery of distribution maintenance programs and manages external contractors who deliver civil inspection, surveying, engineering and design services. Contract administration support for these activities is provided by the Distribution Contract Management Department, described above.

5C.4.2 Overview of Operating Costs and FTEs

Table 5C-4 Program and Contract Management KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Program and Contract Mangement	0.6	0.0	0.2	0.0	0.0	0.0	0.0	**0.8**	4
2	Portfolio Services	1.3	0.0	0.0	0.0	0.0	0.0	0.0	**1.4**	24
3	Trans Capital and Mtce Programs	0.7	0.0	0.0	0.0	0.0	0.0	0.0	**0.8**	14
4	Vegetation Management	3.0	0.0	0.3	0.1	0.1	0.0	0.0	**3.5**	66
5	Distribution Capital Projects	0.5	0.0	0.0	0.0	0.0	0.0	0.0	**0.5**	16
6	Distribution Program Delivery	1.4	0.0	0.1	0.0	0.0	0.0	0.0	**1.5**	21
7	D Contract Management	2.9	0.0	0.1	0.0	0.0	0.0	0.0	**3.0**	34
8	D COMS	1.2	0.0	0.1	0.0	0.0	0.0	0.0	**1.4**	42
9	**Total (Sch 5.3 L1, Sch 16.0 L15)**	**11.6**	**0.0**	**0.9**	**0.1**	**0.2**	**0.0**	**0.0**	**12.8**	**221**

The number of FTEs in the Program and Contract Management KBU reflect the labour requirements to deliver the maintenance, capital programs and capital projects assigned by the Integrated Planning Business Group. The budget for this work is held by the Integrated Planning Business Group.

From fiscal 2016 to fiscal 2019, total operating costs for this KBU have remained relatively constant.

From fiscal 2016 to fiscal 2019, the total FTEs in this KBU increased by 30 FTEs from 191 FTEs to 221 FTEs. The increase in FTEs was due to the conversion of contractors to employees through the Workforce Optimization Program which is described in Chapter 5, section 5.6.1.

5C.4.2.1. Director, Program and Contract Management Department

The majority of this department’s budget is related to labour. This represents four FTEs: a Director, a Senior Program Manager, a Human Resources Advisor (seconded 100 per cent to Columbia Hydro Constructors Ltd.) and an administrative assistant.

The $0.2 million in non-labour costs for this department represents funding for travel costs and annual dues.

5C.4.2.2. Portfolio Services Department

The majority of this department budget is related to labour. This represents 24 FTEs including: one Department Manager, six Resource Strategy and Management Advisors/Specialists, one Program Technologist Manager and 15 Program Technologists. One FTE represents overtime which is driven by peak demand.

5C.4.2.3. Transmission Capital and Maintenance Programs Department

The majority of this department's budget is related to the labour. This represents 14 FTEs including: one Department Manager, three Program Managers and 10 Work Package Managers. The FTEs are supplemented by 10 external Work Package Managers during peak times.

5C.4.2.4. Vegetation Management Department

The majority of this department's budget is related to labour. This represents 66 FTEs including: one Department Manager, 11 Regional & Program Managers, seven Vegetation Specialists and Foresters, 33 Vegetation Coordinators and five Administrators. Nine FTEs that represent overtime which is driven by peak demand.

The $0.3 million in non-labour costs for this department represents travel costs, annual dues, employee training and office supplies.

5C.4.2.5. Distribution Capital Projects Department

The majority of this department's budget is related to labour. This represents 16 FTEs including: one Department Manager, five Program Managers and 10 Work Package Managers. The FTEs are supplemented by seven external Work Package Managers during peak times.

5C.4.2.6. Distribution Program Delivery Department

The majority of this department's budget is related to labour. This represents 21 FTEs including: one Department Manager, three Program Managers, five Work Package Managers, one Resource Planning Manager and 10 Distribution Maintenance Analysts. One FTE that represent overtime which is driven by peak demand. Due to high workload, this team is supplemented by five external Work Package Managers during peak times.

5C.4.2.7. Distribution Contract Management Department

The majority of this department's budget is related to labour. This represents 34 FTEs including eight Contract Managers, one Business Operation Manager, four Line Field Representatives and 19 Service Contract Administrators. Two FTEs that represent overtime which is driven by peak demand.

5C.4.2.8. Distribution Contract and Operations Management Services (D COMS) Department

The majority of this department's budget is related to labour. This represents 42 FTEs including three Contract Managers, two Civil Contracts & Inspection Managers, one Project Manager, 21 Civil Inspectors, four Pole Maintenance Coordinators, four Line Field Representatives, one administrative assistant. Six FTEs that represent overtime which is driven by peak demand. The FTEs are supplemented by 14 external inspectors during peak times.

5C.4.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5C-5 Program and Contract Management KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.3 L1	13.8	11.6	14.1	11.9	14.3	12.8	14.0	14.2
2	FTEs	16.0 L15	213	205	217	206	217	221	228	228

Operating Costs are increasing by approximately $1.2 million from fiscal 2019 forecast to fiscal 2020 plan due to:

- A re-organization in September 2018 that transferred four FTEs from the Stations Field Operations KBU to Program and Contract Management KBU ($0.6 million);
- Standard Labour Rate increases ($0.5 million); and
- NERC CIPv5 sustainment resources, as discussed further in section 5C.10.3 ($0.1 million).

Operating Costs are increasing by approximately $0.2 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases.

FTEs are planned to increase by seven from fiscal 2019 forecast to fiscal 2020 plan due to the transfer of four FTEs from Stations Field Operations KBU, two Workforce Optimization Program conversions and the addition of one FTE for NERC CIPv5 sustainment.

5C.5 Line Field Operations KBU

5C.5.1 Responsibilities

The Line Field Operations KBU is responsible for executing the day to day operational activities on BC Hydro's distribution and transmission line system. Key activities performed by this KBU include:

- **New customer connections to the BC Hydro system:** Once customers have approved designs to connect to the BC Hydro system, Line Field Operations KBU crews complete the connections in accordance with BC Hydro customer service targets for connection times;
- **Preventative, corrective, and condition based maintenance activities as directed by the Integrated Planning Business Group:** Planned maintenance activities are based on system need determined by the Integrated Planning

Business Group, and are executed by Distribution, Transmission and Trouble Line Field Operations crews;

- **End-of-life equipment replacements and small system improvement projects:** This work is organized as projects, managed by the Program and Contract Management KBU, and generally consists of smaller-scale projects not requiring the full level of project oversight associated with larger capital projects. Distribution and Transmission Line Field Operations crews deliver this work;
- **Restoration work due to emergent trouble response including major storm events:** When the Power System incurs damage due to weather, natural disasters such as wildfires, or other situations such as motor vehicle accidents, Distribution, Transmission and Trouble Line Field Operations crews all play a role in repairing the system and restoring customers. The work is performed with the assistance of the Hydro Restoration Center, which triages the damage and dispatches emergent work to crews. For larger events such as major storms, Power Line Technicians respond in the field, supported by field managers and administrators working in Storm Rooms and Regional Emergency Operations Centers, assisted by the Hydro Restoration Center;
- **Maintenance, installation, and replacement of customer meters:** New customer connections and changes to both residential and commercial customers' service requirements require meters to be installed, changed or upgraded. This work is performed by the Provincial Metering Operations department of this KBU. BC Hydro also must comply with legal requirements established by Measurement Canada, and this testing and calibrating work is completed at the provincial meter shop; and
- **Switching operations, as directed by the T&D Systems Operations KBU:** Since the T&D Systems Operations KBU has a view of the entire transmission and distribution system, it has insight into opportunities to open and close field

devices allowing the desired flow of power either to enable repairs to take place or to minimize customer outages. Distribution, Transmission and Trouble Line Field Operation crews perform these switching duties as directed by T&D Systems Operations KBU.

This KBU was created subsequent to the filing of the Previous Application. It includes a number of departments from the former Field and Grid Operations KBU.

This KBU is comprised of the following four departments:

- Distribution Line Field Operations Department;
- Transmission Line Field Operations Department;
- Trouble Line Field Operations and Operations Support Department; and
- Provincial Metering Operations Department.

5C.5.1.1. Distribution Line Field Operations Department

This department is responsible for maintenance and construction activities on approximately 56,000 km of distribution overhead and underground lines and cable, and executing switching operations as directed by T&D System Operations. The department is also responsible for initial storm and major event response and restoration in BC Hydro's service area, and response to routine trouble outside of the Greater Vancouver area and Victoria, where first response is generally provided by the Trouble Line Field Operations department. Distribution Line Field Operations also implements customer connections, executes small system improvement projects, and performs routine maintenance. The department is primarily comprised of Power Line Technicians.

5C.5.1.2. Transmission Line Field Operations Department

This department is responsible for maintenance and construction activities on approximately 18,000 km of overhead, underground, and submarine transmission lines, underground distribution lines, and executing switching operations as directed by T&D System Operations KBU. Maintenance work carried out by this department includes visual inspections, testing, repair, and replacement of transmission and distribution underground equipment. The Transmission Line Field Operations department also provides emergency response and restoration for the BC Hydro transmission system, including routine trouble and major storm damage, and supports distribution line restoration in storms once transmission lines have been restored. The department is primarily comprised of Power Line Technicians and Cable Splicers.

5C.5.1.3. Trouble Line Field Operations and Operations Support Department

This department consists of the Trouble Line Field Operations Team and the Operations Support team.

The Trouble Line Field Operations Team is responsible for day-to-day routine outage restoration on the distribution system within the Greater Vancouver area and Victoria. The department also supports Distribution Line Field Operations and Transmission Line Field Operations when those departments are responding to storm events. This team is primarily comprised of Power Line Technicians.

The Operations Support team provides administrative and operational support to the front-line managers and crew. It consists of the Hydro Restoration Center and the Operations Support Processing Center teams:

- The Hydro Restoration Center team provides support for Power System restoration activities. The team dispatches Distribution or Trouble field crews to respond to customer outages based on information from customer calls, smart meters and protection equipment such as re-closers and circuit breakers. The team also works closely with First Responders to provide them with BC Hydro support when required in the case of community emergencies that involve BC Hydro equipment; and

- The Operations Support Processing Center team provides planned outage notifications, centralized administration of timesheets and expense processing for employees. The team also processes work order completions.

5C.5.1.4. Provincial Metering Operations Department

This department maintains the Meter Shop facility and conducts testing, installation and replacement of meters. This department is primarily comprised of Meter Technicians.

5C.5.2 Overview of Operating Costs and FTEs

Table 5C-6 Line Field Operations KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Director, Line Field Operations	0.4	0.0	0.2	0.0	0.0	0.0	0.0	**0.6**	2
2	Distribution Line Field Operations	16.7	0.0	2.6	2.4	0.1	0.0	0.0	**21.7**	592
3	Transmission Line Field Operations	3.9	0.0	0.3	0.6	0.6	0.0	0.0	**5.4**	166
4	Trouble Line Field Ops and Ops Support	24.5	0.0	12.2	1.2	0.1	0.0	0.0	**38.0**	123
5	Provincial Metering Operations	1.2	0.0	0.1	0.1	0.1	0.0	0.0	**1.6**	48
6	Disconnect Reconnect Work	0.4	0.0	0.5	0.0	0.0	0.0	0.0	**0.9**	-
7	**Total (Sch 5.3 L2, Sch 16.0 L16)**	**47.0**	**0.0**	**15.9**	**4.3**	**1.0**	**0.0**	**0.0**	**68.2**	**931**

5C.5.2.1. Director, Line Field Operations Department

This department holds the budget for the Director of the Line Field Operations KBU. It primarily consists of labour costs for the Director and an administrative assistant. Non-labour costs include funding for monthly Front Line Employee Councils and travel for regional visits.

5C.5.2.2. Distribution Line Field Operations Department

This department is organized into three regional teams: Lower Mainland, Interior and Vancouver Island. Across the three regions, there are 48 managers, three administrative assistants, 37 Field Service Administrators, and 365 trades FTEs, located in 68 regional offices. An additional 139 FTEs that represent overtime which is driven by peak demand are budgeted each year. This is primarily for Trouble response outside of normal operating hours but also to accommodate customer schedules and to minimize the costs incurred to demobilize active crews and mobilize new crews in their place.

The level of resourcing in this department is driven by BC Hydro's customer service objective to respond to Trouble incidents within one hour in urban locations and two hours in rural locations. It also reflects regional work volumes for maintenance, capital, and customer driven work.

Approximately 90 per cent of the labour costs for the trades positions in this department are charged out to distribution capital projects and maintenance programs. Overtime is charged out 100 per cent to these projects and programs. The time not charged to projects and programs is allocated to safety training, technical training and to team, management and safety meetings as well as shop time.

Non-labour costs in this department are for the purchase of personal protection equipment, small tools and crew supplies, required cyclical tool testing and travel to complete training requirements.

5C.5.2.3. Transmission Line Field Operations Department

This department is organized into two regional teams: Lower Mainland/Vancouver Island and South Interior/North Interior. Across these two teams, there are 15 managers, four Field Service Administrators, 10 Transmission Technologists, and 96 trades FTEs. An additional 41 FTEs in overtime is budgeted for when seasonal demand exceeds supply.

The number of FTEs in this department is driven by regional work volumes on transmission maintenance programs and transmission capital projects. On average, these crews deliver about 88,000 hours work on recurring Transmission and Distribution Capital Programs and Projects and spend another 52,000 hours on Corrective and Preventative Transmission Maintenance activities.

Approximately 90 per cent of the labour costs for positions in this department are charged out to transmission maintenance programs and transmission capital projects. Overtime is charged out 100 per cent to projects and programs. The time not charged to projects and programs is allocated to safety training, technical training and to other management and administrative activities such as safety and team meetings.

Non-labour costs in this department are for the purchase of personal protection equipment, small tools and crew supplies, required cyclical tool testing and travel to complete training requirements.

5C.5.2.4. Trouble Line Field Operations and Operations Support Department

This department consists of the Trouble Line Field Operations team and the Operations Support team. It also holds the budget for Distribution Restoration maintenance. Maintenance is discussed in Chapter 5, section 5.8. The department is led by a manager with support from an administrative assistant and two project managers.

The Trouble Line Field Operations team consists of six managers, two Field Service Administrators, and 44 trades FTEs. An additional 17 FTEs in overtime is budgeted each year, primarily to respond to overall restoration work demand.

Approximately 90 per cent of the labour costs for trades positions in this department are charged out to Distribution Restoration maintenance programs, which are discussed further in Chapter 5, section 5.8. Overtime is charged out 100 per cent to these programs. The time not charged to projects and programs is allocated to safety training, technical training and to activities such as safety and team meetings and shop work.

Non-labour costs in this department are for the purchase of personal protection equipment, protective clothing and small tools as well as required cyclical tool testing and travel for training requirements.

The Operations Support Team includes the Operations Support Processing Center team and the Hydro Restoration Center team.

The Hydro Restoration Center team operates four in-take stations to respond to power outage calls. Two in-take stations are operated 24/7 and two in-take stations are operated from 7:00 a.m. to 11:00 p.m., when call volumes are higher. The team consists of 22 FTEs including a manager, an analyst and 20 dispatchers. Included in the budget is one FTE that represent overtime which is driven by peak demand. In fiscal 2018, this team answered approximately 85,000 calls.

The Operations Support Processing Center team consists of 27 FTEs and is primarily made up of Field Service Administrators. In fiscal 2018, this team processed approximately 135,000 timesheets, 93,000 employee expense claims and issued 6,155 planned outage notifications.

Non-labour expenses for this department include training, team activities, and office supplies.

5C.5.2.5. Provincial Metering Operations Department

This department consists of an Electronic Meter Shop and two Field Metering teams. One team provides service to Lower Mainland North and Vancouver Island and the other team provides service to Lower Mainland South and the Interior.

Across the three teams, there are four managers, two Field Service Administrators, one Network and Equipment Co-ordinator, and 33 trades FTEs. In addition, there are eight FTEs that represent overtime which is driven by peak demand. This is associated with the accommodation of customer installation schedules, and minimizing mobilization and demobilization costs.

Approximately 90 per cent of the labour costs for positions in this department are charged out to projects and programs. Overtime is charged out 100 per cent to projects and programs. The time not charged to projects and programs is allocated to safety training, technical training and other management and administrative activities such as safety and team meetings.

Non-labour costs in this department are for the purchase of personal protection equipment, small tools and crew supplies, required cyclical tool testing and travel to complete training requirements.

In fiscal 2018, this department completed approximately 4300 customer connections and 5100 meter exchanges. It also received or issued approximately 64,000 meters, performed approximately 21,000 firmware upgrades on those meters and assembled or upgraded approximately 3250 meters.

5C.5.2.6. Disconnect Reconnect Work Department

This department does not contain any FTEs. When internal or external field crews manually disconnect or reconnect meters, they charge their time to this department. BC Hydro may perform a manual disconnection or reconnection:

- To allow customers to safely perform non-electrical maintenance;
- To enable customers to perform maintenance or repairs on their own;
- When a meter is not within the Smart Meter service area; or
- When service is no longer required at an address.

5C.5.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5C-7 Line Field Operations KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.3 L2	67.7	69.8	68.2	71.6	68.7	68.2	82.3	83.1
2	FTEs	16.0 L16	844	838	844	856	844	931	938	938

Operating costs are increasing by approximately $14.1 million from fiscal 2019 forecast to fiscal 2020 plan due to an increase of $11.1 million to the five-year average that drives the storm response budget (discussed further in Chapter 5, section 5.5.2), Standard Labour Rate increases ($2.0 million), and the transfer of funding for Apprentices from the Business Unit Support KBU in the Operations Business Group ($1.0 million).

Operating costs are increasing by approximately $0.8 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases.

FTEs are increasing by seven from fiscal 2019 forecast to fiscal 2020 plan due to the Workforce Optimization Program, described in Chapter 5, section 5.6.1.

The increase in FTEs from fiscal 2019 RRA to fiscal 2019 forecast was primarily driven by the Workforce Optimization program, described in Chapter 5, section 5.6.1.

5C.6 Stations Field Operations KBU

5C.6.1 Responsibilities

The Stations Field Operations KBU is a technical frontline management and trades team responsible for executing maintenance, equipment operations, and capital projects support at over 300 generation, transmission, and distribution stations assets. This KBU was created subsequent to the filing of the Previous Application and includes responsibilities that were previously part of the former Generation Operations and Field & Grid Operations KBUs.

The Stations Field Operations KBU is organized into four regions:

- Northern Interior;
- Southern Interior;
- Lower Mainland/Bridge River; and
- Vancouver Island/Thermal/Non-Integrated Areas.

Each region is managed by a Regional Manager and comprised of trades employees with Senior Field Managers, Field Managers, Project Managers, a Construction Contracts Specialist, and Planning and Scheduling teams located throughout the different headquarters for trades and work management. The work performed by this KBU includes:

- Work planning and scheduling for executing maintenance and manual equipment operations;
- Equipment switching, isolation, and manual equipment operations;
- Equipment inspection, cleaning, testing, measurements, repairs, calibration, fluid and filter changes, and troubleshooting;
- Trades staff support for capital projects implementation;
- Spillway field operations and water conveyance;
- Safety inspections; and
- Emergency and off-hours equipment trouble response.

5C.6.2 Overview of Operating Costs and FTEs

Table 5C-8 Stations Field Operations KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Station Field Operations Director	0.5	0.0	1.7	0.0	0.0	0.0	0.0	**2.3**	3
2	Field Grid Ops Third Party Work	0.1	0.0	0.0	0.0	0.0	0.0	0.0	**0.1**	-
3	Apprentices and Trades Trainees	1.0	0.0	0.1	0.1	0.0	0.0	0.0	**1.2**	-
4	Stations Operations	26.6	0.0	10.8	1.5	0.9	0.0	0.0	**39.9**	807
5	Generation Maintenance	2.4	0.0	0.3	0.0	0.1	0.0	0.0	**2.8**	48
6	**Total (Sch 5.3 L3, Sch 16.0 L17)**	**30.5**	**0.0**	**13.0**	**1.7**	**1.0**	**0.0**	**0.0**	**46.2**	**858**

In September 2018, the Stations Field Operations KBU underwent a re-organization to align with the Plan-Build-Operate-Support business model. The goals of this re-organization were to consolidate trades staff within the same geographic region performing similar work on similar equipment under one KBU and one management structure and to reduce duplicate procedures and processes.

As part of the re-organization, a number of FTEs included in Table 5C-8 above were transferred from the Stations Field Operations KBU to other KBUs, reducing the total FTE count for the Stations Field Operations KBU. This reduction is reflected in Table 5C-9 below for fiscal 2020 and fiscal 2021.

- 22 FTEs were transferred from the Stations Operations department to the Engineering KBU;
- Four FTEs were transferred from the Stations Operations department to the Stations Asset Planning KBU;
- Four FTEs were transferred from the Stations Operations department to the Program and Contract Management KBU;
- Five FTEs were transferred from the Generation Maintenance department to the Stations Asset Planning KBU;
- Four FTEs were transferred from the Generation Maintenance department to the Energy Planning and Analytics KBU; and
- 36 FTEs were transferred from the Generation Maintenance department to the Engineering KBU.

Additional details on these transfers can be found in the sections for each of the receiving KBUs.

As part of the re-organization, the generating stations maintenance budget of approximately $52.7 million previously held by Stations Field Operations was transferred to the Stations Asset Planning KBU in the Integrated Planning Business Group which combined the overall stations maintenance budget into a single portfolio in Integrated Planning. Accordingly, the Stations Operations maintenance budget is described within the Station Asset Planning KBU in Chapter 5A, section 5A.6.

The sections below describe the Operating Costs and FTEs for the Stations Field Operations departments, after these transfers were complete.

5C.6.2.1. Stations Field Operations Director Department

This department includes three FTEs: the Director of the KBU, a Transition Manager responsible for aligning business processes across the KBU, and an administrative assistant.

The Services – Other budget for this department includes $1.5 million in reserve funding to perform unanticipated maintenance and repairs on Stations assets and facilities which cannot be absorbed within the fiscal year budget by reprioritizing previously planned work. This budget also includes funding for Public Safety Management Program reviews, consistent with regulatory compliance requirements at Stations facilities.

5C.6.2.2. Field Grid Operations Third Party Work Department

This department does not have any FTEs. Stations Operations staff occasionally complete work requests for industry partners, including apparatus testing and equipment fault investigation and repairs. The labour required to complete these requests is charged to this department and offset through revenue collected through invoices to those industry partners.

5C.6.2.3. Apprentices and Trades Trainees Department

This department does not have any FTEs. The labour budget in this department is for apprentices and trade trainees in the Learning and Development KBU who are working on Stations assets and incur training or meeting time that cannot be charged to work programs or projects. The non-labour budget is for small tools and consumable supplies.

5C.6.2.4. Stations Operations Department

Stations Operations is the workforce required to safely and effectively maintain and operate the Stations assets. This department is organized into four regions as described above:

- Northern Interior;
- Southern Interior;
- Lower Mainland/Bridge River; and
- Vancouver Island/Thermal/Non-Integrated Areas.

The total FTEs for the Stations Operations department, after the September 2018 re-organization, includes 75 manager and professional roles, 550 trades roles, and 53 technical and administrative roles as well as 114 FTEs for overtime.

The number of FTEs in Stations Operations is driven by the work volumes required to complete maintenance, equipment operations, off-hours equipment trouble response, and capital projects support for the stations assets in each region. On average, this department completes approximately 548,000 hours of maintenance, 235,000 hours of capital projects support and 415,000 hours of operations work each year. The labour budget held within this department is for operations work. The labour budgets for maintenance are held within the Integrated Planning Business Group. The labour budgets for capital projects support are held within the Capital Infrastructure Project Delivery Business Group.

The total FTEs and associated overtime allocations for Stations Operations have remained essentially constant over the past four fiscal years despite increasing work demands due to aging assets, additional equipment added to the system, capital support needs, and increased safety, environmental, and regulatory requirements.

The 114 FTEs of overtime included in this department is used primarily by trades employees to meet seasonal and overall work demand peaks for manual equipment operations, off-hours equipment trouble response, maintenance, and capital projects support. These demand peaks occur as a result of seasonal constraints on work volumes due to equipment availability requirements for system loads, environmental and inflow conditions, and water license requirements.

The non-labour budget for this department includes services, materials, and buildings and equipment. The services portion includes the John Hart Generating Station public-private partnership contract with InPower, the General Electric emergency support engine lease and the distributed control system support at the Fort Nelson Gas Generating Station, the Mica Emergency Response Team, janitorial and waste removal, tools and equipment calibration and testing, training, and travel expenses.

The materials portion includes shop supplies, fire retardant clothing and personal protective equipment, as well as office supplies.

The building and equipment portion includes the Campbell River Ironwood office lease, the Burrard Generating Station foreshore lease, and internet and communications charges for the Mica, Hudson Hope, and Bridge River employee accommodations.

With the exception of cost increases for the John Hart partnership contract, the Stations Operations department budget has remained essentially constant for the past four fiscal years despite increasing work demands due to aging assets, additional equipment added to the system, capital support needs, and increased safety, environmental, and regulatory requirements.

5C.6.2.5. Generation Maintenance Department

As discussed above, the September 2018 re-organization transferred the 48 FTEs within the Generation Maintenance department to the Engineering, Stations Asset Planning and Energy Planning and Analytics KBUs. The labour portion of this budget is for non-billable time including safety and technical training, and the non-labour portion is for travel and expenses.

The positions and associated labour and non-labour budgets that were transferred are further described within the respective KBU sections noted above.

5C.6.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5C-9 Stations Field Operations KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.3 L3	41.0	41.5	41.1	39.4	46.9	46.2	52.9	53.5
2	FTEs	16.0 L17	856	829	856	818	856	858	777	777

Operating costs are increasing by approximately $6.7 million from fiscal 2019 forecast to fiscal 2020 plan. This includes a $2.0 million increase for the first full year of operation of the John Hart Generating Station public-private partnership contract with InPower and $1.2 million for Standard Labour Rate increases. Approximately $3.5 million of the increase is a net transfer from the September 2018 re-organization, which is offset by equivalent reductions in other KBUs and has a net zero impact on BC Hydro’s overall operating cost budget.

Operating costs are increasing by approximately $0.6 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases.

FTEs are decreasing by 81 from fiscal 2019 forecast to fiscal 2020 plan due to the September 2018 re-organization as well as the following changes that are approximately cost neutral:

- The reduction of three John Hart shift electrician roles that are no longer required with the new plant now in operation;
- The elimination of the Lower Mainland Generation Capital Storekeeper role as part of the Ruskin Re-development capital project completion;

- The reduction of three other FTEs representing a small plants administrator role, an electrician apprentice role, and trades overtime;
- The addition of two Communication, Protection and Control trades at the Mica Generating Station to assist with capital projects implementation;
- The addition of a John Hart Construction Contracts Specialist to act as BC Hydro's representative to InPower, the company contracted to manage the John Hart Generating Station for the first 15 years; and
- The addition of a Field Manager for Electricians and Communication, Protection and Control trades at the Bridge River Generating Station due to the large amount of capital projects underway at that location.

The increase in FTEs from fiscal 2019 RRA to fiscal 2019 forecast was primarily driven by the Workforce Optimization program, described in Chapter 5, section 5.6.1.

5C.7 Distribution Design and Customer Connections KBU

5C.7.1 Responsibilities

The Distribution Design and Customer Connections KBU is a technical and front line customer group that leads the new customer connections program for distribution voltage customers (25 kV and under) and provides design work, project coordination and work packages for other distribution system improvement and end of life asset replacement programs. It is a high volume business area, producing over 35,000 service orders and 15,000 designs and work order packages annually. The Designers in this KBU are also regularly deployed in emergency response roles as damage assessors and wire guards because of their technical expertise and knowledge of the distribution system.

The above activities are performed by Designers located in 29 district offices throughout the province, as well as Electrical Service Coordinators working in centralized Express Connect centres in Kamloops, Burnaby and Nanaimo.

The customer connection work, driven by customer connection requests, is the highest priority and largest work program for the Distribution Design and Customer Connections KBU. Customer work is the provision of new or upgraded electrical services as requested by current and future residential, commercial or industrial BC Hydro customers. By their nature, all of these requests are “unplanned” throughout the year and range from simple overhead services to very large and complex multi-million dollar projects. The customer work involves liaising with customers and their consultants and contractors, electrical and civil design, estimating and quoting, work package development and project management activities. Chapter 6, section 6.4.15.1 provides additional information on the Customer Capital Program managed by Distribution Design and Customer Connections KBU, including customer contributions in aid.

Planned work programs such as system improvement projects make up the remainder of the work for this KBU. These programs are described further in Chapter 6, sections 6.4.15.1 and 6.4.15.2.

This KBU was part of the Customer Service and Distribution Design KBU in the Previous Application. There have been no material changes to the responsibilities of this KBU since the Previous Application.

Distribution Design and Customer Connections KBU is comprised of the following departments:

- Customer Program Office Department;
- Distribution Design Department;
- Design Programs and Services Department;

- Customer Connections Department; and
- Customer Connect Work Programs Department.

5C.7.1.1. Customer Program Office Department

This department provides program management for the customer capital program and monitors the customer connection processes through metrics and reporting. It also initiates and leads process and technology improvement projects, such as new on-line capabilities, to increase efficiency and improve customer service and experience.

5C.7.1.2. Distribution Design Department

This department plans, designs, and provides project coordination for customer connections to BC Hydro's distribution system and other province-wide distribution system improvement and asset replacement projects and programs that require design, estimating and work packages. The department issues approximately 15,000 work orders to distribution line crews and civil contractors every year.

5C.7.1.3. Design Programs and Services Department

This department provides technical design for large system improvement projects and provides quality assurance of work designed by BC Hydro approved professional engineering firms.

5C.7.1.4. Customer Connections (Express) Department

This department, usually called Express Connections, responds to over 35,000 customer requests each year for simple new service connections, upgrades, and service disconnects. Through a provincial contact centre with staff located in three regions, technically trained Electric Service Coordinators handle calls and applications from customers and issue simple work orders to crews.

5C.7.1.5. Customer Connect Work Programs

The Customer Connect Work Programs department does not contain any FTEs. It contains costs associated with services requested by customers that are not directly related to new or upgraded services. Examples include temporary re-locations and guarding of overhead lines for house moves and active construction sites, customer electrical vault isolations and temporary construction power. Customers are charged for these services and payments are received as revenue.

5C.7.2 Overview of Operating Costs and FTEs

Table 5C-10 Distribution Design Customer Connections KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Mgr Dist'n Design and Custmr Connection	0.5	0.0	0.1	0.0	0.0	0.0	0.0	**0.7**	3
2	Customer Program Office	0.3	0.0	0.2	0.0	0.0	0.0	0.0	**0.5**	2
3	Distribution Design	7.3	0.0	0.9	0.2	0.1	0.0	0.0	**8.6**	293
4	Design Programs and Services	0.4	0.0	0.1	0.0	0.0	0.0	0.0	**0.5**	17
5	Customer Connections	1.5	0.0	0.1	0.0	0.0	0.0	0.0	**1.6**	64
6	CC Work Programs	0.6	0.0	1.4	0.4	0.0	0.0	0.0	**2.5**	-
7	**Total (Sch 5.3 L4, Sch 16.0 L18)**	**10.7**	**0.0**	**2.7**	**0.7**	**0.2**	**0.0**	**0.0**	**14.3**	**379**

The level of economic activity in the province is the single largest driver of the Customer Capital Program and workload for Distribution Design and Customer Connections KBU. Housing starts, multi-year provincial infrastructure investments, and new industries such as cannabis grow operations have contributed to a construction boom over the past three years. This, in turn, has led to an unprecedented volume of distribution customer connection requests, with fiscal 2018 and fiscal 2019 having the highest number of connection requests in BC Hydro's history. The Customer Capital Program capital expenditures have increased from $170 million in fiscal 2016 to a forecast of $234 million for fiscal 2019.

The work involved to complete these customer service requests has become increasingly complex over the past five years due to increased environmental and safety regulations and municipal planning requirements. Evolving customer needs and expectations also require new processes and capabilities. Distribution Design and Customer Connections KBU is currently implementing broader web–based services for electrical service applications and on-line banking for project payments.

The high customer activity levels are expected to remain for another two years through the fiscal 2020 and fiscal 2021 test period, based on what is in the current pipeline and the expected impacts of the electrification programs by the Government of B.C. and municipalities.

Overall, the utilization rate of designer and electrical service coordinator positions is 91 per cent, which means only 9 per cent of employees' time is used for training, initiatives and administrative requirements and the rest is charged to work.

5C.7.2.1. Manager, Distribution Design and Customer Connections Department

The budget for this department primarily consists of labour for the Director of the KBU, an administrative assistant and a program manager.

5C.7.2.2. Customer Program Office Department

This budget for this department primarily consists of labour for a Project Manager and a Business Improvement Manager.

5C.7.2.3. Distribution Design Department

Most of the work performed by this department is charged out to the Customer Capital Program and other Distribution growth and sustaining capital work programs and projects as described in Chapter 6, sections 6.4.15.1 and 6.4.15.2. The majority of the labour budget in this department covers training and administrative time that is not chargeable to these programs. There are 293 FTEs in this department consisting of 213 Designers, 36 Design Assistants and administrators, 15 front-line Design Managers, seven Senior Design Managers and two Division Managers. The remaining 20 FTEs represents overtime which is driven by peak demand.

Every year, the Resource Strategy and Management department models demand for distribution design services against design capacity. The model includes internal Designer headcount and demographics (trainees and experienced Designers), overtime and the availability of external engineering service providers to augment capacity at a regional level. This modelling currently shows there is a good balance between internal Designers and contractors for the forecasted workload. If there was a slowdown in customer work, there is enough contracted work that could be pulled back in-house to keep internal Designers fully utilized.

Although engineering firms can provide design services for system improvement and end of life projects, they are unable to undertake the estimating, quoting and local customer communications work required for customer projects that involve the Electric Tariff and extension policy. Therefore, internal Designers based out of local district offices deliver all the customer connections work, with the exception of a few large projects where external firms provide the technical design and the small Customer Build Program for residential subdivisions where BC Hydro quoting is not required.

To handle the increase in customer requests and maintain reasonable service levels, this department has added 28 designers, some temporary, over the past two fiscal years. These positions also offset the need to contract out more design work at a higher cost. The additions are included in the design demand and capacity modelling described above. The current forecast indicates that current staffing levels will need to be maintained through the test period.

5C.7.2.4. Design Programs and Services Department

Most of the work performed by this department is charged out to Distribution growth and sustaining capital work programs and projects as described in Chapter 6, sections 6.4.15.1 and 6.4.15.2. The majority of the labour budget covers training and administrative time that is not chargeable to these programs. The 17 FTEs in this department consist of 10 Designers, five Distribution Project Coordinators, one Services and Design Assistant, and one front-line Design Manager.

5C.7.2.5. Customer Connections (Express) Department

This department is comprised primarily of Electric Service Coordinators. Most of the work performed by this department is charged out to the Customer Capital Program described in Chapter 6, section 6.4.15.1. The majority of the labour budget covers training and administrative time that is not chargeable to this program.

The scope of express connection services provided by BC Hydro is unique among Canadian and U.S. utilities and provides an efficient model that minimizes design work effort. To handle the unprecedented increase in customer requests and maintain reasonable service levels, this department added seven Electric Service Coordinator positions over fiscal 2017 and fiscal 2018, funded entirely through contractor cost savings and reductions in overtime.

While the volume of service requests has increased and become more complex, response times for express customer connections have substantially improved over the past three years. BC Hydro conducts a monthly customer satisfaction survey which indicates the overall satisfaction level has increased from an average of 70 per cent three years ago to above 85 per cent in 2018. Connection times have decreased from 12 days to eight days over the same period.

5C.7.2.6. Customer Connect Work Programs

The Customer Connect Work Programs department does not contain any FTEs. It contains costs associated with services requested by customers that are not directly related to a new or upgraded service. Customers are charged for these services and payments are received as revenue.

5C.7.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5C-11 Distribution Design Customer Connections KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.3 L4	12.8	10.2	13.1	10.6	13.5	14.3	14.8	15.1
2	FTEs	16.0 L18	338	325	338	347	338	379	379	379

Operating costs are increasing by approximately $0.5 million from fiscal 2019 forecast to fiscal 2020 plan and by approximately $0.3 million from fiscal 2020 plan to fiscal 2021 plan, due to Standard Labour Rate increases. FTEs are planned to remain constant.

The increase in FTEs from fiscal 2019 RRA to fiscal 2019 forecast was primarily driven by the Workforce Optimization program, described in Chapter 5, section 5.6.1.

5C.8 Construction Services KBU

5C.8.1 Responsibilities

The Construction Services KBU provides a range of services supporting the capital replacement, maintenance and capital expansion of transmission, distribution, station, and generation assets. This KBU is comprised of full time regular managers and office staff who manage and support a scalable full-time temporary workforce of approximately 300 trade employees. There have been no material changes to the responsibilities, organization and make-up of the Construction Services KBU since the Previous Application.

The Construction Services KBU is comprised of the following departments:

- Construction Services Lower Mainland / Vancouver Island;
- Construction Services South Interior / North Interior; and

- Project Planning and Coordination.

5C.8.1.1. Regional Departments

The Lower Mainland / Vancouver Island and Southern Interior / Northern Interior departments are organized by geographic boundaries and are responsible for the four regional offices located in the regions they serve:

- Prince George (Northern Interior);
- Vernon (Southern Interior);
- Surrey (Lower Mainland); and
- Nanaimo (Vancouver Island).

Construction Services KBU delivers an integrated bundle of services with on-demand skilled construction trades including power line technicians, electricians, general trades (carpenters, millwrights, and mechanics), winders, and equipment operators who are utilized to help implement the BC Hydro maintenance and capital programs. This internal construction group is used in place of contract resources where the implementation risks are more appropriately managed with the use of internal crews. This KBU also provides specialized services, such as construction expertise in planning stages of utility projects, specialty concrete repairs of generation civil infrastructure and asbestos abatement in energized environments.

In addition to increasing BC Hydro's operational flexibility, the Construction Services KBU performs the following:

- Employing highly trained crews who are familiar with BC Hydro facilities, policies, procedures and systems;
- Deploying resources in response to urgent and emergent work;
- Providing solutions to complex, multi-disciplinary projects, particularly when safety or system reliability challenges exists (i.e., brownfield work), or when the

construction risk is more appropriately managed by internal BC Hydro resources rather than being transferred to external contractors;

- Partnering with local First Nations to create development opportunities, and increase engagement through involvement with project work, consistent with BC Hydro's Indigenous Relations strategy;
- Providing timely access to scarce, skilled trades (e.g., winders and specialized civil); and
- Maintaining a workforce that is scalable, mobile and transferrable and can respond to overall changes in long-term capital demand as well as short-term project based work.

5C.8.1.2. Project Planning and Coordination Department

The Project Planning and Coordination department consists primarily of Construction Technologists. It is responsible for developing and maintaining project management practices and processes. The department also supports the Construction Services KBU field staff in planning and implementing projects.

5C.8.2 Overview of Operating Costs and FTEs

Table 5C-12 Construction Services KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	CS-General Manager	0.4	0.0	0.2	0.0	0.0	0.0	0.0	**0.6**	3
2	Regional Departments	7.6	0.0	1.1	2.1	0.7	0.0	0.0	**11.6**	377
3	Project, Planning and Coordination Departme	0.5	0.0	0.0	0.0	0.0	0.0	0.0	**0.6**	19
4	**Total (Sch 5.3 L5, Sch 16.0 L19)**	**8.6**	**0.0**	**1.4**	**2.2**	**0.7**	**0.0**	**0.0**	**12.8**	**398**

5C.8.2.1. General Manager Department

The majority of the General Manager's department budget is related to labour. This represents three FTEs: the General Manager, an administrative assistant and a Business Operations Manager.

5C.8.2.2. Regional Departments

The regional departments' workforce assists with the delivery of the Transmission, Generation, and Distribution capital and maintenance programs. The overall demand for the workforce is driven by the expansion or contraction of capital and maintenance expenditures in these programs. There are 377 FTEs charged to these programs for work performed, of which approximately 73 FTEs represents overtime which is driven by seasonal or peak demand. Across the four regions combined, there are 24 managers, 15 Field Service Administrators, and 265 trades FTEs.

The labour budget for trade positions in these departments are charged out 90 per cent to projects and programs. Overtime is charged out 100 per cent to projects and programs. The time not charged to projects and programs is allocated to safety training, technical training and other management and administrative activities such as team and safety meetings.

The non-labour expenses budgeted in these departments are for the purchase of personal protection equipment, small tools and crew supplies, required cyclical tool testing and travel for training requirements.

5C.8.2.3. Project Planning and Coordination Department

Almost all of the Project Planning and Coordination department's budget is related to labour. This represents 19 FTEs including two managers, 16 temporary project planning coordinators and one temporary records administrator. Most of the roles in this department are temporary to allow the workforce to be scaled according to project volumes. FTEs in this department charge 90 per cent of their time to projects and programs. The labour costs associated with this time are not included in the department's operating budget. The time not charged to projects and programs is allocated to Safety Training, Technical and Professional Training, and management and administrative activities such as team and safety meetings.

5C.8.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5C-13 Construction Services KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.3 L5	13.5	11.4	13.7	12.4	13.9	12.8	13.2	13.3
2	FTEs	16.0 L19	404	411	404	409	404	398	397	397

Operating costs are increasing by approximately $0.4 million from fiscal 2019 forecast to fiscal 2020 plan and by approximately $0.1 million from fiscal 2020 plan to fiscal 2021 plan, due to Standard Labour Rate increases. FTEs are planned to remain constant.

5C.9 Generation System Operations KBU

5C.9.1 Responsibilities

The Generation System Operations KBU is responsible for planning the operation of BC Hydro’s reservoirs and generation facilities and for integrating other resources into those operations to meet BC Hydro’s load obligations.

The Generation System Operations KBU plans short to mid-term (hourly up to three years) dispatch of both the Heritage Assets and the dispatchable Non-Heritage generating resources. This involves the consideration of inputs such as loads, inflows, outages, and market conditions. This KBU also determines the surplus system capability available to BC Hydro’s electricity trading subsidiary, Powerex. In addition, the Generation System Operations KBU manages BC Hydro’s water licenses as well as the Columbia River Treaty, Canal Plant Agreement, Keenleyside Entitlement Agreement and the Waneta Co-Possessors and Operating Agreement with Teck.

This KBU was called Generation Resource Management in the Previous Application. The name was changed to better reflect its role and to distinguish its functions from the Stations Field Operations KBU. There have been no material changes to the responsibilities of this KBU since the Previous Application.

The Generation System Operations KBU is composed of the following five departments:

- Planning, Scheduling and Operations Department;
- Operations Planning Department;
- Planning and Licensing Department;
- Hydrology Department; and
- Generation System Operations Department.

5C.9.1.1. Planning, Scheduling and Operations Department

This department directs the real-time operation of the BC Hydro generation system and water release facilities. This includes scheduling hourly generation of the BC Hydro system and contracted IPPs and identifying Powerex trade limits. The dispatch of these decisions is conducted by T&D System Operations KBU.

5C.9.1.2. Operations Planning Department

This department is responsible for planning water releases and generation dispatch over the medium to long-term (daily/weekly to multi-year time horizon). In addition, this department implements coordination agreements with utility partners, directs the purchase and sale of electricity from Powerex for domestic needs, sets system reservoir price signals, and forecasts the cost of operations for financial reporting purposes.

5C.9.1.3. Planning and Licensing Department

This department is responsible for managing BC Hydro’s water licenses, coordination agreements including the Columbia River Treaty and Canal Plant

Agreement, as well as conducting system analysis and modelling to determine operational and financial benefits and impacts.

5C.9.1.4. Hydrology Department

This department provides weather, inflow and wind forecasts for operational purposes throughout BC Hydro. It also manages a hydro-meteorological data collection network and maintains records of generation facility operations.

5C.9.1.5. Generation Systems Operations Department

This department provides resources, tools, and support to the Generation System Operations KBU. The department's primary areas of responsibility include management of the KBU, application support, and administrative services.

5C.9.2 Overview of Operating Costs and FTEs

Table 5C-14 Generation System Operations KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Planning, Scheduling and Operations	2.3	0.0	0.2	0.0	0.0	0.0	0.0	**2.6**	14
2	Operations Planning	2.8	0.0	0.4	0.0	0.0	0.0	0.0	**3.2**	16
3	Planning and Licensing	1.7	0.0	0.4	0.0	0.0	0.0	0.0	**2.1**	10
4	Hydrology	1.5	0.0	3.0	0.0	0.2	0.0	0.0	**4.7**	13
5	Generation Systems Operations	1.5	0.0	0.1	0.0	0.4	0.0	0.0	**2.0**	11
6	**Total (Sch 5.3 L6, Sch 16.0 L20)**	**9.9**	**0.0**	**4.1**	**0.0**	**0.6**	**0.0**	**0.0**	**14.6**	**64**

From fiscal 2016 to fiscal 2019, total operating costs for this KBU increased by $0.9 million from $13.7 million to $14.6 million. This increase was primarily driven by:

- Increased licensing and maintenance costs required to support specialized applications and models;
- Increased expenditures related to the Water Use Plan Order Reviews; and
- Increased hydrometric monitoring costs.

These cost increases were partially offset by a budget reduction of $0.2 million in fiscal 2019.

From fiscal 2016 to fiscal 2019, total FTEs for this KBU remained constant at 64.

5C.9.2.1. Planning, Scheduling and Operations Department

This department's budget mainly consists of labour costs for 14 FTEs, which includes one manager, a specialist engineer responsible for maintaining all information technology functions and 12 shift Engineers. The shift Engineers rotate through three roles which plan for the next seven days of operation, direct the real-time (24/7) operation of BC Hydro generation and water management, and support the 24/7 operation including after-the-fact analysis of operational decisions related to generation and water management.

This department also has a non-labour budget of $0.2 million for dedicated specialized desktop and local area network support due to the criticality of the technology used by the department.

5C.9.2.2. Operations Planning Department

This department's budget mainly consists of labour costs for 16 FTEs, which includes one manager and 15 FTEs organized into three sub functions: Operations Planning Engineers, Resource Coordinators, and System Optimization Engineers. Engineers in this department plan generation, plant generating capacity, water conveyance and inter-annual storage management, over a daily to multi-year time frame, in coordination with transmission and other system constraints.

This department also has a non-labour budget of $0.4 million for engineering services related to the monitoring and operations of BC Hydro's generating facilities along the Peace River.

5C.9.2.3. Planning and Licensing Department

The Planning and Licensing department's budget consists mainly of labour costs from 10 FTEs, which includes a manager and nine FTEs who work on Water License renewals, Water Use Plan Order Reviews, coordination agreements including the Columbia River Treaty and Canal Plant Agreement, and mid-term and long-term (multi-year) modelling.

This department also includes a non-labour budget of $0.4 million to mainly support resourcing requirements for Water Use Plan Order Reviews.

5C.9.2.4. Hydrology Department

The Hydrology department consists of 13 FTEs, including one manager and 12 FTEs organized into weather and climate services (daily tailored forecast products); operational runoff forecasting (daily and seasonal); hydrometric monitoring station management, and generation data analysis.

The Hydrology department also manages over $3.0 million in service contracts including:

- A cost sharing program with Environment Canada on the operations and maintenance of Canada's Water Survey Stations;
- Hydraulic consultants who operate and maintain BC Hydro's network of 76 Water Stations in Northern and Southern B.C.;
- An agreement with the University of British Columbia to provide numerical weather and wind forecasts; and
- Funding to support the Pacific Climate Impacts Consortium quantitative studies on the impacts of climate change in the Pacific region.

5C.9.2.5. Generation System Operations Department

This department's budget mainly consists of labour costs associated with 11 FTEs including the Director of Generation System Operations, a manager of business operations, a manager of business systems, administrative staff that support the KBU, and application leads who oversee the KBUs information technology applications and tools.

5C.9.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5C-15 Generation System Operations KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.3 L6	14.5	16.0	14.7	14.2	14.8	14.6	15.0	15.2
2	FTEs	16.0 L20	64	65	64	68	64	64	63	63

Operating costs are increasing by approximately $0.4 million from fiscal 2019 forecast to fiscal 2020 plan and by approximately $0.2 million from fiscal 2020 plan to fiscal 2021 plan, due to Standard Labour Rate increases. FTEs are planned to remain constant.

5C.10 T&D System Operations KBU

5C.10.1 Responsibilities

The T&D System Operations KBU is responsible for managing the real time operation of the BC Hydro generation, transmission, distribution and telecommunication systems as well as day-ahead planning of the electricity grid. This KBU relies on input from other BC Hydro departments responsible for scheduling generation, maintenance, and the interconnection of new facilities. It also coordinates with other registered entities in B.C. to ensure the reliable operation of non-BC Hydro facilities such as IPPs and B.C. entities with generation and/or transmission assets.

In addition, this KBU is responsible for managing unplanned outages, implementing BC Hydro's safety policies and procedures for transmission and distribution and supporting and implementing emergency management preparedness plans. This KBU facilitates fair and open access to the transmission grid for all customers through administration of the Open Access Transmission Tariff and the operation of the wholesale transmission market.

This KBU was called Real Time Operations in the Previous Application. The name was changed to better reflect its role and distinguish this KBU from the Line Field Operations KBU and the Generation System Operations KBU. Since the Previous Application, there have been two material changes to the responsibilities of this KBU:

- The Grid Telecom Operations department has transferred from the former Smart Technology Operations and Restoration KBU to the T&D System Operations KBU; and
- The Provincial Reliability Coordination Operations department has been added into the T&D System Operations KBU. This reflects the BCUC's anticipated appointment of BC Hydro as the Reliability Coordinator for B.C. This role was previously contracted out to Peak Reliability, which has notified BC Hydro and other entities that it will no longer provide this service.

The T&D System Operations KBU is comprised of the following seven departments:

- Operations Support Department;
- Real Time Operations Department;
- Operations Planning Department;
- Market Policy and Operations Department;
- Business Services and Administration Department;
- Grid Telecom Operations Department; and
- Provincial Reliability Coordination Operations Department.

5C.10.1.1. Operations Support Department

The Operations Support department supports the real time computer systems and applications used for electric system monitoring and control by Real Time Operations department. This involves on-site support to the system control centres during business hours as well as on-call support at all other times. The department is also responsible for compliance with the Critical Infrastructure Protection Standards applicable to T&D System Operations KBU, which are among the mandatory reliability standards adopted by the BCUC.

5C.10.1.2. Real Time Operations Department

The Real Time Operations department controls and monitors in real time more than 79,000 kilometers of transmission and distribution circuits, over 30 generating stations, and over 300 substations from BC Hydro's Fraser Valley Control Centre and the Southern Interior Control Centre. The system control centres dispatch generation, restore service when outages occur on the Power System and monitor and control equipment during maintenance and operations. The function is performed 24/7.

This department also performs the outage scheduling function, so that planned outages of generation, transmission, and distribution facilities are safely and efficiently coordinated to enable maintenance of existing facilities and commissioning of new facilities.

5C.10.1.3. Operations Planning Department

The Operations Planning department consists primarily of Power System engineers. The department studies and plans the operation of the electrical grid and coordinates operations with other utilities connected to BC Hydro. This involves examining planned outages of generation and transmission facilities as well as the addition of new facilities to determine their impact on the grid. The department undertakes seasonal studies to develop contingency plans so that operating staff are prepared to manage events on the grid each day as they arise. The department is also responsible for compliance with requirements of the Transmission Operations Standards, which are among the mandatory reliability standards adopted by the BCUC.

5C.10.1.4. Market Policy and Operations Department

The Market Policy and Operations department is the point of contact for BC Hydro's Open Access Transmission Tariff customers. The department is responsible for wholesale transmission market policies, contracts, the Open Access Transmission Tariff, and the administration of wholesale transmission services. This includes transmission pre-scheduling, settlements and billing, energy accounting, revenue reporting and forecasting, data reporting, as well as business systems sustainment and enhancements.

5C.10.1.5. Business Services and Administration Department

This department provides administrative support to employees at the Fraser Valley Control Centre and the Southern Interior Control Centre.

5C.10.1.6. Grid Telecom Operations Department

The Grid Telecom Operations department is responsible for the telecommunications network that supports critical infrastructure throughout the BC Hydro electrical system. The network provides electric system protection, stability, visibility and control to the system control centres. Employees in this department provide 24/7 onsite support to the system control centres and field workers. These employees are augmented by a support team, which tests existing and new hardware and software in a controlled laboratory environment. The testing conducted by this team identifies issues early and limits the amount of changes that are required after equipment has already been deployed onto the system.

5C.10.1.7. Provincial Reliability Coordination Operations Department

This is a new department established in October 2018. The costs are being funded internally for the remainder of fiscal 2019 from other KBUs across the Operations Business Group. Starting in fiscal 2020, the costs will be funded from the Inter-utility Operations department.

In July 2018, Peak Reliability, the existing Reliability Coordinator for B.C., announced that it would no longer provide Reliability Coordinator services after December 31, 2019. BC Hydro submitted its application for registration as the Reliability Coordinator for B.C. to the Western Electricity Coordinating Council (**WECC**) on September 4, 2018 and followed up with additional information filed with the BCUC on October 29, 2018.

The Provincial Reliability Coordination Operations department will be responsible for assessing transmission reliability, coordinating system operations, and directing actions to preserve the integrity and reliability of the Bulk Electric System for all of British Columbia.

The Reliability Coordinator function will be staffed by employees who have been certified by the North American Electric Reliability Corporation, meet annual training requirements, and have significant experience in operating or planning the Bulk Electric System. Employees in this department will use operational tools and information to analyze the reliability of the Power System on a continuous basis. They will also be responsible for the coordination and oversight to reliably operate the interconnected grid. In the event of disturbances or blackouts, these employees will intervene to ensure that the grid is restored in a coordinated manner.

5C.10.2 Overview of Operating Costs and FTEs

Table 5C-16 T&D System Operations KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Inter-utility Operations	0.0	0.0	8.9	0.0	0.0	0.0	0.0	**8.9**	-
2	T-Control Centres	0.7	0.0	0.0	0.0	0.0	0.0	0.0	**0.7**	-
3	D-Load Dispatch-Engineering Support	1.2	0.0	0.1	0.0	0.0	0.0	0.0	**1.3**	-
4	D-Load Dispatch-FO Support	1.5	0.0	0.1	0.0	0.0	0.0	0.0	**1.6**	-
5	Operations Support	3.3	0.0	1.5	0.0	1.5	0.0	0.0	**6.3**	27
6	Real Time Operations	12.9	0.0	0.3	0.1	0.2	0.0	0.0	**13.4**	96
7	Operations Planning	1.4	0.0	0.0	0.0	0.2	0.0	0.0	**1.6**	10
8	Market Policy and Operation	0.7	0.0	0.0	0.0	0.0	0.0	0.0	**0.7**	6
9	Business Services and Administration	0.2	0.0	0.0	0.0	0.0	0.0	0.0	**0.2**	4
10	Grid Telecom Operations	2.2	0.0	0.7	0.1	0.5	0.0	0.0	**3.4**	35
11	**Total (Sch 5.3 L7, Sch 16.0 L21)**	**24.1**	**0.0**	**11.6**	**0.2**	**2.4**	**0.0**	**0.0**	**38.3**	**178**

From fiscal 2016 to fiscal 2019, total operating costs for this KBU increased by approximately $5 million, from $33.3 million to $38.3 million. The increase was primarily driven by:

- The centralization of WECC and Peak Reliability funding from across BC Hydro into the T&D System Operations KBU (the centralization is net neutral for BC Hydro as a whole);
- Increases in Peak Reliability's fees, denominated in US$;
- A lower Canada to U.S. exchange rate which increased the cost of WECC and Peak Reliability fees;
- The transfer of funding for applications related to the Energy Management System and the Distribution Management System from other KBUs to the Operations Support department; and
- Increased funding for system maintenance in the Grid Telecom Operations department to support and maintain an increased number of technologies.

From fiscal 2016 to fiscal 2019, total FTEs in this KBU increased by 14 from 164 to 178. This increase was primarily driven by the additional resources required in the Grid Telecom Operations department to support and maintain an increased number of technologies and in the Operations Support department to manage an increase in system maintenance requirements related to the transfer of the additional applications, as mentioned above.

5C.10.2.1. Inter-utility Operations Department

This department does not contain any FTEs. It holds the funding for BC Hydro's mandatory annual membership fees for Peak Reliability and WECC. This budget has increased since fiscal 2016 due to the centralization of funding for these fees from across BC Hydro into the T&D System Operations KBU, increases in PEAK Reliability's fees, and lower Canada to U.S. exchange rates.

5C.10.2.2. Transmission Control Centres Department

This department does not contain any FTEs. When Communication Protection and Control Technologists from stations operations perform corrective work that supports real time monitoring and control, they charge to this department. Approximately 8,000 hours of work is charged to this department each year. This work program is managed by the Real Time Operations department.

5C.10.2.3. Distribution-Load Dispatch-Engineering Support Department

This department does not contain any FTEs. When engineers from the Integrated Planning Business Group conduct power quality investigations, they charge to this department. Approximately 24,000 hours of work is charged to this department each year. This program is managed by the Operations Planning department.

5C.10.2.4. Distribution-Load Dispatch-Field Operations Support Department

This department does not contain any FTEs. When the PLTs from the Line Field Operations KBU perform customer switching activities on distribution equipment to restore power, they charge to this department. Approximately 17,000 hours of work is charged to this department each year. The costs for this program are held by the Real Time Operations department.

5C.10.2.5. Operations Support Department

This department manages the real time systems and consists of 27 FTEs that provide extended hours of on-site technical support for the critical hardware and applications to operate the Power Systems at the Fraser Valley Control Centre and the Southern Interior Control Centre. The department also manages approximately $3 million in licenses, and support and maintenance contracts with external vendors.

5C.10.2.6. Real Time Operations Department

This department consists of 96 FTEs which are required to support 24/7 operation of the Fraser Valley Control Centre and the Southern Interior Control Centre. This includes one Director, 12 System Control Managers, three Specialist Engineers, one Engineering Technical Assistant, one Reliability Coordination Manager and 78 Operators. The Operators are assigned to consoles at the Fraser Valley Control Centre and the Southern Interior Control Centre from which they control various portions of the Power System across the province. The Operator staffing model is built around providing 24/7 coverage and meeting mandatory training needs, while recognizing that staffing can be reduced to a minimum during weekends, evenings and holidays when there is less planned work on the Power System.

5C.10.2.7. Operations Planning Department

This department consists of 10 FTEs and three Engineers-in-Training. These employees:

- Assess approximately 6,500 planned transmission system outage requests per year. These requests can take anywhere from 30 minutes to eight hours and involve engagement, analysis, and the preparation of contingency plans;
- Create support plans for approximately 25 major distribution outages per year, to reduce or eliminate customer impacts. These plans take multiple days to complete including consultation and coordination;
- Develop approximately 20 restoration and mitigation plans per year. These plans are developed in real time during major storm and fire events and take approximately one to two days to complete; and
- Draft and update approximately 120 base operating procedure documents per year. These documents include detailed technical requirements for advanced power system controls and drafting can take multiple days to complete.

5C.10.2.8. Market Policy and Operations Department

This department consists of six FTEs including one manager, one Contract Specialist, one Business System Specialist, and three coordinators. This department manages pre-scheduled sale of transmission service and ancillary services. In fiscal 2018, the department billed over 27.7 million MWh of transmission service and generated $16.5 million in revenue from non-BC Hydro customers.

5C.10.2.9. Business Services and Administration Department

This department consists of four FTEs who provide administrative support to the 150 employees based at the Fraser Valley Control Centre and the Southern Interior Control Centre.

5C.10.2.10. Grid Telecom Operations Department

This department consists of 35 FTEs including one manager, one Field Manager, one Project Manager, two Senior Engineers, 10 Telecom Network Controllers, 13 Communication Protection and Control Technologists, two Project Resource Assistants, one Field Service Administrator, and four FTEs that represent overtime which is driven by peak demand. These FTEs operate BC Hydro's telecom infrastructure, maintain a 24/7 network controller desk, and provide engineering support to more than 40 applications and 1,000 devices at over 200 sites.

5C.10.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5C-17 T&D System Operations KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.3 L7	36.2	38.2	36.7	40.4	37.4	38.3	39.8	40.3
2	FTEs	16.0 L21	165	170	165	174	165	178	197	197

Operating costs are increasing by approximately $1.5 million from the fiscal 2019 forecast to the fiscal 2020 plan due to Standard Labour Rate increases of $1.1 million and funding for NERC CIPv5 sustainment resources of $0.4 million (discussed further below). Operating costs are increasing by approximately $0.5 million from the fiscal 2020 plan to the fiscal 2021 plan due to Standard Labour Rate increases.

FTEs are planned to increase by 19 from the fiscal 2019 forecast to the fiscal 2020 plan. This includes 13 FTEs related to the Provincial Reliability Coordination Operations department, five FTEs related to the sustainment of NERC CIPv5 (discussed further below) as well as one FTE addition through the Workforce Optimization Program, which is discussed further in Chapter 5, section 5.6.1.

The increase in FTEs from the fiscal 2019 RRA to the fiscal 2019 forecast was primarily driven by the Workforce Optimization program, described in Chapter 5, section 5.6.1.

Starting in fiscal 2020, the Provincial Reliability Coordination Operations department will require a budget of $2.5 million which will be funded from within the T&D System Operations department through the re-allocation of the budget previously required for payments to Peak Reliability.

The NERC CIPv5 Program is the enterprise wide program to attain compliance with NERC CIPv5 standards by October 1, 2018. This is a regulatory requirement. NERC CIP is a collection of physical and electronic security standards designed to protect the computer/electronic equipment used to control and monitor the Bulk Electric System from cyber-attack and sabotage.

The BCUC has mandated that BC Hydro comply with NERC CIP as part of the BC Mandatory Reliability Standards Program. The program successfully achieved compliance by the regulatory deadline and is in the process of transitioning into operations.

BC Hydro has re-purposed 18 existing roles to support compliance with NERC CIPv5. The funding for these roles has been provided from within existing operating budgets.

5C.11 Business Unit Support KBU

5C.11.1 Responsibilities

The Operations Business Unit Support KBU holds the budget for the Executive Vice President, Operations and for business group costs that are not specifically related to any KBU.

5C.11.2 Overview of Operating Costs and FTEs

Table 5C-18 Business Unit Support KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Executive VP	1.2	0.0	0.8	0.0	0.0	0.0	0.0	**2.0**	3
2	Business Support	2.2	0.0	0.4	0.0	0.0	0.0	0.0	**2.6**	-
3	Waneta	0.0	0.0	6.4	0.0	0.0	0.0	0.0	**6.5**	-
4	**Total (Sch 5.3 L8+L12, Sch 16.0 L22)**	**3.5**	**0.0**	**7.6**	**0.0**	**0.0**	**0.0**	**0.0**	**11.1**	**3**

- The Executive VP department holds the labour budget for three FTEs: the Executive Vice-President of Operations, a Strategic Business Advisor and an administrative assistant. It also includes a labour and services budget to support BC Hydro's Stations Work Planning and Execution initiative.
- The Business Support department contains $1.9 million in labour costs for apprentices performing work in generation plants as well as labour costs for all Operations employees conducting union business for IBEW and MoveUp. These costs are invoiced to IBEW and MoveUp. This department includes the budget for BC Hydro's annual Safety Rodeo.
- The Waneta department contains the maintenance budget for the Waneta generating facility of which $3.8 million in costs are offset in Miscellaneous Revenue, as shown in Appendix A, Schedule 15.0.

5C.11.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5C-19 Business Unit Support KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.3 L8+L12	6.6	5.4	6.6	6.3	6.7	11.1	11.1	11.3
2	FTEs	16.0 L22	3	3	3	3	3	3	5	5

Operating costs are planned to remain constant from the fiscal 2019 forecast to the fiscal 2020 plan. Due to changes to BC Hydro's apprentice program, $1.9 million is being transferred from the Business Support KBU to the Stations Asset Planning and Stations Field Operations KBUs. This is offset by an increase of $1.9 million in maintenance costs at the Waneta generating facility, representing the first full year of ownership related to BC Hydro's purchase of the remaining two-thirds interest in that facility, as discussed in Chapter 4, section 4.2.3. These additional costs are offset through Miscellaneous Revenue, as shown in Appendix A, Schedule 15.0, line 21.

Operating costs are increasing by approximately $0.2 million from fiscal 2020 plan to fiscal 2021 plan due to cost increases under the terms of the Waneta agreement.

Fiscal 2020 to Fiscal 2021

Revenue Requirements Application

Chapter 5D

Operating Costs

Safety

Table of Contents

List of Figures

List of Tables

5D.1 Introduction – Safety Business Group

Chapter 5D provides and explains in detail the composition of, and rationale for, the operating costs of the Safety Business Group. The Safety Business Group is one of six Business Groups in the organization and serves as a Support function of the Plan-Build-Operate-Support model.

The Safety Business Group budget was developed as part of the budgeting process outlined in Chapter 5, section 5.4. The information provided in this Chapter 5D demonstrates the basis for the entirety of the Business Group and KBU budgets, rather than focussing only on incremental cost requirements.

Chapter 5D is organized as follows:

- Section 5D.2 provides an overview of the organization and responsibilities of the Safety Business Group;
- Section 5D.3 provides the operating costs and FTE information for the Safety Business Group as a whole,[232] and
- Sections 5D.4 to 5D.8 provide more detailed information on the responsibilities, cost and FTEs for each KBU within the Safety Business Group. The operating costs and FTE information for each KBU is broken out into two sections:[232]
  - ▶ Overview of Operating Costs and FTEs – This subsection explains the starting operating costs and FTEs based on the fiscal 2019 forecast; and
  - ▶ Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs – This subsection explains any incremental changes between fiscal 2019 forecast and fiscal 2020 and fiscal 2021 plan.

[232] Please note the amounts presented in the tables in these sections may not add due to rounding.

5D.2 Overview of Safety Business Group Organization and Responsibilities

The Safety Business Group has a clear focus – we make it easier for people to work safely. The scope of this mandate includes employees, contractors, and the safety of the public. This Business Group provides safety support services, including training, skill development and overall physical security, so that every KBU in BC Hydro can perform their work safely.

The Safety Business Group consists of the following KBUs:

Business Group	Key Business Unit
Safety	Safety System and Assurance Learning and Development Field Safety Services Security and Emergency Management Business Unit Support

Since the Previous Application, the Learning and Development KBU has been added to the Safety Business Group from the previous Training, Development and Generation Business Group.

Between April 2005 and September 2012, BC Hydro employees suffered 15 permanent disabling injuries (approximately two per year). Between April 1999 and August 2010, there were eight fatalities (all electrical workers). Since August 2010, BC Hydro has had no employee fatalities. Three permanent disabling injuries have occurred in this time period. The decrease in fatalities and disabling injuries reflects BC Hydro's concerted effort to improve worker safety.

Despite a reduction in injuries and fatalities due to electrical worker accidents, BC Hydro continues to have a higher all injury frequency rate and lost time injury rate, compared to industry peers in the Canadian Electricity Association. Accordingly, BC Hydro's focus going forward is to reduce the frequency of other incidents leading to injury.

The figures below demonstrate the opportunity to further reduce worker injuries at BC Hydro as well as BC Hydro's progress on completing corrective actions on time and increasing the reporting of safety incidents.[233] Developing effective corrective actions and learning from reported incidents will lead to further improvements in safety performance over time.

Figure 5D-1 Lost Time Injury Frequency – Employees[234]

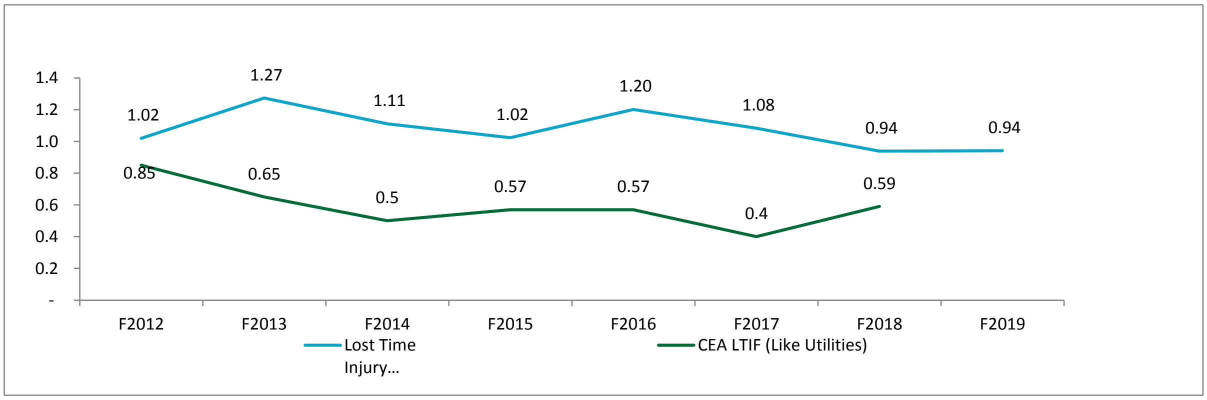

Figure 5D-2 All Injury Frequency – Employees[235]

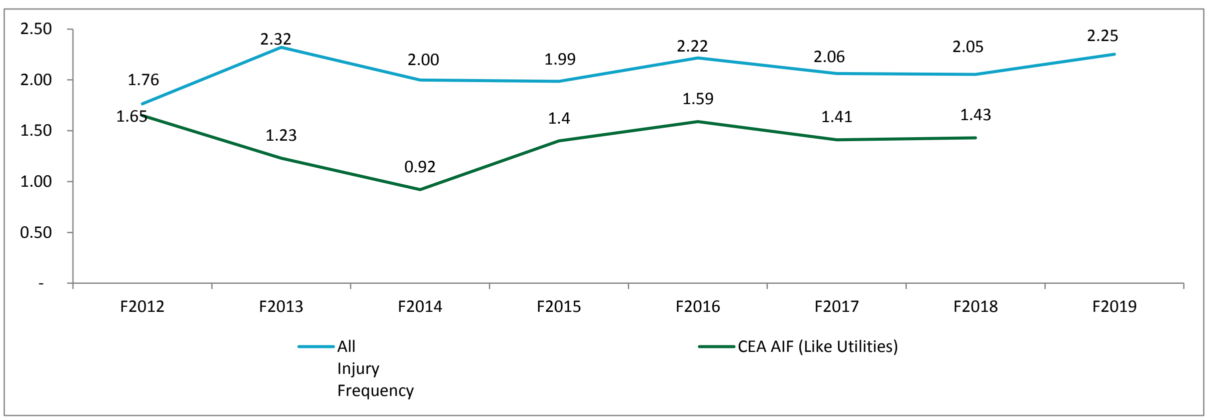

[233] In the charts below, CEA LTIF includes a subset of companies with over 1,500 employees. This subset includes companies with a mix of generation, transmission, and distribution work, as well as construction.

[234] Lost Time Injury Frequency is determined by multiplying the number of Lost Time Injuries incurred, by 200,000 (to represent regular hours worked per employee in a year) and then dividing by the total number of hours worked in that period.

[235] All Injury Frequency is determined by multiplying the number of Lost Time Injuries and Medical Treatment Injuries incurred in a year, by 200,000 (to represent regular hours worked per employee in a year), then dividing by the total number of hours worked in that period.

Figure 5D-3 Corrective Actions Completed on Time[236]

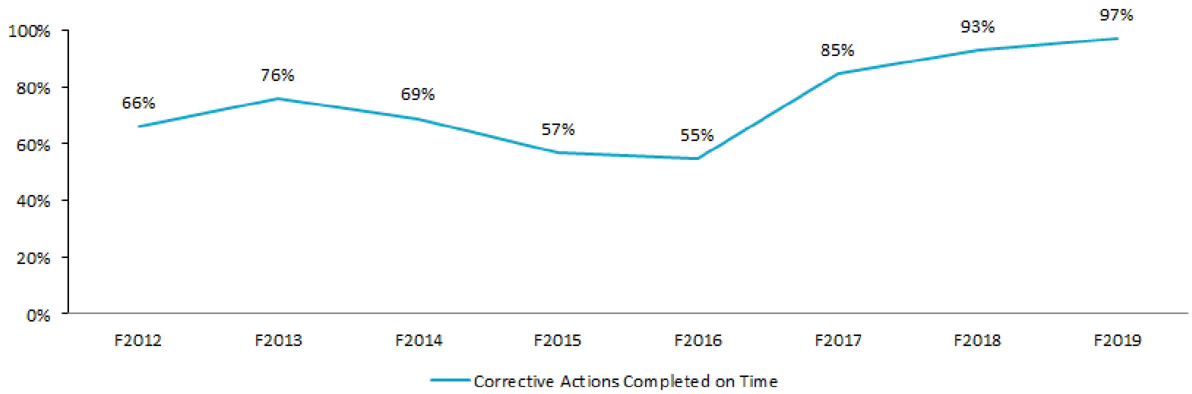

Figure 5D-4 Employee Near Miss / Good Catch Reporting[237]

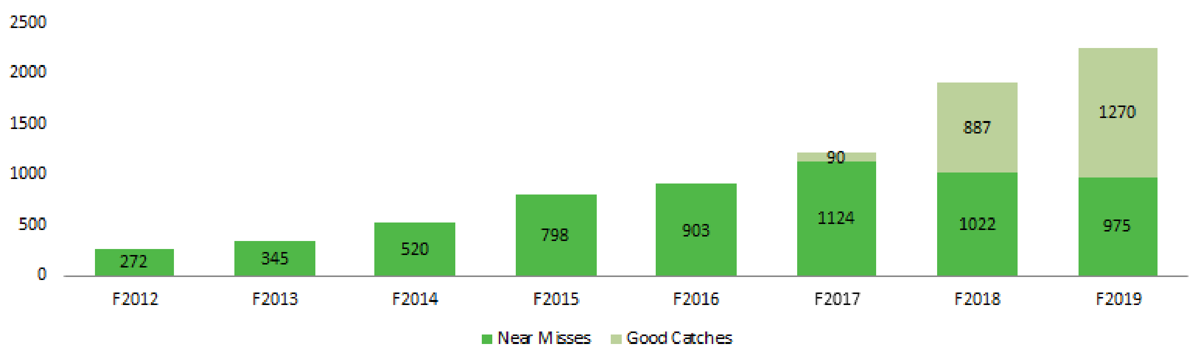

Over the test period, BC Hydro plans to focus on the following key Safety initiatives:

- Investing in improvements to our Safety and Health Management System;
- Improving incident reporting;
- Building better corrective actions;
- Focusing on improvements to safe work observations;
- Improving safety documentation;

236 This percentage measures the percentage of corrective actions completed by the due date.

237 Good catches were piloted in fiscal 2016 and incorporated into BC Hydro's Incident Management System in fiscal 2017.

- Performing job hazard assessments of the work we do to improve training and procedures;
- Advancing worker ergonomics programs;
- Meeting NERC CIPv5 requirements, as discussed further in Chapter 5C, section 5C.10.3;
- Focusing on contractor safety to support our capital program; and
- Dedicating resources to support confined space entry work, consistent with regulatory requirements.

In a large and complex organization like BC Hydro, the most effective way to deliver a safety program consistently and effectively is to build it into a management system. Our Safety and Health Management System provides a framework and a set of consistent program elements as well as supporting processes and documents. These elements integrate people and processes to keep workers safe and meet internal and regulatory safety and health requirements. When integrated into daily activities, the Safety and Health Management System contributes to BC Hydro's long-term success by:

- Clearly communicating the organization's accountabilities and responsibilities for safety and health;
- Improving our management and control of safety and health risks from planning to work execution;
- Making it easier for workers to get the information and support they need to do their jobs safely;
- Improving our culture by integrating safety and health in everything we do; and
- Improving safety and health performance through continual improvement.

Figure 5D-5 below provides a visual representation of the Safety and Health Management System.

Figure 5D-5 Safety and Health Management System

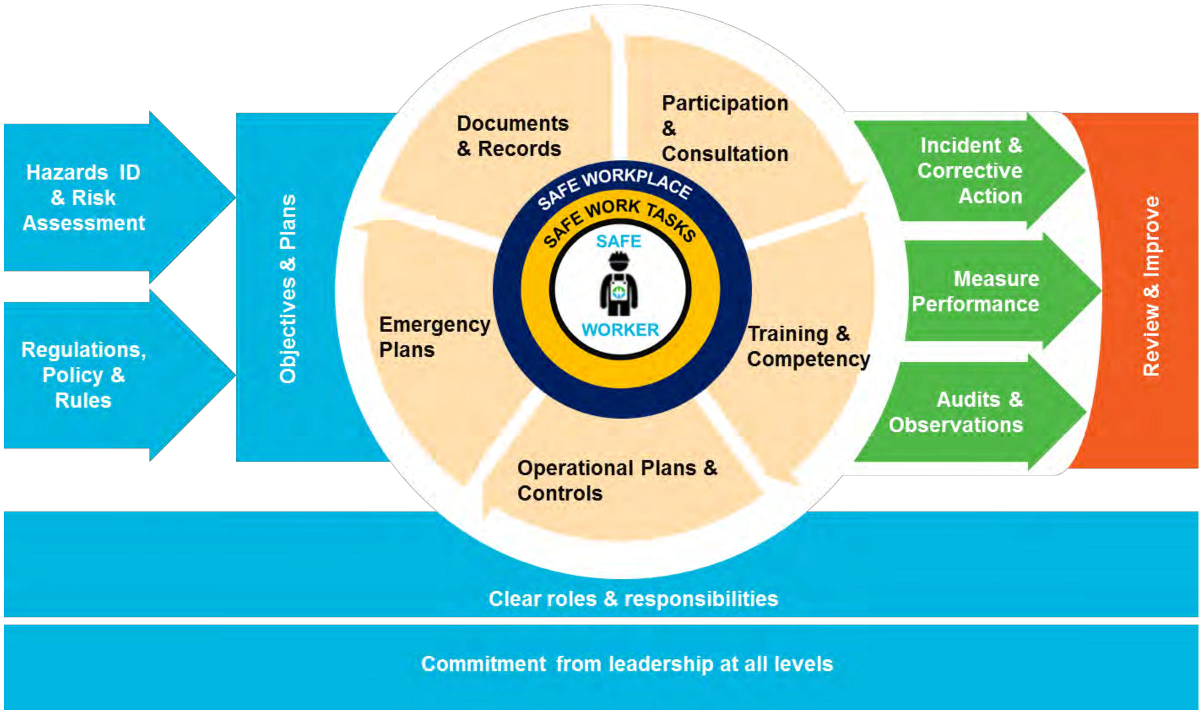

Figure 5D-6 below provides further detail on each of the elements of the Safety and Health Management System.

Figure 5D-6 Diagram of the 14 Elements That Make up the BC Hydro Safety Management System

	Element	Purpose	Teams/Departments
Plan	Leadership and Commitment	Safety is a core value supported at every level by our policies and actions.	Executive Team Safety System and Assurance
	Roles, Responsibilities, and Accountabilities	Everyone is clear about their function to work safely.	Worker Safety Programs Learning and Development
	Hazard Identification and Risk Assessment	All hazards are identified, and informed risk decisions are made at the right level.	Process Safety and Regulatory Risk Management Field Safety Services Learning and Development
	Legal and Other Requirements	Regulations and rules are identified, interpreted and integrated into clear work procedures.	Process Safety and Regulatory Risk Management Worker Safety Programs Field Safety Services
	Goals, Objectives and Plans	Improving the right things at the right time with the right people.	Safety Planning Analytics Field Safety Services
Do	Training and Competency	Relevant and timely training, verified competency, available to workers.	Learning and Development Field Safety Services
	Participation, Consultation and Communication	Empowering workers to be involved and be heard.	Safety Planning Analytics Worker Safety Programs Field Safety Services
	Document Control and Records Management	Easy access to clear, current, concise and relevant safety information.	Worker Safety Programs
	Operational Planning and Control	Workers are provided what they need to manage risk and meet safety requirements.	Worker Safety Programs Process Safety and Regulatory Risk Management Learning and Development Field Safety Services
	Emergency Preparation and Response	Workers are equipped for an emergency with plans, training and supplies.	Emergency Management
Check	Incident, Non-Conformity, and Corrective Action	Incidents, near misses, good catches are reported and learnings lead to systemic improvement.	Safety Incident Management Field Safety Services
	Performance Monitoring and Measurement	Check our performance against our goals and objectives to see if we have, or can improve.	Safety Planning Analytics
	Audit and Assurance	Check to confirm we are doing what we said we must.	Safety Audits Field Safety Services Learning and Development
Act	Management Review and Continual Improvement	Senior leaders are accountable to respond to safety performance and support improvement opportunities.	Executive Team Safety System & Assurance

5D.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTE Summaries.

This section addresses planned operating costs and FTEs for the Safety Business Group. The following are some key points of note with respect to the information provided in Figure 5D-7, Table 5D-1 and Figure 5D-8, Table 5D-2 and Table 5D-3:

- The Field Safety Services KBU (25 per cent) and the Learning and Development KBU (45 per cent), charge out a significant portion of their labour costs to maintenance and capital work programs;
- Apprentices and trainees FTEs reside in the Learning and Development KBU and comprise over 45 per cent of the total FTEs in the Safety Business Group. These FTEs represent only 13 per cent of the total operating budget for the Safety Business Group because they charge out their labour to maintenance and capital work programs. Major categories for the apprenticeship and trainee roles include Power Line Technicians, Electricians, Mechanics, Utility Fleet Mechanics, Distribution Design and Customer Connect technologists, Communication Protection and Control technologists and Engineers; and
- Operating cost increases from fiscal 2019 forecast to fiscal 2021 plan are primarily driven by increases to Standard Labour Rates (discussed further in Chapter 5, section 5.5.2.2) as well as NERC CIPv5 requirements (discussed further in Chapter 5C, section 5C.10.3).

Planned operating costs for the Safety Business Group are approximately $56.8 million in fiscal 2020 and approximately $57.5 million in fiscal 2021. The operating costs for the Safety Business Group are summarized by KBU in Figure 5D-7. Additional cost details are provided in Table 5D-1 below.

5D.4 Safety System and Assurance KBU

5D.4.1 Responsibilities

The Safety System and Assurance KBU develops and implements the elements of the Safety and Health Management System, consistent with the requirements of the ISO 45001 standard. This provides a structured, consistent and disciplined system for managing health and safety risk across BC Hydro and for supporting continual improvement.

This Key Business Unit consists of the following departments:

- Office of the Director of Safety Assurance Department;
- Safety Planning, Analytics and Incident Management Department;
- Process Safety and Regulatory Risk Management Department; and
- Worker Safety Programs Department.

5D.4.1.1. Office of the Director of Safety Assurance Department

In addition to overall management of the KBU, this department is responsible for:

- Introducing safety programs into worker processes to increase the safety of workers and reduce regulatory compliance risk; and
- Completing safety audits to assess BC Hydro's compliance with occupational health and safety requirements as well as the effectiveness of programs, procedures and corrective actions. These field-focused audits support quality assurance and system improvements by comparing regulatory and internal requirements with observed practices in the field. The findings from these audits lead to corrective actions that improve programs as well as the overall Safety and Health Management System.

5D.4.1.2. Safety Planning, Analytics and Incident Management Department

This department includes the following three teams:

- The Safety Systems and Business Planning team is the owner of the Safety Incident Management System[239]. The team provides support, subject-matter expertise, prioritization of requests, governance, business enhancements, and daily operations of the system. This team also provides support and content management for the Qualification and Learning Management System[240] and leads the BC Hydro Safety Business Planning process. Both of these systems are key components of the overall Safety and Health Management System;
- The Safety Analytics team produces analytical reports on Safety performance. The team analyzes lagging indicators to review past performance, as well as leading indicators to identify and highlight potential risks based on common incidents. The team liaises with other utilities and is an active member of the Canadian Electricity Association to benchmark analytics across Canadian

[239] The Safety Incident Management System (**IMS**) is a module of SAP, employed company-wide to report, investigate, and communicate safety incidents, and to document and track completion of related corrective actions.

[240] The Qualification and Learning Management System is an Enterprise Learning Management System used to deliver, access, schedule and report on training activities. It is also used to manage employee qualifications.

utilities and participates in joint activities to identify trends and proactively address changing safety risks in the industry; and

- The Safety Investigators team triages all safety incidents (injuries, near miss and good catch events) that occur at BC Hydro, provides subject matter expertise to assist field managers with simpler investigations, leads the incident investigation process for complex investigations and ensures corrective actions address root causes and WorkSafeBC requirements. When appropriate, the team also conducts more in-depth safety investigations for specific BC Hydro incidents to determine if additional learnings can be acquired and shared across the company.

5D.4.1.3. Process Safety and Regulatory Risk Management Department

This department includes the following five teams.

The Policy and Regulations team manages BC Hydro's relationship with safety regulators. This includes:

- Monitoring and influencing changes to regulators' policies and regulations;
- Maintaining the Safety Risk Profile, which assesses the risk to BC Hydro workers from the 61 hazards identified at BC Hydro workplaces; and
- Coordinating and supporting efforts throughout BC Hydro to address regulatory orders as well as supporting appeals and variance applications to safety regulators;

The Public Safety team is responsible for increasing public awareness of electrical safety at home, at work and in the community. The team also conducts risk assessments and oversees the implementation of public safety control measures at our dams and in public use management areas. This team works closely with the Dam Safety KBU. The public safety team minimizes the risk to the public caused by the operations of BC Hydro's facilities while the Dam Safety KBU is accountable for the safety of BC Hydro's dams under both normal and extreme conditions.

The Fire Risk Management team is responsible for developing and maintaining a program to assess fire related risks, including wildfires, as well as providing technical support, governance and assurance functions. The team supports the organization in meeting its obligations under the Wildfire Act and acts as the internal authority, providing expert advice and support on other fire-related topics. The team works closely with the Program and Contract Management KBU, the Security and Emergency Management KBU and the Engineering KBU to collectively manage this cross-organizational risk.

The Safety Engineering and Risk Management team provides risk assessments of various safety related business process, broader Occupational Health and Safety topics, as well as unique and challenging safety issues on capital projects and asset management programs. This team also provides governance, advice and support to key safety functions such as Safety by Design,[241] Job Hazard Assessments[242] and human factors, and other technical safety issues. The engineers on this team have various formal disciplines and are included in this KBU rather than the Engineering KBU, given their expertise in human factors, ergonomics and safety.

The Work Methods team is responsible for the development and maintenance of clear, safe work procedures and evaluation of tools used by BC Hydro for some of the highest risk work on the Power System (i.e., energized/de-energized work, fall hazards, arc flash). The team supports the Operations Business Group, responding to questions regarding work procedures and rules and works with vendors to evaluate new tools and equipment to improve the safety and efficiency of the procedures. The group also reviews proposed capital project designs (with respect

[241] Safety by Design is an application of engineering principles and standards for designing features into new and existing facilities to ensure that they are inherently safe.

[242] Job Hazard Assessment is a technique to identify potential hazards present in the steps of a task or job and recommend mitigations so that each step is safe.

to energized and de-energized workability) so that BC Hydro has the appropriate work procedures and tools in place to build, operate, maintain and repair new assets.

5D.4.1.4. Worker Safety Programs Department

This department provides oversight of the governance model used for all safety programs and includes the following two teams:

- The Worker Safety Programs team collaborates with other departments to deliver a range of projects and programs to improve safety at BC Hydro, such as the Field Access to Safety Information,[243] as well as the Contractor Safety Program,[244] and
- The Occupational Safety and Hygiene team translates safety regulation and business decisions into programs for complex topics (such as asbestos or hazardous materials) that support safety management across BC Hydro's KBUs. This team also provides occupational hygiene and ergonomics expertise and advice to the Operations Business Group and the Field Safety Services KBU.

5D.4.2 Overview of Operating Costs and FTEs

Table 5D-4 Safety Systems and Assurance KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Director Safety Assurance	1.1	0.0	0.1	0.0	0.0	0.0	0.0	**1.3**	6
2	Safety Planning, Analytics and Incident Mgmt	1.7	0.0	0.1	0.0	0.1	0.0	0.0	**1.9**	14
3	Process Safety and Regulatory Risk Mgmt	2.9	0.0	2.4	0.0	0.0	0.0	0.0	**5.4**	19
4	Worker Safety Programs	1.9	0.0	2.5	0.1	0.0	0.0	0.0	**4.4**	13
5	**Total (Sch 5.4 L1, Sch 16.0 L24)**	**7.6**	**0.0**	**5.1**	**0.1**	**0.1**	**0.0**	**0.0**	**12.9**	**52**

[243] Field Access to Safety Information is an initiative to separate rules and procedures, make them easier to find, and to improve the quality of safety information.

[244] The Contractor Safety Program is an initiative to provide a systematic and consistent approach to ensuring BC Hydro meets its Owner duties, as described in the *Workers Compensation Act* part 119, for safety in contracted work.

5D.4.2.1. Office of the Director of Safety Assurance Department

The majority of this department's budget relates to labour costs for six FTEs:

- Four FTEs represent the Director of the Safety Assurance KBU and an administrative assistant as well as a project manager and support staff who are responsible for improving the implementation of safety programs within BC Hydro (e.g., confined space, asbestos); and
- Two FTEs are trained auditors who complete a total of three to four safety audits each year and coordinate audit findings across the organization. Each audit takes three to four months to complete and typically involves visiting more than 10 sites across the BC Hydro system and conducting many interviews. These audits are focused on safety and on practices observed in field, which is different than the audits performed by the Internal Audit department of the Finance KBU. These audits support the Audit and Assurance element of the Safety and Health Management System.

5D.4.2.2. Safety Planning, Analytics and Incident Management Department

The majority of this department's budget relates to labour costs for 14 FTEs as follows:

- One FTE is the department manager;
- Three FTEs on the Safety Systems and Business Planning team. This team administers the Incident Management System, which receives over 6,000 entries per year as well as the Learning Management System, which tracks and administers more than 900 courses. The team is also responsible for the development of BC Hydro's annual safety plan;
- Five FTEs are Safety Analysts on the Safety Analytics team. All safety and learning analytics are provided through this team including monthly dashboards for each KBU and regular reports to BC Hydro's Executive Team and Board of Directors; and

- Five FTEs are Safety Incident Investigators who triage an average of 3,000 employee good catches, near misses and injuries per year and support managers after an incident to perform incident investigations and complete corrective actions so that WorkSafeBC requirements are met. The team also participates in the development and implementation of complex corrective actions.

5D.4.2.3. Process Safety and Regulatory Risk Management Department

This department's labour budget represents costs related to 19 FTEs as follows:

- One FTE is the department manager;
- Four FTEs provide governance of public safety programs related to safety around water and electricity. These FTEs oversee adherence to the Canadian Dam Association Guidelines for Public Safety around Dams and Waterways. They also conduct approximately 22 field risk assessments and implement controls to 65 public use areas and generation facilities each year. These FTEs also coordinate electrical safety awareness training and communications to the public, high risk trades and first responders. In fiscal 2018, this training was delivered to 9,679 members of the public and trades as well as over 10,000 elementary and high school students. These FTEs also provide outreach at approximately 25 trades safety events per year and are responsible for BC Hydro's 19 Public Use Management Areas[245] which have a total of approximately 1.7 million visitors annually. The operating costs for BC Hydro's Public Use Management Areas were $1.03 per visitor day in fiscal 2019 which compares favorably to operating costs of B.C. Parks;[246]

[245] Public Use Management Areas are recreational facilities owned and operated by BC Hydro to manage public use and safety around reservoirs and redirect the public away from hazards associated with generating assets to sites under BC Hydro control where these hazards are managed.

[246] BC Parks operating costs/visitor days in most recent annual report is $2.17 or $1.16 after accounting for revenues from user fees. (see: http://www.env.gov.bc.ca/bcparks/research/statistic_report/statistic-report-2015-2016.pdf?v=1547851037669).

- Two FTEs are Regulatory Risk Management professionals who are primarily responsible for managing BC Hydro's relationship with WorkSafeBC. They monitor WorkSafeBC policy and regulations as well as over 30 additional safety-related Acts and regulations to identify, communicate and oversee regulatory changes. The team responds to over 140 requests each year for regulatory interpretations or risk analysis and supports the assessment and response to over 30 regulatory inspection reports and five to 10 regulatory orders, variances, or appeals annually;
- Two FTEs are Fire Risk Management professionals. These FTEs advise approximately 25 capital projects with more complex fire risk management requirements each year. They also develop or revise fire safety plans for approximately 25 BC Hydro properties and stations annually. In addition, these FTEs provide tactical support for major fires, requiring approximately five to 10 follow-up investigations each year. The team also provides support to other fires that impact our system annually (e.g., wildfires);
- Five FTEs provide safety risk assessment leadership and support to BC Hydro. This includes participation in and quality control assessment of 30 to 35 capital projects per year through the Safety by Design process, development of the Job Hazard Assessment process (26 Job Hazard Assessments were produced in fiscal 2018), and the development and annual update of the BC Hydro Safety Profile. This team also performs an average of six risk assessments per year on complex, high risk topics where specialist expertise is required and maintains 46 safety equipment specifications. Lastly, the team is developing and will be responsible to maintain a set of Human Factors design standards for the Engineering KBU; and
- Five FTEs are engineers in the Work Methods team. This team reviews and updates approximately 70 existing safe work procedures each year and

develops approximately 10 new procedures each year to address gaps as well as changes to regulations and standards.

The $2.4 million in non-labour costs for this department include $1.7 million for the operation of Public Use Management Areas, with the remainder funding public safety communications as well as consultants to support Fire and Public Safety work.

5D.4.2.4. Worker Safety Programs Department

This department's labour costs represent 13 FTEs as follows:

- Two FTEs represent a department manager and an administrative assistant;
- Five FTEs deliver safety projects that improve and sustain processes to enable frontline workers and others to receive and use safety and hazard information. This includes maintaining and improving the SafeHub[247] document management system which contains over 2,100 documents and ensuring effective governance for the 200 documents that are added, updated or removed from the system each year; and
- Six FTEs lead the development and implementation of formal safety programs (e.g., asbestos and other hazardous materials, ergonomics, fall protection, confined space, storage rack safety, and winter safety). These safety programs are in place so that BC Hydro protects workers and meets regulatory requirements to manage and control worker exposure to hazardous materials such as asbestos as well as hazards such as confined spaces and falling from heights.

This department's non-labour costs are primarily allocated to the Field Access to Safety Information project which aims to standardize, simplify and separate rules from procedures. This multi-year effort will make it easier for our workers to find the

[247] Safehub is an online and offline (via an App) available compilation of all safety documentation. A significant amount of document cleanup and removal of duplication/conflicting documents was undertaken (and is ongoing) to populate the Safehub repository.

information they need to work safety and efficiently and reduce document administration burden. This project responds to the top concern raised in over 500 interviews with BC Hydro employees regarding safety issues and is following guidance from a WorkSmart process that BC Hydro conducted to identify opportunities to improve efficiency. The project costs primarily consist of consultants and cross-charges by subject matter experts from other departments.

5D.4.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5D-5 Safety System and Assurance KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.4 L1	14.9	14.5	14.8	14.7	14.7	12.9	13.1	13.3
2	FTEs	16.0 L24	52	48	52	49	52	52	52	52

Operating costs are increasing by approximately $0.2 million from the fiscal 2019 forecast to the fiscal 2020 plan and by approximately $0.2 million from the fiscal 2020 plan to the fiscal 2021 plan, due to Standard Labour Rate increases. FTEs are planned to remain constant.

5D.5 Learning and Development KBU

5D.5.1 Responsibilities

The Learning and Development KBU leads the training and competency element of the Safety and Health Management System and supports the other elements of the system. It oversees the ongoing sustainment of a trained, competent and qualified workforce at BC Hydro, addressing the needs of existing workers and providing technical training for new workers (apprentices, engineers-in-training and trainees). This KBU enables the continuous improvement of electrical safety through projects, training, mentorship and coaching.

Learning and Development applies the 70-20-10 learning model where 70 per cent of learning is on the job, 20 per cent is through relationships like coaching and mentoring and 10 per cent is through attendance at courses. This KBU also applies an industry standard model for training course content development that includes analyzing, designing, developing, implementing and evaluating courses and curriculum. This includes trades, technical, safety, leadership, professional development, regulatory and corporate compliance training.

Most of the Learning and Development KBU resides at the Trades Training Centre, which was built in 2013 to meet the unique training requirements of BC Hydro, as a major electric utility. Located on BC Hydro's Surrey Campus, the Trades Training Centre provides the only hands-on training facility within British Columbia for many of our critical trades such as Communication Protection and Control Technologists and Power Line Technicians. It is also the only approved location within British Columbia to provide the Industry Training Authority approved Red Seal Apprentice Power Line Technician program. The Trades Training Centre now serves as a training and meeting facility for the entire BC Hydro workforce.

The Learning and Development KBU's responsibilities have changed since the Previous Application. Electrical Safety Programs and Safety Advocates have been added to this KBU. The management and strategy of leadership and professional development training programs has been transferred to the Human Resources KBU while support for scheduling and logistics, course development and training records management for leadership and professional development remains within the Learning and Development KBU.

The Learning and Development KBU includes the following departments that support employee learning across BC Hydro in both regional locations and the Trades Training Centre in Surrey:

- Electrical Safety Programs Department;
- Learning Governance and Planning Department;
- Safety Training and Learning Quality Assurance Department;

- Training Operations Department;
- Technical and Trades Training Department; and
- Trainees Department.

5D.5.1.1. Electrical Safety Programs Department

This department is responsible for developing electrical safety programs and worker protection systems[248] and depends on resources throughout the Learning and Development KBU for implementation. This group is different from the Worker Safety Programs department in the Safety Systems and Assurance KBU which is responsible for non-electrical safety projects and relies on the Field Safety Services KBU for implementation.

The Electrical Safety Programs department was formed in response to 21 electrical contact incidents that occurred between fiscal 2006 and fiscal 2016. To improve the safety of BC Hydro employees and contractors this department provides a framework to identify hazards and apply appropriate barriers. This department also maintains authorization records of both employees and contractors, identifying who can work safely on BC Hydro's Power System. It is responsible for maintaining the rules, procedures, documents and information technology applications specific to the worker protection systems.

5D.5.1.2. Learning Governance and Planning Department

The Learning Governance and Planning department coordinates, plans and schedules training. It also maintains training records and works with KBUs across BC Hydro to develop and implement learning policies.

5D.5.1.3. Safety Training and Learning Quality Assurance Department

The Safety Training and Learning Quality Assurance department includes two teams.

[248] See Section 5D.5.2.2 for description of Worker Protection Systems.

The Safety Training team provides access to training which is required by regulation through a combination of internal trainers, external contractors and resources in the Field Safety Services KBU, so that employees can work safely and achieve regulatory compliance.

The Learning Quality Assurance team is responsible for BC Hydro's learning quality assurance strategy which includes establishing processes and standards for courses and curriculum for both internally and externally developed content. The team develops and maintains electrical utility specific courses and curriculum for a number of subjects such as technical and trades training, safety training, business application support, and distribution design. They also perform quality checks on externally developed content. Once courses are developed by this team, the Safety Planning, Analytics and Incident Management team uploads and administers the courses in the Learning Management System.

5D.5.1.4. Training Operations Department

This Training Operations Department includes two teams.

The first team manages the day-to-day operations of the Trades Training Centre facility. Management includes the maintenance and operation of eight classrooms, four trade specific labs, three workshops, a training pole yard, a chainsaw training area, confined space and fall protection training structures and an outdoor covered training space.

The second team provides centralized administrative and contract support to the Learning and Development KBU.

5D.5.1.5. Technical and Trades Training Department

There are three teams within this department.

The first team is made up of instructors who deliver trade and technical specific training in the classroom and on the job. They serve as subject matter experts in the development of training, work methods and procedures and support implementation of electrical safety projects. This team supports roles such as Power Line Technicians, Cable Splicer, Generation and Stations Electricians, Mechanics and Communications Protection and Controls Technologists.

The second team is made-up of Safety Advocates. The Safety Advocate role was established in 2012 in response to a high number of serious safety incidents. Safety Advocates work in the field with employees to resolve electrical safety issues and implement electrical safety projects. The training delivered by the trades instructors is reinforced by the Safety Advocates through in field coaching and mentoring. They also assist the Work Methods team in developing work procedures. The field observations made by this group are used throughout BC Hydro to identify additional learning and management intervention opportunities.

The third team manages the apprentice and trainee programs which are structured programs that develop and qualify employees in critical occupations. Apprentices and trainees are hired based on resource strategies, which consider attrition and future needs. These employees will enter the BC Hydro workforce once they graduate from their respective multi-year program. This team provides program management and subject matter expertise for curriculum development and coordinates with trades instructors to comply with Industry Training Authority[249] requirements, including Red Seal certification for the Apprentice Power Line Technician program. BC Hydro is the only qualified institution in British Columbia to provide this program.

5D.5.1.6. Trainees Department

This department holds the FTEs and budget for 10 Apprentice Programs, three Technical Trainee Programs and the Engineers-in-Training Program. However, the

[249] The Industry Training Authority (**ITA**) leads and coordinates British Columbia's skilled trades system. The ITA works with BC Hydro to set program standards and issue certifications for trades.

Trainees department labour budget only holds the training time for these FTEs as they charge out the majority of their time to maintenance and capital work programs.

5D.5.2 Overview of Operating Costs and FTEs

Table 5D-6 Learning and Development KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Training and Development Leadership	0.4	0.0	0.5	0.0	0.0	0.0	0.0	**0.9**	2
2	Electrical Safety Programs	0.7	0.0	1.3	0.0	0.0	0.0	0.0	**2.0**	4
3	Learning Governance and Planning	1.1	0.0	0.0	0.0	0.0	0.0	0.0	**1.2**	13
4	Safety Training and Learning Quality Assur.	2.1	0.0	1.3	0.0	0.0	0.0	0.0	**3.4**	19
5	Training Operations	0.8	0.0	0.1	0.3	0.1	0.0	0.0	**1.2**	8
6	Technical and Trades Training	7.9	0.0	1.0	0.0	0.1	0.0	0.0	**9.0**	62
7	Trainees	5.4	0.0	2.2	0.2	0.0	0.0	0.0	**7.8**	250
8	**Total (Sch 5.4 L2, Sch 16.0 L25)**	**18.4**	**0.0**	**6.4**	**0.5**	**0.2**	**0.0**	**0.0**	**25.5**	**358**

To meet BC Hydro’s learning needs, the Learning and Development KBU supplements internal resources with contracted services and resources. Decisions on how to allocate training between internal and external providers are generally based on utility-specific knowledge, cost, efficiency and subject matter expertise.

5D.5.2.1. Training and Development Leadership Department

This department’s labour costs are related to two FTEs – the Director of the Learning and Development KBU and an administrative assistant.

This department’s non-labour budget includes $0.1 million for supplemental labour resources across the KBU to respond to work peaks and $0.3 million for additional training requirements and developing contractor training governance and for unplanned work arising from incident investigations.

5D.5.2.2. Electrical Safety Programs Department

This department’s labour costs are related to four FTEs. Two FTEs manage the electrical safety projects. The other two FTEs manage BC Hydro’s worker protection systems - Power System Safety Protection[250] and Worker Protection Practices[251]. Currently there are over 18,000 workers, consisting of both employees and contractors, authorized to work on BC Hydro's Power System. For Worker Protection Practices, these FTEs conduct six to eight reviews per year resulting in every generation facility being inspected every three years. The Power System Safety Protection program receives one major review per year, with each region being inspected every four years.

This department's non-labour budget includes funding for projects to support electrical safety programs.

5D.5.2.3. Learning Governance and Planning Department

The majority of this department's budget relates to labour costs for 13 FTEs who provide training coordination services. These FTEs process approximately 1,800 training requests for safety, trades, technical, leadership and professional development, resulting in approximately 4,000 classroom sessions each year. In addition, these FTEs maintain employee training records in the learning management system and centrally manage the scheduling of training resources, including 100 contracted instructors. Lastly, these FTEs arrange logistics and scheduling for over 200 apprentices and trainees.

5D.5.2.4. Safety Training and Learning Quality Assurance Department

The majority of this department's budget relates to labour costs for 19 FTEs as follows:

- One FTE is the department manager;

[250] Power System Safety Protection (**PSSP**) defines the constraints applied to the Power System to provide safety protection from Power System hazards during prescribed work on transmission and distribution lines and in substations. .

[251] Work Protection Practices (**WPP**) are the rules and procedures that govern how equipment at generating stations and associated facilities are isolated from potentially hazardous sources of energy and made safe to work on.

- Five FTEs lead and support the Safety Training program and its pre-qualified external trainers. The average BC Hydro non-field employee is required to take approximately six hours of one-time training and the average field employee is required to take approximately 40 hours of one-time training. Additional safety training is driven by regulated re-training requirements, competency gaps, career progression and exposure to hazards and new equipment. In fiscal 2018 approximately 1,800 safety training sessions were delivered across BC Hydro; and
- 13 FTEs are responsible for creating new courses and maintaining approximately 400 classroom and 100 online courses for trades and technical, safety and business application systems topics. In fiscal 2018, the team developed over 45 new courses and updated over 25 existing courses. These courses vary in length from 30 minutes to five days.

This department's non-labour budget primarily provides funding for approximately 40 contracts with pre-qualified safety trainers to provide training requirements.

5D.5.2.5. Training Operations Department

The majority of this department's budget is related to labour costs for eight FTEs at the Trades Training Centre.

- Two FTEs oversee the Trades Training Centre and its $0.8 million capital budget as well as manage a $0.5 million operating budget for centralized tools and equipment to maintain the facility and onsite courses and program; and
- Six FTEs provide administrative support for all Learning and Development employees and help operate the Trades Training Centre. They also arrange travel logistics, tools and equipment purchases for approximately 45 trades instructors, 10 Safety Advocate FTEs and two Fleet Safety trainer FTEs. In addition, the department processes payments for external apprentices and administers over 100 external learning contracts.

5D.5.2.6. Technical and Trades Training Department

The majority of this department's budget is for labour costs related to 62 FTEs as follows:

- One FTE represents the department manager;
- 45 FTEs provide trades training, building trade-specific skills and knowledge for approximately 2,100 field employees and front line managers at BC Hydro. A benchmarking exercise conducted in fiscal 2018 by Mosaic Consulting indicates that this number is aligned to the utility industry norm of approximately one training staff for every 50 trades employees. To support front line employee knowledge retention and application, this team spends approximately 65 per cent of its billable time on course delivery, on the job training and conducting assessments. In fiscal 2018, this team delivered over 800 trade specific classroom sessions and from April 2018 to December 2018, instructors have provided over 8,500 on the job training hours to field workers. This team spends the remaining 35 per cent of its billable time serving as subject matter experts for course development and work procedures, working groups and projects;
- 10 FTEs represent Safety Advocates. From April 2018 to December 2018, Safety Advocates spent over 3,000 person hours in the field responding to crew and manager requests for coaching, field visits and attending work planning and safety meetings. They also performed over 400 safe work observations and spent over 450 hours responding to employee safety questions;
- Three FTEs deliver courses, on-the-job training and mentoring to approximately 300 employees in the Distribution Design and Customer Connect KBU and 30 trainees; and
- Three FTEs manage the budget and program progression for approximately 200 apprentices and 20 Engineers-in-Training.

This department's non-labour budget primarily consists of travel costs for Safety Advocates and Trades Training Instructors.

5D.5.2.7. Trainees Department

This department's budget is managed by the Technical and Trades Training department. The majority of this department's budget relates to labour costs for 250 FTEs who are apprentices and trainees, training for roles such as Power Line Technicians, Electricians, Mechanics, Utility Fleet Mechanics, Distribution Design and Customer Connect technologists, Communication Protection and Control technologists and Engineers. Approximately 77 per cent of their labour costs are charged out to other KBUs or specific projects and the remaining 23 per cent is charged to training.

This department's non-labour budget includes travel expenses and tuition to attend third party institutions (e.g., British Columbia Institute of Technology, Thompson Rivers University and the University of the Fraser Valley), relocation costs for trainees as well as small non-capital tools costs for new trainee and apprentice intakes.

This department's materials budget provides funding for their initial set of personal protection equipment.

5D.5.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5D-7 Learning and Development KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.4 L2	25.0	25.7	25.0	23.2	25.4	25.5	25.8	26.2
2	FTEs	16.0 L25	438	456	438	437	438	358	317	300

Operating costs are increasing by approximately $0.3 million from fiscal 2019 forecast to fiscal 2020 plan due to Standard Labour Rate increases which are partially offset by reduced training requirements and relocation savings due to a reduced number of apprentices and trainees. Operating costs are increasing by approximately $0.4 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases.

FTEs are planned to decrease during the test period, primarily due to a reduction in the planned number of apprentice and trainee intakes, which are based on future resourcing requirements.

5D.6 Field Safety Services KBU

5D.6.1 Responsibilities

The Field Safety Services KBU provides occupational safety and health expertise and support to BC Hydro's workforce and work programs, including work completed by contractors. The Field Safety Services KBU is dispersed across the province, and provides in-the-field safety expertise during all phases of work through reviewing safety plans, field inspections and spot audits, and delivering training in the field. Field Safety Services staff has the training expertise for confined spaces, fall protection, worksite coordination and hazardous materials, and are often geographically located at headquarters and field offices where training is required. The training delivered by the Field Safety Services KBU is coordinated with the Learning and Development KBU.

Since the Previous Application, the following changes have been made to the responsibilities of this KBU:

- The Aircraft Operations department has been transferred from the former Field & Grid Operations KBU to the Field Safety Services KBU;
- The Occupational Safety and Health (**OSH**) Specialists supporting Construction Services in the Learning and Development KBU have been transferred back to the Field Safety Services KBU;

- BC Hydro's Safety Advocates are now part of the Learning and Development KBU; and
- As a result of the implementation of the Safety Taskforce contractor safety recommendation to address inconsistencies in managing the safety of contractors, a Capital Safety Planning team was initiated in Field Safety Services.

The Safety System and Assurance and Learning and Development KBUs set direction through their regulatory expertise, safety engineering, safety initiative management and safety programs and standards. In turn, the Field Safety Services KBU functions as the "implementation arm" assisting other KBUs to apply safety standards, implement safety programs, and properly use approved safe work procedures as required by WorkSafeBC regulations (e.g., confined space safe work procedures).

Field Safety Services employs occupational safety and health professionals that support all BC Hydro functional areas and geographic locations, with a particular focus on KBUs performing hazardous work. Electrical safety services are provided to the field crews by the Safety Advocates and Trades Training Instructors in the Learning and Development KBU.

Field Safety Services includes OSH Specialists, Occupational Hygienists, and Aircraft Operations professionals and is organized into seven departments:

- Field Safety Services Manager Department;
- Field Safety Services Stations (Generation) Department;
- Field Safety Services Transmission and Distribution Department;
- Field Safety Services Construction Services Department;
- Field Safety Services Capital Project Delivery Department;

- Fleet, Materials Management, Properties and Office Safety Services Department; and
- Aircraft Operations Department.

While each of the Field Safety Services departments provides support to specific KBUs, their responsibilities are similar. These departments support any field work involving hazards such as asbestos, lead, silica, biohazards, confined space and working from heights. This support includes safe work planning and execution, conducting hazard identification, assessing risk, and developing safe work procedures (e.g., work in confined spaces or work involving hazardous substances, such as lead, silica, asbestos). During work execution, the departments observe job activities and conduct inspections, and provide coaching to field workers on regulatory compliance requirements and the correct use of health and safety equipment (e.g., atmospheric monitors, respirators, and rescue equipment). This coaching is provided so that safety regulations are followed and work is performed safely and in accordance with procedures.

BC Hydro’s capital occupational health and safety requirements are substantial, given the size of our capital program. The Field Safety Services KBU supports projects in the planning phase to achieve the appropriate contracting strategy, embeds safety requirements into contracts, develops required safety documentation (e.g., Owner Safety Plans, Owner Hazard Identification and Risk Assessments, and Safety Management Plans), and reviews contractor safety programs and safe work procedures. During construction, the Field Safety Services departments provide site safety coordination, inspect job sites and work activities and perform safe work observations (“formal verifications”).

To reduce risks associated with confined space entries, BC Hydro issued an internal safety directive, requiring an OSH Specialist ("Qualified Person" [252]) to attend every entry into a confined space, unless a Confined Space Supervisor has been specifically authorized to lead the work without an OSH Specialist present. BC Hydro has more than 15,800 confined spaces throughout its operations, and on average, there are 500 confined space entries per year.

Field Safety Services is also providing safety support to the Site C Project. Specific support was provided in fiscal 2019 through temporary assignments and shifting internal workloads, until additional resources were hired. The Field Safety Services KBU will continue to support the Site C Project safety efforts where required. This work is charged to the Site C Project.

The following is a list of the key role-specific responsibilities in the Field Safety Services KBU:

5D.6.1.1. OSH Specialists

The majority of the Field Safety Services KBU's field work mandate is performed by OSH Specialists who provide the following occupational safety and health services:

- Specialized support for field job planning, such as first aid assessments, job hazard identification and risk assessments, and the development of safety management plans and safe work procedures for hazardous materials, confined spaces, and fall protection hazards;
- Work execution support in the field, such as training delivery, safety coaching and mentoring, spot audits, and safe work observations;
- Contractor safety management, including providing safety expertise during the procurement phase when evaluating contracts, developing hazard

[252] Section 9.11 of the WorkSafeBC Confined Space regulations states that a "Qualified Person" must have adequate training and experience in the recognition, evaluation and control of confined space hazards, and must have specific qualifications, such as a certified industrial hygienist (CIH), or a Canadian registered safety professional (**CRSP**), or other combination of education, training and experience acceptable to WorkSafeBC.

identifications, risk assessments, and safety management plans during the planning phase and completing field verifications, during the construction phase;

- Assisting BC Hydro's KBUs in developing and implementing their annual safety plans; and
- Technical support for storm, fire and flood response (e.g., writing and overseeing safety management plans and first-aid assessments as well as fit-testing and providing instructions on how to use respiratory and other personal protection equipment).

5D.6.1.2. Occupational Hygienists

Occupational Hygienists are specialists with very specific qualifications who provide technical support and guidance to the OSH Specialists. These roles are field-focused and provide advice on the development of occupational hygiene policies, standards and programs. In particular, Occupational Hygienists develop and provide guidance on field safe work procedures for high hazard situations and unusual circumstances (e.g., procedures for complex asbestos abatement work).

5D.6.1.3. Management and Administrative Team

Safety Managers in the Field Safety Services KBU act as the single point of contact for KBUs throughout BC Hydro for all safety and health issues. Managers are also responsible for supporting the implementation of safety programs and initiatives.

The administrative team provides services such as expenses and purchasing management, contract administration, and communications support.

5D.6.1.4. Aircraft Operations Professionals

Aircraft Operations professionals within the Field Services KBU oversee all charter-related aviation activities including helicopter, fixed wing and remotely piloted aerial vehicle work. These professionals work in the Aircraft Operations department, which was created as a corrective action item following a 2008 incident that resulted in four fatalities. The department's functions include aviation related training requirements, policy development and adherence, risk assessment and mitigation, flight monitoring and internal flight coordination, as well as contract development and management. This oversight function applies to both BC Hydro and contractors' use of chartered aircraft for BC Hydro work. This level of oversight is necessary as Transport Canada only provides minimum oversight for utility charter aviation.

The Aircraft Operations manager liaises with all internal KBUs or departments that use aircraft services, provides strategic guidance and field support and conducts incident investigations. Aviation Safety Advisors verify the correct standard operating procedure, the correct aircraft for the flight, day-of-flight risk assessments, and source emergency aircraft as required.

5D.6.2 Overview of Operating Costs and FTEs

Table 5D-8 Field Safety Services KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Field Safety Services Manager	0.3	0.0	0.1	0.0	0.0	0.0	0.0	**0.4**	2
2	Field Safety Services Stations, Generation	0.9	0.0	0.1	0.0	0.0	0.0	0.0	**1.0**	9
3	Field Safety Services, T&D	1.6	0.0	0.2	0.0	0.0	0.0	0.0	**1.7**	15
4	Fields Safety Services Construction Svcs	0.2	0.0	0.0	0.0	0.0	0.0	0.0	**0.3**	4
5	Field Safety Svcs, Cap Project Delivery	0.9	0.0	0.1	0.0	0.0	0.0	0.0	**1.0**	20
6	Fleet, MM, Properties,Office Safety Svcs	0.8	0.0	0.0	0.0	0.0	0.0	0.0	**0.9**	8
7	Aircraft Operations	0.7	0.0	0.1	0.0	0.0	0.0	0.0	**0.9**	5
8	**Total (Sch 5.4 L3, Sch 16.0 L26)**	**5.5**	**0.0**	**0.6**	**0.1**	**0.0**	**0.0**	**0.0**	**6.2**	**63**

Overall, Field Safety Services provides support to:

- More than 2,100 BC Hydro field workers and front line managers;
- Work completion in more than 300 substations and 30 generating stations and over 86,000 km of transmission and distribution lines;
- All KBUs across BC Hydro, including office workers, to assist them in the development of their annual safety plans and addressing safety and health issues;

- BC Hydro's annual capital plan for construction and system upgrades; and
- Contractor safety management in all areas of the business.

The resourcing requirements for this KBU are driven by BC Hydro's ongoing capital and maintenance plan, safety programs and initiatives, as well as existing and changing WorkSafeBC requirements. In recent years, WorkSafeBC has provided increased scrutiny through dedicated high risk area inspection teams and higher financial penalties, especially for high hazard areas.

Benchmarking resourcing levels in Field Safety Services is challenging, because there are currently no Canadian Electrical Association benchmarks for the ratio of safety resources to utility workers. An approximate benchmark that can be applied to construction-type work is the informal construction industry ratio of between 1:50 and 1:75. Assuming that work performed by BC Hydro's Operations Business Group is comparable to construction type work, the ratio of OSH Specialists and Hygienists to front-line employees in the Operations Business Group at BC Hydro is 1:75 (28 to 2,100), which is consistent with this informal ratio. The overall ratio of Field Safety Services OSH Specialists and Hygienists to all BC Hydro employees is 1:150 (40 to 6,000).

5D.6.2.1. Field Safety Services, Manager Department

The majority of this department's budget consists of labour costs for two FTEs –the senior manager of the Field Safety Services KBU and an administrative assistant. The remaining budget is for contracted services and travel expenses.

5D.6.2.2. Field Safety Services, Stations (Generation) Department

The majority of this department's budget consists of labour costs for nine FTEs who provide support to employees in the Stations Field Operations KBU, with assistance from the Field Safety Services, Transmission and Distribution Department. These FTEs are deployed across the province, and are associated with the larger generation stations.

5D.6.2.3. Field Safety Services, Transmission and Distribution Department

The majority of this department's budget is related to labour costs for 15 FTEs who are dispersed across the province. Collectively, these FTEs provide support to employees in the Line Field Operations KBU and the Stations Field Operations KBU. In addition, the OSH Specialists in this department support an average of more than 500 confined space entries per year.

5D.6.2.4. Field Safety Services, Construction Services Department

This department's budget is largely related to labour costs for four FTEs who are located in the four Construction Services KBU headquarters across the province. The resourcing requirements in this department are driven by BC Hydro's capital plan and the occupational safety and health needs of BC Hydro's Construction Services KBU.

Between April and September 2018, these FTEs attended 531 crew interactions including 65 spot audits, 24 training events, 24 safety meetings, 99 confined space work occurrences, and 319 job planning and risk assessments as well as other crew support requests.

5D.6.2.5. Field Safety Services, Capital Project Delivery Department

This majority of this department's budget relates to labour costs for 20 FTEs. The FTEs in this department charge approximately 80 per cent of their time to the capital projects they support. The resourcing requirements in this department are driven by BC Hydro's capital plan. These 20 FTEs include 12 temporary OSH Specialists, allowing resources to be adjusted to match capital plan requirements.

Between April and September 2018, this department completed 353 formal contractor verifications and developed 22 Owner Safety Plans and 59 Owner Hazard Identifications and Risk Assessments. In addition, the department on-boarded 95 projects, and provided support to 592 projects under the Contractor Safety Management Program.

5D.6.2.6. Fleet, Materials Management, Properties and Office Safety Services Department

The majority of this department's budget consists of labour costs for eight FTEs. The remaining budget is for travel costs, primarily for the Hygienists, as they frequently travel across the province to provide specialized technical assistance.

5D.6.2.7. Field Safety Services, Aircraft Operations Department

The majority of this department's budget is for labour costs related to five FTEs.

The Aircraft Operations Department supports between 2,000 and 3,000 flight events per year. For example in fiscal 2018, the department provided oversight for 27 fixed wing charter flights, 1,778 helicopter charter flights, and 373 remotely piloted aerial vehicle flights.

5D.6.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5D-9 Field Safety Services KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.4 L3	4.9	5.7	5.0	5.7	5.1	6.2	6.6	6.7
2	FTEs	16.0 L26	53	50	55	56	55	63	62	62

Operating costs are increasing by approximately $0.4 million from fiscal 2019 forecast to fiscal 2020 plan and by approximately $0.1 million from fiscal 2020 plan to fiscal 2021 plan, primarily due to Standard Labour Rate increases.

FTEs are decreasing by one from the fiscal 2019 forecast to the fiscal 2020 plan, due to a reduction in planned overtime, and are planned to remain constant from the fiscal 2020 plan to the fiscal 2021 plan.

5D.7 Security and Emergency Management KBU

5D.7.1 Responsibilities

The Security and Emergency Management KBU safeguards our people, assets and operations from emergencies and disasters related to natural or human-induced events. The KBU reduces impacts to safety, reliability, reputation and finances by providing:

- Integrated physical security solutions, including the creation, management and sustainment of physical security controls required to meet NERC CIP regulatory compliance requirements;
- A structured process to identify critical business functions and processes through a company-wide business impact analysis and other business continuity processes; and
- The framework for company-wide emergency preparedness, including plans and procedures to help the organization respond to and recover from a major event.

This KBU also participates in the Canadian Electricity Association's Emergency Management and Security Councils. In addition, the KBU maintains mutual aid agreements with the Canadian Electricity Association and the Western Energy Institute, supporting disaster preparedness.

There have been no changes to the responsibilities of this KBU since the Previous Application.

The Security and Emergency Management KBU consists of the following departments:

- Security Investigations and Analytics Department;
- Emergency Management Department; and

- Security and Continuity Program Management Department.

The Security and Emergency Management KBU monitors evolving regulations and threats, and adapts to protect the Bulk Electric System and create a safe working environment for employees. The KBU also defines the standards for BC Hydro's physical security system and is responsible for its operation and maintenance. This includes establishing protective measures and procedures for regulatory compliance including Critical Infrastructure Protection, as set by the North American Electric Reliability Corporation.[253]

As an essential and critical service provider in British Columbia, BC Hydro has appropriate plans, training and exercises to be response-ready at a moment's notice. This KBU establishes and manages BC Hydro's framework to prepare for, respond to and recover from emergencies, aligning with the *Emergency Program Act*. BC Hydro has adopted British Columbia's Emergency Management Structure to improve response and recovery coordination and capabilities through standardization of roles, communication between organizations during a large response and a common understanding for response prioritization. This KBU develops the standards for response planning, conducts response training and exercising, and maintains necessary tools for immediate response such as situational awareness, earthquake and building damage assessment applications as well as emergency centres.

Since 2012, significant progress has been made in our Emergency Management Program, moving the program from underdeveloped to a mature state according to an external Disaster Preparedness Audit. [254] BC Hydro is also experiencing more extreme seasonal weather events including flooding, wildfires and winter storms, which require improved capacity and capability to recover quickly.

[253] The BCUC requires BC Hydro to comply with these Mandatory Reliability Standards.
[254] Further information on this audit is provided in Appendix HH.

5D.7.2 Overview of Operating Costs and FTEs

Table 5D-10 Security and Emergency Management KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Security Investigations and Analytics	1.2	0.0	5.2	0.0	0.0	0.0	0.0	**6.4**	8
2	Emergency Management	0.9	0.0	0.1	0.0	0.1	0.0	0.0	**1.0**	6
3	Security and Continuity Program Mgmt	1.3	0.0	0.2	0.0	0.0	0.0	0.0	**1.5**	8
4	Security and Emergency Mgmt	0.6	0.0	0.1	0.0	0.0	0.0	0.0	**0.7**	4
5	**Total (Sch 5.4 L4, Sch 16.0 L27)**	**4.0**	**0.0**	**5.5**	**0.1**	**0.1**	**0.0**	**0.0**	**9.6**	**26**

5D.7.2.1. Security Investigations and Analytics Department

This department’s labour budget is related to eight FTEs and its non-labour budget provides funding for BC Hydro’s external security contract.

Four FTEs manage BC Hydro’s physical security program, keeping our people and assets safe and secure. An external security contract provides security services including staffing a 24/7 security command centre, security guards, and security system technicians. Outsourced work includes guarding services as well as specialized technician work that is unpredictable and dispersed across the province. This allows BC Hydro to contract for specialized services at a lower cost and enables this department to act as a knowledgeable owner, with key responsibilities kept in-house such as regulatory compliance, standards, systems knowledge and engineering. This model is consistent with other comparable Canadian utilities and Crown Corporations.

BC Hydro’s current security contractor was selected in 2012 through a competitive bid process. The contract provides security services at more than 150 facilities and 45 substations across the province and includes installation and service of more than 2,200 cameras, 4,300 intrusion points and 2,400 access card readers, enabling prompt detection of a security anomaly and rapid determination of the threat level and appropriate response. In fiscal 2018, the department deployed over 134,000 hours of permanent guards (greater than 12 months at a post) and approximately 20,000 hours of temporary guards (less than 12 months at a post).

The Security and Emergency Management KBU has developed a Category Strategy and is partnering with Supply Chain's Procurement Team to fulfill the Strategy, leveraging their procurement expertise. A competitive bid will be prepared in fiscal 2019 to address our evolving security needs within today's market. New contract(s) will be established to deliver cost-effective security services, starting in fiscal 2020. The demands on the security program are changing, primarily driven by regulatory compliance requirements. In addition, threats are changing and becoming more sophisticated. The use of technology will increase going forward, as it is often a more reliable and cost-effective security solution.

The other four FTEs in this department provide security analytics and investigations. Work in this area is increasing in complexity. This team has been successful at reducing break and enters and thefts as well as at increasing arrests. This can be attributed to an integrated security program including the use of technology, human response and intervention. Table 5D-11 below shows the number of incidents, our investigations[255] and the number of arrests from fiscal 2017 to fiscal 2019.

Table 5D-11 Incidents, Investigations and Arrests (Fiscal 2017 to Fiscal 2019)

	Incidents (Excluding Frauds)	Incidents Assigned to an Investigator	Break and Enters or Thefts	Arrests
Fiscal 2017	1505	333	341	9
Fiscal 2018	1719	366	319	12
Fiscal 2019 (up to December 31, 2018)	1773	315	259	20

These FTEs also perform threat assessments. From April 2018 to December 2018, the team conducted 117 unplanned assessments. Sixty-five of these assessments were performed to assess security risks on capital projects and deploy appropriate security controls (e.g., temporary security guards, fencing, video surveillance, and/ or access detection to mitigate risks). Fifty two assessments were conducted to

[255] Incidents include such things as break and enter, theft, vandalism, public / customer threat, assistance to police or external agency, mischief and trespassing.

support employees traveling internationally for work. Assessments for international travel involve a risk assessment and follow-up with the traveller(s) including an information package and briefing to provide tips on how to stay safe.

FTEs on this team typically have experience in policing or military and generally hold certifications with the American Society for Industrial Security International, including designations such as Certified Protection Professional, Associate Protection Professional, Physical Security Professional or Professional Certified Investigator.

5D.7.2.2. Emergency Management Department

The majority of this department's budget relates to labour costs for six FTEs who build, maintain and operate BC Hydro's emergency management program, which provides a systematic and coordinated response to emergencies and disasters.

This department sets standards, establishes processes, and works with KBUs to help develop and maintain their site specific plans. The department maintains over 200 plans[256] including approximately 125 regulatory plans, requiring an annual review. The department also supports public safety and preparedness, liaising with external agencies such as Emergency Management British Columbia, critical infrastructure owners, government agencies, police, stakeholders and First Nation communities. An example of this work is our 14 emergency planning guides[257] which are shared externally and provide key information on BC Hydro's dams including inundation maps, contacts, and emergency and communication procedures.

The Emergency Management department also provides specific training on the roles required for emergency preparedness and response and conducts annual exercises to test processes and provide learning opportunities for employees working within our emergency management system during an event. From April 2018 to

[256] Plans include such things as facility emergency plans, plans for Dams and Stations, building damage assessment, and supporting plans such as emergency centre plans, wildfire, tsunami, flood, and storm response.

[257] Requirement of the Water Sustainment Act, Dam Safety Regulation and are also issued annually to the Water Comptroller. An emergency planning guide may include numerous dams based on river system. For example, Campbell River emergency planning guides has all dams on Campbell River System.

December 2018, 129 employees were trained in their response roles and 114 exercises were completed.

In addition, this department maintains all BC Hydro emergency centres (two corporate emergency coordination centres and six regional emergency operation centers) in a state of readiness and regularly reviews and updates standard operating procedures, including testing associated equipment. The department also coordinates mutual aid with our partners across Canada and the Western Grid.

During an emergency event, the department activates our emergency management structure which may include emergency centre(s). The department also provides leadership and subject matter expertise for company-wide prioritization, internal and external coordination and situational awareness during an emergency. Table 5D-12 below shows BC Hydro's emergency management plans, exercises and significant emergency centre activations from fiscal 2017 to fiscal 2019.

Table 5D-12 BC Hydro Emergency Management Plans, Exercises and Emergency Centre Activations

	Plans	Exercises		Emergency Centre Activations
		Evacuation drills	EM Exercises	
Fiscal 2017	143	126	2	22
Fiscal 2018	129	115	2	9
Fiscal 2019 (up to December 31, 2018)	117	112	3	8

A key component to the Emergency Management program is continual improvement. This department compiles a report following each exercise or incident which identifies corrective actions to improve plans and procedures. The team collaborates with the Safety Investigations team when incidents involve safety or more complex issues.

5D.7.2.3. Security and Continuity Program Management Department

The majority of this department's budget relates to labour costs for eight FTEs.

Six FTEs design and oversee the build and maintenance of BC Hydro's integrated physical security system, which is evolving due to emerging threats and new regulations. Security engineers set security standards and establish procedures while maintaining day to day operational compliance with the NERC CIP regulatory requirements. For example, the department developed and maintains BC Hydro's Master Physical Security Plan, developed and implemented physical access procedures, managed the installation of electronic key cabinets at 12 sites and conducted the re-keying of over 600 doors and cabinets at nearly 60 facilities across the province. The team provides ongoing compliance support for NERC physical security sustainment activities, including physical access monitoring, training and engagement with the Operations Business Group, as well as evidence collection and submission.

Two FTEs are accountable for the company's business continuity program. This includes establishing the standard and processes to maintain the company's Business Impact Analysis as well as developing and exercising continuity plans and supporting continual improvements. In fiscal 2018, 34 Business Impact Analyses were completed, identifying our critical technology and applications, people, work space and third party suppliers. KBUs use the results of the Business Impact Analysis to develop mitigation strategies which maintain critical operations during an emergency or restore services as quickly as possible.

5D.7.2.4. Security and Emergency Management Department

The majority of this department's budget relates to labour costs for four FTEs including the Manager of Security and Emergency Management and an administrative assistant. The remaining two FTEs oversee and prioritize key projects[258] as well as monitor and report overall program metrics.

[258] Examples include NERC implementation and sustainment for physical security, NERC's Grid Security Exercise, security standards and application guide development and Category Management for Security Services.

5D.7.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5D-13 Security and Emergency Management KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.4 L4	9.3	9.4	9.3	9.2	9.3	9.6	10.7	10.8
2	FTEs	16.0 L27	18	20	18	25	18	26	31	31

Operating costs are increasing by approximately $1.1 million from fiscal 2019 forecast to fiscal 2020 plan, due to:

- The transfer of positions for security requirements for BC Hydro's NERC CIPv5 physical security program (discussed further in Chapter 5C, section 5C.10.3);
- An increase in forecast costs for BC Hydro's security contract of $0.2 million; and
- Standard Labour Rate increases.

Operating costs are increasing by approximately $0.1 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases.

FTEs are planned to increase by five from fiscal 2019 forecast to fiscal 2020 plan due to the transfer of positions for NERC CIPv5 (discussed further in Chapter 5C, section 5C.10.3). FTEs are planned to remain constant from fiscal 2020 plan to fiscal 2021 plan.

5E.1 Introduction – Finance, Technology, Supply Chain Business Group

Chapter 5E provides and explains in detail the composition of, and rationale for, the operating costs of the Finance, Technology, Supply Chain Business Group. The Finance, Technology, Supply Chain Business Group is one of six business groups in the organization and serves a Support function of the Plan-Build-Operate-Support model.

The Finance, Technology, Supply Chain Business Group budget was developed as part of the budgeting process outlined in Chapter 5, section 5.4. The information provided in this Chapter 5E demonstrates the basis for the entirety of the Business Group and KBU budgets, rather than focussing only on incremental cost requirements.

Chapter 5E is organized as follows:

- Section 5E.2 provides an overview of the organization and responsibilities of the Finance, Technology, Supply Chain Business Group;
- Section 5E.3 provides the operating costs and FTE information for the Finance, Technology, Supply Chain Business Group as a whole[259];
- Sections 5E.4 to 5E.7 provide more detailed information on the responsibilities, cost and FTEs for each KBU within the Finance, Technology, Supply Chain Business Group. The operating costs and FTE information for each KBU is broken out into two sections:[259]
  - Overview of Operating Costs and FTEs – This section explains the starting operating costs and FTEs based on the fiscal 2019 forecast; and

[259] Please note the amounts presented in the tables in these sections may not add due to rounding.

- Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs – This section explains any incremental changes between the fiscal 2019 forecast and the fiscal 2020 and fiscal 2021 plan.

5E.2 Overview of Finance, Technology, Supply Chain Business Group Organization and Responsibilities

The Finance, Technology, Supply Chain Business Group's responsibilities include:

- Providing corporate-wide financial services and support to BC Hydro's KBUs and overseeing financial decisions consistent with BC Hydro's policies and controls. This includes budgeting, planning, forecasting, accounting, financial reporting, tax compliance and planning, cash management, debt and foreign exchange management, risk management, performance improvements through the Work Smart program, internal audit, and overseeing financial policy compliance;
- Facilitating the delivery of materials, vehicles and procurement services necessary for BC Hydro to provide service to customers; and
- Selecting, implementing and operating technology across BC Hydro. This includes managing information technology and operational technology systems to meet compliance and security requirements, sustain productivity, manage risks and enable business objectives.

The Finance, Technology, Supply Chain Business Group consists of the following KBUs:

Business Group	Key Business Unit
Finance, Technology, Supply Chain	Finance Technology Supply Chain Business Unit Support

The following material changes have been made to the responsibilities of the Finance, Technology, Supply Chain Business Group since the Previous Application:

- In fiscal 2017, the Technology KBU moved from the previous Transmission, Distribution and Customer Services Business Group to the Finance, Technology, Supply Chain Business Group;
- In fiscal 2018, the Business Planning and Risk department and the Change Management department moved from the previous Corporate Affairs KBU to the Finance KBU within the Finance, Technology, Supply Chain Business Group; and
- In fiscal 2018, the Smart Metering and Network Operations department moved from the former Smart Technology Operations and Restoration KBU to the Technology KBU within the Finance, Technology, Supply Chain Business Group.

These changes were cost neutral and did not increase the total number of FTEs.

5E.3 Fiscal 2020 and Fiscal 2021 Plan Operating Cost and FTE Summaries

This section addresses planned operating costs and FTEs for the Finance, Technology, Supply Chain Business Group. The following are some key points of note with respect to the information provided in Figure 5E-1, Table 5E-1 and Figure 5E-2, Table 5E-2 and Table 5E-3.

- The Finance, Technology and Supply Chain business group's operating cost budget varies significantly between each KBU.
- The Technology KBU accounts for 51 per cent, or $135.8 million, of the total operating cost budget for the Finance, Technology and Supply Chain business group. All cross organizational technology costs are managed on a consolidated basis within the Technology group, such as licenses, maintenance fees, data center and end point devices.
- The Supply Chain KBU accounts for nearly 50 per cent, or 454 FTEs, of total FTEs for the Finance, Technology and Supply Chain business group. This is

primarily to deliver fleet and materials management services, which account for nearly 300 FTEs, where a regional presence is required to support front line operations.

- From fiscal 2019 RRA to Fiscal 2021 Plan, the increases in the Finance, Technology and Supply Chain KBU operating budgets are largely driven by Standard Labour Rate increases, partially offset by vacancy factor savings.

Planned operating costs for this Business Group are approximately $262.6 million in fiscal 2020 and approximately $264.8 million in fiscal 2021. The operating costs for the Finance, Technology, Supply Chain Business Group are summarized by KBU in Figure 5E-1. Additional cost details are provided in Table 5E-1 below.

5E.4 Finance

5E.4.1 Responsibilities

The Finance KBU provides corporate financial and treasury services, financial support to all of BC Hydro's KBUs, internal audit services, and oversight to financial decisions to ensure they are consistent with BC Hydro's policies and controls.

The Finance KBU performs an important role in the financial stewardship of BC Hydro. To effectively manage an organization as complex as BC Hydro, stakeholders across the company require accurate, timely and insightful financial and management information throughout the annual business cycle and in forward planning. The Finance KBU provides this information through a robust system of controls, as well as complementary services such as internal audit, change management, and Work Smart that add further value to the business and enable BC Hydro to deliver on our Service Plan commitments.

In fiscal 2014, the finance functions were consolidated under the Chief Financial Officer. This enabled the Finance KBU to function as a more effective, centralized organization. Through this centralization, BC Hydro was able to realize 11 net headcount reductions.

Since fiscal 2014 there has been increased demand for the services of the Finance KBU. BC Hydro's business environment continues to grow in complexity each year. Examples of the increased demand on the Finance KBU include the following:

- Increased FTEs across BC Hydro requiring support from the Finance KBU;
- Increased capital expenditures which have contributed to, among other things, an approximately 40 per cent increase in the volume of project due diligence reviews, conducted by the Finance KBU since fiscal 2016; and
- Increased internal and external reporting requirements, both internally and externally, to meet project, policy and regulatory requirements and to ensure our projects have the appropriate oversight to remain on time and on budget. For example, with increased levels of capital expenditures, BC Hydro has developed enhanced reporting for the Capital Delivery Management Committee to add more information on pre-construction and post-construction aspects of project expenditures, providing further visibility to the lifecycle costs of the capital plan.

Despite the above factors, the size and budget of the Finance KBU has remained relatively constant. The increased workload of the Finance KBU is illustrated by the ratio of finance business support FTEs, who provide day-to-day support to all of BC Hydro's KBUs, to BC Hydro's total FTEs. Today, each of the 77 Finance FTEs in the Finance Business Support department who provide day-to-day support to all of BC Hydro's KBUs support an average of 84 FTEs across the company. In fiscal 2014, that same number of Finance FTEs would have been supporting an average of 72 FTEs.

In addition to meeting increased demands and workload while maintaining a relatively constant size and budget, the Finance KBU has led and contributed to many additional initiatives, including:

- Planning – Finance coordinates the completion of annual business plans for each KBU, and creates the annual focus document, which provides clarity and alignment on BC Hydro's priorities across the company;
- Reporting – Finance produces 32 dashboards per month on key performance indicators and targets critical to achieving business objectives that are used across the company to manage business performance;
- Debt Management – the Treasury team now manages approximately $23 billion in total debt and $8 billion in derivative financial instruments, including those related to hedging under our debt management strategy to achieve increased cost certainty for ratepayers on long-term borrowings;
- Forecasting – Finance has led the ongoing efforts to manage within the former 2013 10 Year Rates Plan, including identifying and implementing actions to stay on track, and formulated the updated rates forecast released in the Comprehensive Review; and
- Work Smart – Work Smart is a key enabler in limiting our operating cost increases. We estimate that initiatives led by Work Smart, leveraging the collaboration of teams across BC Hydro have resulted in over 80,000 annual capacity hours gained. This enables the equivalent of over 50 FTEs' worth of effort to address increasing workload and to focus on higher-value work.

The responsibilities of the Finance KBU have changed since the Previous Application. The Business Planning and Risk department and the Change Management department, formerly part of the Corporate Affairs KBU, are now part of the Planning, Forecasting and Risk department of the Finance KBU.

The Finance KBU consists of the following departments:

- Finance Business Support Department;
- Controllership and Treasury Department;
- Planning, Forecasting and Risk Department; and
- Audit Services Department.

5E.4.1.1. Finance Business Support Department

This consolidated finance team is the internal, client-facing team that provides day-to-day and ongoing financial services and support to all of BC Hydro's KBUs, including:

- Facilitating business processes and initiatives through an understanding of the specific business needs of each department and assisting the business unit in achieving its goals from a financial perspective;
- Providing management consultation and decision support services to management teams, front line managers and staff. This includes financial evaluation, risk analysis, and recommendations on strategic issues, capital and initiative investment proposals, and day-to-day operational issues and decisions;
- Supporting business groups delivering capital projects by reviewing capital requests, providing input into the annual prioritization process, providing annual and long-term capital reporting and forecasting, converting projects into assets, preparing depreciation forecasts, completing due diligence reviews (e.g., financial reviews of business cases), preparing financial models, and preparing contract requisitions;
- Ensuring all employees are educated on and following corporate controls and policies;

- Facilitating the annual financial planning, work planning and resource allocation process at the KBU level;
- Applying BC Hydro's accounting and costing methodologies and systems to all financial transactions;
- Delivering management and cost accounting services to provide timely and accurate recording and reporting of cost information to support decision making;
- Providing budget support to the management teams of each KBU including reviewing overall budgets, cost pressures, cost savings and initiatives to develop a prioritized operating and capital budget;
- Preparing monthly reporting for business groups and individual KBUs including variance explanations, trends, emerging business issues and forecasts of year end results;
- Providing revenue and cost of energy reporting including variances, trends and forecasts;
- Preparing non-energy and miscellaneous billing reports and issuing invoices in compliance with contracts;
- Processing transactions including preparing and posting journal entries and completing general ledger reconciliations; and
- Completing accounting reviews including reviews of expenditures among supported KBUs, and working with the financial reporting team in the Controllership and Treasury Department to determine the appropriate accounting treatment.

5E.4.1.2. Controllership and Treasury Department

The Controllership and Treasury department consists of six teams that provide financial management and oversight at BC Hydro. A significant portion of this work supports BC Hydro's statutory reporting requirements to our shareholder and the BCUC. This department includes the following teams:

- **Treasury:** this team is responsible for cash and foreign exchange management and banking, debt management, insurance management, credit risk management and pension plan management. This involves ensuring that BC Hydro has sufficient financial resources to fund its operations and capital plan, maintaining credit facilities and developing and implementing debt management strategies. Treasury is also responsible for managing finance charges, procuring and managing operational and construction insurance programs, and evaluating, monitoring and reporting credit exposures. Treasury also manages investments associated with BC Hydro's pension plan and non-pension post-retirement benefits;
- **Financial Reporting:** this team is responsible for preparing and presenting BC Hydro's consolidated internal and external financial reports. The team manages the external financial statement audit and review process, leads the planning, assessment and implementation of new and revised IFRS standards and provides accounting policy guidance, interpretations and assessments for complex accounting issues;
- **Internal Controls and Policy:** this team is responsible for maintaining and overseeing compliance with internal financial controls by ensuring financial policies are developed and updated, reviewing instances of control exceptions, providing business support for technology solutions, preparing and reviewing financial system access requests, and creating risk and control assessments for projects and initiatives across BC Hydro to support successful business outcomes;
- **Financial Processes:** this team is the conduit between Finance and Technology to ensure that our financial systems are configured to meet business requirements, are operating as designed, and are delivering data in a

timely manner. This team also provides technical support to users and develops solutions to enhance the financial systems to meet reporting requirements;

- **Financial Accounting and Compliance:** this team provides back-office support for the Treasury group and is directly responsible for the accounting, forecasting, and financial analysis of information pertaining to debt, derivatives, pension and other post-employment benefits; and
- **Taxation:** this team provides tax planning and advice throughout the company on property sales and purchases, procurement activities, sales transactions and employee benefits. The team also prepares and submits all the sales and income tax returns for the business and handles dispute resolution with suppliers, customers and tax authorities.

5E.4.1.3. Planning, Forecasting and Risk Department

The Planning, Forecasting and Risk department consists of five teams that deliver the following services which drive decision making, focus and productivity throughout the organization:

- **Business Planning:** this team leads the corporate-wide annual business planning and budgeting process, as well as the development of performance metrics and performance tracking related to business plans for each of BC Hydro's KBUs. The annual planning process involves the development of business plans and the annual focus document, which outlines the key priorities across BC Hydro and within the Business Groups. These business plans provide clarity on our priority work and help to measure progress towards achieving our objectives throughout the year. The annual focus document provides clarity to employees on the company-wide and Business Group objectives and key priorities and ensures alignment of work activities across the company. Dashboards and scorecards prepared by this team are a key performance tool to track progress on targets and help managers identify areas of concern and implement corrective action, if required, to bring performance back on track. The annual financial budgeting/planning process at the overall company level is led by this team in coordination with the Finance Business Support department, which facilitates the process at the KBU level. BC Hydro's budgeting process is described further in Chapter 5, section 5.4;

- **Enterprise Risk Management:** this team leads BC Hydro's approach to enterprise risk, including the annual refresh of the risk landscape, and ongoing monitoring and reporting of key risks and emerging risks to the Executive and Board of Directors. This team also works with Business Groups and KBUs throughout BC Hydro during the annual planning process to identify and understand key risks related to achieving business objectives so that these risks are considered in the development of each KBU's business plan as well as actively monitored throughout the fiscal year;
- **Forecasting:** this team is responsible for preparing and updating BC Hydro's consolidated financial forecast, which is part of BC Hydro's internal and external reporting requirements, and informs BC Hydro's Revenue Requirements Applications and annual Service Plan. The forecast is used extensively by management in making both short-term and long-term financial decisions. In addition to regular forecast updates, this team is also involved in key initiatives and regulatory filings. Previous examples include the Site C Inquiry, the 2017 Waneta Transaction Application, the Supply Chain Applications Project Application, and the Government of B.C.'s Comprehensive Review;
- **Work Smart:** this team leads BC Hydro's performance improvement initiatives through the Work Smart program. Further information on the Work Smart program is provided in Chapter 5, section 5.4.5; and
- **Change Management:** this team works on projects and initiatives across BC Hydro to understand what people need to do differently to achieve the benefits of the project. Communications, engagement, training and leadership plans are developed for specific groups so that that they have the appropriate

knowledge, skills and abilities to perform their roles - both during and after the change. They also play a key role in ensuring leadership support and business ownership for the change to drive long term sustainment and achievement of benefits. This is a critical component to all projects where employee productivity is involved.

5E.4.1.4. Audit Services Department

The purpose of Audit Services is to provide independent, objective assurance and consulting services to add value and improve BC Hydro's operations. Audit Services reports functionally to the Audit and Finance Committee of the BC Hydro's Board of Directors and administratively to the Executive Vice President of Finance, Technology and Supply Chain and Chief Financial Officer.

Audit Services adheres to the Institute of Internal Auditors International Standards for the Professional Practice of Internal Auditing.

The Audit Services department develops and executes a two-year Audit Plan which incorporates both operational and financial audits to address BC Hydro's key risks and priorities. Information on the types and outcomes of the audits undertaken over the last three fiscal years can be found in Appendix HH.

5E.4.2 Overview of Operating Costs and FTEs

Table 5E-4 Finance KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs

2	Controllership and Treasury	5.4	0.0	0.9	0.0	0.1	0.0	0.0	**6.4**	35
3	Planning, Forecasting and Risk	5.0	0.0	0.2	0.0	0.0	0.0	0.0	**5.3**	36
4	Audit Services	1.5	0.0	0.3	0.0	0.0	0.0	0.0	**1.9**	12
5	**Total (Sch 5.5 L1, Sch 16.0 L30)**	**28.6**	**0.0**	**1.9**	**0.1**	**0.2**	**0.0**	**0.0**	**30.8**	**204**

The Financial Executives Research Foundation, together with Robert Half, published a report entitled 2018 Benchmarking Accounting and Finance Functions. The report includes analyses of the number of internal staff and the cost of staff for finance and accounting functions for companies of various sizes in North America.

The analyses provided data for companies of different sizes, based on annual revenues.

The following table compares BC Hydro's FTEs and base operating cost budget to the benchmarks provided in this report for both revenue categories.

Table 5E-5 Benchmarking Accounting and Finance Functions

Benchmark	BC Hydro	Companies with annual revenue of $5 billion and higher
Number of internal staff in Accounting and Finance	181[260]	180 (median)
Cost of internal staff in Accounting and Finance as a percentage of overall revenues	0.49%[261]	0.5% (bottom quartile) 0.8 (median)

As shown in the table above, the Finance KBU's FTE complement is comparable to the median for companies with revenues of $5 billion and higher and is below the bottom (best) quartile of companies.

5E.4.2.1. Finance Business Support Department

Approximately 97 per cent of this department's budget is related to labour. This represents 121 FTEs as follows:

- Two Finance Directors and two administrative assistants;
- 77 FTEs supporting all of the KBUs within BC Hydro. Each of these finance FTEs supports an average of 84 FTEs and $15 million in annual operating budgets;

[260] The Finance KBU has 204 FTEs. However, this total includes 23 FTEs that perform business planning, change management and enterprise risk management functions which are not traditional finance and accounting functions. Excluding these FTEs, the total number of FTEs in the Finance KBU is 181.

[261] The Finance KBU has a base operating cost budget of $30.8 million which equates to approximately 0.49 per cent of BC Hydro's total fiscal 2018 revenues of $6.237 billion.

- 22 FTEs provide project reviews, evaluations, monitoring and reporting on over 500 capital projects or $1.6 billion in expenditures annually; analyse and convert over 2,500 projects and work orders into in-service assets; review 40 contracts and contract revisions for senior management and maintain asset records for $29 billion in capital assets;
- 11 FTEs are responsible for the annual preparation of 33,000 non-energy bills, processing of 6,000 journal entries and reconciliation of 150 general ledger accounts; and
- Seven FTEs provide monitoring and reporting services on BC Hydro's revenues and cost of energy. These FTEs handle the payment, accounting, forecasting, and budgeting for approximately 130 Electricity Purchase Agreements.

This Finance Business Support department has $0.5 million in non-labour expenditures (e.g., training, travel costs and professional dues and fees).

5E.4.2.2. Controllership and Treasury Department

Approximately 85 per cent of this department's budget is related to labour. This represents 35 FTEs as follows:

- Seven FTEs on the Financial Reporting team prepare over 80 internal and external financial reports and documents including monthly financial statements. In addition, this team is responsible for researching, analyzing, and drafting over 50 technical accounting memos relating to new accounting standards or supporting key initiatives and transactions across BC Hydro;
- Nine FTEs on the Treasury team. This team manages $23 billion in total debt, $8 billion in derivative financial instruments, over $20 billion in annual cash flow management, $70 million in average monthly accounts receivable through credit risk management, $1.4 billion in letter of credit facilities, a $4.6 billion insurance portfolio, and a $3.5 billion pension plan. The activities in this department are supported by the Financial Accounting and Compliance team;

- Five FTEs in the Financial Accounting and Compliance team provide back-office support for the Treasury team including accounting, forecasting, reporting and financial analysis of information pertaining to financial instruments, pension and other post-employment benefit plans, and finance charges. The team also monitors and reports monthly on the Treasury department's compliance with the Liability Risk Management Annual Strategic Plan and the Treasury Risk Management Policy. Best practices require the segregation of duties to an independent team to ensure that proper internal controls are in place for the safeguarding of assets and the accurate and timely recording of Treasury initiated transactions;
- 11 FTEs on the Internal Controls & Financial Processes teams maintain over 900 financial policy, procedure, and guideline documents, review business and travel expense compliance across BC Hydro on a quarterly basis, maintain approximately 35 Financial Process flow diagrams and review approximately 50 Technology projects each year. This team uses a risk and control framework to guide the design of financial controls, triage and support over 260 technical issues per year, initiate an average of 12 financial system and reporting enhancements per year, and conduct testing of system upgrades; and
- Three FTEs in Taxation.

Controllership and Treasury has $0.9 million in non-labour expenditures mainly for external audit, credit rating agency fees, and professional fees.

5E.4.2.3. Planning, Forecasting and Risk Department

Approximately 95 per cent of this department's budget is related to labour. This represents 36 FTEs as follows:

- 10 FTEs on the Business Planning and Risk team support the development of annual business plans for each of BC Hydro's key business units. These FTEs also carry out interviews and workshops to support BC Hydro's risk management activities and produce 32 dashboards per month on key performance indicators and targets critical to achieving business objectives;

- Nine FTEs on the Forecasting team support the preparation of the quarterly forecast update to the government and BC Hydro Board. This team is also critical in supporting key initiatives such as the Site C Inquiry, the BC Hydro 2017 Waneta Transaction and the Comprehensive Review;
- Four FTEs on the Work Smart team, which completes approximately 35 projects annually and has generated an estimated 80,000 annual capacity hours gained since the program's inception; and
- 13 FTEs on the Enterprise Change Management team which supports approximately 50 change management projects per year.

This Planning, Forecasting and Risk group has $0.2 million in non-labour expenditures (e.g., consultants, training, and professional dues and fees).

5E.4.2.4. Audit Services Department

Approximately 80 per cent of the Audit Services department budget is related to labour. This represents 12 FTEs who complete approximately 15 audits per year and follow up on past audits to ensure recommendations are being addressed. This team is also responsible for investigating claimed control breaches that are reported via the company's hotline. A description of the audits undertaken over the past three years can be found in Appendix HH.

The department's services budget primarily provides funding for external subject matter experts, which supplement our teams where subject-matter specific expertise can add value, such as dam safety, smart meter reviews and cybersecurity.

5E.4.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5E-6 Finance KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.5 L1	29.7	28.7	30.2	28.7	30.7	30.8	31.6	32.1
2	FTEs	16.0 L30	188	194	188	196	188	204	206	206

Operating costs are increasing by approximately $0.8 million from the fiscal 2019 forecast to the fiscal 2020 plan due to Standard Labour Rate increases. Operating costs are increasing by approximately $0.5 million from the fiscal 2020 plan to the fiscal 2021 plan due to Standard Labour Rate increases. FTEs are planned to remain stable.

The increase in FTEs from the fiscal 2019 RRA to the fiscal 2019 forecast was primarily driven by the Workforce Optimization program, described in Chapter 5, section 5.6.1.

5E.5 Technology KBU

5E.5.1 Responsibilities

The goal of the Technology KBU is to select, implement and operate technology across BC Hydro so that our systems are reliable, secure, and able to meet the information and operational needs of BC Hydro.

Technology plays an important role in BC Hydro, helping to deliver safe, reliable and affordable service to our customers. For example, the Technology KBU:

- Maintains the health, stability and security of our digital systems, helping to provide reliable and responsive electricity service;
- Enables productivity improvements through technology that streamlines workflows, optimizes work and asset management, and informs decision making; and

- Provides mobile applications with information specific to the job and location, which improves the safety of our field workers.

Since fiscal 2016, BC Hydro has made a number of changes to the management of the Technology KBU:

- **Reorganization:** Planning and performance functions were brought together into a single department to provide integrated and comprehensive investment planning;
- **Improved Technology Delivery Model:** The Technology KBU delivers services with both external and internal resources, using a multi-vendor outsourcing model. Since fiscal 2016, to improve service governance and vendor integration management, BC Hydro has:
  - Renegotiated application service support contracts to improve cost effectiveness and service, developed a Service Integration and Management capability to support service improvement opportunities across all vendors;
  - Replaced our Information Technology Service Management Tool with an internal system to eliminate dependence on external service providers and enable future flexibility; and
  - Created an internal cyber security monitoring and response capability to bring this critical service in-house and provide appropriate management of cyber security risks.
- **Repatriated Critical Roles under the Workforce Optimization Program:** As part of the Workforce Optimization Program, BC Hydro identified specific areas where contractors could be converted to internal employees to strengthen our team and repatriate critical roles. These areas included service governance, vendor integration management, cybersecurity, application services and project management. Overall, these conversions were cost neutral and were

undertaken so that critical functions were maintained in-house and to reduce the risk of losing institutional knowledge and the number of management roles being performed by contractors was reduced. Since fiscal 2016, the Technology KBU has converted 88 contractor positions to internal FTE positions; and

- **Created a New Technology Business Management team:** The Technology Business Management team was created to consolidate the governance functions from across Technology. This consolidation enables greater oversight and consistency in functions such as budget management, vendor management, contract management, policies and standards management, workforce planning, risk management, and records and information management.

Results on performance metrics tracked by the Technology KBU indicate that these changes have been successful. For example:

- **Operational Metrics:** Technology performs well against operational targets used to evaluate and track the performance of our systems and services. For example, from April 2018 to December 2018, BC Hydro had only two high business impacts technology incidents, well below the target level of nine or less. In addition, during the same period, only 8 per cent of calls to the Technology Help Desk waited longer than 30 seconds, below our target of up to 10 per cent. In addition, only 0.6 per cent of customer survey responses were dissatisfied with help desk service;
- **Delivery Metrics:** Technology performs well against metrics used to assess and track the performance of capital investment delivery which include measures on cost, schedule, and quality. Please refer to Chapter 6, section 6.5 for more information on Technology's delivery metrics; and
- **Business Satisfaction:** Technology recently started conducting an annual survey to solicit feedback from across the business to measure the level of satisfaction with Technology delivery and services. Results indicate that overall

satisfaction has improved over the three years of running the customer satisfaction survey.

There have been two material changes to the responsibilities of the Technology KBU since the Previous Application:

- The Telecommunications Planning department moved from the Technology KBU to the Line Asset Planning KBU; and
- The Smart Metering and Network Operations department moved from the former Smart Technology Operations and Restoration KBU to the Technology KBU.

Technology is comprised of the following departments:

- Business Partner Services Department;
- Planning and Performance Department;
- Delivery Department;
- Operations Department; and
- Smart Metering and Network Operations Department.

5E.5.1.1. Business Partner Services Department

The Business Partner Services department works directly with BC Hydro KBUs to understand their business needs and develop technology solutions. The department assists with developing statements of objectives and business cases, initiating work, and meeting business needs and objectives for all technology initiatives. The department also monitors issues, identifies and prioritizes enhancements, and oversees the delivery of sustainment programs for existing business systems and applications that are used by specific areas of the business. Enterprise-wide systems and applications are supported by the Operations department, which is described further below.

5E.5.1.2. Planning and Performance Department

The Planning and Performance department provides technology strategy development and investment planning, portfolio and resource management, cyber security governance, risk and compliance, and business management functions for the Technology KBU.

The investment planning teams are responsible for strategic planning of technology solutions across BC Hydro, integrated investment planning, and enterprise architecture, as well as infrastructure, network and cyber security investment planning. Enterprise architecture develops and maintains technology roadmaps, reference architectures and technical standards which are used to guide technology investment and design decisions.

The portfolio and resource management team manages the selection and prioritization of investments into the delivery portfolio, the availability of resources to deliver on investment plans, processes to track benefit realization from investments, monthly and quarterly tracking of the portfolio, as well as regulatory and long-term capital planning.

The cybersecurity governance, risk and compliance team provides risk assessments, training and awareness, as well as procedural oversight to maintain the security and integrity of BC Hydro’s data, customer and employee information, and digital systems. The team aligns BC Hydro’s technology solutions with cyber security control processes and NERC CIP compliance requirements.

The business management team ensures financial transparency, monitors and reports on performance and supports continuous improvement in the provision of technology services. This team is responsible for all aspects of technology governance including budget management, vendor and contract management, policies and standards management, workforce planning, risk management, business continuity planning, service portfolio management and records and information management.

5E.5.1.3. Delivery Department

This department is responsible for overseeing delivery of the technology capital investment portfolio including defining and ensuring compliance with project management standards, processes and procedures. The capital projects and work programs are described in Chapter 6, section 6.5. The delivery of capital initiatives typically includes operating expenditures related to early stage planning, project identification, analysis of alternatives, requirements analysis, change management, training, and data migration.

5E.5.1.4. Operations Department

The Operations department supports various technology applications that are enterprise-wide or used by multiple business groups. Activities carried out by this department include maintaining, sustaining, upgrading and optimizing enterprise applications such as customer support, financial, supply chain and human resource systems, project and portfolio management and smart metering applications.

This department is also responsible for the maintenance and sustainment of software and hardware related to data centers, including disaster recovery sites; personal computing and mobile devices; networks and other telecommunications equipment and systems; and cybersecurity monitoring and incident management.

This department's responsibilities include the technology help desk for general user support as well as business application support and service management.

5E.5.1.5. Smart Metering and Network Operations Department

The Smart Metering and Network Operations department is responsible for the day-to-day operation of the smart metering system. The department is responsible for data collection as well as device and network operations for approximately two million metering devices. This department also supports the meter-to-cash (e.g., billing) and energy conservation functions (by providing energy usage information), as well as energy loss and theft detection, power quality analysis, distribution grid use cases, and outage management functions.

5E.5.2 Overview of Operating Costs and FTEs

Table 5E-7 Technology KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Business Partner Services	5.4	0.0	16.9	0.0	4.8	0.0	0.0	**27.1**	43
2	Planning and Performance	7.8	0.0	2.5	0.3	0.1	0.0	0.0	**10.8**	58
3	Delivery	1.9	0.0	0.9	0.0	0.2	0.0	0.0	**3.0**	16
4	Operations	15.1	0.0	41.6	2.2	30.3	0.0	0.0	**89.2**	122
5	Smart Metering and Network Ops	3.0	0.0	0.6	0.0	0.0	0.0	0.0	**3.6**	24
6	**Total (Sch 5.5 L2, Sch 16.0 L31)**	**33.2**	**0.0**	**62.4**	**2.5**	**35.5**	**0.0**	**0.0**	**133.7**	**263**

As BC Hydro identifies opportunities to use technology to improve safety, reliability and productivity, the Technology KBU must manage the costs associated with these commitments while maintaining acceptable service levels. Primary technology cost-drivers include:

- **Software Licensing and Maintenance:** Software licensing and maintenance costs have increased by approximately 10 per cent between fiscal 2016 and fiscal 2019 due to market pricing, U.S./Canadian exchange rates, changes in licensing models and growth in the number of users;
- **Capital Investment in New and Existing Business Applications:** Higher application outsourcing, sustainment and maintenance costs are driven by new applications and enhancements to existing systems;
- **Infrastructure and End Point Devices:** As BC Hydro develops new technology solutions to improve reliability, safety and productivity, the foundational infrastructure to support these solutions (i.e. data centre servers, data storage and end point devices) must be expanded. For example, since fiscal 2016, data storage volume has grown from approximately 40 per cent from 2,000 terabytes to 2,900 terabytes. In addition, BC Hydro has provided

mobile devices to field workers, which has increased the number of these devices from 2,350 to 4,800; and

- **Cybersecurity:** Cost increases in this area have been largely driven by NERC compliance requirements as well as protection against an increased number and complexity of cybersecurity threats in the energy sector.

The Technology KBU has been able to maintain an appropriate level of service by implementing initiatives to offset the cost drivers described above. Examples of these initiatives, which are reflected in our revenue requirements, include:

- **Contract Re-negotiations:** BC Hydro has re-negotiated and renewed its data centre services contract to mitigate future costs over the next five years;
- **Consolidation of Infrastructure:** BC Hydro has initiated capital projects to eliminate data centre space at the Vancouver Internet Data Centre and consolidated racks and data center links at our Calgary Internet Data Centre. These initiatives resulted in approximately $0.8 million and $0.3 million in annual avoided costs, respectively;
- **Technological Improvements:** The implementation of next generation servers and storage devices has improved performance and capacity, resulting in more efficient use of equipment; and
- **Telecommunications Services Commoditization:** BC Hydro has been able to secure a reduction in rates for commodity technology services such as telecommunications data plans.

Operating costs of the Technology KBU by department are as follows.

5E.5.2.1. Business Partner Services Department

The labour budget for this department represents 43 FTEs. FTEs in this department charge approximately 13 per cent of their time to capital projects. These FTEs are organized across five teams and support approximately 200 business-specific technology systems and applications.

The services budget in this department funds external service providers for business application maintenance and sustainment. These external service providers perform, evaluate, prioritize and manage security, user-interface and platform stability improvements and upgrades across all business applications to maintain asset health and reliability.

This department also has a building and equipment budget for software licensing costs required for vendor support, security patches, and vendor-driven upgrades.

5E.5.2.2. Planning and Performance Department

The majority of the Planning and Performance department budget is related to labour costs for 58 FTEs. Employees in this department charge approximately 4 per cent of their time to capital projects.

- Four FTEs are responsible for strategic planning, investment benefits tracking, integrated investment planning, and portfolio and resource planning for BC Hydro's annual technology capital portfolio and five-year plan;
- Five FTEs are responsible for Enterprise Architecture including technology roadmap development and architecture standards and design;
- Three FTEs are responsible for infrastructure and telephony asset planning;
- Eight FTEs are responsible for cybersecurity planning including governance, risk and compliance;
- 10 FTEs are responsible for business planning, performance reporting, risk management, software asset management, business continuity and disaster recovery planning as well as the planning and implementation of continuous improvement activities;

- 20 FTEs in the Records Information Office manage BC Hydro's 3.2 petabytes of online and physical records including performing quality assurance, issuing approximately 60,000 drawings per year and circulating approximately 10,000 items per year; and
- Eight FTEs in the Vendor Management Office provide vendor relationship management and contract management, supporting a portfolio of approximately 90 vendors and a total average annual spend of approximately $200 million.

The budget for this department also includes funding for security testing, research and subscriptions.

5E.5.2.3. Delivery Department

This department delivers the Technology capital portfolio, which includes approximately 145 projects and work programs annually. The Delivery department workforce includes a mix of internal employees and external contractors. The labour budget for this department represents 16 FTEs. FTEs in this department charge approximately 37 per cent of their time to capital projects.

The non-labour budget for this department is primarily for contract resources to support Smart Metering Infrastructure end to end testing.

5E.5.2.4. Operations Department

The labour budget for this department represents 122 FTEs. Employees in this department charge approximately 10 per cent of their time to capital projects. Specifically:

- Two FTEs in this department represent the Chief Information Officer and an Administrative Assistant;
- 45 FTEs on the Enterprise Applications team operate, sustain and evolve approximately 100 enterprise-wide technology systems and applications used by BC Hydro employees and contractors;

- 35 FTEs on the Infrastructure, Cybersecurity Operations and Network and Telecommunication Operations team manage all enterprise-wide and business-specific BC Hydro Technology systems. This includes BC Hydro's 2,500 data centre servers. This team also manages approximately 8,200 desktop and laptop computers and 4,800 mobile devices across BC Hydro. In addition, this team is responsible for cybersecurity monitoring and incident response including the management of 280 firewalls, 23 Intrusion Detection System sensors, 10,000 Antivirus and Malware protection endpoints and two Security Event Monitoring Systems; and
- 40 FTEs on the Business Application Support and Service Management team respond to approximately 25,000 incidents and requests annually. Resourcing requirements for this team are driven by the continued need to operate, train and provide helpdesk support for critical technology systems.

This department's Services budget provides funding for the following costs:

- The development, sustainment and maintenance of technology enterprise applications;
- Data Center requirements including servers, pooled storage, middleware, racks and cybersecurity devices; and
- End Point Devices including service desk support, desktops, laptops, mobile devices and video devices.

This department's materials budget provides funding for the lease and usage of approximately 500 printers/copiers located throughout BC Hydro.

This department's building and equipment budget provides funding for the following costs:

- Software license and maintenance fees for enterprise systems and applications; and

- Communications and utilities services across BC Hydro including mobile phones services, landline services, telecom services, internet services, satellite services and hardware maintenance and support.

5E.5.2.5. Smart Metering and Network Operations Department

The majority of this department's budget is related to labour. This represents 24 FTEs, who manage over 2 million meters, approximately 8,000 mesh network devices as well as over 370 million pieces of data per day (e.g., consumption data, power quality attributes, safety and security alarms, and operational exceptions). This department operates in a near real-time capacity and facilitates the use of meter and field device data for BC Hydro's operational requirements including:

- Customer service operations functions including automated meter readings for residential, commercial, and industrial customer billing, demand billing, remote disconnect and reconnect, high bill and other customer investigations;
- Energy conversation programs including the energy conservation portal, in-home display solutions, and demand response pilots; and
- Energy loss and theft detection, load forecasting, power quality analysis, outage management, and distribution asset management.

Examples of improved business outcomes from Smart Metering Infrastructure include:

- 30,000 fewer estimated bills and 12,000 fewer invoices stopped each month for review by billing control processes;
- 3,200 vacant premises disconnected per month, which reduces the amount of electricity consumed that is potentially unbillable to customers; and
- 3,000 avoided truck dispatches for customer-side outages.

The non-labour budget for this department is primarily for contractor resources providing Smart Metering Infrastructure subject matter expertise and resource augmentation.

5E.5.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5E-8 Technology KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.5 L2	141.1	134.5	141.3	128.3	140.5	133.7	135.8	136.4
2	FTEs	16.0 L31	176	186	191	226	202	263	269	269

Operating costs are increasing by approximately $2.1 million from the fiscal 2019 forecast to the fiscal 2020 plan due to standard labour rate increases ($1.6 million) and budget transfers from other KBUs due to re-organization ($0.5 million).

Operating costs are increasing by approximately $0.6 million in fiscal 2021 compared to fiscal 2020 due to standard labour rate increases.

FTEs are planned to increase by six from the fiscal 2019 forecast to the fiscal 2020 plan due to the conversion of contractors to internal FTEs as part of the Workforce Optimization Program, which is discussed further in Chapter 5, section 5.6.1.

The increase in FTEs from the fiscal 2019 RRA to the fiscal 2019 forecast was also primarily driven by the Workforce Optimization program.

5E.6 Supply Chain KBU

5E.6.1 Responsibilities

The Supply Chain KBU supports safe, cost-effective and timely work at BC Hydro through the delivery of materials, vehicles and procurement services to all KBUs. Over the last decade, BC Hydro’s work and annual spend with our external suppliers has increased by more than 300 per cent from $650 million to over $2 billion due mainly to BC Hydro’s growing capital program. Supply Chain functions have become integral to delivering on key BC Hydro priorities such as capital plan delivery, ongoing reliable operations, safety and cost containment. BC Hydro uses suppliers to deliver equipment and materials such as transformers, generators, wire, electrical components and vehicles, as well as significant portions of work through services such as distribution line work, traffic management, vegetation management, security, information technology, engineering, vehicle maintenance and capital project construction. Meeting the needs of a BC Hydro that has become both an operations and project delivery company has required all areas of Supply Chain to evolve accordingly.

In fiscal 2013, in response to the growing criticality of Supply Chain functions to BC Hydro, BC Hydro started a multi-year implementation of an updated Supply Chain and Fleet Services Business Model. Implementation of the business model includes changes to people, processes and technology. A significant portion of the people and process changes are well underway or complete. The Supply Chain KBU is also responsible for the design and implementation of the Supply Chain Applications Project. Further details on this project are included in Appendix J.

The Supply Chain Applications Project will provide information technology and other tools for Supply Chain to help achieve a number of the remaining capabilities needed to fully operationalize the Supply Chain and Fleet business model. The Supply Chain Applications Project is currently being reviewed by the Commission in a separate proceeding.

The ongoing operations and improved capabilities of Supply Chain are having a positive impact on performance across BC Hydro while helping to control costs. Some examples of how Supply Chain supports BC Hydro in maintaining its strong reliability ratings and delivering its capital, maintenance and operations plans on schedule and within budget include:

- Improved logistics support to other departments across BC Hydro on an ongoing basis for planned work as well as during emergency events ensuring that BC Hydro is able to safely and efficiently complete work and respond quickly during outages and emergencies. For example, Supply Chain's logistics support during storms and wildfires includes ensuring that the materials needed to restore power are available to field crews at outage sites across the province, coordinating transportation and accommodation for goods and people who must be mobilized to respond, and emergency repairs of vehicles and equipment to keep staff operational throughout emergency events;

- Developing and implementing project supply chain strategies related to Stations, Lines and Interconnection projects to ensure materials and services required for these projects are available in a timely manner; and
- Developing and implementing category strategies which are estimated to provide approximately $16 million in cost avoidance and cost reduction benefits for fiscal 2019. Examples of category strategies include:
  - The Power Transformer Category strategy where BC Hydro created an improved contracting model, transportation management and quality management processes that together with improved contract and supplier management have greatly reduced transformer quality issues and supported on time project delivery. The same types of strategy elements are now being applied to other major equipment categories; and
  - Several of BC Hydro's category strategies for services have included "unitizing" the service which means creating hundreds of individual work units that represent the full range of services that could be required. This allows for more transparency into the costs of different work packages, supports market competitiveness and provides reliable information for work planning and budgeting to improve delivery of work.

The Supply Chain KBU is comprised of the following three departments:

- Procurement Department;

- Materials Management Department; and
- Fleet Services Department.

There have been no material changes to the responsibilities of the Supply Chain KBU since the Previous Application with the exception of the repatriation of the Accounts Payable function from Accenture in May 2018. This resulted in the transfer of approximately 23 FTEs to the Procurement department.

5E.6.1.1. Procurement Department

Overall, the Procurement Department has evolved to provide more strategic capabilities to respond to the needs of BC Hydro and to the increased complexities in the market. This includes more robust planning, analysis and supply market engagement.

The Procurement department is responsible for:

- Developing and executing supply chain related strategies, sourcing programs and project delivery strategies to support approximately $2 billion in annual enterprise capital construction, operational and maintenance needs;
- Developing and implementing category management processes and individual category strategic plans for BC Hydro’s key spend categories which incorporate strategy development, business process change, sourcing, and guidance on contract and supplier management. Examples of spend categories include power transformers, line services, vegetation management services, engineering services, security services, electrical components and distribution transformers;
- Leading Indigenous procurement policies and processes and working with the Indigenous Relations KBU to identify Indigenous procurement opportunities to meet commitments included in Impact Benefit Agreements and Relationship Agreements with First Nations;

- Developing, communicating and monitoring compliance with BC Hydro’s procurement policies and guidelines which incorporate the obligations under trade agreements that BC Hydro is a party to such as the Canadian Free Trade Agreement and the New West Partnership Trade Agreement;
- Managing several enterprise-wide programs such as travel, credit card and the contingent labour resource augmentation solution; and
- Managing BC Hydro’s Accounts Payable function following the repatriation of this function from Accenture in May 2018.

5E.6.1.2. Materials Management Department

This department provides the following services:

- Inventory forecasting and planning;
- Material distribution and transportation;
- Field warehouse operations;
- Disposition of assets at end of life from BC Hydro’s systems; and
- Waste transformer oil management.

This department has one main distribution centre located in Surrey, B.C. and services over 80 locations that cover the entire BC Hydro service area, requiring over 400,000 kilometers of travel each year. Over 50 per cent of our locations are serviced remotely from larger headquarters and require scheduled deliveries using complex transportation routes to replenish inventory levels over difficult terrain and remote islands.

Rigorous planning and inventory replenishment processes ensure that high service fill rates are achieved to support our crews performing restoration work and storm response. Our network provides business continuity with the management of spare parts and emergency inventories to ensure rapid response in the event of a system failure or natural disaster. BC Hydro's service fill rate as of December 2018 was 97 per cent and is currently in line with North America industry benchmarks of 96 per cent[262].

Materials Management is also required to procure inventory items that conform to unique specifications as a result of BC Hydro's system design. Achieving these objectives requires active contract management with key suppliers to realize on time delivery and quality specifications. Many of our materials have long-lead times such as power poles that require rigorous demand management to plan and distribute inventory for project work. Our Planning function manages inventory levels for approximately 39,000 inventory items that are situated across the BC Hydro network.

Materials Management also performs the pre-assembling of materials that involve staging, assembling, and kitting of inventory components to meet the needs of some capital projects.

5E.6.1.3. Fleet Services Department

The Fleet Services department is responsible for the procurement and life-cycle management of approximately 3,600 fleet assets (including vehicles, trailers and other equipment such as forklifts). The life-cycle management of fleet assets includes:

- Asset planning and acquisition;
- Engineering;
- Registration and insurance;
- Maintenance and repair;
- Vehicle fueling;
- Asset transfers and disposal; and

[262] PWC 2017 Utilities Materials Logistics Benchmark Study.

- Fleet supplier and contract management.

Fleet Services operates five main garages and also has mobile mechanics based out of 16 additional district offices.

5E.6.2 Overview of Operating Costs and FTEs

Table 5E-9 Supply Chain KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Procurement	19.3	0.2	3.1	0.1	0.0	0.0	0.0	**22.7**	161
2	MMBU	15.8	0.0	6.6	2.6	0.7	0.0	0.0	**25.6**	180
3	Fleet Management	12.7	0.0	13.8	16.3	0.4	0.0	0.0	**43.2**	109
4	Supply Chain Lead	0.9	0.0	0.9	0.0	0.0	0.0	0.0	**1.8**	4
5	**Total (Sch 5.5 L3, Sch 16.0 L32)**	**48.6**	**0.2**	**24.4**	**18.9**	**1.1**	**0.0**	**0.0**	**93.3**	**454**

5E.6.2.1. Procurement Department

Eighty-five per cent of the Procurement department’s budget is related to labour. This represents 161 FTEs. Total FTEs have increased by 40 from 121 FTEs in fiscal 2017 to 161 FTEs in fiscal 2019. Twenty-three FTEs were related to the repatriation of the Accounts Payable function from Accenture. Sixteen FTEs were related to the conversion of contractors to internal employees under the Workforce Optimization Program and were cost neutral.

Approximately 60 per cent of the Procurement department’s Services budget relates to contractor and supplemental labour to provide specialized expertise and resource augmentation for work peaks. The remainder of this budget relates to licence fees for program tools and external training fees.

The Procurement’s department operating cost budget has remained flat from fiscal 2017 to fiscal 2019 despite the large volume, increasing complexity of work and improved strategic support.

The 161 FTEs are divided into the following teams:

- 59 FTEs on the Category Management team develop and implement category management strategies that will best meet BC Hydro requirements and optimize value. These FTEs focus on the approximately 50 spend categories that are critical to BC Hydro and represent the majority of BC Hydro's annual supplier spend.

  When developing and executing specific category strategies, BC Hydro sets high-level objectives in eight areas to reflect what good performance would be in that specific category to meet BC Hydro's needs. The eight areas are: reliability, responsiveness, safety, organizational productivity and efficiency, First Nations, compliance and control, supplier performance and relationships and total lifecycle cost. Category strategies are driving improved performance in all these areas which is helping individual areas of BC Hydro and the company as a whole deliver their business priorities. As an example, improved supplier performance is helping to ensure safety, work delivery and reliability. Cost benefits in certain categories are helping to ensure BC Hydro can offset and/or contain costs within budgets;

- 28 FTEs on the Infrastructure Projects team are responsible for developing and implementing project procurement strategies for approximately 450 active projects related to Stations, Lines and Interconnection projects. Projects range in complexity and risk from simple to very complex and from low to high risk such as the Site C project. Approximately 80 per cent of the labour costs for these FTEs are charged directly to the capital projects they support; and

- 31 FTEs on the Purchasing team are responsible for supporting the thousands of procurement related transactions annually such as contract requests, releases and amendments that happen on a daily basis. They are also responsible for the smaller to medium sized and lower to medium complexity procurements. This mostly includes the sourcing of all materials over $25,000 as well as the sourcing of some short to medium term requirements for construction and other services.

Overall, the 118 FTEs on the Category Management, Infrastructure Procurement and Purchasing teams conduct approximately 30,000 procurement transactions each year including 260 public sourcing competitions and 450 secondary sourcing processes for suppliers pre-qualified through public competitions. These FTEs also develop and implement project procurement strategies for approximately 450 active projects and develop and implement category strategies that will cover approximately 80 per cent of BC Hydro's supplier spend.

The Supply Chain Central Services team that is also part of the Procurement group is composed of the following:

- Eight FTEs on the Procurement Policy, Compliance and Reporting team that develop, sustain, communicate and support compliance with procurement policies and guidelines across all of BC Hydro. This team provides training and interpretation guidance as well as reporting on Supply Chain metrics. The team maintains 16 policies and approximately 160 procedure and guidance documents and produces 20 reports on a weekly or monthly basis;
- 12 FTEs manage several enterprise-wide services, programs and contracts including:
  - The Bid Station which posts approximately 600 procurement-related bids and amendments on BC Bid each year and provides central collection of all Bid submissions;
  - The credit card program with 5,500 card holders and approximately 3,500 change requests per year including new card requests, suspensions, lost and damaged cards and card limit changes; and
  - The eCommerce program which allows for purchase orders and invoices to be sent electronically thereby reducing manual work for staff. This program

also allows suppliers to choose earlier payment options on approved invoices in exchange for a sliding scale discount. BC Hydro earns approximately $400,000 per year in discount revenues through the eCommerce program; and

- 23 FTEs on the Accounts Payable team. The Accounts Payable function was repatriated to BC Hydro in May 2018 from Accenture and costs that were previously shown as ABSU – Services are now shown as labour costs. The Accounts Payable team processes approximately 140,000 invoices per year.

  BC Hydro's Accounts Payable function scores favourably compared to other top performing organizations on several metrics. For example the number of invoices processed per FTE per year for BC Hydro is 6,086 compared to 4,706 for the top performing group in the American Productivity and Quality Centre benchmark. [263] BC Hydro's on-time invoice payment of 92 per cent is also above the 90 per cent average of other top performers based on a Hackett Group report.[264]

5E.6.2.2. Materials Management Department

Materials Management is a critical support function to provide materials related services to over 1,500 BC Hydro field employees as well as approximately 80 contractor crews that perform work across the province. The department manages approximately 350,000 transactions per year that include the issue, transfer and receipt of materials and also manage approximately $200 million of inventory spread across the province.

Overall the Material Managements operating cost budget has remained flat over the fiscal 2017 to fiscal 2019 period despite increasing work volumes and maintaining

[263] 2017 American Productivity and Quality Centre (APQC) benchmark, https://www.apqc.org/benchmarkig-portal/osb/accounts-payable-and-expense-reinbursement.

[264] The Hackett Group, https://www.zycus.com/knowledge-hub/research-reports/three-characteristics-of-top-performing-purchase-to-pay-organizations.html.

service levels. This is being achieved by continually evaluating its delivery processes and finding improvements such as:

- Centralized contractor fulfillment for Lower Mainland contractor crews;
- Optimization of the main distribution centre labor pool to service multiple work streams at BC Hydro including project materials; and
- Consolidation of Maintenance, Repair, Operations inventory at Field Stores to support crews and contractors.

The majority of this department's budget relates to labour costs for 180 FTEs. The number of Field Storekeepers at each location is aligned to BC Hydro's crew complements and transactional volumes to fulfill planned, emergent and maintenance work. The 180 FTEs are in the following functions:

- 27 FTEs are responsible for planning, acquiring and managing materials. These FTEs process an average of 225,000 inventory material requests each year, manage 39,000 catalogue items, process 18,000 purchase requisitions for catalogue and non-catalogue items each year and perform 30 inventory counts per year with close to 110,000 catalogued items counted. In addition, this team is responsible for managing approximately 130 contracts worth approximately $1.5 billion with over 100 suppliers;
- 77 FTEs in Regional Operations that support 60 regional field stores. This team manages 350,000 transactions each year related to the receipt of materials at the regional field stores and issuing materials to field crews across the province; and
- 76 FTEs in Central Operations that manage the delivery of materials to regional field stores with a monthly average of 80 scheduled runs via 16 routes to over 80 locations across the Province. This team also manages the disposals of materials and equipment, scrap materials recycling as well as oil management and wood recycling. BC Hydro processes between 1.5 million to 2 million

pounds of salvage materials each month, generating $4.5 million per year from the sale of scrap materials and $500,000 per year from the sale of recycled oil. The recycling of transformer oil and materials results in approximately 94 per cent diversion from landfills and our transportation network is optimized to leverage backhauls from outbound routes to return materials for salvage processing.

This department's Services – Other budget includes $4.2 million for third-party transportation costs to transport materials from the Main Distribution Centre to the regional field stores and $1.1 million for environmental contractors to handle used materials. The remainder of this budget funds travel for staff travelling between store locations to cover regional field stores that are not regularly staffed.

This department's Materials budget is largely composed of the annual provision for obsolete materials.

The budget for Buildings and Equipment is made up of storage fees and miscellaneous tools and equipment.

5E.6.2.3. Fleet Services Department

BC Hydro's fleet assets are relied on by diverse BC Hydro work teams, including over 1,500 operational crew members, doing planned and unplanned work (such as responding to storms and emergencies) safely and efficiently across the province. Almost 40 per cent of our fleet assets are located in smaller and remote locations and require use in off-road terrain such as transmission rights of way.

This department's labour budget represents 109 FTEs of which 85 per cent are union roles. These FTEs are in the following main functions:

- Nine FTEs are responsible for asset planning, acquisition, fleet engineering and supplier and contract management. This team develops and implements acquisition strategies, scans the market to keep abreast of new and green vehicle technologies, delivers on a Fleet capital spend of approximately

$30 million per year, manages contracts and relationships with 40 suppliers (with an annual operating and capital spend of approximately $60 million), participates in sourcing events to select suppliers, performs fleet safety and maintenance engineering, manages manufacturer recalls, updates vehicle specifications, and manages fleet initiatives such as trials of new heavy hybrid vehicles; and

- 100 FTEs deliver maintenance operations across the province to keep our fleet assets and BC Hydro staff operational. Approximately 1,900 (53 per cent) of BC Hydro's 3,600 fleet assets are maintained and repaired in-house and the remaining lighter-duty assets are outsourced for repair and maintenance through a fleet management supplier.

BC Hydro's specialized and heavy aerial units are safety-critical vehicles operated in proximity to high-voltage power lines by our field crews. To ensure the availability of these specialized units and safety of our crews BC Hydro predominantly performs in-house maintenance/repair of heavier assets and equipment including maintenance scheduling and mandatory annual testing. This in-house maintenance/repair is performed by employees that are skilled, red-seal-journeyed tradespeople, and are supplemented by the use of external heavy-vehicle chassis dealers across the province.

Feedback from our user groups has reflected the desire for greater vehicle availability and more Fleet mechanics in the field to support operational objectives. Since fiscal 2017, the number of FTEs in this department has increased by eight, largely as a result of cost neutral additions through the Workforce Optimization Program, such as the addition of mechanics at locations across the province to optimize vehicle availability. The Workforce Optimization Program is discussed further in Chapter 5, section 5.6.1. This program enables us to do more heavy work in-house where we can control the prioritization and turnaround of repairs on these critical assets and where costs (such as for parts) are lower. We also invest in specialized training for our mechanics in order for them to earn their Canadian Utility Fleet Mechanic certification and increase technical competency working on aerial equipment. To-date over 55 BC Hydro staff have earned this certification, and another 24 mechanics and apprentices are presently at various stages in the Utility Fleet Mechanic training/certification process.

The FTEs in this group also manage the outsourced maintenance and repair of light and medium duty assets; operate a Fleet parts room; administer BC Hydro's vehicle pools, asset insurance/registration renewals, asset transfers and disposals; complete commissioning on new heavy vehicles, and manage fuel, lubricant and carbon offset costs.

Each year, Fleet Services purchases 200 to 350 new assets annually for diverse user groups across the organization, completes approximately 33,000 vehicle work orders and 8,000 part orders, manages approximately 107,000 fuel transactions, and responds to approximately 150 accidents requiring repair coordination and cost recovery with ICBC.

In order to manage its budget and to support the objectives of its user groups Fleet Services continues to look for improvements to gain efficiencies. Recent examples include:

- Doubling the throughput in a mid-life maintenance inspection process;
- Implementing manufacturers' new vehicle programs to gain access to a larger network of certified outfitting vendors (who install specialized equipment such as winches, safety equipment and storage on new vehicles) and gain shipping efficiencies; and
- Ensuring that our maintenance program, personnel and facilities meet provincial Commercial Vehicle Safety & Enforcement standards to save money and vehicle downtime. This enables us to complete one mandatory commercial

inspection annually via internal staff at our own facilities versus the requirement for two inspections annually if vehicles had to go for external inspection.

The department's Services – Other budget includes $7.7 million for the costs of outsourced maintenance and repairs on light and medium assets, $2.1 million for asset registration and insurance costs with ICBC, $0.9 million for mandatory vehicle testing services provided by BC Hydro's subsidiary Powertech and carbon offset costs of $0.5 million. The remainder of this budget relates to mobile mechanic travel costs to maintain and repair assets in their assigned territories including remote locations, and vehicle lease costs.

The department's Materials budget primarily includes fuel costs of $10.6 million and parts costs of $5.4 million.

5E.6.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5E-10 Supply Chain KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.5 L3	91.8	89.9	92.2	89.0	93.0	93.3	94.5	95.5
2	FTEs	16.0 L32	402	421	402	447	402	454	468	468

Operating costs are increasing by approximately $1.2 million from the fiscal 2019 forecast to the fiscal 2020 Plan and by approximately $1.0 million from the fiscal 2020 plan to the fiscal 2021 plan, due to Standard Labour Rate increases.

FTEs are planned to increase by 14 from the fiscal 2019 forecast to the fiscal 2020 plan, primarily due to the establishment of an administrative/clerical pool to replace external contract resources. These temporary employees provide short-term coverage and are only paid for their time while on assignment. They charge all their time to the individual cost centres they are assigned to.

The increase in FTEs from the fiscal 2019 RRA to the fiscal 2019 forecast was primarily driven by the Workforce Optimization program, described in

Chapter 5, section 5.6.1 and the Accenture repatriation, described in Chapter 5, section 5.6.2.

5E.7 Business Unit Support KBU

5E.7.1 Responsibilities

The Finance, Technology and Supply Chain Business Unit Support KBU holds the budget for the Office of the Executive Vice President of Finance, Technology, Supply Chain and Chief Financial Officer.

Chapter 5F

Operating Costs
People, Customer, Corporate Affairs
Business Group

Table of Contents

List of Figures

List of Tables

5F.1 Introduction – People, Customer and Corporate Affairs Business Group

Chapter 5F provides and explains in detail the composition of, and rationale for the operating costs of the People, Customer and Corporate Affairs Business Group. The People, Customer and Corporate Affairs Business Group is one of six business groups in the organization and serves a Support function in the Plan-Build-Operate-Support model.

The People, Customer and Corporate Affairs Business Group budget was developed as part of the budgeting process outlined in Chapter 5, section 5.4. The information provided in this Chapter 5F demonstrates the basis for the entirety of the Business Group and KBU budgets, rather than focussing only on incremental cost requirements.

Chapter 5F is organized as follows:

- Section 5F.2 provides an overview of the organization and responsibilities of the People, Customer and Corporate Affairs Business Group;
- Section 5F.3 provides the operating costs and FTE information for the People, Customer and Corporate Affairs Business Group as a whole;[265] and
- Sections 5F.4 to 5F.11 provide more detailed information on the responsibilities, cost and FTEs for each KBU within the People, Customer and Corporate Affairs Business Group. The operating costs and FTE information for each KBU is broken out into two subsections:[265]
  - ▶ Overview of Operating Costs and FTEs – This subsection explains the starting operating costs and FTEs based on the fiscal 2019 forecast; and

[265] Please note the amounts presented in the tables in these sections may not add due to rounding.

- Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs – This subsection explains any incremental changes between fiscal 2019 forecast and fiscal 2020 and fiscal 2021 plan.

5F.2 Overview of People, Customer and Corporate Affairs Business Group Organization and Responsibilities

The People, Customer and Corporate Affairs Business Group is responsible for serving our customers and supporting our people. The Business Group's role includes:

- Attracting and retaining a high-performing, engaged workforce;
- Managing the experience of our 4 million residential, commercial and industrial customers as they interact with BC Hydro;
- Designing and implementing energy efficiency programs that enable and encourage all customer groups to conserve and manage the energy they use;
- Building relationships with the public, customers, external stakeholders, our regulator and our shareholder through ongoing communication and engagement opportunities;
- Ensuring compliance with regulatory standards and developing customer rates; and
- Managing commercial agreements and bilateral negotiations on behalf of BC Hydro.

The People, Customer and Corporate Affairs Business Group consists of the following KBUs:

Business Group	Key Business Unit
People, Customer and Corporate Affairs	Human Resources Customer Service Conservation and Energy Management Power Acquisitions and Contract Management Communications and Community Engagement Regulatory and Rates Ethics and Merit Office Business Unit Support

The People, Customer and Corporate Affairs Business Group is similar to the former Corporate Affairs KBU in the Previous Application with the following material changes:

- The addition of the Customer Service KBU from the former Transmission, Distribution and Customer Service Business Group;
- Business Planning and Risk is now part of the Finance KBU of the Finance, Technology and Supply Chain Business Group;
- Energy Planning is now part of the Energy Planning and Analytics KBU of the Integrated Planning Business Group; and
- The addition of the Enterprise Learning Department from the former Training, Development and Generation Business Group.

5F.3 Fiscal 2020 and Fiscal 2021 Plan Operating Cost and FTE Summaries

This section addresses planned operating costs and FTEs for the People, Customer and Corporate Affairs Business Group. The following are some key points of note with respect to the information provided in Figure 5F-1, Table 5F-1, Figure 5F-2, Table 5F-2 and Table 5F-3.

- The Customer Service KBU and the Human Resources KBU comprise over 75 per cent of the operating cost budget and over 65 per cent of the total FTEs for the People, Customer, Corporate Affairs Business Group. This reflects the repatriation of services from Accenture, which has delivered annual savings in excess of the expected savings and is discussed further in Chapter 5, section 5.6.2;

- Overall, labour costs make up over 65 per cent of the total operating costs for the People, Customer, Corporate Affairs Business Group; and
- Total operating costs are relatively flat from fiscal 2019 forecast to fiscal 2021 plan. Cost increases, primarily related to Standard Labour Rate increases and the Customer Crisis Fund, are offset by cost savings such as a reduction to advertising costs and reduced postage and printing costs due to paperless billing and other correspondence. The increases related to the Customer Crisis Fund are funded by the Customer Crisis Fund Rate Rider.

Planned operating costs for this Business Group are approximately $115.9 million in fiscal 2020 and approximately $117.2 million in fiscal 2021.

The operating costs for the People, Customer and Corporate Affairs Business Group are summarized by KBU in Figure 5F-1. Additional cost details are provided in Table 5F-1 below.

5F.4 Human Resources KBU

5F.4.1 Responsibilities

The Human Resources KBU is responsible for employee attraction and retention programs as well as supporting the productivity and engagement of our workforce through:

- Employee development;
- Performance management;
- Career and succession planning;
- Rewards programs;
- Health promotion and return to work programs; and
- Strong and effective relationships with our unions.

The responsibilities of this KBU have changed since the Previous Application due to the repatriation of Recruitment Services, Payroll Services and the Employee Service

Center from Accenture. The repatriation of services from Accenture is discussed in Chapter 5, section 5.6.2. In addition, the Enterprise Learning Department, which was previously part of the Learning and Development KBU, has moved to the Human Resources KBU. Lastly, the Change Management Department has moved from the Human Resources KBU to the Planning, Forecasting and Risk Department of the Finance KBU.

The Human Resources KBU is organized into five departments:

- Employee Relations Department;
- Recruitment Department;
- Enterprise Learning and Talent Management Department;
- Total Rewards and Systems Department; and
- Client Services Department.

5F.4.1.1. Employee Relations Department

The Employee Relations department is responsible for the overall labour relations strategy/management, collective agreement administration, union contract negotiations, policy development and governance, supporting managers/HR with workplace issues, and dispute resolution (e.g., arbitrations).

5F.4.1.2. Recruitment Department

The Recruitment department is responsible for the internal and external recruitment of employees through direct sourcing and by maintaining relationships with professional associations and educational institutions. With the repatriation of services previously performed by Accenture, this department now includes Recruitment Services which provides services such as screening candidates, overseeing background checks and coordinating interviews.

5F.4.1.3. Enterprise Learning and Talent Management Department

The Enterprise Learning team is responsible for non-technical and professional related training and leadership development. The Talent Management team is responsible for our diversity, engagement, talent management, performance and succession planning programs.

5F.4.1.4. Total Rewards and Systems Department

The Total Rewards and Systems department is comprised of the following teams: Total Rewards, Systems and Analytics, and Health and Recovery Services.

The Total Rewards team is responsible for the compensation, benefit, pension and time off programs that we provide to attract and retain employees. This includes the management of third party providers of benefits and pension services. With the repatriation of services previously performed by Accenture, this group now includes payroll, long-term disability, relocation and retiree benefit services.

The Systems and Analytics team is responsible for human resources information systems, and providing reporting, and data and statistical analysis. With the repatriation of services previously performed by Accenture, this group now includes the Employee Service Center which fields employee questions and processes employee transactions such as setting up new hires in our system.

The Health and Recovery Services team is responsible for health promotion and supporting the return to work of employees. This includes preventative wellness programs, return to work programs, attendance management and WorkSafeBC claims.

5F.4.1.5. Client Services Department

The Client Services department works directly with managers and employees to provide human resources support. This includes activities such as: supporting clients with human resources processes (e.g., performance management and succession planning), organizational design, leadership coaching, and addressing employee performance issues.

5F.4.2 Overview of Operating Costs and FTEs

Table 5F-4 Human Resources KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs

6	Client Services	4.0	0.0	0.1	0.0	0.0	0.0	0.0	**4.1**	30
7	**Total (Sch 5.6 L1, Sch 16.0 L35)**	**14.9**	**0.4**	**5.6**	**0.1**	**0.1**	**0.0**	**0.0**	**21.1**	**125**

Overall, BC Hydro has one Human Resources FTE for every 59 BC Hydro FTEs. This is comparable to ratios at other organizations. According to a recent HR Metrics Service report, the median rate for Canadian organizations is one Human Resources FTE for every 54 FTEs.[266] For comparison purposes, both ratios exclude payroll staff.

The goal of the Human Resources KBU is to attract, retain and engage the employees required to operate our business. The operating costs allocated to this KBU have been effective in meeting this goal and returning value to BC Hydro.

For example, BC Hydro's voluntary turnover rate is 1.1 per cent which is below the 3.8 per cent average for the Power and Utilities industry as reported by the Conference Board of Canada.[267] Minimizing turnover results in fewer replacement costs, and retains the specialized knowledge required to safely operate our system. In addition, our employee engagement score of 84 per cent exceeds the utilities industry average of 76 per cent. [268] A study by Gallup[269] found that businesses in the

[266] 2017 HR Annual Metrics Report, HR Metrics Service, 2017.

[268] Price Waterhouse Coopers – 2018 Employee Engagement Survey Results.
[269] Gallup Q[12]® Meta-Analysis Report, Gallup, https://news.gallup.com/reports/191489/q12-meta-analysis-report-2016.aspx.

top quartile of employee engagement outperformed bottom quartile businesses by 10 per cent in customer loyalty and engagement, 21 per cent in profitability and 20 per cent in productivity.

The FTEs in the Human Resources KBU remained stable at 88 from fiscal 2017 to fiscal 2018. The FTEs in this KBU increased to 125 in fiscal 2019 as a result of the Accenture repatriation discussed further in Chapter 5, section 5.6.2. As shown in Table 5F-5 below, in-sourcing these services reduced annual operating costs and is the primary reason that the overall KBU budget has reduced from $23.1 million in fiscal 2016 to $22.9 million in fiscal 2017 forecast.

5F.4.2.1. Chief Human Resources Officer Department

The majority of this department's budget is related to labour. This represents two FTEs: the Chief Human Resources Officer and an administrative assistant.

5F.4.2.2. Employee Relations Department

All of this department's budget is related to labour. This represents eight FTEs including one Manager, six Advisors, and one Administrative Assistant.

This group provides guidance and advice to the organization on managing complex and escalated labour relations issues, many of which take significant time to investigate and resolve over months or even years. Average annual work volumes include approximately 75 corrective action investigations, 30 workplace accommodations and 80 grievances and arbitrations. This group is also responsible for daily collective agreement administration and interpretation, negotiating settlements and other forward-looking workplace agreements (e.g., Memorandums of Understanding), as well as leading collective bargaining negotiations.

5F.4.2.3. Recruitment Department

Approximately 55 per cent of this department's budget is related to labour. This represents 22 FTEs as follows:

- Six FTEs in Recruitment Services. This group, which was previously outsourced to Accenture, is responsible for all interview coordination and candidate scheduling. This group schedules over 3,800 interviews and conducts over 1,200 background checks (including over 250 Drug and Alcohol tests) per year; and
- Sixteen FTEs in Recruitment. This team is responsible for all internal and external hires and fills approximately 1,800 positions per year. Recruitments are primarily to fill existing positions vacated from employees leaving the position (i.e., internal movement, termination, etc.) and not due to an increase in the number of overall positions or employees. As discussed in Chapter 5, section 5.6.4, the number of BC Hydro FTEs is expected to remain relatively flat over the test period, increasing by 72 in fiscal 2020 and decreasing by six in fiscal 2021.

  On average each recruiter manages 34 active vacancies, which is a higher volume compared to other organizations. According to a Society of Human Resources Management report, recruiters in other organizations manage a median of 25 recruitment requisitions.[270] The volume of hires at BC Hydro has increased approximately 18 per cent since fiscal 2016 due to capital projects such as Site C, and the expansion of our workforce due to the repatriation of services from Accenture and the Workforce Optimization program. To support this additional volume, two additional temporary FTEs have been added to this team since fiscal 2016. Additional recruitment volume will continue due to the repatriation of positions from Accenture and capital projects during the test period.

The department's Services – Other budget relates to employee relocation expenses, background checks, external recruitment agencies, recruitment advertising and

270 Mariotti, Andrew, *2017 Talent Acquisition Benchmarking Report*, Society for Human Resource Management, https://www.shrm.org/hr-today/trends-and-forecasting/research-and-surveys/Documents/2017-Talent-Acquisition-Benchmarking.pdf.

interview travel expenses. BC Hydro only utilizes external recruitment agencies for hard to fill positions. All other recruitment is performed by in-house recruiters.

5F.4.2.4. Enterprise Learning and Talent Management Department

Approximately 53 per cent of this department's budget is related to labour. This represents 12 FTEs as follows:

- Four FTEs in Enterprise Learning. This team provides enterprise-wide professional and leadership training for BC Hydro employees. Conducting this training in-house, and negotiating competitive pricing, results in lower costs than employees attending external training. For example, the cost per individual of a one-day professional training course delivered in-house is approximately $200 to $650, compared to the cost of a one-day professional training course at the University of British Columbia Sauder School of Business which can typically range from $800 to $1000; and
- Eight FTEs in Talent Management. This team provides a range of talent management programs. The primary focus of these programs is effective talent management and succession planning for various levels of management and critical roles to support business continuity. Programs such as talent management identify and prepare succession candidates for key positions that may be difficult to fill from the external market. For example, in 2018 our Director, Dam Safety retired. This would have been an exceptionally difficult position to hire from the external market due to its specialized nature, and is a critical position to ensure the safety of our dam facilities. We were able to fill the position internally with a candidate that had been identified via our talent management program.

The department's Services – Other budget relates to services provided for programs such as in-house leadership training, recognition programs, and the employee engagement survey. As an example of the benefit these services provide to BC Hydro, the employee engagement survey provides employees an opportunity to give feedback on what is working well and what could be improved. It also allows BC Hydro to take action to improve employee engagement and the effectiveness of our organization. This process is a key reason why our employee engagement exceeds the utilities industry average.

5F.4.2.5. Total Rewards and Systems Department

Approximately 69 per cent of this department's budget is related to labour. This represents 51 FTEs as follows:

- Two FTEs to support the department - one Manager and one Administrative Assistant;
- 18 FTEs the Systems and Analytics team which includes the Employee Service Centre. Eight of the FTEs work in the Employee Service Center. They process employee transactions (e.g., new hires) and respond to approximately 16,000 employee inquiries per year. The remaining FTEs support the Human Resources systems platform and related applications, and provide analytical support. In a typical year they handle 280 reporting requests and implement 250 system fixes and enhancements;
- 18 FTEs in Total Rewards. This team develops and administers all compensation, benefit and pension programs. Annually, this team manages over 170,000 employee payments, 15,500 payroll inquiries, 220 employee relocations and 135 employee retirements. This team also oversees the services provided by external vendors for pension and benefit administration which includes 250,000 employee benefit payments, and 42,500 benefit and pension inquiries per year. Eight of the FTEs in this group are payroll staff. According to a Deloitte report, this is lower than the industry average of 11 payroll FTEs for a company of BC Hydro's equivalent size;[271] and

[271] *The Payroll Operations Survey,* Deloitte, 2014, https://www2.deloitte.com/content/dam/Deloitte/us/Documents/human-capital/us-hc-payroll-operations-survey-summary-results-010715.pdf.

- 13 FTEs in Health and Recovery Services. This team provides health promotion services, such as health screens, to 2,900 employees per year. In addition they manage 1,100 sick leave cases, 700 WorkSafe BC claims and 670 recovery services cases per year, of various duration and complexity. Providing proactive health services and managing absences means that BC Hydro has a lower sick time than other public sector organizations. On average, employees have 7.0 sick days per year compared to the public sector average of 9.0 days according to a Conference Board of Canada report. [272] This lower sick leave usage equates to over $8 million in labour productivity savings per year. In addition, our return to work duration for more complex sick leave cases is four weeks compared to Sun Life's benchmark of 6.6 weeks.[273]

The department's Services – Other budget relates to vendors used to deliver pension and benefit administration, pension actuarial evaluations, drug and alcohol testing, immunization clinics, Surges fitness management, the employee family assistance program, expedited medical, and a WorkSafeBC claims management contractor.

5F.4.2.6. Client Services Department

The majority of this department's budget is related to labour. This represents 30 FTEs including two Human Resources Leads, two managers, two Human Resources Analysts, two Administrative Assistants and 22 Human Resources Business Partners. Client Services supports senior leaders, managers, and employees with annual Human Resources activities (e.g., performance management, succession planning), strategic business needs (e.g., talent assessments, senior leader development, organizational changes, vacancy and headcount management) and individual employee matters (e.g., employee

[272] MacLean, Kathryn, and Allison Cowan. *Compensation Planning Outlook 2019*. Ottawa: The Conference Board of Canada, 2018.

[273] Sun Life Financial Canadian Benchmark for fiscal 2018.

investigations). Overall, there is an average of one FTE in this department for every 235 BC Hydro employees.

5F.4.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5F-5 Human Resources KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.6 L1	22.9	21.6	23.1	22.1	23.3	21.1	21.1	21.4
2	FTEs	16.0 L35	88	84	88	88	88	125	124	124

Operating costs are planned to remain the same from fiscal 2019 forecast to fiscal 2020 Plan. Standard Labour Rate increases are offset by the reduction of one FTE, savings related to the Accenture repatriation (discussed further in Chapter 5, section 5.6.2), and vacancy factor savings (discussed further in Chapter 5, section 5.5.2.3).

Operating costs are increasing by approximately $0.3 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases.

Human Resources FTEs are planned to decrease by one from fiscal 2019 forecast to fiscal 2020 Plan. BC Hydro realized efficiencies in the Total Rewards and Systems team after taking over the work that was previously outsourced to Accenture. This enabled a transfer of one FTE to the Ethics and Merit Office KBU, to support additional requirements. Further information is provided in section 5F.10.

The increase in FTEs from fiscal 2019 RRA to fiscal 2019 forecast was primarily driven by the Accenture repatriation, described in Chapter 5, section 5.6.2.

5F.5 Customer Service KBU

5F.5.1 Responsibilities

The Customer Service KBU operates most of the key touchpoints for our residential, commercial and industrial customers as they interact with BC Hydro, including the customer-facing activities related to revenue collection. Customer Service works with other groups across BC Hydro to design, implement and operate services, processes, programs, systems and tariffs that make it easier for customers to do business with us.

In delivering our services we strive to balance:

- Maximizing revenue collection, by exploring and pursuing new load opportunities, retaining existing load, managing accounts receivable, and reducing electricity theft and losses;
- Meeting customers' service expectations, by understanding customer needs, removing barriers, and influencing the organization to incorporate customer perspectives; and
- Minimizing costs, by continuously improving our operational efficiency through the promotion of customer self-service and automation of manual tasks, and by following WorkSmart approaches to review and refine processes.

There have been three changes to the responsibilities of the Customer Service KBU since the Previous Application. First, the Distribution Design and Customer Connections department is now a separate KBU and was transferred into the Operations Business Group. Second, the Contact Centre and Billing Operations department was created to manage the functions previously outsourced to Accenture, as discussed further in Chapter 5, section 5.6.2. Third, the Economic Development team was transferred from the Power Acquisitions and Contract Management KBU to the Customer Service KBU.

The Customer Service KBU is comprised of the following six departments:

- Contact Centre and Billing Operations Department;
- Customer Analytics, Revenue and Risk Management Department;
- Customer Service Operations Department;

- Key Account Management Department;
- Large Customer Rate Operations Department; and
- Vice President, Customer Service Department.

5F.5.1.1. Contact Centre and Billing Operations Department

This department is responsible for day-to-day management of core customer services processes including:

- Ensuring the accuracy of 1.3 million electricity bills sent to customers each month;
- Operating BC Hydro's primary customer contact centre, which receives over 2.7 million calls each year. Customer service representatives answer 1.4 million of these calls and the remainder are resolved within the Interactive Voice Response system;
- Processing payment exceptions when payments cannot be automatically applied to accounts (e.g., cheques with incorrect account numbers, outdated pre-authorized banking information, or Electronic Funds Transfer errors);
- Performing collections activities ("dunning") to maximize the recovery of revenues, such as issuing late payment reminders, disconnecting services for non-payment, assessing security deposits, and participating in bankruptcy proceedings;
- Providing day-to-day support to customers and planning for usability and transactional enhancements to the MyHydro web portal, which allows customers to view and update account information on-line and enables more than 100,000 self-service transactions per month;
- Operating enhanced service channels such as the Business Account Services team and four in-person service offices; and

- Providing operational support and planning to the contact centre and billing teams by forecasting work volumes; developing staffing schedules that minimize labour costs while meeting wait and response time targets; managing training and process documentation; reviewing contact centre calls to enable coaching; and performing root cause analysis of escalations to understand how future issues can be avoided.

The department is also responsible for planning the ongoing improvements to business practices and processes for the above functions.

Contact Centre and Billing Operations' long-term objective is to improve the quality of its services while also reducing labour costs through the elimination of manual transactions and telephone calls when customers have self-service options. For example, continuing to develop and promote customers' use of online tools and increasing the resolution of customer inquiries on the first call will reduce inbound call volumes and manual processing. Customers benefit from greater access to electricity consumption and billing information, as well as the ability to perform transactions outside the contact centre's operating hours. Similarly, continuing to refine billing control and exception processes reduces labour requirements while also avoiding delays in customer billing.

The department was initially responsible for preparing for the transition of the customer service functions as part of the broader project to repatriate functions previously outsourced to Accenture, as well as for managing the customer service portion of the outsourcing Accenture contract until it expired on April 30, 2018. On May 1, 2018, the department assumed direct responsibility for all of those functions.

The Contact Centre and Billing Operations department is also responsible for the delivery of the Customer Crisis Fund pilot.[274] The Customer Crisis Fund pilot started in May 2018 and will operate until June 2021. The objective of the pilot is to allow for an assessment of whether the program is "sufficiently justifiable on an economic or cost of service basis."[275] The ongoing operations of the Customer Crisis Fund will be determined by the Commission following BC Hydro's submission of a program evaluation.

5F.5.1.2. Customer Analytics, Revenue and Risk Management Department

This department is responsible for the reduction of electricity theft and other non-theft revenue loss through distribution system metering and business intelligence tools including Smart Meter Infrastructure and a field inspection team. These activities include:

- Identifying, assessing and prioritizing analytics and human sourced leads for electricity theft, stolen meters and revenue losses, and performing field inspections;
- Quantifying theft and other revenue losses from completed field inspections;
- Recovering funds from parties responsible for theft, including managing the involvement in civil litigation and criminal cases related to electricity theft;
- Conducting proactive distribution feeder inspections and utilizing the energy inventory balance approach enabled by smart meters to prevent recurrence of theft from grow-ops;

[274] In the 2015 RDA Decision Order No. G-5-17, the BCUC directed BC Hydro to submit a proposal for a pilot program to assist residential customers facing short-term financial hardship in avoiding disconnection of their electricity service by providing grants. After a period of program design and stakeholder engagement, BC Hydro filed a Customer Emergency Fund Pilot Application in July 2017. Following a regulatory process, the Commission issued Order No. G-166-17, approving a dedicated rate rider for residential customers of approximately $0.25 per month to fund program grants and operating costs. The Order also approved the creation of the Customer Crisis Fund Regulatory Account.

[275] 2015 RDA Decision, Order No. G-5-17, pages 97 to98, January 20, 2017.

- Working with customers to address overloaded services and assist with customer safety and security related concerns;
- Identifying and resolving metering and billing errors; and
- Responding to local government requests for consumption information under the *Safety Standards Act*.

This department also manages the customer and energy analytics function. The volume of customer consumption and transaction data has increased significantly with the introduction of technologies such as smart meters and customer self-service capabilities. Analysis of this data allows us to make data-driven business decisions that improve customer service and reduce costs. These analyses include:

- Providing hourly load profiling and localized consumption information to assist with long-term business planning such as load forecast and demand-side management program development;
- Identifying detailed customer characteristics and consumption information to inform the Electric Tariff and rates designs;
- Leading the data collection and analyses for regulatory filings such as the assessment on the impacts of the Winter Disconnection Moratorium Pilot and the evaluation of the Customer Crisis Fund Pilot; and
- Supporting operating groups by providing insights that help improve or develop operational policies and business practices.

5F.5.1.3. Customer Service Operations Department

This department is responsible for the day-to-day management of core field-related customer services including:

- Providing manual meter reading services for approximately 45,000 non-automated meters and other field customer service work;

- Supporting the Operations Business Group to coordinate all meter exchanges and manage the planned outage notification processes; and
- Operating the Underground Locate Centre in accordance with the BC One Call Ltd. membership agreement[276] in support of safety and damage prevention. This team responds to property owner or contractor requests by sending site plans showing the exact location of BC Hydro's underground facilities.

The department also leads projects to improve our customer service or reduce costs, and looks to bring customer perspectives to certain cross-organizational projects. For example, the department is represented on BC Hydro's street light replacement program project team to bring a customer view to how the project is developed and implemented. In addition, Customer Service Operations is responsible for the timely response and resolution of escalated customer issues and claims investigations, working with stakeholders across BC Hydro to investigate, and find solutions and improve processes and customer service.

5F.5.1.4. Key Account Management Department

This department provides a single point of contact for BC Hydro's largest customers. Dedicated Key Account Managers support customers across all sectors of the B.C. economy including large industrial, commercial, institutional, government and municipal customers.

Key Account Management supports approximately 635 customers with nearly 59,000 accounts, representing almost half (46 per cent) of BC Hydro's domestic energy sales and more than one-third (38 per cent) of BC Hydro's revenue.

[276] BC One Call Ltd. is a not-for-profit corporation that enables public and worker safety, as well as the reduction in damages, by providing a single point of contact for contractors and members of the public to identify the location of underground equipment. BC Hydro, FortisBC, Telus and more than 300 other utilities and municipalities are members. BC One Call pre-screens requests to locate underground equipment and notifies BC Hydro when digging will occur in the vicinity of our assets, based on mapping we provide. BC Hydro then provides the requestor with drawings that indicate the exact location of our equipment.

Core customer service areas include new and expanded service connections, capital project and program delivery, billing and rate inquiries, and outage scheduling and notification. For example, in fiscal 2019, Key Account Management supported:

- Voltage conversion for approximately 100 customer vaults;
- Replacement of approximately 35 meters with PCBs at customer sites, as well as replacement of three transmission customer revenue meters;
- Negotiation of land lease agreements for 26 electric vehicle fast charging stations; and
- Adoption of paperless billing by approximately 52 per cent (as of January 2019) of the 45,000 consolidated billing accounts associated with Key Account customers.

Key Account Management also works with customers to identify opportunities for energy conservation, low carbon electrification and load retention and expansion. Key Account customers typically deliver about half of BC Hydro's energy savings target through participation in energy conservation programs. Key Account Management also oversees the contracts and deliverables of over 100 customer energy managers.

In addition, Key Account Management collects information on customers' business plans, market conditions, and other factors to inform BC Hydro's load forecast, and advances customer perspectives in rate and policy designs to remove barriers and attract or retain load.

5F.5.1.5. Large Customer Rate Operations Department

This department works primarily with BC Hydro's transmission customers to design, implement, manage and support a suite of rate schedules, tariff supplements and contracts for load interconnection and supply. This includes management and overall governance of:

- Rate Schedule 1823 Transmission Service – including maintenance of Tariff Supplement No. 74, Customer Baseline Load Determination Guidelines;
- Tariff Supplement No. 90 (Mining Customer Payment Plan);
- Rate Schedule 1892 Transmission Service - Freshet Energy; and
- Rate Schedule 1880 Transmission Service – Standby and Maintenance.

This department also manages the stakeholder engagement, regulatory approval and implementation of new and updated rate schedules and tariff supplements for BC Hydro's large industrial and other transmission service customers. It is also responsible for the negotiation and oversight of complex new business and commercial arrangements for large customer services.

5F.5.1.6. Vice President, Customer Service Department

In addition to providing the overall leadership to the Customer Service KBU, this department oversees the development of proactive strategies to power new industrial and large commercial customers and to retain and grow load from existing customers. This includes:

- Providing potential new customers with information on how to interconnect with BC Hydro;
- Facilitating load attraction initiatives to remove barriers for new customers; and
- Helping existing customers sustain or grow their businesses through rates, programs and business development opportunities.

The department also leads the development of transportation electrification strategies. This includes working with government ministries as well as with internal and external stakeholders on the development and operation of electric vehicle charging station infrastructure.

5F.5.2 Overview of Operating Costs and FTEs

**Table 5F-6 Customer Service KBU
Fiscal 2019 Forecast Operating Costs
and FTEs by Department**

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Contact Centre and Billing Operations	20.2	2.6	19.8	0.1	0.1	0.0	0.0	**42.7**	308
2	Customer Analytics, Rev and Risk Mgmt	4.8	0.0	2.3	0.8	0.6	0.0	0.0	**8.5**	38
3	Customer Service Operations	9.9	0.0	3.2	0.0	0.0	0.0	0.0	**13.2**	111

6	VP, Customer Service	1.3	0.0	0.1	0.0	0.0	0.0	0.0	**1.4**	7
7	**Total (Sch 5.6 L2+L13, Sch 16.0 L36)**	**39.3**	**2.6**	**25.6**	**0.8**	**0.7**	**0.0**	**0.0**	**69.0**	**495**

5F.5.2.1. Contact Centre and Billing Operations Department

Approximately half of the Contact Centre and Billing Operations department budget relates to labour for operating BC Hydro's contact centre, billing, payments, and collections teams. The department also incurs costs related to service contracts (primarily postage and printing costs for electricity billing and non-billing correspondence); bad debt expense; and the Customer Crisis Fund Pilot.

A portion of these costs is offset by revenue received through the Account Charge, Reconnection Charge, Returned Payment Charge and Late Payment Charge, which are cost-based Standard Charges assessed to the customers. Incremental Customer Crisis Fund Pilot costs are fully offset by the Customer Crisis Fund Rate Rider.

Labour

The Contact Centre and Billing Operations department requires 308 FTEs to operate the contact centre, billing, payment and collection functions that were repatriated from Accenture. The labour plan for these services is based on a staffing snapshot provided by Accenture, which reflected the resources it needed to execute upon its contractual commitments.

Labour requirements are directly linked to call and transactional volumes, as well as the desire to provide customers with timely and accurate services. For example, customers phoning the contact centre expect to speak with an agent without waiting for an extended period. Similarly, customers expect billing inquiries or payment issues to be resolved quickly and without a high level of effort. As there can be significant variations in call and transactional volumes, staffing levels are actively managed with the objective of meeting targeted performance levels at the lowest cost.

BC Hydro has operated these functions for less than one year and is currently assessing and adjusting its processes and workforce for these functions based on operational performance. Staffing adjustments will continue to be made into fiscal 2020 as we gain experience with wait/response times, attrition rates, absenteeism and other factors.

These 308 FTEs can be categorized as follows:

- Two FTEs, the Director of the Contact Centre and Billing Operations department and an Administrative Assistant, provide overall management of this department;
- 203 FTEs are associated with the contact centre. Staffing consists primarily of Customer Service Representatives that are supervised by seven Front Line Managers and three Senior Managers. The span of control for Front Line Managers is approximately one manager for every 25 Customer Service Representatives.

  Contact centre staffing levels follow generally-accepted practices for contact centre management and are set predominately on the forecast volume and timing of in-bound customer calls, based on a target distribution of customer wait times. The contact centre aims to answer 75 per cent of calls within 30 seconds. Schedules and staffing levels are then adjusted to provide consistent levels of service in all hours and to limit the number of customers that could be impacted by extended wait times.

BC Hydro's contact centre performance target is similar to that of FortisBC, which uses a benchmark of 70 per cent of calls answered within 30 seconds for one of its approved Service Quality Indicators[277]. In the first nine months following repatriation (i.e., May 2018 to January 2019), BC Hydro answered 70 per cent of calls in 30 seconds;[278]

- 49 FTEs are associated with the billing and payments functions. Billing and payments are highly automated. Most invoices are generated and issued to customers without manual intervention. Similarly, most payments are processed through systems integrations with financial institutions. However, manual intervention is required when payments are not successfully applied to customer accounts or when bills are stopped before being issued because control points are triggered (e.g., consumption is significantly higher than historical patterns or requires a change to a customer's rate). Accordingly, resource requirements are based on associated work volumes and customer response times.

BC Hydro aims to investigate and resolve stopped bills within 10 days and payment exceptions within five days. In the first eight months after repatriation the payments team investigated and resolved approximately 130,000 payment exceptions. In addition, in calendar 2017, the billing team investigated and resolved 112,000 bills that were stopped because control limits were triggered.

BC Hydro continually works to refine billing controls to balance the cost of manual reviews with the risk of inaccurate billing. For example, the number of stopped bills was reduced by 49 per cent when billing controls were adjusted following the automation of meter reading through smart meter implementation, recognizing the near elimination of manual data entry errors. Labour savings have also been achieved through simplification of the Medium General Service

[277] FortisBC Energy Inc. Multi-Year Performance Based Ratemaking Plan for 2014 through 2018, Order No. G-138-14, page 152 from September 15, 2014.

[278] Excludes contact centre performance during the extreme storm restoration from December 20 to 31, 2018.

and Large General Service rates, and by the automation of service order completion;

- 16 FTEs are responsible for collections activities. Actively managing accounts with overdue balances is a key aspect of minimizing uncollectible revenue and avoiding bad debts.

  In the first nine months after repatriation, this team performed over 130,000 manual reviews of accounts with overdue balances, at an advanced status in the dunning process. This is in addition to over 320,000 automated reviews of overdue accounts conducted by the billing system. This team also processed nearly 400 residential and commercial bankruptcies, which involves working with customers or trustees to close accounts, provide final bills as a “proof of claim”, and re-establish accounts in the name of a trustee when necessary;

- Seven FTEs spend time on the Customer Crisis Fund Pilot. Labour requirements are primarily based on the volume of applications received. Dedicated resources are not assigned to the Customer Crisis Fund team; instead, labour is provided by other teams in the Contact Centre and Billing Operations department and incremental hours worked are charged to the pilot program;

- 27 FTEs are responsible for workforce planning, knowledge management, quality assurance, training, timesheet administration and other support to the operational teams.

  Since repatriation this team has identified about 1,000 changes to business processes and made more than 3,300 changes to process and training documentation. The team has also performed quality assurance reviews for 6,400 customer calls and billing transactions, held over 400 peer coaching sessions, and provided instructor-led training to five classes of new Customer Service Representatives; and

- Four FTEs provide operational reporting and analysis, and are also responsible for process improvement and implementation of initiatives that improve revenue collection, reduce costs or improve customer service.

Service Contracts

Service contracts for this department are budgeted at $19.8 million, the largest component being $8.1 million for postage, printing and paper. Other significant costs include $5.8 million for bad debt expense and $3.4 million for bill credits associated with the Customer Crisis Fund Pilot. In addition, service contract costs include payment processing; credit checks; collection agency commissions; contact centre customer satisfaction surveys; and translation services.

The budget for postage, printing and paper is driven primarily by the number of customers that elect to receive paper bills. Other factors include the volume of non-billing correspondence, Canada Post's postage rates, and printing/paper costs. BC Hydro regularly promotes the adoption of paperless billing during telephone interactions with customers, as well as through online and social media channels. Campaigns and incentives are also used periodically. As a result of these efforts, as of January 2019, about 55 per cent of non-consolidated accounts receive their bills electronically. This is the highest rate of paperless adoption amongst Canadian electric utilities participating in the Canadian Electricity Association's Customer Council. Paperless billing for consolidated accounts was made possible through the Enterprise Billing Infrastructure Project, which went live in February 2018. In the first 11 months, over 29 per cent of consolidated accounts converted to paperless billing.

As a result of BC Hydro's efforts to support paperless billing, postage, printing, and paper costs decreased by approximately 20 per cent between fiscal 2016 and fiscal 2018, despite annual increases in Canada Post charges. BC Hydro estimates that paperless bill delivery saves BC Hydro customers over $7 million each year.

Costs for other service contracts are managed primarily by encouraging customers to use pre-authorized or electronic banking payments instead of cheques. 94 per cent of payments are currently made by pre-authorized or electronic payments. In addition, BC Hydro pays collection agencies by commission so that costs are not incurred unless agencies are able to recover unpaid bills, which provides a corresponding benefit to bad debt.

Bad Debt Expense

This includes bad debt expenses associated with residential and general service customers. Bad debt expense is affected by external factors such as economic conditions and unemployment. Bad debt is also affected by BC Hydro's collection practices (including practices for non-payment disconnections), as well as security deposit and installment plan policies.

As shown in Table 5F-7 below, bad debt costs decreased from $8.7 million in fiscal 2015 to $5.8 million in fiscal 2018. This decrease is primarily the result of improved collections practices made possible by smart meters which provide remote disconnect and reconnect capabilities. BC Hydro's residential and commercial bad debt expense, as a percentage of revenue, is amongst the lowest of Canadian utilities.[279]

Table 5F-7 Bad Debt Expense, Fiscal 2012 to Fiscal 2018

($ million)	Fiscal Year						
	2012	2013	2014	2015	2016	2017	2018
Bad Debt Expense	6.782	6.949	7.209	$8.746	5.861	4.364	5.815
Bad Debt as a Percentage of Revenue	0.25	0.23	0.23	0.27	0.17	0.12	0.15

[279] BC Hydro 2015 Rate Design Application. BC Hydro Final Argument dated October 11, 2016, p. 16; Exhibit B-26-1, Attachment 1, IR 1.192.1, Figure 1; Exhibit B-26-1, p. 41; Transcript Volume 7, p. 1208, corrected in Exhibit B-58-1.

5F.5.2.2. Customer Analytics, Revenue and Risk Management Department

This department is managed by one senior manager who oversees three teams: Revenue Assurance, Field Inspection, and Customer and Energy Analytics. Approximately 60 per cent of this department's budget is related to labour costs. The remainder includes contractors, travel and materials required by the field staff as well as software, services, and warranty costs related to check meters.

Revenue Assurance and Field Inspection Teams

The Revenue Assurance and Field Inspection teams total 26 FTEs. These include:

- Seven FTEs that identify leads for field inspection;
- Three FTEs that are responsible for revenue recovery; and
- 16 FTEs that carry out all field activities associated with the revenue assurance program.

BC Hydro has dramatically reduced theft from marijuana grow-ops by leveraging the tools provided by the Smart Metering and Infrastructure program. Currently, most thefts occur from typical residential and commercial customers: fewer than 5 per cent of grow-ops are now believed to participate in electricity theft, compared to over 60 per cent of grow-ops prior to the installation of smart meters. Accordingly, BC Hydro has been able to reduce Field Inspection FTEs by approximately one-third since fiscal 2014.

BC Hydro continues to require a robust revenue assurance program to prevent recurrence of thefts from grow-ops, as well as to reduce theft and revenue leakage from normal residential and commercial customers. During fiscal 2018, approximately 2,700 investigations were performed related to suspected electricity theft and revenue loss at individual premises. From these investigations, 112 thefts were identified and stopped. The Revenue Assurance team also identified and resolved 85 back-billings related to metering and billing errors.

In addition, the Revenue Assurance and Field Inspection teams now play key roles in identifying and mitigating public and employee safety risks as a result of unsafe electrical services. In fiscal 2018, BC Hydro conducted 244 investigations related to safety risks from potentially overloaded services. After being contacted by the Revenue Assurance team, 42 per cent of these customers voluntarily reduced load or obtained a service upgrade, while 9 per cent of overloaded service investigations resulted in a disconnection to mitigate safety risk. In the remaining cases, the customers' electrical services were not found to be overloaded but in many instances the investigation still led to the resolution of safety issues or the identification of overloaded BC Hydro equipment.

Customer and Energy Analytics Team

The Customer and Energy Analytics team includes 10 FTEs, comprised of one manager and nine data scientists and analysts.

In 2018, the Customer and Energy Analytics team fulfilled 180 Customer Data Requests from internal BC Hydro departments. In addition, the team completed 23 complex projects requiring analysis of customer and energy data, which supported data-driven decisions related to rate design, business practices, and allocation of operational resources.

5F.5.2.3. Customer Service Operations Department

Approximately 75 per cent of this department's budget is relates to labour for 111 FTEs. This department is managed by one senior manager who oversees the following three main functions: field related customer services; customer escalations and claims; and strategic projects, policy and reporting.

The remaining budget includes funding for strategic projects to improve the service we provide or lower costs, travel and materials required by field services, payments to BC One Call, and claims against BC Hydro for damages.

Field Related Customer Services

This function consists of 85 FTEs, including one senior manager, as follows:

- 70 FTEs are responsible for field customer service functions that ensure the timely and accurate recording of consumption used for customer billing.

  Three field managers manage 52 FTEs located in 35 offices across the province. The span of control for Front Line Managers is approximately one manager for every 17 Field Service Representatives. In fiscal 2018, these FTEs conducted 311,000 manual meter reads for meters that are not read automatically. In addition, they performed 14,000 other field service orders for on-site investigation for billing inquiries, non-electrical meter maintenance, and manual single-phase meter disconnections and reconnections. BC Hydro continues to find labour savings by leveraging this cost-effective field resource to perform more non-technical field customer service work.

  The remaining 14 FTEs are responsible for management, planning, scheduling, dispatching, continuous optimization, training, safety, and reporting. This includes two FTEs converted from contractors as a result of Workforce Optimization to administer customers' keys so that employees and contractors can access BC Hydro equipment in buildings and behind locked gates. This team also supports the Operations Business Group to perform the coordination, facilitation, exception management and customer communications for time-expired, failed, and compliance sampling meter exchanges.

  As discussed in Chapter 5, section 5.6.2, BC Hydro in-sourced the field customer service function from Accenture in fiscal 2017. At the time, BC Hydro undertook a third-party optimization study to determine the most efficient office locations and corresponding resourcing requirements. These changes as well as the ongoing optimization of our meter reading routes created efficiencies and increased productivity. As a result, the annual budget for this function reduced from $8.4 million in fiscal 2017 to $6.9 million for fiscal 2019.

BC Hydro's meter reading performance targets are to issue at least 99 per cent of bills using actual meter readings and to issue no more than 0.5 per cent of bills on billing system estimates for consecutive billing periods. These metrics are generally comparable to FortisBC's approved Service Quality Indicator of Meter Reading Accuracy of 97 per cent.[280] As of December 2018, BC Hydro has approximately 6,900 billing system consecutive estimates, representing 0.3 per cent of all bills. Of those, the consecutive estimates from manually read meters decreased by 41 per cent from 4,516 in fiscal 2017 to 2,666 in fiscal 2019;

- Nine FTEs support BC Hydro's membership in the BC One Call organization to provide the locations of BC Hydro's underground facilities to property owners and contractors with a required response time of three days. The volume of BC One Call requests has increased from 166,000 in fiscal 2017 to 182,000 in fiscal 2018 to a forecast of approximately 200,000 for fiscal 2019. Payments to BC One Call are charged on a volumetric basis and, accordingly, BC One Call costs increased from $325,000 in fiscal 2018 to $444,000 in fiscal 2019. However, FTEs have remained constant as BC Hydro has been able to improve productivity through automation of certain aspects of the process;
- Three FTEs are responsible for processing approximately 1,000 requests each year for customer initiated vault maintenance disconnections and incentives for pad mounted transformer decoration. BC Hydro provides an incentive program to decorate pad mounted transformers to prevent graffiti on equipment and to blend in with surroundings. Vault maintenance disconnection work generates approximately $0.6 million per year in revenue to BC Hydro; and
- Three FTEs are responsible for engaging with commercial customers that may be significantly impacted by planned outages. Approximately 2,900 planned

[280] FortisBC Energy Inc. Multi-Year Performance Based Ratemaking Plan for 2014 through 2018, Order No. G-138-14, page 152 (pdf page 166) from September 15, 2014.

outages each year involve commercial customers, and over 1,100 have potentially significant customer impacts.

Customer Escalations and Claims

This function consists of 13 FTEs as follows:

- Four FTEs manage approximately 550 complex escalations per year from the BCUC, government officials and the Office of the Ombudsperson. Our response time target for most escalations is five business days.[281] This team also provides quarterly reporting to the BCUC on escalation volume and response time; and
- Nine FTEs, including one manager, are responsible for resolving approximately 1,000 claims made against BC Hydro for damages to personal or business equipment or property each year, as well as for approximately 1,000 claims made by BC Hydro against third parties for damages to BC Hydro plant and equipment. BC Hydro expects to recover approximately $5 million dollars of damages in fiscal 2019.

Strategic Projects, Policy and Reporting

BC Hydro looks for opportunities to make it easier for customers to do business with us.

- Five FTEs lead customer projects and programs that enhance customer support, remove customer barriers, and improve operational efficiency. Examples include planning and delivering BC Hydro's paperless billing campaigns; executing targeted customer communications; developing and maintaining customer service web pages; and acting as business leads in technology projects such as the Customer Mobile and Enterprise Billing Infrastructure Project;

[281] Complex issues that are dependent on subject matters experts have a target of 10 business days.

- Four FTEs lead BC Hydro's initiatives to create a customer-centric work force. This includes various customer engagement activities such as interviews, workshops, surveys and focus groups. This team also works with project teams across BC Hydro so that the customer perspectives are considered and incorporated early in the project life cycle. Examples include the customer engagement work undertaken for the street light replacement program and the voltage conversion program. In fiscal 2019, this team also expects to deliver customer service training to approximately 1,250 BC Hydro employees; and
- Three FTEs provide policy instructions and directions to the customer operations teams. This includes setting up controls for compliance with the Electric Tariff and customer policies, advancing customer and operational perspectives in BC Hydro's distribution rate design applications and implementing rate and Electric Tariff changes. In addition, this team provides monthly reporting on key performance indicators and targets for the Customer Service KBU.

5F.5.2.4. Key Account Management Department

This department consists of 28 FTEs. Key Account Managers support customer participation in BC Hydro's conservation and energy management programs and approximately 50 per cent of the labour costs for these FTEs is funded by BC Hydro's DSM programs. Chapter 10 details BC Hydro's DSM expenditure schedule request.

On average, each Key Account Manager supports approximately 30 customers. However, each portfolio varies depending on the complexity or volume of customer service needs.

The Key Account Management department reduced from 38 FTEs in fiscal 2014 to 28 FTE in fiscal 2019, a reduction of approximately one-quarter. This was as a result of a review of customers served by Key Account Managers to ensure alignment with BC Hydro's current priorities. Following the review, a number of customers previously served by Key Account Managers were transitioned to be supported by the contact centre's Business Account Services team.

5F.5.2.5. Large Customer Rate Operations Department

The Large Customer Rate Operations department is comprised of four FTEs.

Labour requirements are driven by the activities required to operate, maintain and ensure compliance with the complex rates and tariffs that define how BC Hydro's transmission customers pay for service. For example, each year this department reviews and establishes the Customer Baseline Load (**CBL**) for approximately 100 transmission voltage customers taking service under the stepped rate provisions of Rate Schedule 1823. This effort requires direct interaction with each customer, in addition to preparing and supporting BC Hydro's annual application to the BCUC for CBL approval.

Labour requirements are also determined by the level of analysis and engagement necessary to develop and implement new rates and tariff supplements, as well as for the negotiation of new commercial agreements. These provide transmission customers with options to improve their competitiveness while benefitting all BC Hydro customers through the attraction and retention of load and revenue. Recent examples led by this department include Tariff Supplement No. 87 and No. 88 (Indirect Interconnection Service), Tariff Supplement No. 90 (Mining Customer Payment Plan) and Rate Schedule 1892 (Transmission Service - Freshet Energy). This department also prepares the required compliance filings to the BCUC, such as the Final Evaluation Report for the Freshet Rate Pilot.

5F.5.2.6. Vice President, Customer Service Department

Almost all of the costs in this department are related to labour costs for seven FTEs. Two FTEs, the Vice President of Customer Service and an Administrative Assistant, provide overall management for the Customer Service KBU. The remaining five FTEs are allocated as follows:

- Three FTEs on the Business and Economic Development Team. This team provides a single point of entry into BC Hydro for prospective energy-intensive customers and helps them to understand our interconnection process, rate schedules and tariff supplements. Since January 2018, BC Hydro received 336 inquiries totaling more than 11,000 MW of load from energy-intensive industries such as fuel processing, cannabis, cryptocurrency operators and data centres. The team identifies suitable brownfield sites for energy-intensive customers and helps prospective customers avoid siting load in capacity-constrained areas. In fiscal 2019, 6 MW of new load has been connected at brownfield sites and an additional five projects, totalling 105 MW, have proceeded to the study stage; and
- Two FTEs on the Electric Vehicle team. This team is responsible for improving the overall electric vehicle customer service in primary customer touchpoints and at the 56 fast charging stations owned by BC Hydro. This team also works with governments, businesses and other stakeholders to remove barriers to the adoption of electric vehicles in B.C.

5F.5.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5F-8 Customer Service KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.6 L2+ L13	76.2	68.9	73.6	68.7	73.8	69.0	68.4	69.1
2	FTEs	16.0 L36	124	154	124	191	124	495	479	479

Operating costs are decreasing by approximately $0.6 million from fiscal 2019 forecast to fiscal 2020 plan. This includes the following cost decreases:

- $1.0 million in further savings related to the Accenture repatriation, as discussed in Chapter 5, section 5.6.2;

- $1.0 million due to a further reduction in paper, printing and postage costs resulting from an increase in paperless billing and other forms of correspondence;
- $0.3 million of vacancy factor savings, as described in Chapter 5, section 5.5.2.3; and
- $0.2 million related to re-organization impacts. Two FTEs are being transferred to the Customer Service KBU from other KBUs and six FTEs are being transferred from the Customer Service KBU to other KBUs, primarily to support NERC CIPv5 compliance requirements, as described in Chapter 5C, section 5C.10.3.

These cost decreases are partially offset by the following cost increases:

- $1.3 million to fund the first full year Customer Crisis Fund Pilot (the program was not in operation for the first three months of fiscal 2019). This increase is offset by an equivalent adjustment to miscellaneous revenue for the rate rider which funds this program; and
- $0.6 million related to Standard Labour Rate increases.

Operating costs are increasing by approximately $0.7 million from fiscal 2020 plan to fiscal 2021 plan, due to Standard Labour Rate increases.

Customer Service FTEs are planned to decrease by 16 from fiscal 2019 forecast to fiscal 2020 plan. In addition to the net reduction of four FTEs from the re-organization transfers described above, the Contact Centre and Billing Operations department is reducing by 12 FTEs based on experience gained to date on staffing requirements after repatriation of these functions from Accenture.

Customer Service FTEs are planned to remain constant from fiscal 2020 plan to fiscal 2021 plan.

Operating costs decreased by approximately $4.8 million from fiscal 2019 RRA to fiscal 2019 forecast, primarily because paper, printing and postage costs were lower than anticipated and because actual savings from the Accenture repatriation have been higher than originally projected.

The increase in FTEs from fiscal 2019 RRA to fiscal 2019 forecast was primarily driven by the Accenture repatriation, described in Chapter 5, section 5.6.2.

5F.6 Conservation and Energy Management

5F.6.1 Responsibilities

The Conservation and Energy Management KBU is responsible for a range of activities that encourage customers to manage their energy consumption and help them to reduce their energy bills. These activities include energy efficiency and conservation, capacity-focused initiatives, and low carbon electrification. Collectively, these activities are referred to as demand-side management (**DSM**).

BC Hydro's DSM expenditure schedule request is set out in Chapter 10. There have been no changes to the responsibilities of the Conservation and Energy Management KBU since the Previous Application.

5F.6.2 Overview of Operating Costs and FTEs

Table 5F-9 Conservation and Energy Management KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Conservation and Energy Management	0.5	0.0	0.1	0.0	0.0	0.0	0.0	**0.6**	116
2	**Total (Sch 5.6 L3, Sch 16.0 L37)**	**0.5**	**0.0**	**0.1**	**0.0**	**0.0**	**0.0**	**0.0**	**0.6**	**116**

Employees in Conservation and Energy Management support BC Hydro's DSM activities. Therefore, nearly all labour costs are classified as deferred operating expenditures and are charged to the DSM Regulatory Account. The deferred operating expenditures are not included Table 5F-9.

The operating budget shown above is primarily made up of labour costs totalling $0.5 million for overall management and administration of the KBU. In addition, the budget includes incidental expenses of $0.1 million that indirectly support DSM activities. This operating budget of $0.6 million has been unchanged since fiscal 2016.

FTE levels for this KBU have remained stable since they were assessed and reduced as part of the moderation strategy for DSM expenditures identified in the Previous Application. The KBU consists of 116 FTEs as follows:

- Two FTEs represent the Director of Conservation and Energy Management and an Administrative Assistant;
- Eight FTEs in the Strategic Planning Department. This department develops long-term DSM resource options to support BC Hydro's Integrated Resource Planning process, produces estimates of the potential for DSM in BC Hydro's service territory, establishes the framework for the DSM Plan, performs annual updates of the DSM Business Plan, provides modelling support and cost-effectiveness analysis for the KBU's governance and decision making processes, supports DSM policy development, prepares regulatory applications and supports other regulatory processes;
- 30 FTEs in the Marketing (Program Management) department. Staffing requirements for this department are determined by the number of customer offers in the marketplace and the complexity of those offers. Complexity is influenced by a number of factors including the barriers that exist to customer participation, the number of partnerships involved (e.g., market channels, FortisBC, installation contractors, municipalities), and the number of technologies supported. Developing and managing offers requires gathering and assessing customer and industry feedback, design work, budgeting, partnership management, internal and external training, promotion as well as

monitoring and reporting. The 30 FTEs in this department are divided as follows:

- 17 FTEs design and manage approximately 20 DSM offers targeting BC Hydro's Residential, Commercial and Municipal customers. Many of the offers in the marketplace have an increased level of complexity relative to historical program offers. For example, BC Hydro's new Non-Integrated Areas offer, discussed in Chapter 10, section 10.2.4, has unique geographical and market barriers, relative to similar offers in the integrated area;
- Nine FTEs focus on cross-sectoral initiatives, including the Sustainable Communities offer, New Construction Builder support, Indigenous Communities Policy support and pilot activity on localized DSM, demand response and connected homes and buildings. These FTEs also support for the development of new codes and standards, including B.C.'s Building Step Code;
- Three FTEs deliver marketing analytics, which provides customer targeting, marketing campaign and trial assessments, and reports and dashboards to help manage DSM offers. In fiscal 2018, this team completed 187 data analytics projects to inform BC Hydro's DSM program offers; and
- One FTE represents the manager of the department;

- 19 FTEs in the Industrial Marketing (Program Management) department as follows:
  - 11 FTEs, predominantly program managers and engineers, are responsible for the design and management of DSM offers targeting BC Hydro's Industrial customers. Similar to the Marketing (Program Management) group, staffing requirements are determined by the number and complexity of offers in the marketplace. Currently, approximately 10 industrial offers are being managed by this team, including incentive and energy study offers for

transmission and distribution customers, strategic energy management offers and pilot activity on demand response and localized DSM;

- Seven FTEs manage the training, quality control and accreditation of 900 Alliance members across all customer segments. These members are qualified external service providers who supply goods and services to all of our customers. Staffing levels on this team have remained flat since fiscal 2017, while many drivers of workload have increased. For example, there has been an increase in new and renewal member applications and an increase in referral requests from customers looking for qualified consultants and contractors to provide energy management services; and
- One FTE represents the manager of the department;

- 38 FTEs in the Operations, Engineering and Quality Management department. Staffing levels in this department are driven by the number of customer applications submitted each year. These FTEs can be categorized as follows:
  - Twenty FTEs on the operations team process 1,100 to 1,200 commercial and industrial applications and 32,000 to 48,000 residential applications each year. This includes applications for feasibility studies, plant-wide audits, energy managers, incentive projects and program enabled projects. Processing applications triggers further work such as carrying out credit reviews, reviewing and approving incentive payments and handling escalations. This work also includes quality management functions, such as developing and implementing business processes, implementing controls for business operations, verifying compliance with requirements, and oversight of the information technology systems used for application processing, tracking and reporting;
  - 17 FTEs on the engineering team, covering a range of specialized areas (e.g., lighting, HVAC, Pulp and Paper, Mining, etc.), perform technical reviews of custom projects to validate the viability of the projects and to

estimate energy savings and project costs. Engineering staff also advise Marketing and Industrial Marketing on the development of offers, and provide technical support to customers on their proposed DSM projects; and

- One FTE represents the manager of the department;

- 19 FTEs in the Evaluation, Measurement and Verification department as follows:
  - Nine FTEs on the Evaluation team. Staffing levels on this team are driven by the number of DSM programs and initiatives in the market and by BC Hydro's DSM evaluation criteria. Evaluation reports produce final estimates of the energy impacts of DSM programs, rate structures and codes and standards, and identify opportunities for improvement. The number of these reports has remained similar at four to six per year since fiscal 2016. In addition to completing evaluation reports, this team also conducts between 16 and 19 data collection activities each year. Examples of these activities include Residential and Commercial End-Use Surveys;
  - Nine FTEs on the Measurement and Verification team. While the Evaluation team estimates energy savings at a program level, the Measurement and Verification team estimates energy savings at a project level. This information is used to adjust incentive levels for specific projects, inform individual Customer Baselines claims for rates related projects, inform program evaluations, and provide feedback to customers and BC Hydro staff on project performance. Staffing levels on this team are driven by the volume of projects implemented by commercial and industrial customers and by BC Hydro's measurement and verification criteria. The work resulting from these drivers involves on-site visits, installation of metering equipment on electrically energized equipment at customer sites and data analysis. The team produces between 70 and 100 measurement and verification reports each year, which document final estimates of the energy impacts of

customer projects. This team also provides between 50 to 60 Customer Baseline reviews each year, depending on the number of transmission customers submitting a Customer Baseline claim. Lastly, the team completes between 40 to 60 measurement and verification plans each year, depending on the number of customers submitting project applications; and

- One FTE represents the manager of the department.

5F.6.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5F-10 Conservation and Energy Management KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.6 L3	0.6	0.6	0.6	0.5	0.6	0.6	0.6	0.6
2	FTEs	16.0 L37	114	110	112	112	112	116	116	116

Operating costs and FTEs for the Conservation and Energy Management KBU are planned to remain constant from fiscal 2019 forecast to fiscal 2020 and fiscal 2021 plan.

As discussed above, nearly all labour costs for this KBU are classified as deferred operating expenditures and are charged to the DSM Regulatory Account. Deferred operating expenditures in fiscal 2020 and fiscal 2021 reflect Standard Labour Rate increases.

5F.7 Power Acquisitions and Contract Management KBU

5F.7.1 Responsibilities

The Power Acquisitions and Contract Management KBU is responsible for managing and administering BC Hydro’s IPP resource portfolio and contracts, for both the integrated system and the Non-Integrated Area. These contracts represent a cost commitment of over $50 billion for contracts that extend as long as 60 years. In addition, this KBU provides specialized negotiation expertise for other potential commercial opportunities (e.g., the 2017 Waneta Transaction and the water use agreements with the Greater Vancouver Water District).

More specifically, the responsibilities undertaken by this KBU include:

- Managing and resolving contractual issues relating to approximately 130 existing Electricity Purchase Agreements (**EPAs**);
- Verifying and processing over 140 EPA invoices per month to confirm compliance with contractual terms;
- Forecasting IPP portfolio energy deliveries and costs on a monthly basis;
- Evaluating potential resource acquisitions such as the Biomass Energy Program which is discussed further in Chapter 4, section 4.3.2;
- Negotiating bilateral agreements for EPA renewals and new EPAs that are related to commitments to First Nations;
- Managing remaining applications through the indefinite suspension of the Standing Offer Program, which is discussed in Chapter 4, section 4.3.2;
- Developing, managing, and administering the Net Metering Program; and
- Conducting specialized commercial negotiations with First Nations, IPPs, industrial customers and other utilities.

Since the Previous Application, the focus of this KBU has shifted from pursuing new EPAs to bilateral negotiations related to EPA renewals.

5F.7.2 Overview of Operating Costs and FTEs

Table 5F-11 Power Acquisitions and Contract Management KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Power Acquisitions & Contract Management	4.4	0.0	0.3	0.0	0.0	0.0	0.0	**4.8**	27
2	**Total (Sch 5.6 L4, Sch 16.0 L38)**	**4.4**	**0.0**	**0.3**	**0.0**	**0.0**	**0.0**	**0.0**	**4.8**	**27**

The budget for the Power Acquisitions and Contract Management is primarily made up of labour costs, totalling $4.4 million.

In addition, the budget includes approximately $0.3 million per year in external services expenditures which includes consultant fees related to permitting, technical and other due diligence assessments of IPPs as well as invoice verification system costs.

The number of EPAs in the IPP portfolio doubled from 66 to 131 between fiscal 2010 and 2016, and the annual payments related to EPAs increased from approximately $0.6 billion to $1.3 billion. These contracts are complex, with a range of technologies and contractual terms, stemming from different call processes, programs and bilateral negotiations, such as renewals and new EPAs related to Impact Benefits Agreements.

The total FTEs in this KBU increased from 23 to 27 from fiscal 2016 to fiscal 2019. These additional FTEs were required to support the increased volume, diversity and complexity of EPAs in commercial operation, and to respond to a fiscal 2017 internal audit which emphasized the need for adequate resources to provide effective financial oversight of IPP cost commitments. These FTEs were funded by reducing the use of contractor resources through the Workforce Optimization Program, which is discussed further in Chapter 5, section 5.6.1.

In recent years, the number of bilateral negotiations managed by this KBU has increased as EPA contracts expire. The level of resources and time required for bilateral negotiations is often more significant than the requirements to design standardized calls for power.

During the test period, major initiatives undertaken by this KBU will include:

- Managing up to 15 expiring EPAs. Projects in this category are diverse ranging from small hydro projects from the 1989 call to the Biomass Energy Program to projects in the Non-Integrated Area;

- Implementing the Biomass Energy Program;
- Conducting other commercial negotiations and project assessments, such as those related to Impact Benefit Agreements with First Nations;
- Managing the commercial elements of BC Hydro's contracts in the Non-Integrated Area, which are expected to increase during the test period due to the Government of B.C.'s CleanBC Remote Community Clean Energy Strategy which aims to reduce diesel-powered electricity generating stations in remote communities;
- Administering the Net Metering Program which has increased from 925 participants in fiscal 2017 to 1800 participants in fiscal 2019, and is expected to continue to grow;
- Providing content and consultation for an application to update the Net Metering Program;
- Advancing new Standing Offer Program EPAs that are related to commitments to First Nations; and
- Managing remaining applications through the indefinite suspension of the Standing Offer Program, responding to inquiries from developers and supporting the Ministry of Energy, Mines and Petroleum Resources' engagement with First Nations regarding the extent to which the indefinite suspension may affect their interests.

5F.7.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5F-12 Power Acquisitions and Contract Management KBU Operating Costs and FTEs

	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
		1	2	3	4	5	6	7	8
Operating Costs ($ million)	5.6 L4	4.6	4.6	4.7	4.9	4.8	4.8	4.7	4.7
FTEs	16.0 L38	23	26	23	28	23	27	26	26

Operating costs are decreasing by approximately $0.1 million from fiscal 2019 forecast to fiscal 2020 plan due to the transfer of one FTE to the Economic Development Team in the Customer Service KBU. The cost decrease related to this transfer is partially offset by Standard Labour Rate increases. Operating costs and FTEs from fiscal 2020 plan to fiscal 2021 plan are relatively constant.

5F.8 Communications and Community Engagement KBU

5F.8.1 Responsibilities

The Communications and Community Engagement KBU is responsible for the development and delivery of communications to key audiences, including customers, stakeholders, the Government of B.C., local governments, employees and the media. This includes information about BC Hydro's operations, capital projects, safety programs, conservation programs, emergency preparedness and customer service.

Since the Previous Application, the Policy and Reporting KBU has been transferred to the Communications and Community Engagement KBU. In addition, as a result of the Accenture repatriation, the Graphic Design Services team is now part of the Communications and Community Engagement KBU.

The Communications and Community Engagement KBU includes a number of functions not traditionally housed within a typical Communications department. In addition to marketing and media relations, and employee communications functions, the department includes community relations, policy and research. Consolidation of these teams under one umbrella allows BC Hydro to manage communication activities in an effective and collaborative manner. Since fiscal 2017, the Communications and Community Engagement KBU has also reduced its reliance on outside contractors to allow increasingly important digital communication to be completed in-house and at lower cost.

The Communications and Community Engagement KBU consists of the following five departments:

- Marketing Communications Department;
- Communities and Capital Projects Department;
- Media Relations and Issues Management Department;
- Policy, Research and Strategic Communications Department; and
- Employee Communications Department.

5F.8.1.1. Marketing Communications Department

The Marketing Communications department provides both proactive and responsive communications to customers and stakeholders. The department supports a range of communications activities to build public awareness and understanding of energy conservation and management, customer service offerings, electrical safety and power outage preparedness. In addition, in the event of emergencies, the department supports incident response and restoration efforts through 24/7 communication and outreach to customers. More and more, our customers expect BC Hydro to be online to share information, meet their service needs and hear about programs. As a result, marketing strategies, campaigns, programs and content are centred on creating digital experiences.

As the media landscape shifts to digital communication, we see the value of bringing digital creative production services in-house. With this approach, we can be more agile as the landscape evolves while spending less than it would cost to hire consultants.

The Marketing Communications department is comprised of three teams:

- Digital Communications;
- Customer Campaigns; and

- Brand Strategy.

The Digital Communications team leads BC Hydro's digital strategy and 24/7 social media strategy across all digital channels including bchydro.com, powersmart.ca, Hydroweb (employees' intranet site), customer email, e-newsletters and social platforms, developing rich content to engage customers, build followers and stand out in a crowded digital marketplace to convey important messages to customers. The team monitors social media channels closely for a range of topics related to customer feedback and issues. The team also plans campaigns to reach customers online at key points throughout the year and support customers' needs for information. An emphasis is placed on mobile communications, as 48 per cent of the nearly 18 million visits to bchydro.com each year are through mobile devices and these numbers continue to grow. The shift to digital communications also creates a need for data analytics to evaluate the effectiveness of our efforts and adapt accordingly.

The Customer Campaigns team leads the ongoing development of an annual integrated campaign strategy to provide information to customers. By using a combination of paid (advertising), owned (digital and face-to-face) and earned (media) communications strategies, the team designs campaigns that reach customers when they are most receptive to the information. Safety campaigns in the winter and late spring raise awareness of the hazards of electricity; conservation campaigns in the fall and spring encourage customers to save energy through actions in their homes and businesses; and customer service campaigns raise awareness of new offerings and updated services. The team develops strategies and messages to target a range of demographics and in a number of languages.

The Brand Strategy team leads BC Hydro's face-to-face outreach programs including a community marketing team and a K-12 Schools Program. Engaging with customers face-to-face allows for conversations and dialogue that spark an interest in energy, conservation, customer service and safety, leading to customers taking action at home, in businesses and in schools. The team is also responsible for ensuring the BC Hydro brand is applied in a consistent and effective manner which is key to effective communications in an increasingly cluttered media environment. With the repatriation of services provided by Accenture, this team is also responsible for Creative Services, which supports brand management and standards as well as graphics services and support to KBUs across BC Hydro.

5F.8.1.2. Communities and Capital Projects Department

The Communities and Capital Projects department liaises with stakeholders across B.C. to facilitate approvals for operational imperatives, regional programs and capital projects. The department works to help resolve escalated issues between BC Hydro and its customers and helps to manage BC Hydro's relationships in communities where there is a concentration of assets and operational activities.

The Communities and Capital Projects department is comprised of four teams:

- Community Relations;
- Capital Projects Communications;
- Community Investment and Retiree Programs; and
- Visitor Centres.

The Community Relations team builds relationships with local governments in over 160 communities, including mayors, councillors, regional district officials and community leaders. Community Relations is the primary contact for the constituency offices for all 85 Members of the Legislative Assembly.

This team also provides communications support and coordinates with stakeholders on a range of matters including vegetation management, escalated customer issues, planned power outages, local construction projects, and the operations of our generation facilities. During significant emergency events such as storms and fires, Community Relations shares information with and acts as a conduit for elected officials and the community to support a two-way dialogue.

The Capital Projects Communications team works closely with community stakeholders, leading consultation and communications work on BC Hydro's capital projects. The team gathers local feedback from stakeholders to inform the decision-making process on projects. By conducting early and ongoing consultation and communications during all phases of a capital project, risks of delay or cost increases can be mitigated.

The Community Investment and Retiree Programs team administers the award of scholarships to select B.C. students, support non-profit groups and registered charities through grants, and funds organizations and initiatives through sponsorships that support BC Hydro's business objectives. This team also coordinates an annual charity workplace campaign to help BC Hydro employees give back to their community and supports BC Hydro retirees through the Power Pioneers Program.

The Visitor Centres team operates the Revelstoke Dam Visitor Centre, the W.A.C. Bennett Dam Visitor Centre in Hudson's Hope and the Powerhouse at Stave Falls Visitor Centre in Mission. This work builds understanding of BC Hydro operations in communities. Visitor Centre staff provide information about our historic and current operations in the region as well as education on energy conservation and electrical safety.

5F.8.1.3. Media Relations and Issues Management Department

This department is available 24 hours a day, seven days a week to provide information to the public through major and local media about BC Hydro's business and operations. This includes updates on damage caused by major storms and other emergency events, electrical safety information and tips for customers on how to conserve electricity. To build public awareness and understanding, the department also provides timely information to the media about various customer programs and capital projects that impact customers in communities across the province.

This department also provides communications training to dozens of senior leaders and subject matter experts in BC Hydro each year so that they are prepared to speak on behalf of BC Hydro when required.

Lastly, this department works with the Government of B.C. to keep them informed about our business and provide up-to-date information on key topics. This proactive approach mitigates the amount of time spent on escalated or emerging issues.

5F.8.1.4. Policy, Research and Strategic Communications Department

This department provides policy coordination and advice to support BC Hydro’s priorities as well as the policy objectives of the Government of B.C. The department is comprised of the Policy team and the Corporate and Marketing Research team.

The Policy team works with the Ministry of Energy, Mines and Petroleum Resources to deliver on key reporting and legislated requirements, including the Budget Estimates Debate, the Annual Service Plan Report and the Service Plan. This involves providing information to the public about BC Hydro’s performance, corporate governance and strategic priorities. The team also provides strategic advice and communications support, such as developing briefing materials with KBUs across BC Hydro, in response to emerging public policy developments. The Strategic Communications Plan is also prepared by the team to facilitate collaborative communications work across teams within the KBU.

The Corporate and Market Research team supports a number of BC Hydro’s KBUs, most notably the Conservation and Energy Management KBU and the Customer Service KBU. The team is responsible for assessing the effectiveness and awareness of various initiatives and programs as well as tracking customer satisfaction, which is a BC Hydro Service Plan performance measure.

5F.8.1.5. Employee Communications Department

The Employee Communications department provides employees with the information they need to enhance their work and support BC Hydro's strategic and operational initiatives. As a large number of BC Hydro employees work in the field, at BC Hydro facilities and district offices throughout the province, the department uses a variety of communications platforms to engage employees and meet a growing demand for information. These platforms include an employee intranet, newsletters, executive messages and company-wide conference calls. The department also provides members of BC Hydro's Executive Team with strategic communications support to promote employee engagement and enhance the visibility of senior leadership.

5F.8.2 Overview of Operating Costs and FTEs

Table 5F-13 Communications and Community Engagement KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Chief Communications Officer	0.4	0.0	0.0	0.0	0.0	0.0	0.0	**0.4**	2
2	Marketing Communications	2.3	0.0	3.0	0.0	0.2	0.0	0.0	**5.5**	48
3	Communities and Capital Projects	3.1	0.0	1.4	0.1	0.1	0.0	0.0	**4.7**	38
4	Media Relations and Issue Management	0.5	0.0	0.0	0.0	0.0	0.0	0.0	**0.6**	5
5	Policy, Research and Strategic Comm	0.7	0.0	0.4	0.0	0.0	0.0	0.0	**1.1**	6
6	Employee Communications	1.3	0.0	0.1	0.0	0.0	0.0	0.0	**1.3**	9
7	**Total (Sch 5.6 L5, Sch 16.0 L39)**	**8.3**	**0.0**	**4.9**	**0.1**	**0.3**	**0.0**	**0.0**	**13.6**	**107**

5F.8.2.1. Chief Communications Officer Department

This department's budget consists of labour for two FTEs - the Chief Communications Officer and an administrative assistant.

5F.8.2.2. Marketing Communications Department

This department consists of 48 FTEs. Many of these FTEs support BC Hydro's DSM programs and initiatives. Accordingly, 58 per cent of the costs associated with these FTEs are treated as deferred expenditures and are charged to the DSM Regulatory Account. These FTEs are divided into the following teams:

- Two FTEs represent the Director of Marketing Communications and an administrative assistant;
- 15 FTEs on the Digital Communications team. This team responds to an average of 10,000 social media posts from customers each year, including significant activity during storms and other major emergencies and operational events. The team also delivers 12 million transactional emails annually including email bill delivery, collections notices and notifications related to customer accounts. Lastly, this team manages the employee intranet which receives approximately 1.4 million visits each year. To support this work, the Digital Communications operating budget includes $0.8 million for advertising, software licenses, specialized application support, content development, video production, and other incidental expenses;
- Six FTEs on the Customer Campaigns team. This team delivers more than 20 conservation, safety and other customer information campaigns each year. Examples of other customer information campaigns include BC Hydro's paperless adoption campaign, which supports a reduction in postage, paper and printing costs as described in section 5F.5.2.1. To support this work, the Customer Campaigns operating budget includes $0.7 million for advertising. The fiscal 2019 forecast amount also includes one-time funding of $1.2 million for customer campaigns to promote affordability and conservation measures. This one-time funding is not included in the fiscal 2020 plan or fiscal 2021 plan amounts; and
- 25 FTEs on the Brand Strategy team, including:
  - Two FTEs supporting BC Hydro's Schools and Education Program which provides energy conservation and safety information to approximately 10,000 students each year. The program has substantially increased its reach with the launch of a new online platform which was completed with no increase in budget. The program maintains a teacher mailing list with

approximately 10,000 subscribers, 3,800 teacher user accounts and a web site which received 25,800 visits during the 2017/2018 school year (up from 8,800 visitors in 2016/2017). The program's operating budget includes $0.2 million for advertising, supplies, application support and education consultants to support electrical safety awareness in schools;

- Eight FTEs on the Creative Services team responds to requests from across BC Hydro to create visual content (print, digital and video) to support consistent communication and customer understanding. From fiscal 2016 to fiscal 2018, this team completed approximately 2,200 requests each year. Depending on complexity, the average number of hours spent on each request ranges from five to 12 hours. The Creative Services operating budget includes $0.1 million non-labour for specialized software, application support and supplies;
- 13 FTEs on the Community Outreach team. This includes three FTEs on the core planning team, eight FTEs are a Team Lead, year-round outreach and retail representatives and two FTEs represent casual employees who support the spring and fall awareness campaigns for approximately 10 weeks per year. This team visits 80 communities across the province and engages with over 50,000 customers a year both in-person and through digital channels in conversations about energy conservation and management as well as customer service priorities; and
- The remaining two FTEs represent the department manager and a brand standards lead who is responsible for the development, maintenance and enforcement of all brand assets for employees and suppliers.

5F.8.2.3. Communities and Capital Projects Department

The 38 FTEs in this department are divided into the following teams:

- 14 FTEs on the Community Relations team. Approximately 15 per cent of the cost for these FTEs are charged to capital projects that are supported by BC Hydro's community relations managers;
- Nine FTEs on the Capital Projects Communications team. The FTEs in this department charge approximately 80 per cent of their time to the capital projects they are supporting. In fiscal 2019, the team supported over 180 capital projects;
- Four FTEs on the Community Investment and Retirees Program team. The Community Investment operating budget includes $0.6 million for donations and sponsorships and $0.2 million for advertising. In fiscal 2016, BC Hydro revamped its sponsorships program, reducing the overall funding by 50 per cent and targeting sponsorships to areas that support BC Hydro's operations, such as building a skilled workforce, supporting safe and smart energy use and fostering strong relationships in the communities where our operations have the most impact; and
- 11 FTEs on the Visitor Centres team. In calendar 2019, there were more than 41,000 visitors to BC Hydro's Visitor Centres. The visitor centre's operating budget includes $0.5 million for materials and supplies, advertising (signage, displays, ads), security and janitorial services and travel costs. Costs related to BC Hydro's visitor centres are partially offset by revenue from entrance fees.

5F.8.2.4. Media Relations and Issues Management Department

The majority of this department's budget is related to labour for five FTEs.

The media landscape has changed. Traditional media is shrinking and more outlets are moving online. However, the demand for news is higher than ever and has become a 24/7 business that takes no breaks. Stories will not wait for BC Hydro's comment, which is why BC Hydro's media relations team needs to be available 24 hours a day, seven delays a week.

In addition, as storms and extreme weather have become more frequent over the past five years, so have the after-hours demands on the team. In fiscal 2018, BC Hydro responded to approximately 1,000 media requests.

This department also prepares more than 100 earned media pieces each year ranging from news releases and information bulletins to operational updates and reports to provide customers with important information when and where they need it. Earned media efforts avoid the need to purchase additional advertising spots. Between April and December 2018, BC Hydro's earned media efforts generated over 1,500 stories, with estimated 100 million media impressions.

5F.8.2.5. Policy, Research and Strategic Communications Department

The majority of this department's budget is related to labour for six FTEs.

- Three FTEs on the Policy team provide coordinated advice and information to Government so that the impacts of various policy decisions on ratepayers are understood and considered. In calendar year 2018, this team responded to over 60 requests from the Ministry of Energy, Mines and Petroleum Resources. Between fiscal 2016 and fiscal 2018, the team also prepared an average of 75 briefing notes each year for the Government of B.C.; and
- Three FTEs on the Research team support KBUs across BC Hydro by conducting surveys and focus groups. Feedback gained through this work provides valuable insights so that BC Hydro can better serve its customers and employees. The Research team uses an in-house polling tool called Your Power Poll to survey a group of 4,000 customers, at a lower cost than using an outside vendor. BC Hydro completes an average of 60 surveys through Your Power Poll each year at a cost of approximately $0.08 million. BC Hydro estimates that using an outside vendor for these surveys would cost approximately $0.4 million per year. The Research team also uses Insite Software to conduct customer panel research. BC Hydro completes an average of 12 projects through this software each year at a cost of approximately

$8,000. BC Hydro estimates that using an outside vendor for these projects would cost approximately $0.08 million per year.

The department's operating budget includes $0.4 million for specialized software and application support and research services such as customer satisfaction surveys.

5F.8.2.6. Employee Communications Department

The majority of this department's budget is related to labour for nine FTEs. These FTEs support BC Hydro's KBUs and provide overall and targeted communications to BC Hydro's 6,500 employees, including approximately 2,000 field and stations based workers with limited computer access.

There is a strong correlation between engaged and committed employees and employee retention, productivity and organizational effectiveness. In a time of change in our industry and our company, effective, directed and clear employee communication is essential to keeping employees informed and connected to their work.

Activities carried out by these FTEs include:

- The development of over 140 internal communications plans each year;
- Drafting over 100 Executive Team messages per year, researching and preparing responses to hundreds of employee e-mails and developing speaking notes and supporting visuals for internal and external presentations;
- Developing and executing between 10 to 15 employee campaigns per year on monthly priorities as well as safety and workplace initiatives;
- Executing four safety conference calls per year as well as additional employee calls to respond to operational and emerging issues; and

- Managing six internal communications channels (an employee intranet, executive communications, 75 office and field TV screens, poster boards, all-employee calls and lobby displays).

The department's operating budget includes $0.1 million for promotional materials and supplies.

5F.8.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5F-14 Communications and Community Engagement KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.6 L5	12.8	12.4	12.6	13.7	12.7	13.6	12.9	13.0
2	FTEs	16.0 L39	86	94	86	95	86	107	107	107

Operating costs are decreasing by approximately $0.7 million from fiscal 2019 forecast to fiscal 2020 plan due to the removal of one-time funding of $1.2 million for customer advertising campaigns focused on affordability and conservation, partially offset by Standard Labour Rate increases of approximately $0.4 million.

Operating costs are increasing by approximately $0.1 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases.

FTEs are planned to remain constant during the test period. The increase in FTEs from fiscal 2019 RRA to fiscal 2019 forecast was primarily driven by the Workforce Optimization program, described in Chapter 5, section 5.6.1 and the Accenture Repatriation, described in Chapter 5, section 5.6.2.

5F.9 Regulatory and Rates KBU

5F.9.1 Responsibilities

This KBU is responsible for providing regulatory advice to KBUs across BC Hydro, developing regulatory strategies and managing applications and initiatives through the regulatory process. BC Hydro believes that an open and transparent regulatory process leads to better decisions and improved outcomes for our customers. This KBU supports this approach, acting as the main interface between the Commission and BC Hydro and managing relationships with interveners during and outside regulatory proceedings.

There have been no material changes to the nature of the responsibilities of the Regulatory and Rates KBU since the Previous Application.

This KBU is organized into the following four teams:

- Capital Projects and Resource Planning;
- Rates and Finance;
- Tariffs; and
- Compliance and Filings.

The Capital Projects and Resource Planning team is responsible for providing strategic planning, regulatory advice and support to KBUs regarding capital projects, EPAs, Mandatory Reliability Standards, and resource planning. This includes leading regulatory applications and related compliance filings and providing monthly customer outage reporting to the Commission.

Capital Planning and Resource Planning team also includes the Reliability Compliance group which is responsible for BC Hydro's Mandatory Reliability Standards Program. The Mandatory Reliability Standards, which are approved by the BCUC, define requirements for planning, maintaining and operating the Bulk Electric System such as transmission system planning and modelling, protection system maintenance, critical infrastructure protection and real-time operations.

The Mandatory Reliability Standards Program governs the oversight activities associated with these requirements including the development of recommendations to the BCUC for adopting new or revised Mandatory Reliability Standards in B.C. These activities include:

- The development of annual Assessment Reports for filing with the BCUC;
- Education about and implementation of the Mandatory Reliability Standards with impacted KBUs; and
- Monitoring of Mandatory Reliability Standards compliance including annual self-certifications and on-site audits.

The Rates and Finance team is responsible for providing strategic planning, regulatory advice and support to KBUs regarding accounting, financial and revenue requirement regulatory matters. This includes leading BC Hydro's revenue requirements applications to the Commission, as well as finance-related compliance filings.

The Tariffs team is responsible for residential, general service, transmission service and Open Access Transmission Tariff (**OATT**) rates; administering the Standards of Conduct program[282]; and managing permits and reporting related to BC Hydro's international power lines. To support these responsibilities, the department carries out the following activities:

- Providing regulatory advice and research related to tariffs and rate design;
- Responding to external and internal tariff and rate queries;
- Managing OATT applications, administration and technical issues; and
- Providing support and guidance for customer complaints and compliance filings.

[282] The Standards of Conduct Program is an internal program developed by BC Hydro to support compliance requirements for the management of non-public transmission function information in the provision of wholesale electricity sales.

The Compliance and Filings team is responsible for coordinating and implementing activities to meet regulatory requirements. This includes:

- Preparation, review, quality control and tracking of regulatory materials;
- Research and training to support the development of applications; and
- Coordination and preparation of public workshops and hearings.

5F.9.2 Overview of Operating Costs and FTEs

Table 5F-15 Regulatory and Rates KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Regulatory and Rates	4.8	0.0	1.4	0.0	0.0	0.0	0.0	**6.2**	28
2	**Total (Sch 5.6 L6, Sch 16.0 L40)**	**4.8**	**0.0**	**1.4**	**0.0**	**0.0**	**0.0**	**0.0**	**6.2**	**28**

Approximately 77 per cent of the Regulatory and Rates KBU budget is related to labour. This represents 28 FTEs as follows:

- A Chief Regulatory Officer and an Administrative Assistant;
- One Manager and two Regulatory Specialists in Capital Projects and Resource Planning;
- One Manager and four Reliability Compliance Specialists in Mandatory Reliability Standards;
- One Manager and three Regulatory Specialists in Rates and Finance;
- One Manager and nine Regulatory Specialists in Tariffs; and
- One Manager and three Regulatory Coordinators in Compliance and Filings.

From fiscal 2016 to fiscal 2018, BC Hydro submitted an average of approximately 300 filings to the BCUC each year. This equates to a ratio of approximately 14 filings each year for each manager or specialist in the KBU. The complexity of these filings ranges from recurring compliance reports with no or minimal process, to standard applications which may have an information request and argument phase, to major applications which may span multiple years with multiple rounds of information requests, intervener evidence, oral hearings and arguments. All of these filings, small to large, require varying degrees of regulatory oversight and expertise from employees in this KBU. BC Hydro expects the number and complexity of filings to the BCUC to increase going forward as a result of the Government of B.C.'s Comprehensive Review, which has enhanced the BCUC's regulatory oversight of BC Hydro.

The remaining 23 per cent of the Regulatory and Rates KBU budget consists of the following material costs in Services – Other:

- BCUC Hearing Room Rental Fee;
- BCUC Fees;
- Participant Assistance / Cost Awards awarded by the BCUC to facilitate intervener participation in regulatory proceedings; and
- Consultant resources.

The BCUC Hearing Room Rental Fee is relatively constant and budgeted at $0.2 million annually. The remaining costs are driven by the number, type, complexity and length of regulatory proceedings in a given year and can vary.

- BCUC fees are budgeted at $0.3 million but ranged from approximately $0.2 million to $0.4 million during the fiscal 2016 to fiscal 2018 period. These fees are directly related to the number, length and complexity of regulatory proceedings;
- Participant Assistance / Cost Awards are budgeted at $0.4 million but ranged from approximately $0.3 million to $0.9 million during the fiscal 2016 to fiscal 2018 period. These amounts are also directly related to the number and complexity of regulatory proceedings; and

- Consultant resources are retained to provide expertise in specialized subject areas during regulatory proceedings. They are budgeted at approximately $0.4 million. We expect this budget to be fully utilized going forward as a result of the Government of B.C.'s Comprehensive Review, which has provided the BCUC with enhanced oversight of BC Hydro. Potential applications during the test period, which will require consultant resources, include a performance based regulation application, a cost of capital proceeding and the 2021 Integrated Resource Plan. This budget also covers specialized consultant resources to assist with Mandatory Reliability Standards audits.

5F.9.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5F-16 Regulatory and Rates KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.6 L6	6.0	5.8	6.1	5.4	6.2	6.2	6.3	6.4
2	FTEs	16.0 L40	28	23	27	26	27	28	28	28

Operating costs are increasing by approximately $0.1 million from fiscal 2019 forecast to fiscal 2020 plan and by approximately $0.1 million from fiscal 2020 plan to fiscal 2021 plan, due to Standard Labour Rate increases. FTEs are planned to remain constant.

5F.10 Ethics and Merit Office KBU

5F.10.1 Responsibilities

The Ethics and Merit KBU supports BC Hydro's efforts to provide a safe and respectful work environment, serving as a neutral party to support all BC Hydro employees. This KBU is led by the Ethics Officer and provides independent expert advice to employees, managers, contract managers and contractors promoting respect, dignity, integrity and fairness.

The responsibilities of this KBU have increased since the Previous Application as the Ethics and Merit Office is now also responsible for overseeing fair hiring and merit-based practices.

This KBU is responsible for BC Hydro's Code of Conduct, Contractor Standards for Ethical Conduct, Respectful Workplace, Ombudsperson and Merit Programs.

- The Code of Conduct program provides employees with access to expert advice on Code of Conduct related matters, including consistent and clear interpretation of its standards of business conduct as well as guidelines to mitigate and avoid conflicts of interest. The Contractor Standards for Ethical Conduct program provides these same services to BC Hydro's contractors;
- The Respectful Workplace Program is consistent with WorkSafe BC and Human Rights Code requirements. It provides a variety of services to employees and managers so that employees at BC Hydro are treated respectfully and work in a harassment-free environment;
- The Ombudsperson serves as an impartial intermediary between BC Hydro and its employees. This function has existed within BC Hydro since 1998 and acts as a neutral third party to assist employees with fairness concerns related to employment; and
- The Merit Program was introduced in July 2018 to improve employee trust in BC Hydro's hiring practices. The Ethics and Merit Office KBU conducts reviews so that the principle of fairness is consistently applied in the recruitment process. It provides a mechanism for employees to report hiring concerns for further investigation.

5F.10.2 Overview of Operating Costs and FTEs

Table 5F-17 Ethics and Merit Office KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Ethics and Merit Office	0.5	0.0	0.3	0.0	0.0	0.0	0.0	**0.8**	4
2	**Total (Sch 5.6 L7, Sch 16.0 L41)**	**0.5**	**0.0**	**0.3**	**0.0**	**0.0**	**0.0**	**0.0**	0.8	**4**

The Ethics and Merit Office KBU budget primarily consists of labour for four FTEs including the Ethics Officer, Ethics Advisor, Merit Advisor and an administrative assistant.

From fiscal 2017 to fiscal 2018, demand for the services provided by this KBU increased significantly. Code of Conduct inquiries increased from 104 to 149 and Respectful Workplace cases increased from 52 to 92. These numbers reflect the ongoing promotion of this KBU's services and do not include the additional responsibility for the Merit Program.

This KBU's budget also includes $0.3 million in non-labour costs. This includes funding for a secure confidential reporting line managed by a third-party service provider for individuals who prefer to report an incident anonymously. It also includes funding to retain independent subject-matter experts as required to provide independent investigations or to meet peak caseload and training volumes.

5F.10.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5F-18 Ethics and Merit Office KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.6 L7	0.4	0.5	0.4	0.6	0.4	0.8	1.0	1.0
2	FTEs	16.0 L41	1	2	1	3	1	4	5	5

Operating costs are increasing by approximately $0.2 million from fiscal 2019 forecast to fiscal 2020 plan, primarily due to the addition of one FTE to respond to the increase in demand for this KBU's services. The costs related to this FTE are offset by a reduction in operating costs in the Human Resources KBU. Operating costs are relatively constant from fiscal 2020 plan to fiscal 2021 plan.

5F.11 Business Unit Support KBU

5F.11.1 Responsibilities

The People, Customer and Corporate Affairs Business Unit Support KBU holds the budget for the Office of the Executive Vice-President of People, Customer and Corporate Affairs.

5F.11.2 Overview of Operating Costs and FTEs

Table 5F-19 Business Unit Support KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	EVP, People, Customer and Corp Affair	0.7	0.0	0.1	0.0	0.0	0.0	0.0	**0.8**	3
2	**Total (Sch 5.6 L8, Sch 16.0 L43)**	**0.7**	**0.0**	**0.1**	**0.0**	**0.0**	**0.0**	**0.0**	**0.8**	**3**

5F.11.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5F-20 Business Unit Support KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.6 L8	0.7	0.8	0.8	0.7	0.8	0.8	0.8	0.8
2	FTEs	16.0 L43	3	3	3	3	3	3	3	3

Operating costs and FTEs are planned to remain relatively constant during the test period.

Fiscal 2020 to Fiscal 2021

Revenue Requirements Application

Chapter 5G

Operating Costs

Other

Table of Contents

List of Figures

List of Tables

5G.1 Introduction – Other

Chapter 5G provides and explains in detail the composition of, and rationale, for the operating costs of the Other category.

The Other category includes two KBUs: The Office of the General Counsel, which reports directly to the President and Chief Operating Officer and the Office of the President and Chief Operating Officer.

Also included in this Other category are FTEs and operating costs related to:

- **Site C Project:** FTEs for the Site C Project are increasing during the test period as the project staffs up to a full complement of resources for the peak construction period. The project has no operating expenditures as all Site C costs are charged to capital or the Site C Regulatory Account. These costs will not impact rates until the project's assets are placed into service;
- **Independent Power Producer Capital Leases:** Under IFRS 16, BC Hydro has one EPA that is accounted for as a capital lease during the test period. However, there are no planned operating costs associated with this lease during the test period;
- **Corporate Costs:** Corporate Costs is used to manage the flow of payroll, benefits and current service pension costs to the business through Standard Labour Rates. It also receives general expenses that are not specifically related to any single Business Group or KBU and are captured centrally;
- **Capitalized Costs:** This includes costs that are eligible for capitalization under IFRS IAS 16 Property, Plant and Equipment, which are recorded in operating expenses and allocated to capital projects using a capital overhead loading rate. This also includes a credit for IFRS ineligible capital overhead costs, which are being phased into operating costs over a 10-year period. This phase-in will be complete by the end of fiscal 2022; and

- **Post-Employment Benefit Costs:** This consists of current service costs and non-current service costs. Current service costs are included in the Standard Labour Rates and charged to current work (capital and operating). Therefore, these costs are reflected in the costs presented throughout this Application. Non-current service costs are comprised of plan income on pension plan assets and interest expense on post-employment benefit liabilities. While non-current service costs are included in finance charges, the discussion on non-current service costs is included in this chapter so that current and non-current service costs are discussed together in one section within this Application.

Chapter 5G is organized as follows:

- Section 5G.2 provides the operating costs and FTE information for the Other category as a whole;[1] and
- Sections 5G.3 to 5G.9 provide more detailed information on the costs within the Other category.[283]

5G.2 Fiscal 2020 and Fiscal 2021 Plan Operating Cost and FTE Summaries

The operating costs for the Other category are summarized in Table 5G-1 below.

Table 5G-1 Other Net Operating Costs

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Office of the General Counsel	5.7 L1	12.2	11.1	12.3	10.6	12.3	12.2	11.7	11.8
2	Office of the President and Chief Operating Officer	5.7 L2	0.9	1.0	1.0	0.8	1.0	0.8	0.9	0.9
3	Site C Project	5.7 L3	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
4	Independent Power Producers Capital Leases	5.7 L8	28.2	28.2	63.6	63.6	54.3	54.3	0.0	0.0
5	Corporate Costs	5.7 L4	17.2	13.1	18.4	28.4	19.7	38.9	13.0	13.0
6	Capitalized Costs	5.7 L5+L7	(180.2)	(179.0)	(158.6)	(158.6)	(136.9)	(137.6)	(115.8)	(93.8)
7	Total	5.7 L12	(121.7)	(125.6)	(63.4)	(55.2)	(49.6)	(31.4)	(90.2)	(68.1)

FTEs in the Other category are summarized in Figure 5G-1. Additional detail is provided in Table 5G-2 below.

283 Please note the amounts presented in the tables in these sections may not add due to rounding.

Figure 5G-1 Other FTEs (Fiscal 2020 Plan)

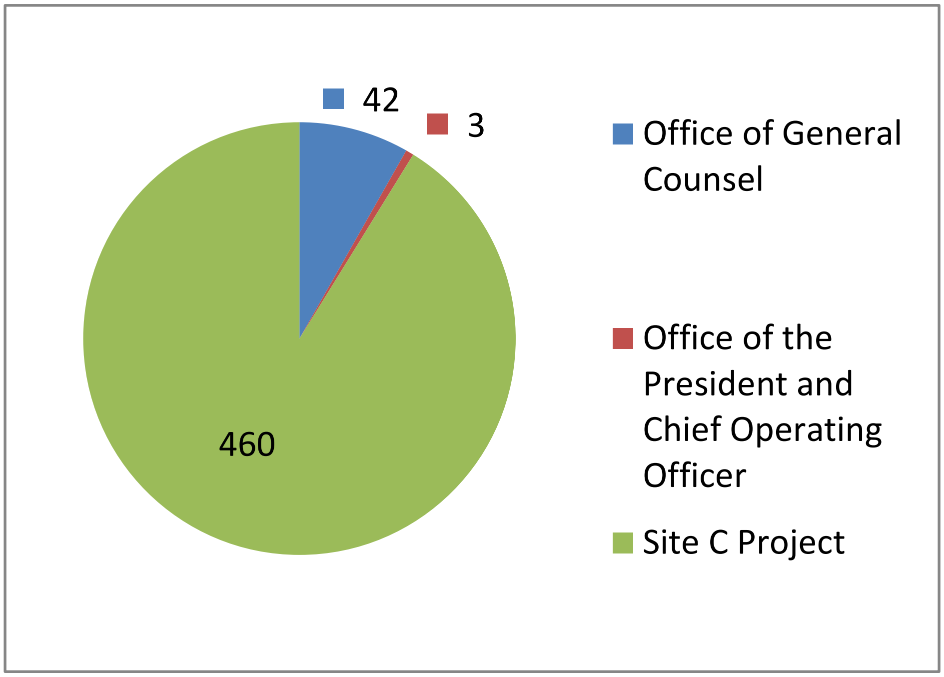

Table 5G-2 Other FTEs

	(FTEs)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan

5G.3 Office of the General Counsel KBU

5G.3.1 Responsibilities

The Office of the General Counsel KBU reports directly to the President and Chief Operating Officer and provides guidance, expertise and oversight throughout BC Hydro on legal matters, corporate governance and freedom of information and

[284] Row 4 of Table 5G-3 relates to the current pension cost adjustment corresponding with BCUC Order No. G-47-18, Directive 18, which directed BC Hydro to use the discount rate in effect at the time the forecast was prepared to calculate current service costs;
Row 7 relates to the impact of the new accounting standard on leases, IFRS 16 which is further explained in section 5G.6 Independent Power Producers Capital Leases;
Row 8 represents IFRS ineligible capital overhead costs that are being phased in to operating costs over a 10-year period. Please refer to section 5G.8 for further information on IFRS ineligible capital overhead;
Row 16 represents the allocated labour costs to the Business Groups including the allocation of the compliance filing adjustment related to pension costs shown on row 4 above. The net labour cost increase for the Other category is $3.3 million (row 4 Compliance Filing Adjustment of $10.4 million plus row 16 labour of $(7.1) million).

privacy. There have been no material changes to the responsibilities of this KBU since the Previous Application.

The Office of the General Counsel KBU is comprised of the following three departments:

- Legal Services Department;
- Freedom of Information Coordinating Office Department; and
- Office of the Corporate Secretary Department.

5G.3.1.1. Legal Services Department

Legal Services is responsible for providing legal advice and support to the Board of Directors, the Executive Team, senior management, the Site C Project and all KBUs and departments across BC Hydro. BC Hydro operates in a complex and challenging legal environment, particularly given our significant presence across the province, increased regulatory compliance requirements and our status as both a regulated utility and a Crown Corporation.

5G.3.1.2. Freedom of Information Coordinating Office Department

The Freedom of Information Coordinating Office (**FOICO**) department is responsible for responding to, advising on, and addressing requests and issues related to access to information and privacy under the B.C. *Freedom of Information and Protection of Privacy Act* (**FOIPPA**) and other applicable legislation. Each year, the FOICO department responds to a large volume of direct requests as well as referrals from other agencies, working across BC Hydro to gather records and respond to requests within the time requirements in legislation. The work often involves detailed reviews of every record, which may involve hundreds or thousands of pages per request, to ensure responses are consistent with FOIPPA. This department oversees the implementation of BC Hydro's privacy policies and undertakes required privacy impact assessments for programs, projects and initiatives. In addition, the department provides compliance training and advice to managers and employees across BC Hydro.

5G.3.1.3. Office of the Corporate Secretary Department

The Office of the Corporate Secretary department organizes, facilitates and records all meetings of the Board of Directors and responds to internal and external inquiries concerning Board decisions. This department also supports the Board of Directors, the Executive Team, management and employees on corporate governance.

5G.3.2 Overview of Operating Costs and FTEs

Table 5G-4 Office of the General Counsel KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Legal Services	4.9	0.0	5.4	0.1	0.0	0.0	0.0	**10.4**	36
2	Freedom of Information	0.6	0.0	0.1	0.0	0.0	0.0	0.0	**0.7**	5
3	Office of the Corporate Secretary	0.3	0.0	0.8	0.0	0.0	0.0	0.0	**1.1**	2
4	**Total (Sch 5.7 L1, Sch 16.0 L45)**	**5.7**	**0.0**	**6.3**	**0.1**	**0.0**	**0.0**	**0.0**	**12.2**	**43**

The operating costs of the Office of the General Counsel KBU are largely comprised of labour costs and external legal fees. This KBU is also responsible for fees and expenses for BC Hydro's Board of Directors.

While the total operating costs of the KBU have remained stable from fiscal 2017 to fiscal 2019, the number of FTEs increased from 37 to 43. The additional FTEs were added through the Workforce Optimization Program, which is discussed in Chapter 5, section 5.6.1.

5G.3.2.1. Legal Services Department

The Legal Services department represents approximately 85 per cent of the General Counsel Office KBU operating costs. Legal services are provided by a team of in-house lawyers, supported by a paralegal and an administrative staff, as well as external lawyers. The department's costs are divided almost equally between labour and external legal support.

In-house lawyers are more cost-effective than external lawyers. For example, in fiscal 2019, the weighted average hourly cost of external counsel was more than three times the cost of our in-house counsel. Given this cost difference, as well as the benefits of having an in-house legal team knowledgeable about BC Hydro’s business, BC Hydro employs a team of in-house lawyers with expertise in a range of subjects.

The department retains external counsel for specialized legal expertise, large regulatory filings, litigation, large transactions and projects and to assist during periods of higher than expected work volumes. The department manages law firm retainers, including costs and work scope, so that external counsel are used appropriately and cost-effectively in conjunction with in-house lawyers.

5G.3.2.2. Freedom of Information Coordinating Office Department

The FOICO department represents approximately six per cent of the Office of the General Counsel KBU’s operating costs. The majority of costs in this department are related to labour. There are five FTEs in the department which consists of two information coordinators, one privacy specialist, one administrative assistant and one manager.

In fiscal 2017, this department was not able to respond to information requests within the statutory time requirements. Therefore, one FTE was added to help respond to the increased volume and backlog of requests. This backlog has now been addressed and to date in fiscal 2019, all FOIPPA information requests have been responded to within statutory time requirements. This additional FTE did not increase operating costs as the costs were fully offset by a reduction in consultant costs.

5G.3.2.3. Office of the Corporate Secretary Department

The Office of the Corporate Secretary department represents approximately nine per cent of the operating cost of the General Counsel Office KBU, including labour costs for two FTEs as well as fees and expenses for BC Hydro's Board of Directors. Labour costs are for the Corporate Secretary and an administrative assistant, who also supports the Executive Chair.

5G.3.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5G-5 Office of the General Counsel KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.7 L1	12.2	11.1	12.3	10.6	12.3	12.2	11.7	11.8
2	FTEs	16.0 L45	37	36	37	35	37	43	42	42

Operating costs are decreasing by approximately $0.5 million from fiscal 2019 forecast to fiscal 2020 plan due to vacancy factor savings and reductions to external services costs, which are partially offset by Standard Labour Rate increases. Operating costs are increasing by approximately $0.1 million from fiscal 2020 plan to fiscal 2021 plan due to Standard Labour Rate increases. FTEs are planned to remain constant.

5G.4 President and Chief Operating Officer KBU

5G.4.1 Responsibilities

The President and Chief Operating Officer KBU includes the President and Chief Operating Officer and two support staff.

5G.4.2 Overview of Operating Costs and FTEs

Table 5G-6 President and Chief Operating Officer KBU Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Office of the President and COO	0.7	0.0	0.1	0.0	0.0	0.0	0.0	**0.8**	3
2	**Total (Sch 5.7 L2, Sch 16.0 L46)**	**0.7**	**0.0**	**0.1**	**0.0**	**0.0**	**0.0**	**0.0**	**0.8**	**3**

5G.4.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

Table 5G-7 President and Chief Operating Officer KBU Operating Costs and FTEs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.7 L2	0.9	1.0	1.0	0.8	1.0	0.8	0.9	0.9
2	FTEs	16.0 L46	4	4	4	3	4	3	3	3

Operating costs are increasing slightly during the test period due to Standard Labour Rate increases.

5G.5 Site C Project

5G.5.1 Responsibilities

Given its size, complexity and duration, the Site C Project has been set up as its own group with a complement of resources to support all components of successful project execution. This project team reports directly to the President and Chief Operating Officer through the Executive Vice President of the Site C Project. Construction of the Site C Project began in July 2015 and is scheduled to complete in 2024. The project cost is $10.7 billion, consisting of an expected project budget of $10.0 billion and a project reserve subject to Treasury Board control of $0.7 billion. These costs will not impact rates until the project's assets are placed into service.

The Site C Project team works closely with other departments in BC Hydro to align with financial, legal, procurement, environmental, contract management, engineering, safety and project delivery policies and practices.

5G.5.2 Overview of Operating Costs and FTEs

Table 5G-8 Site C Project Fiscal 2019 Forecast Operating Costs and FTEs by Department

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Site C Project	0.0	0.0	0.0	0.0	0.0	0.0	0.0	**0.0**	389
2	**Total (Sch 5.7 L3, Sch 16.0 L47)**	**0.0**	**0.0**	**0.0**	**0.0**	**0.0**	**0.0**	**0.0**	**0.0**	**389**

The Site C Project has no operating expenditures as all costs are charged to capital or to the Site C Regulatory Account.

5G.5.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs and FTEs

**Table 5G-9 Site C Project
Operating Costs and FTEs**

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.7 L3	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0
2	FTEs	16.0 L47	186	167	189	226	199	389	460	472

FTEs for the Site C Project are planned to increase by 71 from fiscal 2019 forecast to fiscal 2020 plan and by 12 from fiscal 2020 plan to fiscal 2021 plan, as the project staffs up to a full complement of resources for the peak construction period.

5G.6 Independent Power Producer Capital Leases

5G.6.1 Description

BC Hydro has three Electricity Purchase Agreements (**EPAs**) that are accounted for as capital leases up until the end of fiscal 2019, under International Accounting Standard (IAS) 17 and IFRIC 4, the current accounting standards for Leases.

BC Hydro is required to review all EPAs to assess whether these agreements qualify as leases under IFRS 16, the new accounting standard for Leases that comes into effect starting in fiscal 2020. Please refer to Chapter 8, section 8.12.1 on the related accounting treatment on EPAs and Chapter 8, section 8.13.3 on the adoption of IFRS 16.

5G.6.2 Fiscal 2020 and Fiscal 2021 Plan Operating Costs

**Table 5G-10 Independent Power Producer Capital
Lease
Operating Costs**

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.7 L8	28.2	28.2	63.6	63.6	54.3	54.3	0.0	0.0

Due to the adoption of IFRS 16, starting in fiscal 2020, the operating costs for the three EPAs currently accounted for as capital leases will be recorded as Cost of Energy because these EPAs do not qualify as leases under IFRS 16. In addition, one EPA which was previously accounted for as Cost of Energy will be accounted for as a lease under IFRS 16; however, there are no planned operating costs associated with this lease for fiscal 2020 and fiscal 2021.

5G.7 Corporate Costs

5G.7.1 Description

Corporate Costs is used to manage the flow of payroll, benefits and current service pension costs to the business through Standard Labour Rates as described in Chapter 5, section 5.6.5.3. In addition, Corporate Costs receives general expenses that are not specifically related to any single Business Group or KBU and are captured centrally.

5G.7.2 Overview of Operating Costs and FTEs

Table 5G-11 Corporate Costs
Fiscal 2019 Forecast Operating Costs

	($ million)	Labour	Services - ABSU	Services - Other	Materials	Building & Equipment	Capitalized Overhead	External Recoveries	Total Operating	Total FTEs
1	Corporate Costs	8.9	0.0	29.8	0.0	0.2	0.0	0.0	**38.9**	-
2	**Total (Sch 5.7 L4, Sch 16.0 L49)**	**8.9**	**0.0**	**29.8**	**0.0**	**0.2**	**0.0**	**0.0**	**38.9**	**-**

The labour budget in Corporate Costs is typically zero as 100 per cent of the labour, benefit and current service pension costs planned are allocated out to the KBUs through Standard Labour Rates. In fiscal 2019, the budget of $8.9 million is primarily a result of the Previous Application compliance filing adjustment, pursuant to the BCUC's decision on the forecasting methodology to be used for current service pension costs. This budget has been included in the Standard Labour Rates for fiscal 2020 and fiscal 2021.

The fiscal 2019 forecast non-labour budget consists of the following services and building and equipment costs:

- $9.0 million for premiums on insurance policies including property, general liability, directors' and officers' liability, cyber liability and several other small, miscellaneous insurance policies;
- $4.0 million for annual cost recovery levies from the BCUC and the National Energy Board, as well as various other memberships;
- $15.0 million unallocated funds in fiscal 2019; and
- $1.9 million for trailing costs related to the Accenture repatriation in fiscal 2019. Further information on the Accenture repatriation is provided in Chapter 5, section 5.6.2.

The 2013 10 Year Rates Plan prescribed certain operating cost and rate increase targets, To manage unanticipated cost pressures within these targets, BC Hydro maintained a budget of unallocated funds. Starting in fiscal 2020, the budgets related to unallocated funds and trailing costs for the Accenture repatriation have been repurposed.

- A reduction of $7.0 million will be used to help fund labour cost pressures described in Chapter 5, section 5.5.2;
- A transfer of $7.9 million to the Integrated Planning Business Group will be used to fund maintenance cost pressures, as discussed in Chapter 5, section 5.8; and
- A transfer of $2.0 million to the Operations Business Group will be used to provide supplemental funding for the annualized cost of the John Hart operating agreement with InPower, as described in Chapter 5, section 5C.6.3.

5G.7.3 Fiscal 2020 and Fiscal 2021 Plan Operating Costs

Table 5G-12 Corporate Costs Operating Costs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Operating Costs ($ million)	5.7 L4	17.2	13.1	18.4	28.4	19.7	38.9	13.0	13.0

Corporate Costs are decreasing by $25.9 million from the fiscal 2019 forecast to fiscal 2020 and fiscal 2021 plan. As discussed above, the budgets related to unallocated funds and trailing costs for the Accenture repatriation are being repurposed and the compliance filing adjustment is included in the Standard Labour Rate.

The remaining $13.0 million in Corporate Costs is for insurance policies and annual recovery levies, as described above.

5G.8 Capitalized Costs

5G.8.1 Description

In this Application, eligible and a portion of ineligible capitalized overhead costs have been consolidated under Capitalized Costs. In the Previous Application, eligible capital overhead costs were included in the Business Unit Support KBU of the Capital Infrastructure Project Delivery Business Group while IFRS ineligible capital overhead costs were included in Corporate Costs in the former Operations Support Business Group.

Capitalized Costs consists of two components:

- Eligible capital overhead; and
- IFRS ineligible capital overhead.

Eligible capital overhead costs are costs that are eligible for capitalization under IFRS IAS 16, Property, Plant and Equipment. These costs are recorded in operating expenses and then allocated to capital projects using capital overhead loading rates (i.e., capitalized).

These costs are determined by multiplying the forecast eligible operating expenses by resource (e.g., materials, labour and services) by the eligible capital overhead percentages of each organizational group.

The eligible capital overhead percentages for each organizational group are based on the IFRS Capital Cost Allocation study completed in 2012 with subsequent adjustments for changes in resourcing, work responsibilities and the cost distribution approach (e.g., direct charging to capital rather than allocating through capital overhead), that have occurred since the completion of the study. The study was reviewed by KPMG and was undertaken for the Fiscal 2012 to Fiscal 2014 Amended Revenue Requirements Application. The study's purpose was to determine the amount of costs eligible for allocation to capital under IFRS.

The IFRS ineligible capital overhead reflects the amount of operating costs that were previously eligible for capitalization under Canadian Generally Accepted Accounting Principles (**CGAAP**), Section 3061, Property, Plant & Equipment, but are ineligible for capitalization under IFRS IAS 16. IFRS IAS 16 requires that additions to Property, Plant and Equipment must be "directly attributable" to the asset. Unlike previous CGAAP, costs related to administration and general overhead are excluded from Property, Plant and Equipment.

The IFRS ineligible capital overhead amount determined at the time of transition to the Prescribed Standards (which include the principles IFRS), is being phased into operating expenses over a 10-year period, starting in fiscal 2013, rather than immediately being absorbed in rates. This means that IFRS ineligible capital overhead will be fully phased into operating costs by the end of fiscal 2022. This approach avoided an immediate and significant rate impact in fiscal 2013. The IFRS ineligible capital overhead annual credit amounts planned in Capitalized Costs are the annual amounts transferred to the IFRS Property, Plant and Equipment Regulatory Account. The amounts transferred to this regulatory account are reduced by $22.4 million each year, consistent with the 10-year phase-in approach. Further information on the IFRS Property, Plant and Equipment Regulatory Account is provided in Chapter 7, section 7.8.20.

5G.8.2 Fiscal 2020 and Fiscal 2021 Plan Operating Costs

Table 5G-13 Capitalized Costs Operating Costs

		Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Eligible Capital Overhead ($ million)		(68.2)	(67.0)	(69.0)	(69.0)	(69.7)	(70.4)	(71.0)	(71.4)
2	Ineligible Capital Overhead ($ million)		(112.0)	(112.0)	(89.6)	(89.6)	(67.2)	(67.2)	(44.8)	(22.4)
3	Total Overhead	5.7 L18	(180.2)	(179.0)	(158.6)	(158.6)	(136.9)	(137.6)	(115.8)	(93.8)

The decrease in the planned credits in Capitalized Costs for fiscal 2020 and fiscal 2021 compared to fiscal 2019 forecast is primarily due to the annual reduction of $22.4 million per year to phase the IFRS ineligible capital overhead costs into operating costs over a 10-year period, as described above.

5G.9 Post-Employment Benefit Costs

Post-employment benefit costs are comprised of a number of components that are categorized as either current service costs or non-current service costs:

- **Current service costs** are the annual costs of accruing employees' post-employment benefits. These costs recognize the cost of the future benefits earned by the employees in the current year. Current service costs are included in the Standard Labour Rates and charged to current work (capital and operating). Therefore, these costs are reflected in the costs presented throughout this Application; and
- **Non-current service costs** are comprised of plan income on pension plan assets and interest expense on post-employment benefit liabilities. While non-current service costs are included in finance charges, the discussion on non-current service costs is included below so that current and non-current service costs are discussed together in one section within this Application.

This section has been prepared under International Accounting Standard 19, Employee Benefits (**IAS 19**), with the exception of the return (investment income) on pension plan assets which is determined and based on the expected long-term rate of return rather than the liability discount rate as specified by IAS 19. The expected long-term rate of return reflects BC Hydro's expected earnings on pension plan assets. This forecast methodology is consistent with the methodology used in previous revenue requirement applications.

BC Hydro's external actuary performs an actuarial valuation of its post-retirement benefit plans for accounting purposes using the actuarial cost method prescribed by IAS 19. An actuarial valuation estimates the plans' funded status (assets less liabilities) at a specific point in time. In addition, an actuarial valuation also estimates the annual current service costs. At each actuarial valuation, the plan membership is updated, and all economic and demographic assumptions are reviewed and updated as required. An actuarial valuation is required to be performed at least every three years and actuarial projections are performed in between actuarial valuation years. The last actuarial valuation was performed as at December 31, 2015, and an actuarial valuation is currently being performed as at December 31, 2018 which will be completed by September 2019.

In accordance with BCUC Order No. G-47-18 to the Previous Application, the discount rate used to forecast post-employment benefit plan costs is based on the market discount rate in effect at the time the forecast was prepared. The discount rate is calculated in accordance with IAS 19 by BC Hydro's external actuary and is based on a hypothetical basket of high quality corporate debt (AA) that has the same cash flow as the BC Hydro post-employment benefit plans, in terms of both timing and amount. The discount rate in effect at the time the fiscal 2020 and fiscal 2021 forecast was prepared (as at September 30, 2018), was 3.83 per cent for the pension plans and 3.79 per cent for the other post-employment benefit plans.

5G.9.1 Current Service Costs

Current service costs are the annual costs of accruing employees' post-employment benefits. These costs recognize the cost of the future benefits earned by the employees in the current year. Current service costs are included in the Standard Labour Rates and charged to current work (capital and operating). Therefore, these costs are reflected in the costs presented throughout this Application.

Current service costs are sensitive to changes in the discount rate. A decrease in the discount rate will increase current service costs while an increase in the discount rate will decrease current service costs.

Current service costs are shown below in Table 5G-14.

Table 5G-14 Current Service Costs

($ million)	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
Current Service Costs	103.8	103.8	105.3	101.2	107.0	107.0	103.5	105.6

The decrease in the planned current service costs for fiscal 2020 and fiscal 2021 compared to fiscal 2019 forecast is primarily due to the elimination of Medical Services Plan premiums. In the Budget 2017 Update, the Government of B.C. announced a 50 per cent reduction to Medical Services Plan premiums, effective January 1, 2018. In February 2018, as part of Budget 2018, the Government of B.C. announced that Medical Services Plan premiums will be eliminated effective January 1, 2020. Current service costs are forecast to increase slightly from fiscal 2020 plan to fiscal 2021 plan due to forecast salary increases.

5G.9.2 Non-Current Service Costs

Non-current service costs are comprised of plan income on pension plan assets and interest expense on post-employment benefit liabilities:

- Plan income (i.e., investment income on pension plan assets) is calculated by multiplying the expected long-term rate of return by the market value of the plan assets at the beginning of the fiscal year, adjusted for expected contributions and benefit payments during the year.

The expected long-term rate of return on the pension plan assets is determined based on the actual asset allocation of the BC Hydro registered pension plan. A decrease in the expected long-term rate of return on pension plan assets will decrease the amount of plan income recognized, while an increase in the expected long-term rate of return on pension plan assets will increase the amount of plan income recognized. The market value of the plan assets is provided by the British Columbia Investment Management Corporation; and

- Interest expense, also known as interest accretion, relates to the expected increase in the discounted pension benefit obligation to recognize the passage of time.

  Interest expense is calculated by multiplying the discount rate by the amount of the pension obligation at the beginning of the fiscal year adjusted for the accrual of current service costs and expected benefit payments during the year. A decrease in the discount rate will result in a decrease in interest expense, while an increase in the discount rate will result in an increase in interest expense.

Non-current service costs are shown below in Table 5G-15.

Table 5G-15 Non-Current Service Costs

	F2019 RRA			F2020 Plan			F2021 Plan		
($ million)	**Pension Benefit**	**OPEB**	**Total**	**Pension Benefit**	**OPEB**	**Total**	**Pension Benefit**	**OPEB**	**Total**
Plan Income	(235.8)	N/A	(235.8)	(256.9)	N/A	(256.9)	(268.2)	N/A	(268.2)
Interest Expense	200.6	24.3	224.9	210.1	13.6	223.7	217.8	13.7	231.5
Total	(35.2)	24.3	(10.9)	(46.8)	13.6	(33.2)	(50.4)	13.7	(36.7)

Plan income and interest expense costs are separated into the portion related to the BC Hydro registered pension plan and the portion related to other post-employment benefit plans which includes post-retirement medical, extended health, dental benefits and the supplemental pension plan. Other post-employment benefit plans do not have plan income as they are unfunded plans and therefore have no assets in which to earn income.

Non-current service costs are included in finance charges, as shown in Appendix A, Schedule 8.0, line 17.

List of Tables

6.1 Introduction

This chapter explains BC Hydro's capital planning and delivery processes as well as our planned capital expenditures and additions in fiscal 2020 and fiscal 2021. Capital "additions" are the capital investments that are affecting rates during the test period, which occur when the capital assets enter service. Capital "expenditures" reported in this chapter represent spending incurred on capital assets that will not affect rates until the capital assets enter service.

The capital forecasts in this chapter are derived from the fiscal 2020 to fiscal 2024 Capital Plan (**Capital Plan**) that BC Hydro finalized in October 2018. The Capital Plan supported the Comprehensive Review and contains investment-level detail for fiscal 2020 to fiscal 2024, and a high-level investment projection for fiscal 2025 to fiscal 2029.

BC Hydro has well-established and well-performing practices for the planning and delivery of capital investments. In December 2018, the Office of the Auditor General of B.C. released an independent audit of Capital Asset Management in BC Hydro. The audit found that BC Hydro has good asset management practices as a result of a decade-long plan and associated efforts and had no recommendations for improvement. This audit is included as Appendix F. In 2016, BC Hydro completed its second Organizational Project Management Maturity Model Assessment and placed in the top-tier of participating organizations from around the world. Also in 2016, BC Hydro received the Project Management Office of the Year Award from the Project Management Institute, recognizing superior organizational project management capabilities.

A key metric to evaluate BC Hydro's performance in the delivery of capital projects is to compare the actual project costs for in-service projects to the original approved expected cost, over an aggregated five-year period. Projects included in this metric for the five-year period of fiscal 2014 to fiscal 2018, had an aggregate original approved expected cost of $6.936 billion. The actual aggregate costs for these projects were $27.9 million (or 0.40 per cent) over the original approved expected cost. Since 2014 when BC Hydro began measuring its capital delivery performance with a five-year aggregate, it has ranged from -4.75 per cent to +0.40 per cent of the original approved expected cost.

Planned capital expenditures and additions in fiscal 2020 and fiscal 2021 are lower than the fiscal 2017 to fiscal 2019 period[285] due to the completion of major projects such as the John Hart Generating Station Replacement project.

This chapter is organized around the following key points:

- Section 6.2 explains how the information provided in this application is aligned with BC Hydro's Revised Proposal filed on June 13, 2018 in the Capital Expenditures and Projects Review proceeding. It also identifies how BC Hydro has responded to the BCUC's Decision on our Previous Application;
- Section 6.3 describes our four-step Enterprise Capital Planning Process which balances affordability and system performance. It explains how this process was applied to create the Capital Plan that forms the basis of the capital investment information in this application;
- Section 6.4 describes how our Power System capital investments, which includes Generation, Transmission and Distribution Assets, are appropriately planned, delivered and forecast for the test period. The section describes the nature of the assets, the bottom-up planning processes, the delivery processes, and provides the forecast capital expenditures and additions; and
- Sections 6.5 through 6.9 describe our Technology, Properties, Fleet and Business Support and other capital investments including the nature of these investments and how they are appropriately planned, delivered and forecast for the test period.

[285] Based on average annual amounts and excluding the Site C Project and BC Hydro's acquisition of Teck Resources Ltd.'s two-thirds interest in the Waneta generation facility.

6.1.1 Capital Appendices in the Application

In this application, BC Hydro has made efforts to provide additional information on planned capital investments, to improve the presentation of that information and to provide the BCUC with additional comfort around our planning and delivery processes. To that end, the information in this chapter is supplemented by the following capital-related information in the appendices of this application:

- Appendix A, Schedule 13 compares planned and actual capital expenditures and additions for fiscal 2017 to fiscal 2018, planned and forecast capital expenditures and additions for fiscal 2019 and planned capital expenditures and additions for fiscal 2020 and fiscal 2021;
- Appendix F provides the Office of the Auditor General of B.C. Report, titled Independent Audit of Capital Asset Management in BC Hydro. This report, which was published in December 2018 found that BC Hydro is managing its assets well, with appropriate information, practices, processes and systems and had no recommendations for improvement;
- Appendix G, section 5 provides explanations of material variances between planned and actual capital expenditures and additions for fiscal 2017 and fiscal 2018. As discussed in the appendix, variances are generally due to the timing of project cash flows or changes in project schedule;
- Appendix H provides BC Hydro's Capital Plan with an outline of major investments, related risks, and opportunities. It provides an overview of the capital investments that BC Hydro expects to undertake in the test period, within the context of BC Hydro's Capital Plan for the next five years (fiscal 2020 to fiscal 2024);[286]

[286] In this application, the Capital Plan provides investment-level details for the fiscal 2020 to fiscal 2024 period, and a high level investment projection for the fiscal 2025 to fiscal 2029 period. Detailed capital investment requirements beyond fiscal 2024 will be informed by future initiatives, including BC Hydro's next Integrated Resource Plan (**IRP**). The first two years of planned capital expenditures and additions contained within the Capital Plan form the basis for the capital-related evidence contained within this application.

- Appendix I provides capital investment information for projects that are greater than $2 million for technology or greater than $5 million for other projects, with planned capital expenditures or additions in the test period. In this application BC Hydro has provided additional project related information, consistent with BC Hydro's Revised Proposal filed on June 13, 2018 in the Capital Expenditures and Projects Review proceeding;
- Appendix J provides capital project descriptions for 75 projects and programs of projects with planned total capital expenditures greater than $20 million, with planned capital expenditures or additions in the test period. This information includes a project description, key drivers, issues addressed by the project, and where relevant, a discussion of project alternatives, implementation risks and risk treatment;
- Appendix K provides summaries of Strategies, Plans, and Studies. These documents are developed to seek solutions to invest effectively in the Power System and related infrastructure. These Strategies, Plans, and Studies investigate and/or recommend broader regional, system, or business unit solutions or policies. The summaries provided in Appendix K provide context for the projects listed in Appendix I;
- Appendix L provides BC Hydro's Technology Strategy and Five-Year Plan. This document provides guidance and direction for BC Hydro's future technology investments to manage compliance and security, manage risk and sustain productivity, and enhance business capability. The Plan is evolving and is updated annually;
- Appendix M provides asset health indices for BC Hydro's generation assets. Compared to the Previous Application, the asset health has improved for Key generation facilities, remained variable for Strategic facilities and reduced for Available Energy facilities; and

- Appendix N provides asset health indices for BC Hydro's transmission and distribution assets. The asset health indices indicate that approximately 55 per cent of transmission and distribution assets are in Good or Very Good condition, 35 per cent are in Satisfactory condition and 10 per cent are in Poor or Very Poor condition. It is expected that a certain portion of assets will be in Poor or Very Poor condition at any point in time.

6.1.2 Summary of BC Hydro's Actual and Planned Capital Expenditures and Additions

BC Hydro's actual and planned capital expenditures and additions for fiscal 2017 to fiscal 2021 are provided in Table 6-1 and Table 6-2 below.[287] As shown in these tables:

- Planned capital expenditures and additions in fiscal 2020 and fiscal 2021 are lower than the fiscal 2017 to fiscal 2019 period; and
- BC Hydro's actual capital expenditures and additions in fiscal 2017 and fiscal 2018, as well as forecast capital expenditures and additions in fiscal 2019, are generally expected to be within 5 per cent of planned amounts.[288]

[287] The forecasts for the capital projects and programs included in the fiscal 2020-fiscal 2021 Capital Plan shown in Table 6-1 and Table 6-2 are based on capital project estimates developed as part of the capital planning process. For capital projects that were in progress as of April 1, 2018, the project forecast information reflected in the Application is current as of that date but information for certain projects in progress has been updated for significant events subsequent to this date. As discussed in section 6.4.7.5 to 6.4.7.8, project cost estimates will have different degrees of accuracy depending on the lifecycle phase of the capital project and the project's stage within each phase.

[288] Based on average annual amounts and excluding the Site C Project and BC Hydro's acquisition of Teck Resources Ltd.'s two-thirds interest in the Waneta generation facility. The Site C Project is excluded from this assessment because it is an exempt project and is planned and managed by a separate Business Group within BC Hydro. The Waneta acquisition is excluded because the acquisition opportunity arose after BC Hydro's fiscal 2019 Revenue Requirements Application plan was prepared. Detailed variance explanations for fiscal 2017 and fiscal 2018 are included in Appendix G, section 5.

Table 6-1 BC Hydro Actual and Planned Growth and Sustaining Capital Expenditures Fiscal 2017 to Fiscal 2021[289]

($ millions)	F2017		F2018		F2019	F2019	F2020	F2021

Distribution								
Growth	189.8	232.7	241.6	232.2	229.0	305.2	306.9	344.2
Sustaining	182.3	188.3	157.7	213.3	184.0	222.3	195.3	196.5
Total Distribution (Schedule 13, Line 16)	372.1	421.0	399.3	445.5	413.0	527.5	502.2	540.7
Business Support								
Technology (Schedule 13, Line 18)	81.6	81.6	91.1	97.2	112.6	67.1	147.6	75.5
Properties (Schedule 13, Line 19)	68.3	54.8	118.2	126.9	25.5	28.7	39.9	55.6
Fleet / Other (Schedule 13, Line 20)	210.3	85.6	54.5	59.4	45.7	69.8	64.9	71.3
Total	1,737.6	1,468.5	1,489.8	1,543.8	2,387.8	3,749.4	1,391.0	1,459.1
Less: Contribution in Aid	(90.1)	(103.6)	(88.0)	(129.5)	(84.6)	(148.5)	(146.1)	(165.8)
TOTAL	1,647.5	1,364.9	1,401.8	1,414.3	2,303.2	3,600.8	1,244.9	1,293.2

BC Hydro's capital investments generally fall into two broad categories - sustaining and growth:

- Sustaining investments will address reliability, asset condition, regulatory, safety, security and environmental risks, issues and opportunities associated with existing assets. Sustaining investments also include all business support expenditures such as those related to Property, Technology and Fleet assets; and
- Growth projects will help meet load and system growth through the addition of system capacity and by connecting new electricity supply. Growth expenditures and additions include BC Hydro's acquisition of Teck Resources Ltd.'s

290 Variances between actual and Revenue Requirements Application Plan capital additions for fiscal 2017 and fiscal 2018 are discussed in Appendix G, section 5.

291 The fiscal 2019 forecast amount of $(1.3) million in Generation Growth relates to the return to stock of materials that were not required for a project.

two-thirds interest in the Waneta generation facility and the Site C Project expenditures, which have been individually identified in Table 6-1 and Table 6-2.

Planned capital expenditures and additions in fiscal 2020 and fiscal 2021 are lower than the fiscal 2017 to fiscal 2019 period[292] due to the completion of major projects such as the John Hart Generating Station Replacement project.

As discussed in Chapter 7, section 7.8.2, any differences between the forecast and actual amortization of capital additions are captured in the Amortization of Capital Additions Regulatory Account. This means that the actual amount recovered from ratepayers is ultimately based on the actual capital additions.

BC Hydro's actual capital expenditures and additions in fiscal 2017 and fiscal 2018, as well as forecast capital expenditures and additions in fiscal 2019 are generally expected to be within 5 per cent of planned amounts.[292] Detailed variance explanations for fiscal 2017 and fiscal 2018 are included in Appendix G, section 5.

6.2 The Application Provides Additional Information and Reflects the BCUC's Decision

This section identifies how BC Hydro has responded to the BCUC's recommendations on capital investments in its Decision on our Previous Application. It also explains how the information provided in this application is aligned with BC Hydro's revised proposal to the BCUC's Review of the Regulatory Oversight of Capital Expenditures and Projects proceeding.

[292] Based on average annual amounts and excluding the Site C Project and BC Hydro's acquisition of Teck Resources Ltd.'s two-thirds interest in the Waneta generation facility.

6.2.1 We Have Performed Well in the Planning and Delivery of Large Capital Projects

In the Previous Application, BC Hydro discussed its strong track record in delivering the overall capital portfolio on budget. From fiscal 2012 to fiscal 2016, projects were delivered 0.18 per cent under budget in aggregate.

In its Decision on the Previous Application, the BCUC recommended that the adequacy of BC Hydro's planning and execution related to large capital projects be explored.[293] In the sections below, we describe how BC Hydro's project management processes have been endorsed by independent third-parties and provide statistics that demonstrate that BC Hydro's performance on large projects is similarly strong.

6.2.1.1 Independent Third-Parties Have Endorsed BC Hydro's Project Management Processes

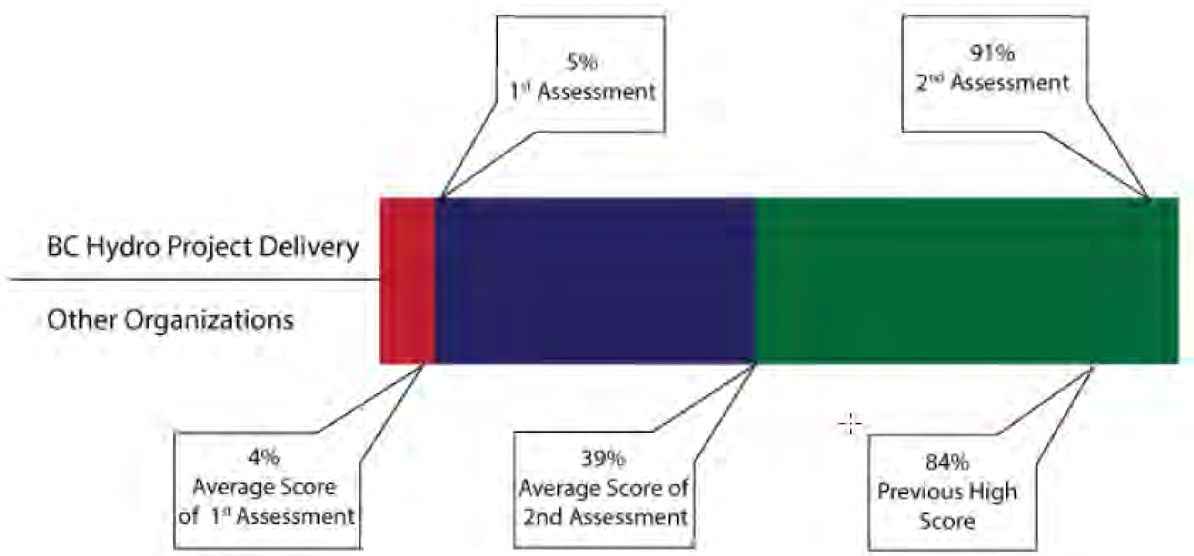
BC Hydro has well-established and well-performing practices for the planning and delivery of capital investments. These practices have recently been recognized and endorsed by the following independent bodies:

- In December 2018, the Office of the Auditor General of B.C. released an independent audit of Capital Asset Management in BC Hydro. The audit found that BC Hydro has good asset management practices as a result of a decade-long plan and associated efforts, with no recommendations for improvement. On page 17 of the report the Auditor General stated: *"BC Hydro has a generally advanced level of maturity in asset management. Its success in this regard is a result of concerted effort over several years by a set of skilled professionals focused on ensuring that a reliable source of electrical power will be supported by a mature asset management practice."* This audit is included as Appendix F.

[293] The BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 45.

- In 2016, BC Hydro completed its second Organizational Project Management Maturity Model Assessment, receiving the highest score among approximately 50 participating organizations from around the world. BC Hydro received a score of 91 per cent, which represents a significant increase in maturity from our first assessment in 2010. This is shown in Figure 6-1 below.

Figure 6-1 Project Delivery Organizational Project Management Maturity Model 2016 Assessment



- Also in 2016, BC Hydro received the Project Management Office of the Year Award from the Project Management Institute, competing against finalists Entel S.A. and Parker Aerospace. The Project Management Institute was founded in 1969 and matures the profession of project management through globally recognized standards, certifications, resources, tools, academic research, publications, professional development courses and networking opportunities.

6.2.1.2 BC Hydro Has Delivered $6.9 Billion of Projects Within 0.4 per cent of Budget

A key metric that we use to evaluate our performance in the delivery of capital projects is to compare the actual project costs for in-service projects to the Original Approved Expected Cost, over an aggregated five-year period. On this metric, we perform very well.

This performance measure is included in BC Hydro's Service Plan, with a target of actual costs falling within +5 per cent to -5 per cent of the original approved expected cost (First Full Funding) in aggregate, excluding project reserve amounts. This metric is calculated using the results of all Generation and Transmission projects as well as major Distribution and Properties projects.

Projects included in this metric for the five-year period of fiscal 2014 to fiscal 2018 had an aggregate original approved expected cost of $6.936 billion. The actual aggregate costs for these projects were $27.9 million (or 0.40 per cent) over the Original Approved Expected Cost. Table 6-3 below summarizes the aggregate results over the past five years.

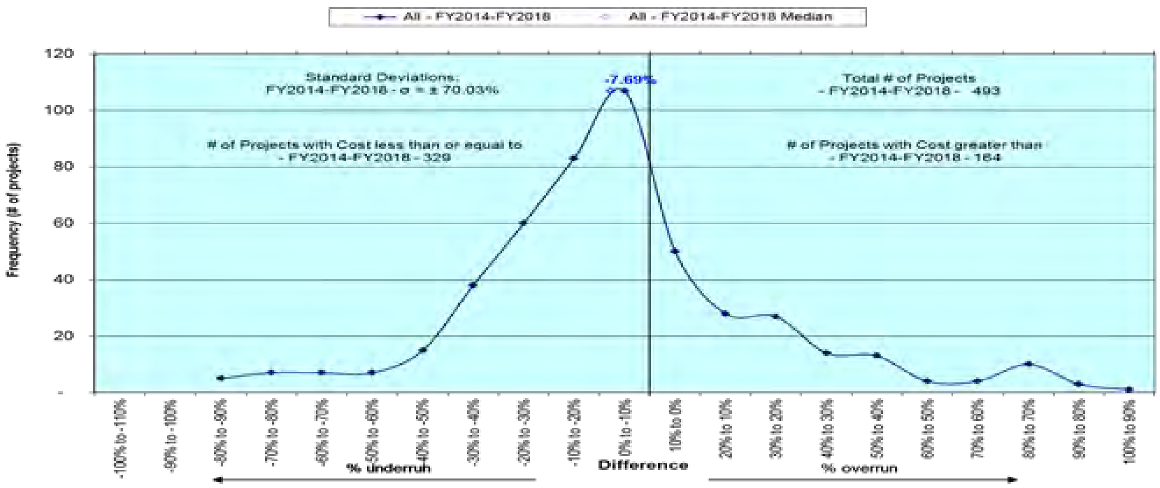
Table 6-3 Five-Year Aggregate Project First Full Funding to Actual Cost (2010 to 2018)

	Capital Infrastructure Project Delivery Project Budget to Actual Cost (2010 - 2018)				
	F2010-F2014	F2011-F2015	F2012-F2016	F2013-F2017	F2014-F2018
# of Projects	661	563	563	540	493
Original Aggregate Budget ($ millions)	3,330	3,924	6,491	6,363	6,936
Actual Aggregate Cost ($ millions)	3,184	3,852	6,479	6,303	6,963
Aggregate Cost Variance ($ millions)	-146.2	-71.8	-12.0	-59.9	27.9
% variance from original budget	-4.39	-1.83	-0.18	-0.94	0.40

Of the 493 projects included in this analysis, 66.5 per cent had an Actual Cost that was less than the original approved expected cost. The median project was 7.7 per cent below the Original Approved Expected Cost.

Figure 6-2 below provides a visual summary of the performance of all 493 projects against the Original Approved Expected Cost.

Figure 6-2 Summary of Actual Cost to Original Approved Expected Cost



6.2.1.3 BC Hydro Performed Well Across Projects of All Sizes, Including Large Projects

The data on completed projects shows that BC Hydro has performed well across projects of all sizes, including large projects. From fiscal 2014 to fiscal 2018, the average variance between the Expected Cost and Actual Cost is:[294]

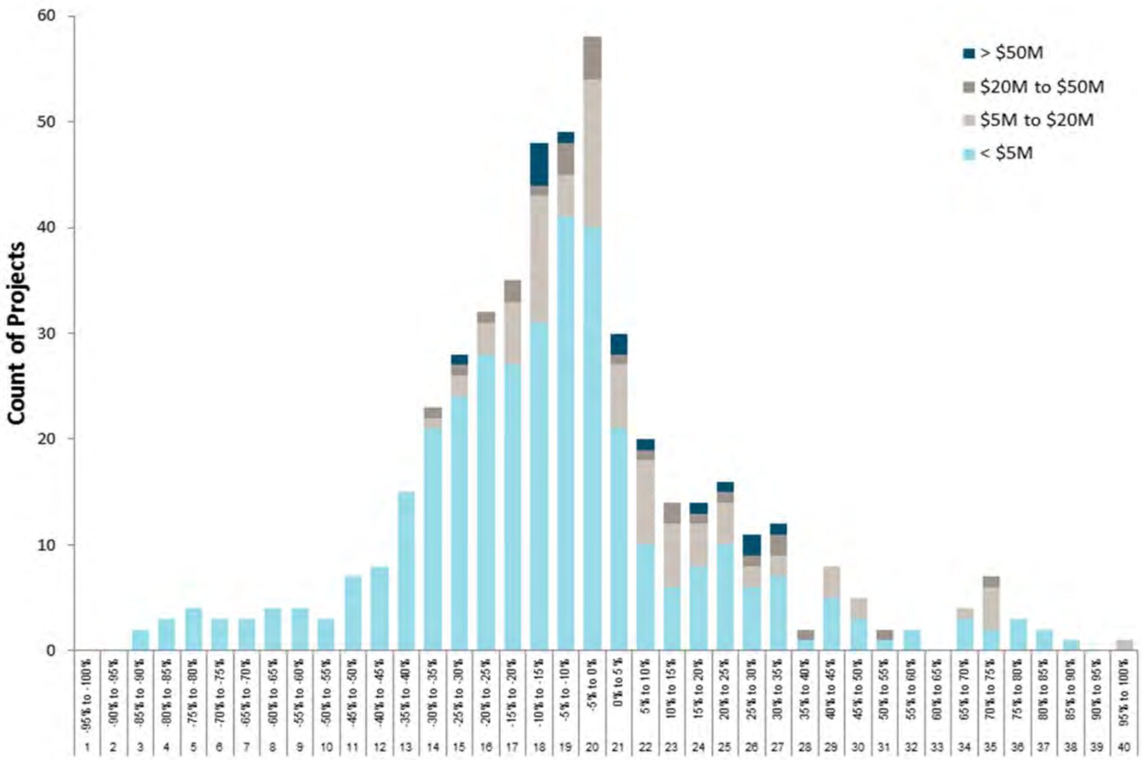
- 1.20 per cent for projects greater than $50 million;
- 0.27 per cent for projects between $20 million and $50 million;
- 2.83 per cent for projects between $5 million and $20 million; and
- -9.82 per cent for projects less than $5 million.

Figure 6-3 below illustrates the distribution of completed projects managed by the Project Delivery KBU within different cost ranges[295] from fiscal 2014 to fiscal 2018.

[294] Based on the most recent Estimate at Completion (**EAC**) amount.

This chart demonstrates that on average, projects fall well within the +15 per cent to -10 per cent preliminary design estimate range, across all four project cost categories, including large projects. Further information on project cost estimate ranges is provided in sections 6.4.7.5 to 6.4.7.8.

Figure 6-3 In-Service Projects (Expected Cost vs Actual Cost) – Fiscal 2014 to Fiscal 2018[296]



The following table provides further information on projects greater than $50 million.

[295] The project categories shown in Figure 6-3 are greater than $50 million EAC (14 projects), between $20 million and $50 million EAC (25 projects), between $5 million and $20 million EAC (87 projects), and less than $5 million EAC (367 projects).

[296] Ten projects had a variance that exceeded 100 per cent and do not appear on the chart. The total EAC for the ten projects is $24.8 million and the total variance was $14.9 million.

Table 6-4 Original Approved Expected Cost vs. Estimate at Completion - Projects Greater Than $50 million (Fiscal 2014 to Fiscal 2018)

Project Title	Original Approved Expected Cost ($000)	Estimate at Completion (EAC) ($000)	Variance ($000)	Variance (%)
GMS G1-5 Turbine Rehabilitation	246,704	183,000	(63,704)	(26)
Mica Unit 5 and Unit 6	700,000	601,385	(98,615)	(14)
Vancouver City Central Transmission	201,000	173,438	(27,562)	(14)
Ruskin Dam and Powerhouse Upgrade[297]	718,036	636,348	(81,688)	(11)
Iskut Extension	126,828	113,300	(13,528)	(11)
Smart Metering Infrastructure	840,000	780,000	(60,000)	(7)

In fiscal 2018, BC Hydro completed a total of 58 projects with a total Original Expected Cost of $1.1663 billion and an actual cost of $1.0746 billion, resulting in a favourable variance of $91.6 million (7.8 per cent).

6.2.1.4 A Number of Improvements in Project Delivery Have Been Introduced

Over the past several years, BC Hydro has implemented a number of improvements to the delivery of its capital projects. Further information on these improvements is provided in section 6.4.11.

297 The numbers in this table are different from the numbers in the Ruskin Compliance reports because those reports exclude Implementation Phase capital overhead.

6.2.2 Capital Investment Information In This Application is Aligned with BC Hydro's Capital Expenditures and Projects Review Proposal

On June 13, 2018, BC Hydro filed its Revised Proposal in the Capital Expenditures and Projects Review proceeding. The BCUC established that proceeding to examine how the BCUC reviews BC Hydro's capital expenditures and projects. While that proceeding is ongoing, the information provided in this application reflects BC Hydro's Revised Proposal, which includes additional information to address concerns identified in the scope of that proceeding. Table 6-5 below provides an overview of where this information can be found.

Table 6-5 Capital Related Information Provided in the Fiscal 2020 to Fiscal 2021 Revenue Requirements Application

Information Included Consistent with BC Hydro's Proposal	Location
(a) The project's unique planning identification number;	Appendix I Column A
(b) The project's driver;	Appendix J
(c) The project's lifecycle stage or phase;[298]	Appendix I Column D
(d) Key project milestone dates;	Appendix I Columns E, F, G
(e) Project forecast capital additions and expenditures;	Appendix I Columns M, N, O and Q, R, S
(f) An indication of whether a project will be subject to a CPCN or expenditure schedule application;	Appendix I Column U
(g) An indication whether a project is an extension;	Appendix I Column T
(h) If applicable, an indication of which strategies, plans, or studies a project is linked to;	Appendix I Column W
(i) Summaries of the strategies, plans, or studies identified in (h) above;	Appendix K
(j) If applicable, an indication of which projects are part of a Program of Projects;	Appendix I Column X
(k) Description, objectives, scope, schedule, risk and mitigation strategies, and, if available, cost estimates for the programs identified in (j) above.	Appendix J

298 The project's lifecycle stage or phase is referred to as the "Development Stage" in Appendix I.

6.2.3 The Application Provides Additional Information on Technology Investments

This Application also provides additional information on Technology investments in response to the BCUC's comments in its Decision on the Previous Application.

6.2.3.1 Technology Strategy and Five-Year Plan Outline the Supporting Analysis for Technology Investments

In its Decision, the BCUC stated that it was unclear on the types of analysis performed by BC Hydro to support its technology investments. BC Hydro's Technology Strategy and Five-Year Plan (Appendix L) describes the analysis performed to support technology investments, including working with business group leaders and technology teams to move from the current state of technology toward desired business outcomes via an achievable capital portfolio plan. The Technology capital expenditures and additions in the test period have been organized by investment driver categories and are presented in section 6.5.2.

6.2.3.2 BC Hydro Has Implemented a New Benefits Realization Process

The BCUC also stated it was unable to assess how technology investments would result in quantifiable efficiencies and cost savings.[299] BC Hydro has implemented a benefits realization process for technology projects which is described further in section 6.5.5. This process is in place so that:

- Benefits claimed in business cases are realized once projects are in service; and
- Ownership for benefits included in technology project business cases extends beyond project completion.

299 The BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 34.

6.3 BC Hydro's Capital Investment Planning Process

This section describes BC Hydro's enterprise wide capital planning process for capital investments and how this process was applied to create the Capital Plan that forms the basis for the capital-related evidence contained in this application. BC Hydro has planning and governance processes in place across the organization so that the capital investments required to sustain, expand and operate its assets appropriately balance affordability and system performance.

This section is organized around the following points:

- Section 6.3.1: BC Hydro's Enterprise Capital Planning Process facilitates the use of a common approach to planning, prioritizing and governing investments across the company.
- Section 6.3.2: BC Hydro's Executive Team sets the strategic direction and priorities for the annual capital planning process.
- Section 6.3.3: A bottom up planning process is used for each of the asset categories.
- Section 6.3.4: BC Hydro uses a collaborative approach to review the capital portfolios across the enterprise and to develop the Capital Plan.
- Section 6.3.5: BC Hydro has robust processes for the governance, oversight and ongoing management of the Capital Plan.

6.3.1 The Enterprise Capital Planning Process Facilitates a Common Approach Across the Company

In 2017, BC Hydro established an Enterprise Capital Planning Working Group. The purpose of the Enterprise Capital Planning Working Group is to apply a common approach to planning, prioritizing and governing investments across the company.

6.3.1.1 There is Now a Dedicated Working Group With Responsibility for Planning Approach

The Enterprise Capital Planning Working Group includes representatives of all of the KBUs with responsibility for capital investment: Dam Safety, Stations Asset Planning, Lines Asset Planning, Energy Planning and Analytics, Properties, Technology, Finance KBUs, as well as the Fleet department of the Supply Chain KBU.

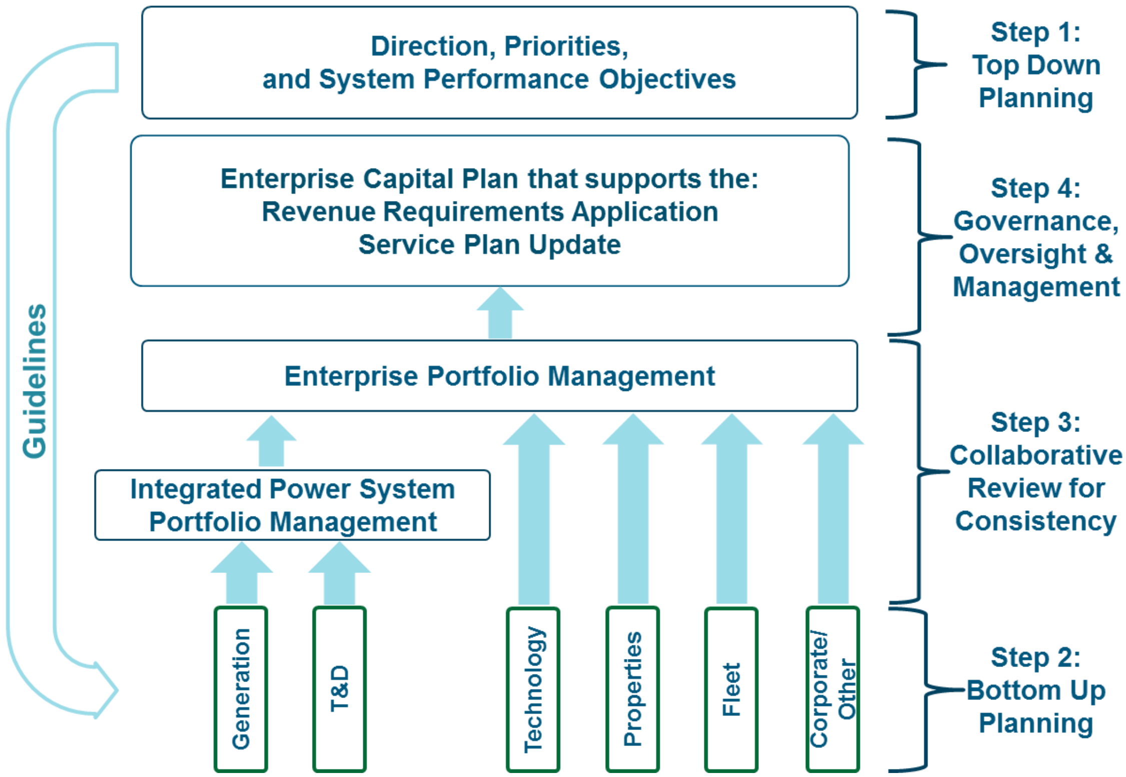
BC Hydro must be flexible and responsive to the investment needs of the system. The Enterprise Capital Planning Working Group manages the annual capital planning process so that the Capital Plan is updated and prioritized to respond to the latest information on the system risks and needs.

6.3.1.2 The Capital Planning Process and Deliverables Are Clearly Articulated

The enterprise wide capital planning process that is overseen by the Enterprise Capital Planning Working Group is clearly defined and the deliverables are well understood by the relevant areas of the business.

Figure 6-4 below provides a simplified depiction of our capital planning process and identifies major outcomes and deliverables of the process. Each step of the process is described in the following sections.

Figure 6-4 Annual Enterprise Capital Planning Process

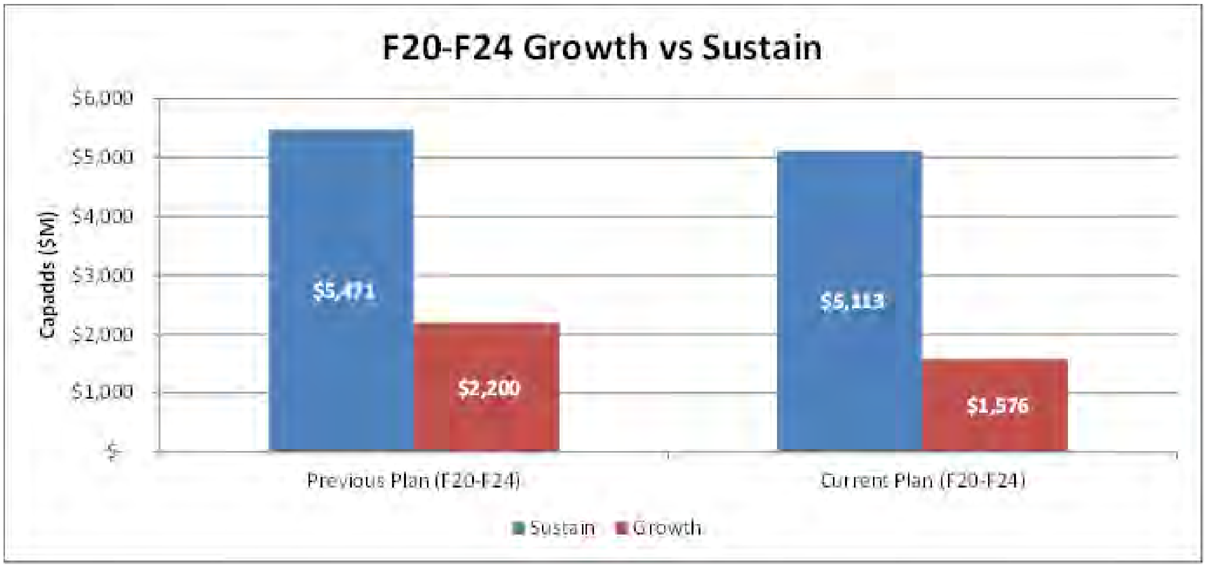


6.3.2 Step 1 - Load Forecast and System Performance Trends Inform Capital Investment Levels

A key element of the annual enterprise capital planning process is the direction provided by the Executive Team on long-term capital investment levels. In providing this direction the Executive Team considers BC Hydro's capital investment needs while balancing affordability, system performance and the need to continue to safely manage our assets. For the planning cycle that informed this application, the Executive Team direction on long-term capital investment levels considered recent trends in forecast load and system performance.

In the following sections, we describe how these trends informed the Capital Plan in this application. Figure 6-5 below illustrates the outcome of this process for the overall level of planned capital additions in the fiscal 2020 to fiscal 2024 period.

Figure 6-5 Comparison of Fiscal 2020 to Fiscal 2024 Planned Capital Additions



6.3.2.1 The Recent Moderation of Forecast Load Growth Allows Moderation of Growth Capital Investment

As discussed in Chapter 3, the demand for electricity is growing at a more moderate rate than previously anticipated. This means that the timing of some planned investments to expand BC Hydro's system has changed and may not be required within the next ten years.

6.3.2.2 Investment in Sustainment Can Be Moderated Due to Strong System Performance

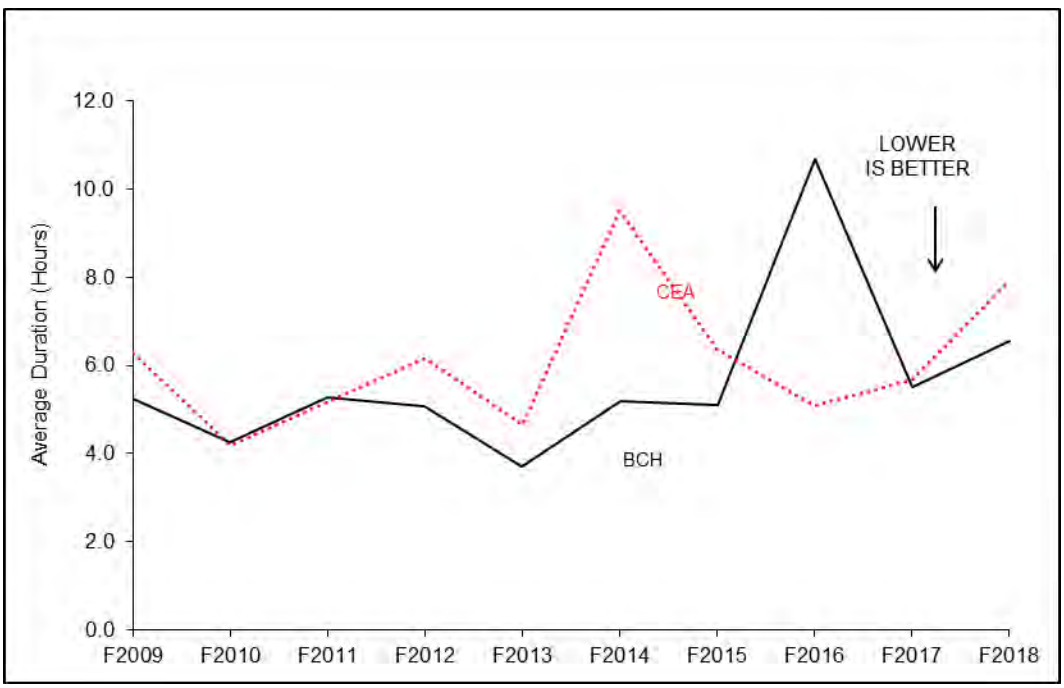
BC Hydro's fiscal 2019 to fiscal 2028 Capital Plan (Previous Capital Plan) had included an increasing level of sustaining expenditures over the ten-year period, primarily driven by the aging system assets and the expected rate of replacement required to maintain system performance.

In recent years, BC Hydro has made significant investments to maintain and, in some areas, improve the Power System. However, over time, the condition of some of the Power System assets has degraded. To this point in time, this degradation has not resulted in a corresponding decline in system performance or customer reliability as measured by two industry-standard metrics. The consistently high level of performance has allowed us to moderate the planned investment in sustainment in the interest of mitigating impacts on customers.

System Average Interruption Duration Index (**SAIDI**) and the System Average Interruption Frequency Index (**SAIFI**) measure the duration and frequency of customer interruptions. BC Hydro tracks these metrics on an ongoing basis. Our performance on SAIDI and SAIFI metrics is also compared regularly with utility industry peers by the Canadian Electricity Association (**CEA**).

Figure 6-6 below shows that in the past decade BC Hydro's unadjusted system average duration ("all-events" SAIDI) trend has performed as good as or better than the CEA composite,[300] with the exception of fiscal 2016 due to the August 2015 summer wind storm.

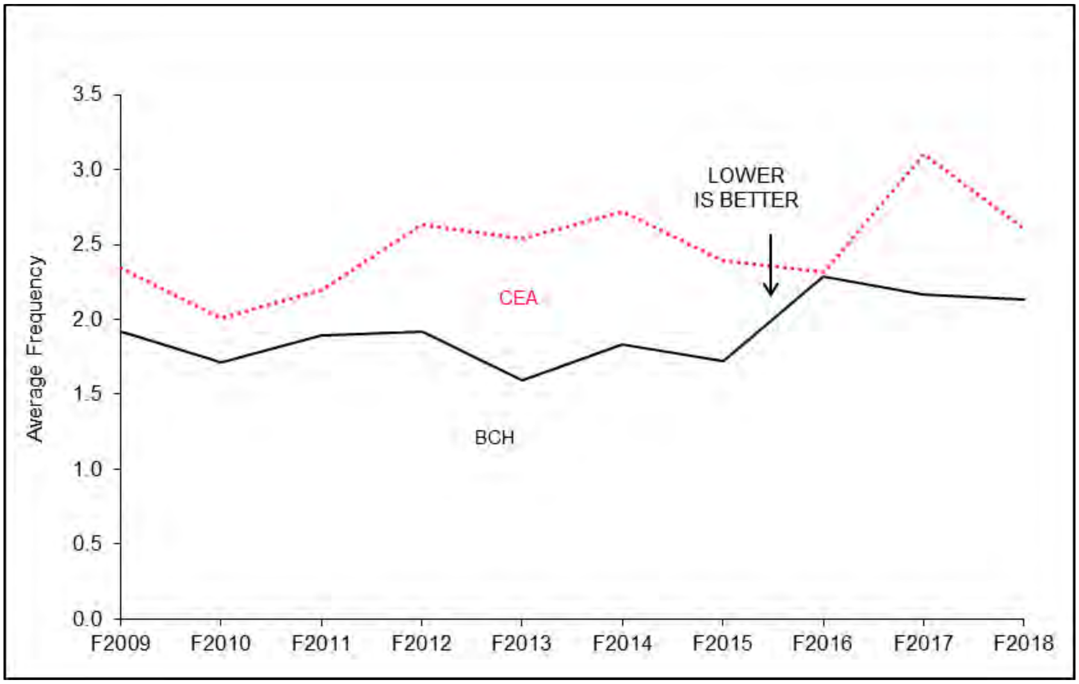
Figure 6-6 SAIDI (All Events, Not Normalized) – Average Interruption Duration per Average Customer



[300] BC Hydro is included in the CEA composite.

In addition, as shown in Figure 6-7 below, BC Hydro's unadjusted system average frequency ("all-events" SAIFI) trend has consistently out-performed the CEA SAIFI composite.

Figure 6-7 SAIFI (All Events, Not Normalized) – Average Number of Interruptions per Average Customer



As shown in Figure 6-8 below, when outage impact related to uncontrollable major weather events are removed, normalized SAIDI, which measures the total outage duration with storm impact adjustments, experienced by an average customer in a year, was 3.28 hours in fiscal 2017, and further improved to 3.07 hours in fiscal 2018.

Figure 6-8 SAIDI (Normalized)

	F2009	F2010	F2011	F2012	F2013	F2014	F2015	F2016	F2017	F2018
Historical SAIDI	4.12	3.47	3.28	3.59	2.82	3.69	3.06	3.01	3.28	3.07
Historical Targets	2.82	2.73	2.62	3.52	3.52	3.34	3.15	3.22	3.22	3.30

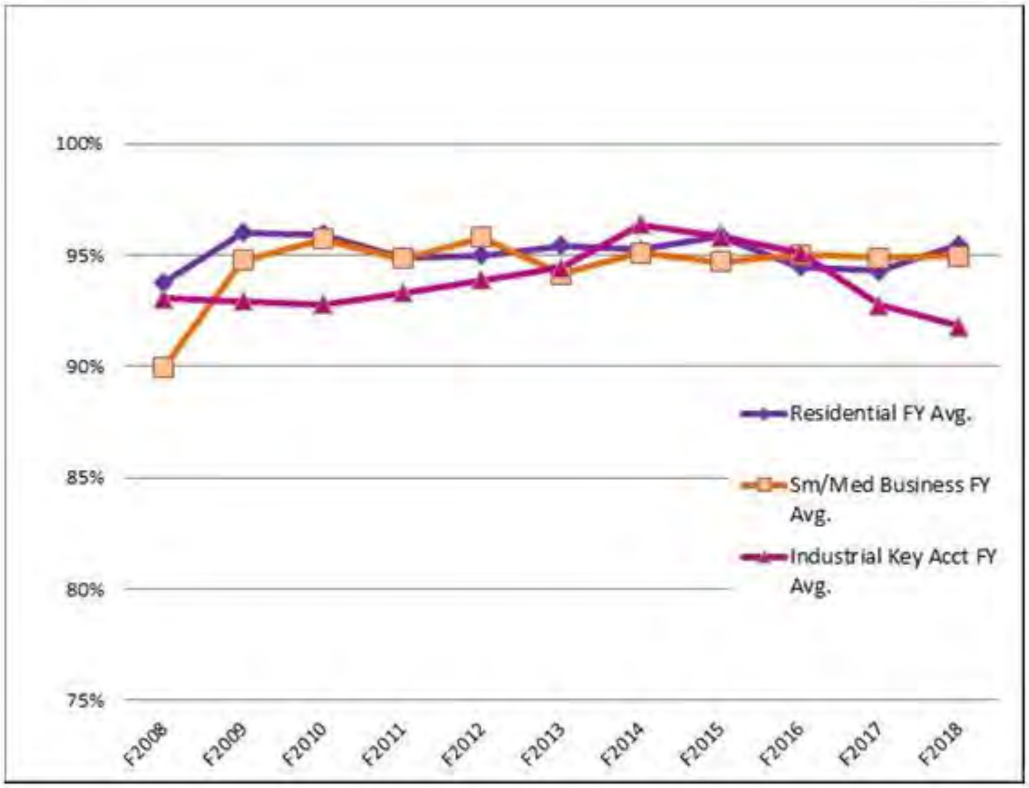
As shown in Figure 6-9 below, normalized SAIFI, which measures the number of sustained disruptions per year excluding major events, was 1.59 disruptions in fiscal 2017, and 1.51 disruptions in fiscal 2018.

Figure 6-9 SAIFI (Normalized)

	F2009	F2010	F2011	F2012	F2013	F2014	F2015	F2016	F2017	F2018
Historical SAIFI	1.67	1.52	1.49	1.58	1.29	1.57	1.30	1.48	1.59	1.51
Historical Targets	1.31	1.27	1.22	1.50	1.50	1.45	1.40	1.40	1.40	1.40

In addition, the reliability scores in BC Hydro's Customer Satisfaction Index indicate that customers continue to be satisfied with the level of reliability they are receiving. This is shown in Figure 6-10 below.

Figure 6-10 Customer Satisfaction Index on Reliability



Lastly, asset-related safety incidents on the transmission and distribution system have declined. This indicates that BC Hydro's investment plans are addressing safety-related risks on the system.

The consistently high level of historic system performance described above presented an opportunity to reconsider the appropriate level of sustaining expenditures. Specifically, for this Capital Plan, BC Hydro considered, at the portfolio level, how to moderate the level of planned sustaining investments, without materially impacting system performance.

As a result of this analysis, the overall portfolio level of sustainment expenditures over the ten-year period was reduced, relative to previously planned amounts. These reductions are targeted as follows:

- **Reductions focused on the last five years**: The majority of the impact was in the last five years of the Capital Plan period (fiscal 2025 to fiscal 2029). Relative to the Previous Capital Plan, expenditures during the first five years of the Capital Plan were relatively unchanged by these planning decisions. Investments in the early years of the Capital Plan were mostly underway and were considered appropriate to continue.
- **Dam safety spending is preserved:** Despite the overall reduction of capital expenditures, Dam Safety investments have not been reduced in response to these planning decisions. Dam Safety risk reduction targets remain consistent with previous capital plans and with the approach approved by the BC Hydro Board of Directors in 2014 to “manage the whole fleet of dams so that there is no significant deterioration in the risk position and that the overall level of risk is kept well within the limits considered to be tolerable.”

6.3.2.3 Reduced Investment Must Be Accompanied by Monitoring of Load Forecasts, Asset Condition and Performance

BC Hydro recognizes that the planned reduction in sustainment expenditures relative to the previous plan must be accompanied by careful monitoring of asset condition and performance. Our objective is to implement the reduction without compromising long-term performance of key assets.

The impact on asset health is expected to vary across the system:

- As explained further in section 6.4.1.2, BC Hydro’s generation facilities are categorized as “Key”, “Strategic” or “Available” according to the significance of the facility to BC Hydro’s system. Under the Capital Plan, the condition of BC Hydro’s “Key” and “Strategic” generation facilities is expected to improve. For example, investments are planned for the G.M. Shrum, Mica, Bridge River and Cheakamus facilities; and
- The recent trend of asset health degradation within some parts of the Power System is expected to continue at this level of capital investment. For example,

over the next five years, the percentage of substation assets in Poor and Very Poor condition is expected to increase from 16 per cent to 19 per cent and the percentage of distribution assets in Poor and Very Poor condition is expected to increase slightly from 13 per cent to 14 per cent. The condition of the assets within BC Hydro's "Available" generation facilities, which provide less than 1 per cent of BC Hydro's annual energy, are expected to continue to deteriorate.

The linkage between asset health and reliability is complex. For example, most of BC Hydro's substations have built in redundancy so that the failure of a single asset will not result in a customer outage. In addition, the installation of automated devices, such as circuit re-closers, on BC Hydro's distribution system, has mitigated the risk of declining reliability from deteriorating asset health. BC Hydro continues to refine the appropriate balance between asset life, system performance and affordability and believes that this reduction in sustainment expenditures will provide more value to both current and future customers.

BC Hydro monitors system performance and forecast demand for electricity at both a system and regional level. Changes in system performance and load forecasts are likely to materialize over time, rather than suddenly. If system performance were to decline or if forecast demand were to change, BC Hydro has options to respond, including:

- Adjusting the level of asset condition driven replacements by redirecting funding from other parts of the BC Hydro capital investment portfolio;
- Updating operational or maintenance practices; and
- Bringing forward investments through our ex-plan governance process, which is described in section 6.3.5.

Overall, based on forecast load growth and system performance, BC Hydro believes that the balance reflected in the planned level of capital investment from fiscal 2020 to fiscal 2024 is appropriate.

6.3.3 Step 2 - Each Asset Category Uses Bottom-Up Planning Processes

Once the long-term capital investment levels have been established, preliminary financial targets are developed for each of the asset categories considering the factors discussed in the previous section as well as the historical composition of the capital plan. These preliminary financial targets are an input into the bottom-up planning process, as shown in Figure 6-4 above.

Within the common Enterprise Capital Planning process, each asset category uses a bottom-up planning process that is tailored to the characteristics of the portfolio, considering:

- The function, criticality, volume and complexity of the different assets;
- The magnitude of the risks, issues and opportunities;
- The size, scope, complexity and costs of the capital investments; and
- The internal stakeholders that should be involved in the process.

The processes used for the asset categories are scaled as required. For example, the largest and most complex portfolios such as Generation or Transmission and Distribution, which collectively comprise the Power System, generally require more complex and detailed planning processes, and involve a broader discussion with internal stakeholders across BC Hydro.

Further information on the specific bottom up planning processes for the Power System, Technology, Properties and Fleet and Business Support/Other can be found in sections 6.5 to 6.8, respectively.

6.3.4 Step 3 - Enterprise Portfolio Management Process Validates and Prioritizes Capital Work Based on Risk and Drivers

Once bottom up planning has concluded, capital planning information is consolidated for:

- Collaborative peer reviews at the enterprise level;
- Validation of alignment with BC Hydro's strategic direction and priorities; and
- Identification of any potential areas for improvement in the process for the next annual capital planning cycle.

Peer reviews are conducted by the Enterprise Capital Planning Working Group, before the enterprise capital plan is submitted to BC Hydro's Executive Team and Board of Directors. The reviews focus on three main areas:

- An overall summary of each asset category portfolio;
- The quality of information used to develop the capital plan; and
- The risk profile of the consolidated capital plan.

The risk profile of the capital plan is based on BC Hydro's enterprise-wide framework for capital prioritization. This framework describes the assessment and prioritization process related to proposed capital investments. Investments are assessed based on the primary driver of the proposed investment, as follows:

- Investments that primarily mitigate risk are scored for prioritization using a methodology that is aligned with the BC Hydro Corporate Risk Matrix; and
- Investments that primarily create value are scored for prioritization using a net value per dollar invested metric. The value prioritization is mainly used for some capital expenditures in the Technology Portfolio.

Through BC Hydro's enterprise-wide framework for capital prioritization, capital investments are classified into one of three categories:

- Mandatory investments driven by legal and regulatory requirements;
- Committed investments not to be postponed. This category includes projects that were prioritized in previous capital plans and are now economically unreasonable to cancel; and
- Investments to be prioritized. This category includes projects that could be re-prioritized without significant costs.

The peer reviews conducted for the Capital Plan in this application resulted in the reallocation of some funding from the Power System portfolio to the Technology and Properties portfolios in the earlier years of the plan. This reallocation was cost neutral and offset by reallocations from Technology and Properties to Power Systems in the later years of the plan. This reallocation increased the amounts allocated to Technology and Properties assets in the earlier years of the plan to smooth the level of investment in these portfolios over the ten-year period and to avoid disrupting BC Hydro's ability to deliver planned investments. As a result, investments in these asset categories are more evenly distributed over the long-term.

6.3.5 Step 4 - Executive Team Reviews and Approves the Capital Plan

The final step in BC Hydro's annual enterprise capital planning process is the review and approval of the capital plan by the Executive Team and Board of Directors, which occurs as part of the annual budget and five-year forecast approval process. This review is conducted to assess whether the plan meets overall business objectives and provides a consistent and appropriate management of risks across all asset categories.

Once the capital plan is approved by the Executive Team, it is monitored, on an ongoing basis, by the Capital Delivery Management Committee. The committee focuses on the early years of the capital plan so that actual and forecast capital expenditures remain aligned with the original capital plan. This management is done at a portfolio level so that, if required, adjustments can be made to re-direct the capital budget, as new information becomes available. To make these decisions, the committee considers financial impacts, the enterprise risk profile, and labour resource availability.

Decisions to reallocate the budget within the capital plan are governed through an ex-plan governance process, which considers the size of the ex-plan request. Requests less than $3 million are reviewed at the Enterprise Capital Planning Working Group level, while requests greater than $3 million are reviewed and approved at the Capital Delivery Management Committee level. Reallocations may result in the approval of new projects to address emerging issues, the advancement of future investments based on new information or the increase of funding to existing programs, in response to identified needs.

6.4 Power System Assets Capital Investments

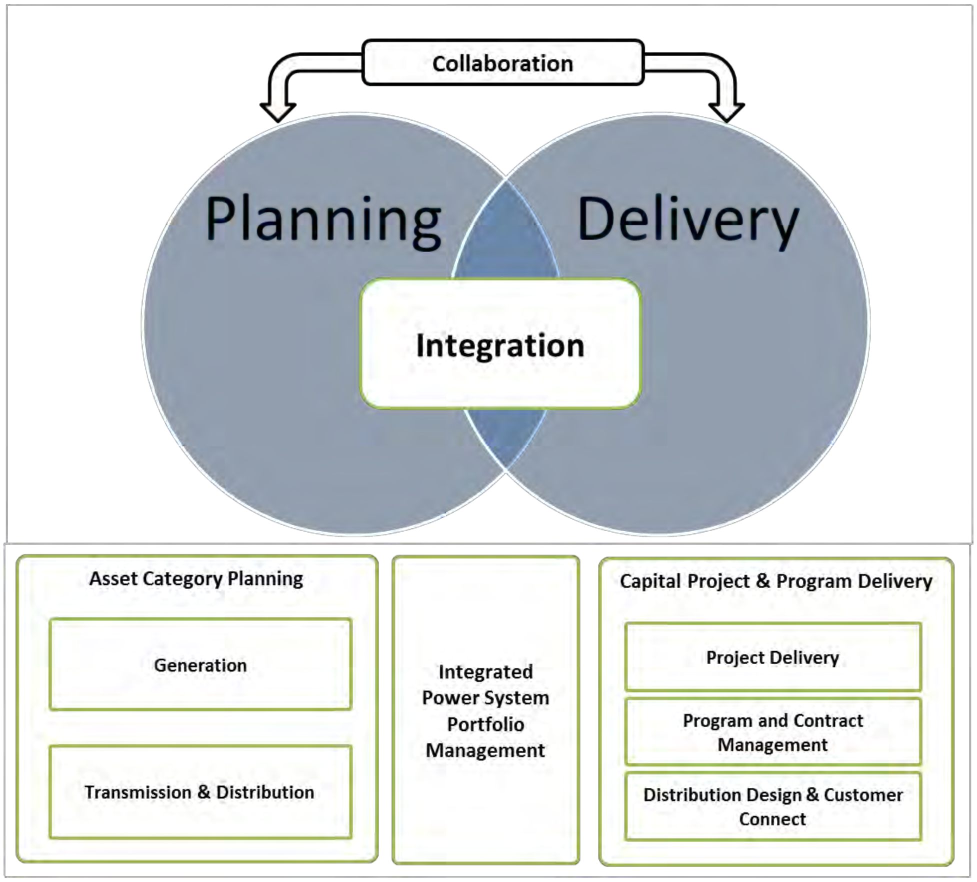
The Power System includes BC Hydro's Generation, Transmission and Distribution assets.

Over time, the condition and performance of existing assets degrade, regulatory and safety requirements change and new assets are required to address load growth and connect new customers. Together, these factors create issues, risks and opportunities to be addressed through capital investment.

The planning and delivery processes for the Power System are integrated, requiring a high degree of collaboration across the organization.

Figure 6-11 below represents a high level depiction of the interaction between functional groups responsible for asset management and planning, and portfolio delivery when planning and delivering capital investments for the Power System.

Figure 6-11 Integrated Power System Planning and Delivery



Planning processes are in place to understand the issues, risks and opportunities associated with the assets and to identify the recommended capital investments.

- Sections 6.4.1 to 6.4.4 provide further information on the Power System assets, the bottom-up planning processes for each asset category and the integrated portfolio planning process for the Power System; and
- Sections 6.4.5 to 6.4.6 provide an overview of the collaboration and integration between planning and delivery through the annual capital planning process, the work planning process and the release of projects and programs to the KBUs responsible for delivery.

Delivery processes are in place to deliver projects and programs on time and on budget, and within scope. Investments associated with the Power System are delivered by three different KBUs: Project Delivery, Program and Contract Management and Distribution Design and Customer Connect.

- Sections 6.4.6 to 6.4.9 explain how investments are assigned to each KBU as well as the project delivery practices used to deliver those investments;
- Section 6.4.10 describes the financial approval policies and procedures applicable to all capital investments; and
- Section 6.4.11 describes recent improvements to our project delivery practices.

Lastly, sections 6.4.12 to 6.4.15 present our forecast capital expenditures and additions for the Power System by asset category.

6.4.1 Generation Assets Capital Investments

During the test period, capital investments in generation assets include asset sustainment, dam safety and growth investments. Generation capital expenditures represent approximately 30 per cent of the BC Hydro Capital Plan during the fiscal 2020 to fiscal 2021 test period. The majority (75 per cent) of capital investments in the Generation portfolio during the test period are driven by the need to address issues and risks associated with existing facilities that are aging.[301]

6.4.1.1 Generation Assets Are Aging and a Number Are at End-of-Life

BC Hydro's generation assets are aging, and a number of generation assets are now at end of life. BC Hydro's generation assets include 83 generating units at 30 hydroelectric generating facilities as well as 81 dams located at generating stations and at additional locations to provide water storage and water diversion functions. Generation assets also include three gas-fired units at BC Hydro's two thermal generating stations and four synchronous condenser units at a dedicated synchronous condenser station. BC Hydro also has 17 diesel generating

[301] Excluding the Site C Project.

stations and one hydroelectric generating station in areas not connected to the integrated electric system.

Construction of most of BC Hydro’s large capacity generating facilities occurred in the 1960s, 1970s and 1980s, while the majority of BC Hydro’s medium capacity facilities were constructed in the 1950s. The age of BC Hydro’s generating facilities ranges from new to 94 years, with an average facility age of 52 years. Asset Health assessments indicate that a number of generation assets are now at end of life. An overview of generation asset health is provided in Appendix M.

BC Hydro manages its generation assets over their lifecycle by:

- Maintaining the assets so that they perform safely and reliably throughout their operating lives;
- Investing in the assets to extend their operating lives, enhance capability, manage risk, and increase efficiency and cost-effectiveness; and
- Managing public and worker safety risks associated with facilities, especially around reservoirs and dams.

Planning processes are in place to support these objectives and to align the portfolio of investments to effectively manage risk and customer needs within financial and labour resource constraints.

With the exception of the Site C Project, which is a growth project, the majority of capital investments in the Generation portfolio during the test period are driven by the need to address issues and risks associated with existing facilities. These investments are categorized as Generation Asset Sustainment and Dam Safety investments. The following sections describe BC Hydro’s Generation Asset Sustainment and Dam Safety portfolios in more detail and then explain BC Hydro’s bottom-up planning process for generation assets.

6.4.1.2 Generation Asset Sustainment Addresses the Highest Risks

The planned generation sustainment capital investments for the fiscal 2020 to fiscal 2021 test period will continue to mitigate or resolve the highest risks identified with BC Hydro's generation assets. Asset Sustainment represents 75 per cent of the Generation expenditures over the fiscal 2020 to fiscal 2021 test period.[302]

The risk assessment considers how important generation facilities are to the overall system, as well as the asset condition.

BC Hydro's generation facilities are categorized as "Key", "Strategic" or "Available", according to the significance of the facility to BC Hydro's system. An investment strategy is in place for each category which reflects the significance of the category of facility to the power system. Table 6-6 below provides a list of BC Hydro's generation facilities by category.

[302] Excluding the Site C Project.

1 Table 6-6 BC Hydro's Generating Facilities by
2 Category

Facility Abb'n	Facilities	Facility Category	Year of Initial Operation	Current Age (Years) 2018	Current Maximum Capacity (MW)	Number of Units

Note 1	On July 26, 2018, BC Hydro became the sole owner of Waneta. Teck Metals Ltd ("TML") continues to act as the Operator of the facility during the 20 year lease term, and is required to operate, manage, and maintain Waneta in accordance with the terms of the Co-Possessors and Operating Agreement ("COPOA").
Note 2	Burrard Synchronous Condenser facility was previously the Burrard Thermal generating facility.

- **"Key" generating facilities:** Seven "Key" generating facilities represent the largest hydro-electric facilities on the BC Hydro system and produce approximately 90 per cent of BC Hydro's average annual energy;
- **"Strategic" facilities**: Eighteen "Strategic" facilities represent all generating stations on Vancouver Island, all stations located on cascading systems, all thermal generation stations and generating stations required to provide voltage support to the transmission network. These facilities produce approximately 9 per cent of BC Hydro's average annual energy and provide significant additional value to BC Hydro due to their geographic location and system support services;
- **"Available" facilities:** Seven "Available" facilities represent those facilities that are of lower strategic importance and produce less than 1 per cent of BC Hydro's average annual energy; and
- **Waneta two-thirds:** On July 26, 2018, BC Hydro became the sole owner of Waneta. Teck Metals Ltd. continues to act as the Operator of the facility during the 20-year lease term. In that role, Teck is required to operate, manage, and maintain Waneta in accordance with the terms of the Co-Possessors and Operating Agreement ("COPOA"), which includes capital planning and operating to a prudent owner standard, exercising the degree of care and skill of an experienced dam operator and acting in accordance with Good Utility Practice.

  As Teck is the Operator of Waneta, processes that BC Hydro generally uses for internal asset management and planning purposes will not be applied. BC Hydro will retain an oversight role as part of the Waneta Operating Committee, including reviewing the annual operating plans for Waneta.

The condition of assets across BC Hydro's generation fleet is a foundational input to the planning process. BC Hydro evaluates the condition of its major equipment (turbines, generators, governors, exciters, transformers, and circuit breakers) based on the latest available maintenance test and inspection data, following BC Hydro's Equipment Health Rating methodology. This provides a systematic, objective, repeatable, and transparent assessment of equipment health. Factors influencing the Equipment Health Rating include:

- Equipment health;
- Maintenance history;
- Equipment reliability;
- Availability of spare parts;
- Availability of technical support; and
- Known equipment type design problems.

Asset health or condition information is used to assess and manage risk and to prioritize the need to make investments to preserve and sustain the generating units. Each health assessment results in a rating of Good, Fair, Poor, or Unsatisfactory.

Over the test period, sustaining capital expenditures will be focused at the G.M Shrum, Bridge River 1 and 2, Mica, and Cheakamus generating stations.

6.4.1.3 Dam Safety Is Another Focus of Generation Expenditures

Dam Safety represents 25 per cent of the Generation expenditures over the test period,[303] recognizing the potential for catastrophic consequences in the unlikely event of a failure.

BC Hydro's dams are subject to the British Columbia Dam Safety Regulation, which defines a "Dam" as:

(a) A barrier constructed for the purpose of enabling the storage or diversion of water diverted from a stream or an aquifer, or both; and

[303] Excluding the Site C Project.

(b) Other works that are incidental to or necessary for the barrier described in paragraph (a).

Consistent with the Dam Safety Regulation, BC Hydro's Dam Safety portfolio comprises all physical features, structures and mechanisms - both constructed and natural - that retain the reservoirs and control the passage of flows past the dam.

The Dam Safety Regulation classifies dams according to the consequences of their failure, such as the potential for loss of life, environmental damage and economic impacts. Classifications range from "Low Consequence" to "Extreme Consequence". These classifications dictate the required frequency of safety activities performed on the dam and are further used to guide the selection of the dam's design and performance criteria.

Dam Safety issues and risks involve:

- The safe storage and controlled passage of water under normal conditions;
- The ability to pass floods (from the annual freshet to extreme events); and
- The ability to withstand a major earthquake without any harmful release of water.

Dam Safety risks generally have a relatively low probability of occurrence but, if realized, a very high consequence. Key drivers of Dam Safety capital investments in the test period include:

- ***Seismic Risk:*** The seismic performance at a number of BC Hydro's major dams is below current Canadian guidelines. For example, the John Hart Dam is classified as an "Extreme Consequence" dam under the British Columbia Dam Safety Regulation. This means that, under the 2007 Canadian Dam Association Guidelines, the expected seismic performance of this dam is to have no uncontrolled release of the reservoir during and following earthquake ground motions that would be expected to occur on that site no more than once every

10,000 years. Seismic upgrades to the John Hart Dam and spillway are required and planned to achieve this level of seismic performance.

- ***Reliability of Spillway Gates:*** A spillway is an essential component of any dam facility. It provides a means for passing sufficient quantities of water from the reservoir to the downstream water course when power generation is unavailable or insufficient to maintain required downstream flows or prevent the reservoir from rising above its maximum safe elevation. Discharge through a spillway may also be required for emergency reservoir drawdown, such as in the event that a defect develops and/or is identified within the dam and there is a need to reduce the load on the dam. Discharge through a spillway is regulated by gates located at its upstream end. Some of BC Hydro’s spillway gates have design or condition-based deficiencies that impinge upon their operational reliability and which, due to their critical safety function, pose a risk. To address this risk, the Capital Plan includes investments to improve the reliability of spillway gates at the W.A.C. Bennett Dam, Ladore Dam, Strathcona Dam, John Hart Dam and Mica Dam.
- ***Condition of Civil Structures:*** BC Hydro has a number of facilities where the integrity or degradation of the existing civil structures poses a risk to the ability to store or pass water safely. For example, reservoir booms throughout BC Hydro’s system are aging and deteriorating. Poorly functioning booms can allow large debris in the reservoir to reach the dam, blocking spillways and other water passages and interfering with or preventing the proper function of these critical features of a dam. Projects to replace a number of reservoir booms will proceed within and beyond the test period.

6.4.2 Generation Bottom-Up Capital Planning Process

The following sections describe the steps of BC Hydro's bottom-up capital planning process for generation assets.

6.4.2.1 Step 1 - Generation Strategic Asset Management Plan

First, BC Hydro considers its Generation Strategic Asset Management Plan. This plan sets out ten year strategies for each facility category – Key, Strategic and Available - to support appropriate resource allocations and performance targets for the facilities.

- **Key facilities:** BC Hydro has implemented a component replacement strategy for its Key facilities. Under this strategy, all major equipment at Key facilities will be restored to Good or Fair condition or will have work underway to restore them to Good or Fair condition, within ten years. This strategy means that, in aggregate, the reliability of Key facilities will be maintained at or slightly above the average of similar facilities, as reported by the Canadian Electricity Association;
- **Strategic facilities:** Equipment in "Poor" or "Unsatisfactory" condition at Strategic facilities will either be refurbished or replaced within ten years, will have work underway to be refurbished or replaced within ten years or will have a long-term plan developed to mitigate the risk of equipment failure. This strategy means that, in aggregate, the reliability of Strategic facilities will be maintained at or restored to the average of similar facilities, as reported by the Canadian Electricity Association; and
- **Available facilities**: With the exception of Whatshan and Aberfeldie (the largest and newest Available facilities) all other Available facilities will receive minimal capital investment and will be taken out of service when they are no longer able to safely generate electricity. BC Hydro will perform regular maintenance and inspection on these assets to keep them safe and inform investment and operating decisions. Options to re-furbish, re-develop or

decommission Available energy facilities that have been taken out of service will be developed as required. Decisions on these options will be informed by BC Hydro’s long-term load resource balance. Over time, this strategy may result in a gradual reduction of the energy produced by Available facilities.

6.4.2.2 Step 2 - Dam Safety Investment Strategy

Second, BC Hydro’s level of investment in Dam Safety is targeted to address identified deficiencies in the dams and their appurtenant structures so that:

- There is no significant deterioration of BC Hydro’s overall risk position with respect to these assets; and
- The overall level of risk is kept well within tolerable limits as guided by the Canadian Dam Association’s Dam Safety Guidelines and the International Commisison on Large Dams’ Bulletin on Dam Safety Management.

In addition, BC Hydro’s dam safety investments also consider qualitative judgements made, on a case by case basis, with regulators and government representatives, First Nations and stakeholders.

This targeted level of investment accounts for the both the experienced and expected future wear and tear of the dams, identification of new issues, and improved understanding of previously identified issues through engineering investigations.

Identified deficiencies are rated by a “Vulnerability Index” that considers:

- The extent to which the design or performance of a particular dam feature (deficiency) differs from accepted good practice;
- The extent to which that feature contributes to the safe performance of the dam;
- The frequency at which the feature is potentially stressed to the limits of its performance; and

- The effectiveness of any interim risk controls that might be in place.

At each dam, issues and risks are grouped to form a project or set of projects based on asset type, similarity of issues or solutions, and location within the facility or system. These projects are then prioritized across the system by considering:

- The potential reduction of the Vulnerability Index;
- The consequence classification of the dam;
- The cost and time to effect remediation compared to the benefits from risk reduction;
- The sequencing of required enabling projects; and
- The completeness of BC Hydro’s understanding of the issue and potential remediation.

BC Hydro’s most recent internal audit of the Dam Safety Program, conducted by a team that included international subject matter experts in Dam Safety management and hazardous process industries, found that

> “BC Hydro continues to be a leader in risk assessment in the international dam safety community with a transparent, systematic and robust risk assessment process.”

6.4.2.3 Step 3 - Growth Driven Generation Investments

Third, BC Hydro identifies opportunities to enhance the capability or increase the efficiency of existing facilities. Generation growth investments are integrated into the capital plan when there is an identified need for increased energy or capacity resources.

6.4.2.4 Step 4 - Facility Asset Plans

Fourth, BC Hydro considers the Facility Asset Plans for its hydroelectric generating facilities, thermal generating and synchronous condenser stations. Facility Asset Plans formulate, document and recommend a ten year investment strategy for each facility, with a focus on the near years of the plan. These strategies account for the facility's role in BC Hydro's system, its Equipment Health Ratings, dam safety issues and deficiencies, performance levels and targets, risks, and growth opportunities. Capital upgrade projects to implement these strategies are carefully planned so that unit outages and maintenance work are coordinated with power system requirements.

As they are developed, each Facility Asset Plan is presented to the Asset and Risk Planning Committee for agreement in principle and endorsement. This committee provides input to the Facility Asset Plan on all issues, risks and planned investments.

Facility Asset Plans are updated periodically to reflect the latest information, including changes in priorities and strategies which influence the scope and timing of facility plans and investments. A Facility Asset Plan may also be updated if new information emerges that affects the investment strategy for the facility. Between updates, BC Hydro continues to monitor the risks and issues associated with the facilities and makes adjustments, if needed.

Summaries of Facility Asset Plans are provided in Appendix K.

6.4.2.5 Step 5 – Annual Capital Planning Review

Fifth, as part of the annual capital planning process, BC Hydro undertakes a review of the planned investments for each facility. Investments are reviewed to check that the facility asset planning process has been applied consistently, the data quality is sufficient and the investments are appropriately prioritized and timed. These investments are then submitted into the Integrated Power System Portfolio Management process, as described in section 6.4.5 below.

6.4.3 Transmission and Distribution Assets Capital Investments

Transmission and Distribution capital expenditures represent approximately 60 per cent of BC Hydro's planned capital expenditures over fiscal 2020 to fiscal 2021.

Over the test period, approximately half of the forecast capital investment in the transmission and distribution systems are investments in sustainment to address issues and risks associated with the asset condition of existing facilities. The other half is related to growth.

6.4.3.1 Transmission and Distribution Assets Are Aging and Many Require Investment in the Near Term

BC Hydro's transmission and distribution assets are aging, and the asset health assessment of these assets indicate that a number of them are now at end of life.

BC Hydro's transmission and distribution assets include over 18,000 circuit km of transmission overhead lines, approximately 350 km of transmission subterranean and submarine cables, 323 substations, an integrated telecommunication system, approximately 58,000 circuit km of distribution overhead lines and 10,000 circuit km of distribution underground lines.

A large portion of the transmission system was built in the 1960s and 1970s and these assets are, or soon will be, reaching or exceeding end-of-life condition. Similarly, a large portion of the distribution system has, or soon will be, exceeding its design life. Asset Health assessments indicate that approximately 10 per cent of the transmission and distribution assets are in poor to very poor condition, which requires either remediation work or replacement within the next ten years. It is expected that a certain portion of assets will be in Poor or Very Poor condition at any point in time. An overview of transmission, distribution and substation asset health is provided in Appendix N.

1 Overall, BC Hydro has approximately four million individual transmission and
2 distribution assets. Table 6-7 below provides the average asset age, by asset class.

3 **Table 6-7 Average Asset Age by Asset Class**

	Asset Class	Number of Assets	Average Age
Distribution	Capacitors	405	22
	Cutouts	408,647	17
	O/H Conductors Primary (circuit km)	48,294	30
	O/H Switches	12,343	18
	O/H Transformers	283,161	25
	Others	39,268	
	Recloser	1,400	5
	Revenue Meter	2,035,097	5
	Street Light	91,977	23
	U/G Cables Primary (circuit km)	10,874	20
	U/G Transformers	67,364	22
	Voltage Regulators (Distribution)	575	7
	Wood Poles	891,328	27
	Total:	**3,890,733**	
Substation	Batteries	338	11
	Circuit Breakers	3,994	19
	Disconnect Switches	14,130	30
	Fire Protection Systems	156	28
	Gas Insulated Switchgear	508	16
	Instrument Transformers	8,455	21
	Mobile Transformers and Substations	9	31
	Others	3,225	
	Protection and Control Systems	12,496	24
	Reactors	1,949	28
	Series Capacitors	14	27
	Shunt Capacitors	434	18
	Standby Generators and Fuel Systems	75	23
	Static Var Compensators	5	18
	Station Insulators	435	42
	Surge Arrestors	6,277	14
	Synchronous Condensers	4	47
	Transformers/Tap Changers	1,437	35

	Asset Class	Number of Assets	Average Age
	Voltage Regulators (Substation)	362	38
	Total:	**54,303**	
Transmission	Conductor Systems (circuit km)	19,349	44
	Line Disconnect Switches	286	26
	Metal Support Structures	24,366	44
	Others	319	
	Underground Cables (circuit km)	346	38
	Wood Pole Structures	82,142	44
	Total:	**126,808**	

BC Hydro has established planning processes in place to:

- Develop transmission and distribution system plans for the safe and reliable delivery of electricity to customers;
- Connect new customers and generators;
- Expand networks with existing capacity constraints to meet anticipated load growth;
- Manage asset performance; and
- Meet regulatory requirements.

Over the test period, the transmission and distribution capital forecast includes investments in both sustainment and growth expenditures. As indicated above, approximately 50 per cent are sustainment expenditures, driven by the need to address the issues and risks associated with existing assets. Sustainment expenditures are made so that the assets perform as required throughout their lifecycle. Investments in existing assets include activities such as:

- Replacement of assets based on condition;
- Enhancements to maintain or improve customer reliability and extend asset life;
- Upgrades to mitigate risks including safety, environment, security and seismic;

- Improvements to meet evolving regulatory standards; and
- Relocations to address third-party requests.

6.4.3.2 BC Hydro Is Investing a Similar Amount as in Past Years to Replace Existing Assets

The replacement of assets represents 75 per cent of transmission and distribution sustainment expenditures, or approximately $640 million over the test period. This level of expenditures is similar to the expenditures in the previous three years. While this level of investment will result in a gradual deterioration in overall asset condition of the transmission and distribution assets, the associated risk is mitigated.

Assets are replaced when the equipment performance can no longer be managed due to comparatively high cost or due to lack of parts and inadequate manufacturer support. Asset replacements are also required to mitigate increasing public and worker safety risks as well as environmental risks, which could result from asset failures.

The Asset Health Index is used to assess the condition of the transmission and distribution assets. This approach considers factors such as asset age and available test and inspection data and then assigns ratings of Very Good, Good, Fair, Poor, or Very Poor to each asset. These ratings can be grouped and analyzed to assist with investment decisions.

Most replacements are the result of proactive inspections and maintenance. For example, cedar wood poles are tested and treated 20 to 29 years after initial installation and then every ten years thereafter. Units that fail the test criteria are then scheduled for replacement.

In cases where the impacts of asset failure on customer reliability are low and proactive maintenance is ineffective in extending asset life, a ‘run to failure’ strategy is used to minimize the life cycle costs of managing the assets. Examples of asset classes that are ‘run to failure’ include overhead distribution transformers.

At the level of capital investment in this Capital Plan, the number of assets in Poor or Very Poor condition is expected to gradually increase, which will increase the probability of failure associated with some components of the transmission and distribution system. The potential impact of asset failures on system performance is mitigated by the redundancy on the system as well as the installation of automated devices.

6.4.3.3 Customer Reliability Investments Are Aimed at Managing Current Reliability Levels

Customer reliability investments include upgrades to existing assets as well as adding new assets to manage reliability. Customer reliability capital expenditures are required during the test period to manage current levels of system performance and total approximately $100 million. Examples of customer reliability projects include backup circuit ties to enable faster restoration in the event of customer outages as well as circuit re-locations and re-configurations to avoid potential outage causes, such as tree and vegetation contacts.

6.4.3.4 A Portion of the Sustainment Budget is Directed at Mitigating Other Risks

A portion of the transmission and distribution capital investment portfolio is to address a variety of other risks including public and worker safety, environment, fire, security, seismic and extreme weather.

Capital expenditures to address other risks associated with transmission and distribution are expected to total approximately $45 million in the test period. This includes:

- **Safety risk mitigation**: Examples of safety projects include the replacement of H-Frame structures in the alleys of downtown Vancouver, which pose a public safety risk due to reduced clearances to buildings as well as a project to replace concrete poles, which pose an employee safety risk due to a lack of adequate integral bonding.

- **Environmental risk mitigation**: Examples of environmental projects include those to manage oil-filled equipment to avoid the risk of spills as well as projects to modify structures in areas where protected bird species congregate in order to avoid electrical contract incidents.
- **Fire and security risk mitigation**: Examples of projects to address fire and security risk at substations include the installation or upgrading of fire protection systems or the installation of access detection and control, video monitoring, perimeter fencing and gate upgrades.
- **Extreme weather risk mitigation**: Examples of projects to address risks related to extreme weather include installing piles, reinforcing foundations and constructing protective structures such as retaining walls, riprap berms and debris deflectors around transmission structures and their foundations, to withstand storms, floods, landslides, and avalanches.

6.4.3.5 Localized Growth Investments Are Driven by Emerging Demand

Growth expenditures are required to expand the transmission and distribution system to accommodate load growth and to connect new customers. This includes:

- Upgrades and additions of station equipment;
- Upgrades and additions of transmission lines and distribution feeders; and
- New service connections and upgrades.

Growth expenditures represent approximately 50 per cent of all transmission and distribution expenditures during the test period.

Demand for electricity continues to increase in some areas of the province and certain parts of the BC Hydro system are reaching capacity. In certain sectors of the economy, such as the oil and gas sector in the Peace and North Coast regions, economic growth is driving the need to reinforce the system in areas that do not have the infrastructure to meet the emerging demand. In addition, new investments continue to be required to connect new customers to the BC Hydro system.

Growth investments and their timing are informed by forecast load growth, resource supply additions and existing system capacity.

Capital investments to interconnect transmission customers are also difficult to forecast. Due to uncertain timing, location and scope, only known transmission interconnection projects are included as specifically identified projects in the forecast capital expenditures for the test period.

BC Hydro also includes provisions for emerging transmission interconnection projects. These amounts are aligned with the historical levels of spend and anticipated future activity. Deviations from these provisions, to respond to emerging interconnection needs, require an adjustment of the timing or scope of other projects and programs within the capital plan.

Due to the continued economic activity expected in the Liquefied Natural Gas and Oil and Gas sectors, there are potentially significant upgrades to the transmission system in the North Coast and Peace region that may be required in the near future. These potential upgrades, including a project to convert the voltage of the electric supply in the Dawson Creek area from 138 kV to 230 kV, are not currently included in BC Hydro's Capital Plan. These projects would allow BC Hydro to serve potential new LNG and oil and gas customers with clean renewable energy from the power grid. BC Hydro will work with the load customers to define the need and scope of these future projects. These projects will proceed once there is a formal commitment from the potential customers. Depending on the timing, these projects will be either incorporated in future annual capital plan updates or initiated under BC Hydro's ex-plan governance process, described in section 6.3.5.

Distribution interconnection expenditures are more stable and are forecast based on historical levels.

6.4.4 Transmission and Distribution Bottom-Up Capital Planning Process

The following sections describe the steps of BC Hydro's bottom-up capital planning process for transmission and distribution assets.

6.4.4.1 Step 1 – Identify the System and Asset Needs

First, BC Hydro identifies system and asset needs to be considered for remediation. This assessment includes reviews of system performance data to identify assets with degrading conditions, representing safety or environmental risks, not performing adequately or not meeting regulatory requirements. System and substation load forecasts are also developed to identify areas in the system that may require reinforcement. Based on these reviews, BC Hydro develops a preliminary approach and timeline for remediation.

The following information and data is used to assess system and asset needs:

- ***Asset Health and Performance:*** BC Hydro evaluates the condition of the Transmission and Distribution assets, based on the latest available maintenance test and inspection data, as well as engineering assessments and assigns an Asset Health Index to each asset. The methodology provides assessments that are objective, repeatable, and consistent across asset classes. Assets with an index of Very Poor are generally considered for reinvestment within three years and assets with an index of Poor are generally considered for reinvestment within ten years. The Asset Health Index methodology and summary ratings for transmission and distribution assets is provided in Appendix N;
- ***Customer reliability:*** BC Hydro also reviews reliability statistics, identifies assets with poor performance and develops solutions for improvement. For example, the worst performing distribution feeders are studied to determine the areas of under-performance, conduct root cause analysis and assess solutions for future investment to improve reliability;

- ***Regulatory Requirements:*** BC Hydro also evaluates the compliance of assets with the regulatory requirements of the *Workers Compensation Act*, the B.C. *Wildfire Act* and environmental laws as well as the requirements of Mandatory Reliability Standards, Measurement Canada, and Transport Canada; Compliance is addressed within the requirements of each regulation;
- ***Load and Energy Forecasts:*** BC Hydro assesses the capability of the transmission and distribution system to meet expected peak demand and accommodate forecast load and generation additions; and
- ***Other Risks:*** BC Hydro assesses the potential severity and likelihood for a range of risks including safety, seismic, environment, fire, extreme weather, and security. High risks, as determined by BC Hydro's enterprise-wide framework for capital prioritization, are considered for remediation. The enterprise-wide framework is discussed further in section 6.3.4.

6.4.4.2 Step 2 – Determine the Scope of the Studies

Second, BC Hydro determines the scope of studies to assess identified needs. These studies integrate multiple needs, impacting the same parts of the system, within a similar timeframe, so that they proceed through the planning process together.

In this step, identified needs are reviewed by regionally-focused cross-functional teams to determine integration opportunities. These teams consider how needs relate to each other as well as the required timelines for remediation and the risks of delay. These reviews may result in certain needs being addressed through province-wide work programs or deferred due to low risk.

Third-party interconnection requests are not typically considered for integration with other needs. These projects normally proceed individually through their respective mandated and schedule-driven processes.

6.4.4.3 Step 3 – Undertake Studies

Third, BC Hydro studies identified needs in detail and identifies technically feasible alternatives to remediate these needs through projects or work programs. There are three types of studies: Area Plans, Substation Asset Plans and Asset Class Strategies. The studies vary from a few weeks to several years depending on the complexity of the needs and alternatives.

- ***Area Plans:*** Area Plans are specialized technical planning studies to identify alternatives to address needs related to issues such as load growth, new generation and system reliability. The Downtown Vancouver Electric Supply Plan and the Squamish Area Reinforcement Study are examples of integrated Area Plans;
- ***Substation Asset Plans:*** Substation Asset Plans are developed for substations with multiple pieces of equipment that require replacement within a similar timeframe. The Barnard Substation Asset Plan is an example of a substation asset plan; and
- ***Asset Class Strategies:*** Asset Class Strategies determine the appropriate remediation approach for each asset class. Asset Class strategies include replacing the asset or continuing to perform maintenance on the existing asset.

Summaries of Area Plans, Substation Asset Plans and Asset Class Strategies are provided in Appendix K.

6.4.4.4 Step 4 – Annual Capital Planning Review

Fourth, as part of the annual capital planning process, BC Hydro undertakes a review of planned investments. Investments are reviewed by cross-functional teams to align investments across the portfolios. In addition, investments are reviewed to check that the data quality is sufficient and the investments are appropriately prioritized and timed. These investments are then submitted into the Integrated Power System Portfolio Management process, as described in section 6.4.5 below.

6.4.5 Integrated Power System Portfolio Management Brings Planned and Ongoing Projects and Programs into One Portfolio

Once a year, forecasts for the planned generation, transmission and distribution projects and programs, developed through the bottom-up processes described in the preceding sections, are brought together with projects and programs already being delivered. This consolidation of a single Power System capital investment portfolio begins the final stage of the preparation of the Power System Capital Plan.

The enterprise-wide framework for capital prioritization, described in section 6.3.4, is used to categorize each investment in the initial portfolio, and assign risk to the deferral of the investments. Where labour resources have been identified as a risk to the delivery of the portfolio, the demands on the labour pool to deliver each investment are assessed and the availability of those resources are estimated.

In the most recent capital planning process, the prioritization of the portfolio for fiscal 2020 to fiscal 2024 was managed within the established level of capital investment, as discussed in section 6.3.2. This review considered the resource availability of various labour groups, including Communications, Protection and Control Technologists as well as Distribution Designers. While in previous planning cycles, the availability of Communications, Protection and Control Technologists has constrained BC Hydro's ability to include certain investments in its portfolio, recent measures have prevented the undue delay of higher risk investments. For example, BC Hydro has increased the availability of these labour resources through improved contract management which has diversified the external suppliers used to perform this work. As a result, in this most recent capital planning cycle, labour resource constraints did not trigger the deferral of investments in the fiscal 2020 to fiscal 2024 period at the portfolio level.

The final step of the process is to review the Power System capital investment portfolio to determine the highest priority projects and programs within the labour and financial constraints that have been identified. These results are then reviewed with the leadership team of the Integrated Planning Business Group. This provides an opportunity for senior leaders to offer input and to align the portfolio business objectives. Once endorsed by the Integrated Planning leadership team, the Power System Capital Plan is submitted into the Enterprise Capital Planning process, which is described in section 6.3.4.

6.4.6 Planning and Delivery Processes Are Well Integrated

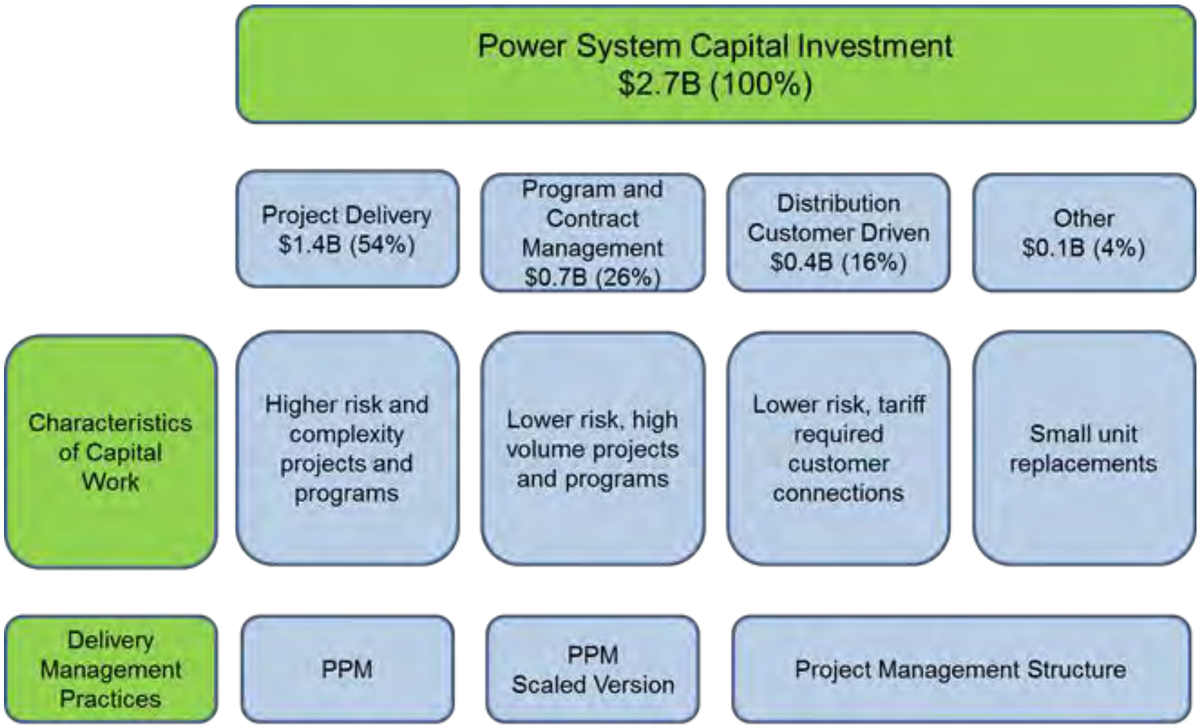
This section provides an overview of the collaboration and integration between planning and delivery through the annual capital planning process, work planning and the release of projects and programs to the KBUs responsible for delivery.

Investments associated with the Power System are delivered by three different KBUs: Project Delivery, Program and Contract Management and Distribution Design and Customer Connect. The processes followed by each KBU are adapted to suit the types of investment that they are responsible for delivering.

Large and complex investments generally require more rigorous delivery processes, involve a larger and broader group of internal and external stakeholders, and call for a high level of oversight and governance. Smaller projects or higher volume replacements of less complex assets require a scaled approach. Therefore, BC Hydro utilizes a range of delivery management practices to suit the range of investments that need to be delivered.

Figure 6-12 below provides a summary of the Power Systems capital investments to be delivered by each KBU for fiscal 2020 to fiscal 2021 as well as the delivery management practice used to deliver those investments.

Figure 6-12 Summary of Power Systems Capital Investments by Delivery KBU for Fiscal 2020 to Fiscal 2021



6.4.6.1 Established Process Allows Early Identification of Issues and Resources

BC Hydro has an established process for early identification of issues and resources, so that work is assigned to the correct KBU with the appropriate delivery process for the nature of the investment and with resources to complete the work.

During the annual capital planning process to develop the capital plan for the Power System, the planning and delivery KBUs collaborate to:

- Consider labour resource availability, and validate that the Power System capital plan can be delivered with available internal and external resources;
- Determine the delivery model and assign capital investments to the appropriate KBU for delivery, considering factors such as:
  - Asset types and characteristics;

- The size, scope, complexity, duration and costs of the projects or programs; and
- The number of internal and external stakeholders that need to be involved.

- Review the larger and more complex projects that are proposed to be delivered by the Project Delivery KBU. This includes a review of the problem statement, possible alternatives, project scope, project duration, delivery risks and potential operational constraints.

6.4.6.2 Integrated Planning Remains Involved Throughout the Delivery Process

After the completion of the annual capital planning process, BC Hydro begins work planning. This involves reviews of specific investments targeted for release in the next fiscal year. The planning and delivery KBUs review the scope of planned capital investments in greater detail and consider the portfolio of planned work as well as investments already underway, to determine the appropriate time to start new work.

After work planning is complete, capital investments are prepared for release to the appropriate KBUs for delivery. This step includes final planning reviews and required financial approvals to initiate the work.

Capital investments to be delivered by the Project Delivery KBU are released on a quarterly basis to respond to changing project and resource load conditions that may require the timing of work to be adjusted. This quarterly release plan is reviewed regularly to confirm that adequate resources are available prior to project release. Capital investments to be delivered by the Program and Contract Management KBU and the Distribution Design and Customer Connections KBU are typically released on an annual basis, prior to the start of the fiscal year. After planned capital investments have been released to the appropriate delivery group, the Integrated Planning Business Group continues to be involved throughout the delivery process and participates in key decisions and accountability meetings as the initiating group representatives.

6.4.7 Project Delivery KBU Uses the Program and Portfolio Management System to Deliver Larger, More Complex Projects

The Project Delivery KBU is responsible for delivering larger, more complex Power System projects. Approximately 54 per cent of the planned capital investments in the Power System for fiscal 2020 to fiscal 2021 will be delivered by the Project Delivery KBU.

A rigorous project delivery process is critical to delivering large or complex projects effectively. The Project Delivery KBU uses the Project and Portfolio Management System (**PPM**) system for consistent management of project risk, scope, schedule and cost.

6.4.7.1 Program and Portfolio Management System is Consistent with Industry Standards

PPM is BC Hydro's framework to manage engineering and construction projects that require engineering and/or project management services. It provides a consistent approach to minimize delivery risks. PPM practices are consistent with industry standards such as the Project Management Institute's Project Management Book of Knowledge and the Association for the Advancement of Cost Engineering International Recommended Practices. PPM is structured as a Quality Management System, consistent with the principles of ISO 9001, 2008 Quality Management Systems - Requirements.

There are three key components to the PPM system: practices, tools and learning. These components are described further in the sub-sections below.

6.4.7.2 PPM Practices Standardize the Management of Large, Complex Projects

All capital projects managed within PPM are delivered using a standard set of defined practices. BC Hydro's six defined Project Delivery Practices are:

- **Project Management** - The objective of this practice is to increase efficiency and discipline in our work by providing a consistent framework for delivering projects and producing associated documentation. Application of these practices increases safety for the public and employees, the quality of work delivered through the projects and our future capacity by sharing knowledge and lessons learned;

- **Design** – This practice aims to increase efficiency and consistency in engineering design to provide facilities and equipment that are fit for purpose and will operate safely, reliably, economically and in an environmentally responsible manner, over the asset lifetime;
- **Construction and Contract Management** - This practice documents the services that we apply to construction projects, programs, and portfolios to achieve project objectives with regards to safety, security, environment, project scope, quality, schedule, and cost;
- **Indigenous Relations** – This practice manages consultation and engagement with First Nations on BC Hydro's capital projects;
- **Procurement** - The objective of this practice is to increase efficiency, consistency and quality in major capital project procurement by providing a framework for producing and delivering contracts that meets project requirements; and
- **Regulatory, Environment, Social Issues and Properties** - The purpose of this practice is to support the delivery of the regulatory, environment, social issues and properties related services to capital projects by developing and maintaining processes, tools, templates and guides to successfully achieve project scope, schedule, quality and cost objectives. This supports regulatory compliance as well as conformance with BC Hydro's policies, strategic objectives and Statements of Strategic Intent.

In addition to the six Project Delivery Practices, PPM also includes Program Management and Portfolio Management Practices.

The specific objectives of the Program Management Practice are to:

- Integrate program management with other Project Delivery practices including portfolio management and project management;
- Provide a common approach to the management of programs within BC Hydro;
- Support the planning and delivery of programs, including objectives, outcomes and benefits; and
- Support program managers with processes, techniques and templates.

The Portfolio Management Practice aims to establish consistent standards to support effective management of portfolios of project, program, and work program expenditures across BC Hydro. In particular, portfolio management guides the creation of a Portfolio Delivery Plan that describes the optimal approach to delivery of the entire portfolio, considering aggregation and coordination of opportunities and risk responses.

The Portfolio Management Practice also supports development of a baseline for measuring actual performance of the Portfolio Delivery Plan against the identified targets. This performance measurement allows management to understand and make more informed decisions on the interactions between projects, programs and work programs, to identify potential problems or opportunities, and to make timely interventions.

Underlying all of the Project, Program and Portfolio Practices are four “global” Practices:

- Document and Records Management is responsible for defining the framework in which documentation and records are required and dealt with for portfolio, program and project delivery;
- Performance Management defines key performance indicators that are implemented to measure the project;

- Reporting provides background on reporting, its structure, the basics about the reporting process as well as what is required to develop quality reports; and
- Resource Management ensures that the correct resources are assigned to complete projects on schedule.

6.4.7.3 PPM Incorporates the Consistent Use of Technology in Project Management

BC Hydro’s PPM process uses technology solutions to manage project components. The following provides a high-level summary of these solutions and their application.

- There are two modules in the SAP system:
    - The Project Systems module provides a single system of record for work breakdown structures and financial data; and
    - The Business Warehouse module provides automated reporting on projects in the PPM process.
- The Primavera system has three components:
    - P6 software provides cost and schedule forecasts for each project;
    - Unifier is a contract management tool that is linked to the project schedules in Primavera P6; and
    - Primavera Risk Analysis performs schedule risk analysis on complex projects with a higher degree of risk.
- The PPM Workspace system (Microsoft SharePoint) provides document management functions.
- The PPM Information Centre is a web-based system that provides a record of the PPM practices.

6.4.7.4 PPM Includes a Learning Component to Support Best Practices

The Learning component of PPM involves the development of BC Hydro's staff and the sharing of knowledge and experience. This is achieved through:

- **PPM Information Centre** – A website of learning and reference materials associated with Project and Portfolio Management;
- **Community of Practice** – Team sessions for all BC Hydro staff and contractors facilitated by internal and external subject matter experts;
- **Communication Hub** – an online newsletter that provides role-specific, directed communications of changes that affect how we deliver PPM projects;
- **Learning Plans** - including role-based learning available online for Document Coordinators, Schedulers and Work Package Managers to provide easy access to role specific training information;
- **Career Development site** – career pathways and progression models based on Project Delivery roles;
- **Training Sessions** – BC Hydro hosts bi-weekly Community of Practice Learning events as well the International Project Management day, where internal and external presenters share their knowledge of best practices, lessons learned and provide an opportunity to network with others; and
- **Industry Organizations** – BC Hydro participates in industry groups to share Project Management best practices, including the Project Management Institute West Coast Chapter, Western Energy Institute, Canadian Electric Utility Project Management Network and Utility Peer Group (consisting of North American utilities).

6.4.7.5 Project Delivery Lifecycle Involves Staged Refinement of Scope and Estimates and Gate Approvals

The delivery lifecycle of PPM projects is divided into four phases: Initiation, Identification, Definition and Implementation. Each phase is further divided into various stages. The lifecycle represents a staged approach to project definition and gate approvals.

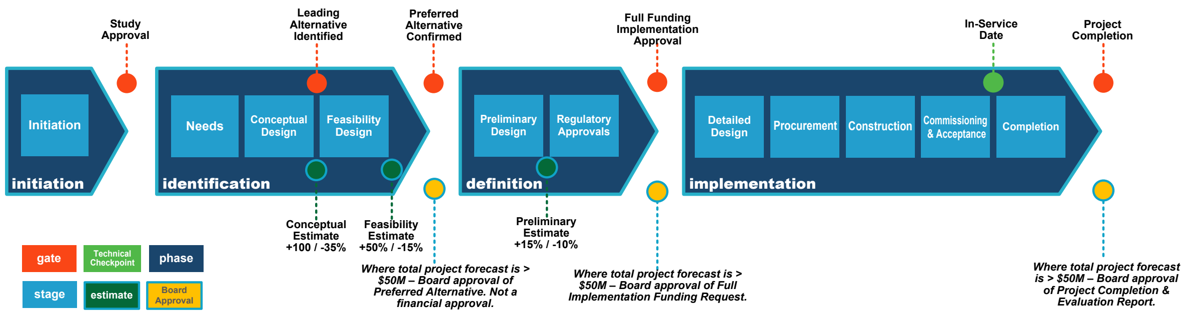
As projects move through this process, they become more defined. The increased level of definition allows for updated cost estimates to be developed. Cost estimates are provided at completion of the following stages:

- Conceptual Design: This estimate has an expected accuracy range of +100 per cent and -35 per cent;
- Feasibility Design: This estimate has an expected accuracy range of +50 per cent and -15 per cent; and
- Preliminary Design: This estimate has an expected accuracy range of +15 per cent and -10 per cent.

Gate approvals also occur at various points of the project lifecycle. Each gate is a formal approval point where key information on project cost, schedule, scope, procurement and risk is presented to the Gate Board. Further information on Gate approvals is provided in section 6.4.7.10 below.

Figure 6-13 below provides a summary of the project delivery lifecycle. The Gates following each phase of the project lifecycle are shown as red circles, and approvals by the Board of Directors are shown in yellow circles. These project lifecycle phases and stages are non-discretionary.

Figure 6-13 PPM Project Lifecycle



The following sections describe the four phases of the PPM Project Lifecycle: Initiation, Identification, Definition and Implementation.

6.4.7.6 Phase 1 in PPM Project Lifecycle: Initiation

The Initiation Phase begins by establishing an issue, risk or opportunity to be addressed through a planned capital project. A Study Approval Gate occurs at the end of the Initiation phase to conclude this phase and provide approval to proceed to the Needs and Conceptual Design Stages of the Identification Phase. This Gate represents the release of the project from Integrated Planning to Project Delivery. A Project Manager is then assigned to manage the specific project through to completion.

6.4.7.7 Phase 2 in PPM Project Lifecycle: Identification (+100/-35 per cent)

The Identification Phase consists of three stages: Needs, Conceptual Design and Feasibility Design.

- **The Needs Stage** clarifies and validates the risk, issue or opportunity to be addressed and develops a selection of high-level solution alternatives for further consideration. In this stage, an initial Work Breakdown structure, Statement of Objectives and Project Plan are developed. This includes the development of documents and systems to support the project delivery process throughout the lifecycle of the project;

- **The Conceptual Design Stage** analyzes the alternatives developed in the Needs stage and selects the alternatives to be carried forward into the Feasibility Design stage. For each selected alternative, an overall concept plan is developed including preliminary drawings of major project features, a general definition of equipment and system requirements and an overview of First Nations, stakeholder, environmental, socio-economic and procurement considerations. The selected alternatives are refined to eliminate the alternatives that do not meet the project objectives and to recommend a Leading Alternative that is technically and economically feasible and should be considered further. The main deliverable in the Conceptual Design stage is a business case which describes the alternatives considered, the methodology for evaluating those alternatives and the recommended Leading Alternative. The recommended Leading Alternative is confirmed through the Leading Alternative Identified Gate. Once this approval is provided, a conceptual design level estimate is prepared, with an expected accuracy range of +100 per cent and -35 per cent; and
- **The Feasibility Design Stage** conducts the investigations and analysis required to confirm that the Leading Alternative should be selected as the Preferred Alternative, to be carried forward to the Preliminary Design Stage of the Definition Phase. This analysis may include field and laboratory investigations as well as further evaluation of First Nations interests, environmental and other non-technical considerations. This analysis provides the required detail to prepare plans for the Definition Phase and to develop a feasibility design level estimate, with an expected accuracy range of +50 per cent and -15 per cent. At the end of the Feasibility Design stage, an updated business case is developed and a Preferred Alternative Gate is held to confirm the Preferred Alternative. After the Gate, for projects with an Estimate at Completion greater than $50 million, the Executive Team reviews the Preferred Alternative before it proceeds to the Board of Directors for approval.

6.4.7.8 Phase 3 in PPM Project Lifecycle: Definition (+15/-10 per cent)

The Definition Phase defines the major project components in sufficient detail to develop a Preliminary Design cost estimate with an accuracy range of +15 per cent and -10 per cent. In this phase, implementation funding and any required regulatory authorizations are obtained. In addition, the Project Manager verifies that sufficient input has been received from First Nations via engagement and/or consultation as well as from internal and external stakeholders. To complete the Definition Phase, the Statement of Objectives, the Project Plan for the Implementation Phase and the final Business Case are examined through the Full Funding Approval Gate. This Gate confirms that the risks associated with executing the work in the Implementation Phase are well managed and acceptable, before proceeding to that phase. After the Gate, for projects with an Estimate at Completion greater than $50 million, the Executive Team reviews the Full Funding Approval request before it proceeds to the Board of Directors for approval. All projects greater than $100 million are reviewed and approved by the BCUC.

6.4.7.9 Phase 4 in PPM Project Lifecycle: Implementation

The Implementation Phase consists of five stages: Detailed Design, Procurement, Construction, Commissioning and Acceptance, and Completion.

- The Detailed Design stage is the final stage in the design process. This stage refines the Preferred Alternative so that it can be represented in a manner that allows work to be procured, manufactured and constructed in accordance with objectives, requirements, industry standards and accepted practices. Drawings and specifications are prepared in this stage and depending on the scale of the project, several design reviews may be required.
- The Procurement Stage initiates the sourcing process and issues tenders or requests for bids and proposal documents. In this stage, contracts are awarded for the supply, installation and construction of required work.

- The Construction Stage develops, manufactures, supplies, installs and constructs the required work in accordance with the contract specifications, drawings, and criteria.
- The Commissioning and Acceptance Stage tests and commissions the constructed facility or component in accordance with the prescribed criteria. Once the facility or component has been successfully commissioned, accepted and is fit for service, operational authority is transferred from the Project Delivery KBU to the appropriate KBU within the Operations Business Group.
- During the Project Completion Stage, the Project Delivery KBU provides a list of post-project commitments and conditions of permits, approvals and agreements to the responsible KBU within the Operations Business Group. The final deliverable in this stage is the project completion and evaluation report. Once this report is accepted, the project is classified as complete.

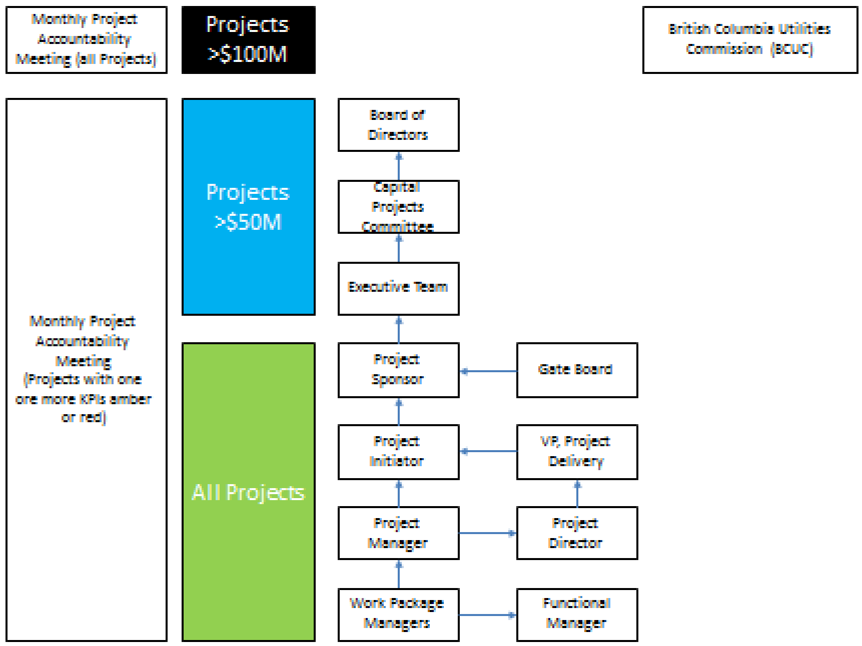
6.4.7.10 Project Delivery Roles and Responsibilities are Well Defined

Another important attribute of our project delivery process is that roles and responsibilities are well-defined in advance. The process we employ streams projects based on their size and complexity, with additional levels of oversight for complex or higher risk projects.

BC Hydro deploys a matrix organization for resourcing and managing people assigned to capital investments delivered by the Project Delivery KBU. This means that staff are assigned to a project from various KBUs across the company to perform the required roles. Staff can be assigned to a project on a full-time or part-time basis and are accountable to the Project Manager for all project related work and decisions. The Project Manager is responsible for the day to day direction and decisions on the project. The KBUs that assign staff are responsible for setting standards, process and practices for their staff, conducting training on those practices and processes and for providing collegial support, approval of expenses and performance management.

Figure 6-14 below illustrates the project governance structure for projects delivered by Project Delivery.

Figure 6-14 Project Delivery KBU - Project Governance Structure



The following provides a summary of the various roles within this governance structure;

- ***Work Package Manager:*** The Work Package Manager is responsible and accountable for the planning and delivery of the Work Package within the approved scope, cost, and schedule as detailed in the Work Package Agreement. The Work Package Manager works with the Project manager and related Work Package Managers to create and develop the Work Package agreement (an element of the project scope);
- ***Functional Manager:*** The Functional Manager is responsible for the review of the Work Package agreement with the Work Package Manager to assess expectations for resource needs and review assumptions, scope, deliverables, milestones and activities related to the Work Package Agreement;

- ***Project Manager:*** The Project Manager is responsible for leading the project team to complete the objectives of the project. The Project Manager is accountable to the Project Initiator to determine the need, justification and objectives (scope, schedule and cost) of the project as well as to the Project Delivery Director for the delivery of the project against approved objectives and in accordance with approved policy and practice;
- ***Project Delivery Director:*** The Project Delivery Director is accountable to the Vice President of Project Delivery and is responsible for the execution of the projects in their portfolio against approved objectives and in accordance with approved policy and practice. The Project Delivery Directors chair the gate board meetings for projects with a cost of less than $10 million;
- ***Vice President, Project Delivery:*** The Vice President, Project Delivery is responsible for the delivery of the projects assigned to the Project Delivery KBU and is accountable to the Senior Vice President of Capital Infrastructure Project Delivery. The Vice President, Project Delivery chairs the gate board meetings for projects with a cost of greater than $10 million;
- ***Project Initiator:*** The Project Initiator is the person with the authority to initiate work and is responsible for defining the work through the Statement of Objectives and justifying the work through the Business Case. The Project Initiator is also responsible for securing all required financial approvals. The Project Initiator sets project requirements which are then translated by the Project Manager into project scope, schedule and cost. The Project Initiator is accountable to the Project Sponsor for the definition and justification of the project; and
- ***Project Sponsor:*** The Project Sponsor supports the success of the project, by approving the project and liaising with senior management. At Gate board meetings, the Project Sponsor receives and considers Gate board recommendations to decide whether to approve key project decisions.

The following committees provide oversight of projects and endorsement of project funding requests:

- **Project Accountability Meetings:** BC Hydro conducts monthly Project Accountability Meetings to allow the Project Manager to update Gate Board members and internal stakeholders on the ongoing status of each project and provide a forum for participants to ask questions and deliver input and guidance. All projects with forecast capital costs greater than $100 million and projects under $100 million where one or more Project Key Performance Indicators are amber or red are reviewed monthly. The discussion at these meetings includes items such as project schedule, cost, scope, safety, operations, Indigenous relations, stakeholder engagement and project risks.

Table 6-8 below identifies Project Accountability Meeting attendees.

Table 6-8 Project Accountability Meeting Attendees

Senior Vice President, Integrated Planning	Senior Vice President, Capital Infrastructure Project Delivery
Senior Vice President, Safety	Executive Vice President, Operations
General Manager, Engineering	Vice President, Project Delivery (*Chair*)
Director, Stations Asset Management	Director, Indigenous Relations
Director, Dam Safety	Director, Environment
Director, Line Asset Planning	Director, Properties
Director, Interconnections	Director, Line Field Operations
Director, Finance	Director, Stations Field Operations

- **Gate Board Meetings:** Depending on the stage of the capital project, the project's estimated cost, scope, alternatives assessment, and implementation plans are subject to endorsement by a review at a Gate Board Meeting, before a funding request is approved. The Gate Board reviews the project to determine if it is ready to progress to the next stage of its lifecycle. In addition to funding and stage progression approvals, these meetings provide an avenue for discussions with, and guidance from, key delivery partners on the status of projects and potential future issues.

As shown in Table 6-9 below, there are two types of Gate Board Meetings, depending on the cost of the capital project:

Table 6-9 Types of Gate Board Meetings

Meeting Type	Capital Project Size
Major Gate Meeting	Projects ≥ $10 million
Non- Major Gate Meeting	Projects < $10 million

Table 6-10 below identifies major and non-major Gate members.

Table 6-10 Major and Non-Major Gate Board Members

Major Gate Board Members	Non-Major Gate Board Members
Executive Vice President, Operations	Project Director(s) (*rotating chair*)
Senior Vice President, Integrated Planning	Manager, Project Environmental Risk Management
Senior Vice President, Capital Infrastructure Project Delivery	Manager, Indigenous Relations
Senior Vice President, Safety	Director, Stations Asset Planning
Vice President, Project Delivery (*Chair*)	Director, Dam Safety
Director, Environment	Director, Stations Field Operations
Director, Indigenous Relations	Director, Line Asset Planning
Director, Stations Asset Management	Director, Line Field Operations
Director, Dam Safety	Director, Interconnections
Director, Stations Field Operations	General Manager, Engineering
Director, Line Asset Planning	Finance Manager, Business Planning
Director, Line Field Operations	Capital Safety Manager
General Manager, Engineering	
Director, Finance	
Director, Properties	

The following additional governance roles are performed for all projects with a forecast cost greater than $50 million:

- ***Executive Team:*** The Executive Team reviews the project to determine if the project is the appropriate response to the identified risk, issue or opportunity.

This review occurs at the end of the Identification Phase. The Executive Team also conducts a review at the end of the Definition Phase to determine whether the project is ready to proceed to the Implementation Phase, given the assessment of residual risks. This review supports the recommendation for approval to the Board of Directors;

- ***Capital Projects Committee:*** The Capital Projects Committee is one of the standing committees of BC Hydro's Board of Directors. This committee assists the Board of Directors in fulfilling its obligations and oversight responsibilities related to the delivery of capital projects. Specifically, this includes, but is not limited to, dam safety, the execution of long-term capital plans and budgets, project oversight and relationships with First Nations. For capital projects with a forecast cost greater than $50 million, the Committee reviews the status of capital projects during the Identification and Definition phases, reviews and recommends the preferred alternative for approval by the Board of Directors, following the completion of the Identification Phase, and reviews and recommends financial approval by the Board of Directors, before the start of the Implementation Phase. When making its recommendations to the Board of Directors, the Capital Projects Committee reviews potential impacts to Aboriginal rights and title as well as planned mitigations and considers whether, in moving forward with a project, BC Hydro's consultations with First Nations uphold the honour of the Crown. The Capital Projects Committee meets quarterly in conjunction with the Board of Directors Meeting; and
- ***Board of Directors:*** BC Hydro's Board of Directors is appointed by and accountable to the B.C. Government. The Board of Directors is responsible for safeguarding BC Hydro's resources by approving annual operating and capital budgets as well as individual capital projects with a forecast cost greater than $50 million. For these projects, BC Hydro has established processes in place to facilitate Board of Directors review and approval of the preferred alternative, following the completion of the Identification Phase, and financial approval, prior

to the start of the Implementation Phase. When considering approval, the Board of Directors reviews potential impacts to Indigenous peoples as well as planned mitigations and ensures that in moving forward with a project, the honour of the Crown is maintained.

In addition to the roles and responsibilities described above, the BCUC provides independent third-party review and approval of the need for projects greater than $100 million or of significant public interest, unless a project has been exempted by government regulation. The BCUC also reviews the status of projects through quarterly or semi-annual progress reporting, and may undertake a prudency review of projects, once implementation is complete.

6.4.8 We Use a Simplified Framework for Routine Power System Investments

The Program and Contract Management KBU is responsible for delivering less complex and repetitive Power System capital investments on BC Hydro's power system. The KBU is the single point of contact for the annual delivery of the maintenance and small capital investment portfolio that is developed and optimized by the Integrated Planning Business Group.

Approximately 26 per cent of planned capital investments in the Power System for fiscal 2020 to fiscal 2021 will be delivered by Program and Contract Management.

When the annual maintenance and small capital investment portfolio is received from the Integrated Planning Business Group, the Program and Contract Management KBU develops annual program and project delivery plans in collaboration with the KBUs in the Integrated Planning and Capital Infrastructure Project Delivery Business Groups. This includes consideration of First Nations and environmental issues. Internal resource commitments to deliver the work are obtained from the Engineering, Distribution Design and Customer Connect, Line Field Operations, Stations Field Operations and Construction Services KBUs. Contracting plans are then developed to deliver the balance of the portfolio. Internal

FTEs are used to deliver a significant volume of the small capital work, with external contractors being used to provide scalability due to fluctuations in demand. Additional discussion on how Program and Contract Management delivers work is provided in Chapter 5C, section 5C.4.

The capital investments delivered by Program and Contract Management are typically “like for like” replacements of assets or system upgrades that are based on pre-defined design standards, developed by BC Hydro’s Engineering KBU. Examples of capital investments delivered by the Program and Contract Management KBU include duct-bank construction, some end-of-life equipment replacement and overhead line relocations within an existing or public right-of-way. These investments are routine in nature, have a lower risk profile and require minimal, if any acquisition of property or rights of way. The standardized nature of these investments means that there are limited, if any alternatives to evaluate. Standard procedures are established to select the most feasible alternative when required.

These investments generally do not require specific equipment procurement and the required materials are typically inventoried by BC Hydro’s Materials Management department. When specialized services, equipment or materials are required, standing blanket services contracts or master purchasing agreements are used. Work is completed through unit-based contracts with external contractors.

The Program and Contract Management KBU applies a simplified version of the PPM practices that is suited to the lower complexity of the projects it delivers. For program investments that involve standardized units of work, the Program and Contract Management KBU applies simplified work management processes.

6.4.9 We Use a Standardized Process for Routine Customer Driven Work

The Distribution Design and Customer Connections KBU is responsible for work related to customer requests for new or upgraded connections to BC Hydro's distribution system. This KBU provides technical design services and project management for customer driven new connections work, under 5 MW in size. More complex projects over 5 MW or over $2 million in cost are managed by Program and Contract Management, with Distribution Design and Customer Connections providing design services. Approximately 16 per cent of the planned capital investments in the Power System for fiscal 2020 to fiscal 2021 will be delivered by the Distribution Design and Customer Connections KBU.

The Distribution Design and Customer Connections KBU designs to standards, with engineering support where required, and follows a project management structure that involves standardized work order packages, with environmental, archeological, safety and job planning processes and checklists. This simplified process enables project cycle times to align with customer requirements.

The Distribution Design and Customer Connections KBU issues approximately 5,000 work orders for new customer connections and 10,000 work orders for internal distribution growth and sustaining capital work programs each year. These work orders require design work and project coordination. A dedicated Express Connections Contact Centre within this KBU issues 35,000 express service orders per year. Express service orders are very simple customer connections which do not require design work.

While the Distribution Design and Customer Connections KBU plans for customer connections at a system level, individual customer connection projects depend on actual customer requests. Therefore, these projects are driven by customer timelines and are not planned in detail. Program volumes and characteristics are forecast based on historical trends. The staffing model for the Distribution Design and Customer Connections KBU includes full-time regular designers, full-time temporary designers and contractor engineering resources to provide flexibility and to balance internal work program and customer program demands so that customer requests are prioritized for delivery to the agreed in-service dates.

6.4.10 Financial Approval Policies and Procedures Apply to All Capital Investments

BC Hydro has well established Management and Accounting Policies (**MAPP**) and Procedures and Financial Approval Authority Policy (**FAAP**) that set funding approvals required for capital investments through each phase of the project lifecycle. These approval requirements and processes have been developed to balance financial controls with operational efficiency, based on the nature and risk of the capital investments. The policies and procedures apply to all groups delivering BC Hydro's capital investments.

6.4.10.1 Company-Wide Approval Policies Are Documented

The policies that govern capital investment approvals are primarily included in:

- Management and Accounting Policies and Procedures 1.2.31A (Expenditure Authorization Requirements Policy);
- Management and Accounting Policies and Procedures 1.2.3B (Expenditure Authorization Requirements Procedure); and
- Management and Accounting Policies and Procedures 1.2.1B.2 (Financial Approval Authority Procedure).

The required financial approval processes set out in these documents depend on the type of capital investment. Capital investments are categorized into the following four main categories for financial approval processes:

- Phased Capital Projects;
- Non-Phased Capital Projects;
- Recurring Capital Investments; and

- Expenditure Authorization Request Exempt Capital Investments.

The financial approval processes for each category are discussed further in the sections below.

6.4.10.2 Phased Capital Projects Require Phase-by-Phase Funding Approval

For capital projects which are delivered using PPM phases, funding approval is required prior to the commencement of work for that stage or phase. Typically, funding is approved only for the next stage or phase once the required work for the prior stage or phase has been completed. The financial approver level is dependent on the stage or phase as well as the funding amount being requested. For projects that meet the BCUC thresholds for Certificate of Public Convenience and Necessity (**CPCN**) and section 44 reviews, applications are generally submitted to the BCUC during the Definition Phase.

Table 6-11 below provides information on the funding approval process for phased capital projects, delivered by the Project Delivery KBU and Technology.

Table 6-11 Funding Approval Process for Phased Capital Projects (Project Delivery KBU)

Phase	Primary Budget	Estimate Accuracy Level	Funding Approval Documents	Project Approvers and Finance Review	Basis of Approval	FAAP Approver
Identification Phase (Needs Stage)	O&M (CPI)[304]	N/A	• Annual Release Plan from Capital Plan • Maximum request is generally $200,000	• Project Release Committee • No Finance Review	Amount requested	Director Project Delivery
Identification Phase (Conceptual Design stage)	O&M (CPI)	End of Stage provides +100% / -35%	• Statement of Objective (**SOO**) • If over $2M, business case and Expenditure Authorization Request (**EAR**) Form also prepared	• Project Sponsor • Project Initiator • No Finance Review unless requested amount is more than $2M	Based on cumulative O&M amount requested	Chief Operating Officer (**COO**): Up to $50M Others: 25% of FAAP Planning limit
Identification Phase (Feasibility Design Stage)	Capital	End of Stage provides +50% / -15%	• SOO • Business Case • EAR Form	• Gate Board • Project Sponsor • Project Initiator • Finance Review required	Based only on amounts requested going forward	COO: Up to $50M Others: 25% of FAAP Planning limit
Definition Phase	Capital	End of Stage provides +15% / -10%	• SOO • Business Case • EAR Form	• Gate Board • Project Sponsor • Project Approver • Finance Review required	Based on cumulative amount requested starting from Feasibility Design Stage	COO: Up to $50M Others: 25% of FAAP Planning limit
Definition Phase with Partial Implementation Phase costs (not including construction)	Capital	End of Stage provides + 15% / - 10%	• SOO • Business Case • EAR Form	• Gate Board • Project Sponsor • Project Initiator • Finance Review required	Based on cumulative amount requested starting from Feasibility Design Stage	COO: Up to $50M Others: 25% of FAAP Planning limit

304 CPI refers to Capital Project Investigation cost.

Phase	Primary Budget	Estimate Accuracy Level	Funding Approval Documents	Project Approvers and Finance Review	Basis of Approval	FAAP Approver
Partial Implementation Phase costs including construction	Capital	N/A	• SOO • Business Case or CPCN if applicable • EAR Form	• Gate Board • Project Sponsor • Project Initiator • Finance Review required	Based on cumulative amount requested starting from Feasibility Design Stage	Ultimate FAAP approver for total project estimate
Implementation Phase	Capital	N/A	• SOO • Business Case or CPCN if applicable • EAR Form	• Gate Board • Project Sponsor • Project Initiator • Finance Review required	Based on cumulative amount requested starting from Feasibility Design Stage	Ultimate FAAP approver for total project estimate

Table 6-12 below provides information on the general funding approval process for phased capital projects delivered by other KBUs.

Table 6-12 Funding Approval Process for Phased Capital Projects (Projects Delivered by Other KBUs)

Phase	Primary Budget	Estimate Accuracy Levels	Approval Documents	Project Approvers and Finance Review	Basis of Approval	FAAP Approver
Identification	O&M	N/A or Various	• SOO or business case or equivalent • EAR form (Technology)	• Business group dependent • Finance Review dependent on amount requested and type of capital	Amount requested or based on Total Project Estimate (Technology)	COO: Up to $50M Others: 25% of FAAP Planning limit
Definition	Capital	Various	• Business Case • EAR Form	• Business group dependent • Finance Review required	Cumulative amount being requested or based on Total Project Estimate (Technology)	COO: Up to $50M Others: 25% of FAAP Planning limit
Implementation	Capital	Various	• Business Case • EAR Form	• Business group dependent • Finance Review required	Total Project Estimate	Ultimate FAAP approver for total project estimate

6.4.10.3 Non-Phased Capital Projects Require Business Case and Authorization

Non-Phased Capital Projects are capital investments that are not delivered using project phasing but are similar to a one-time capital investment. Examples include the purchase of new equipment or office furniture. For Non-phased capital investments over $0.5 million, an approved business case and Expenditure Authorization Request (**EAR**) form are required prior to any capital spending. These authorization documents are approved based on the total investment amount, in accordance with BC Hydro’s Financial Approval Authority Policy guidelines.

6.4.10.4 Recurring Capital Investments are Approved Annually

Recurring Capital Investments are generally completed each year, on an ongoing basis. This work is generally lower risk, involving like-for-like unit replacements, such as the annual distribution wood pole replacement program. These investments are authorized at the beginning of each fiscal year using the Recurring Capital Annual Expenditure Authorization Form.

6.4.10.5 Approved Work Orders Are Required for Low Cost Recurring Capital Projects

Expenditure Authorization Request Exempt Capital Investments are recurring capital projects with a low cost and high volume. Examples include work activities to connect distribution customers, which are required under the Electric Tariff and less than $1 million in cost. These investments are operationally approved through BC Hydro’s Work Order system. A business case is required for any projects with a forecast cost of more than $1 million.

6.4.11 Our Project Delivery Practices Reflect Many Recent Improvements

The project delivery practices outlined above reflect a number of improvements that have been introduced over the past several years. Specifically, BC Hydro has:

- Created a PPM Governance Committee that is accountable for the ongoing sustainment, ongoing realization of benefits and continuous improvement of the PPM System, including prioritizing and implementing enhancements;
- Created a PPM Practices Development and Review Committee that is responsible for development and continuous improvement of the PPM Practices program and its contents, and for developing and implementing corrective actions as required. The committee reviews and endorses proposals for changes to practices, or for new practices, and ensures that all practices remain aligned and consistent;
- Created a Project Acceptance Guide to document the process used by the Project Delivery KBU to deliver capital projects in compliance with operating orders and commissioning procedures;
- Implemented a lessons learned procedure to identify opportunities to improve the delivery and outcomes of future projects. These lessons learned generally result in recommendations to alter a practice or procedure, address a knowledge gap or improve project delivery tools. Lessons learned are documented throughout the project lifecycle and a lessons learned meeting is conducted prior to a project being placed into service;
- Established Field Review Sub-Practice and Procedures to set out the processes, roles, responsibilities and documentation requirements for project design and construction teams;
- Integrated specific geotechnical risk management into the Engineering Design Practice which requires site investigations to be conducted early in the project

delivery process and planned, as appropriate, throughout the phases of the project lifecycle.

- Conducted Project and Portfolio Management compliance audits on a quarterly basis to assess whether projects are following Project and Portfolio Management practices;
- Implemented “One Report” an online tool to standardize project reporting, reduce the level of effort required to extract project data and create reports and enhance the ability of internal stakeholders to view consolidated and detailed project information;
- Implemented the “Project and Portfolio Management Communication Hub”, a central location where Practice, Procedure and Process changes and updates are communicated to those responsible for the delivery of capital projects; and
- Implemented a Portfolio Risk Adjustment approach, recognizing that different phases in the project lifecycle have different levels of schedule and cost variability. Portfolio Risk adjustments are discussed further in section 6.4.12 below.
- Established the PPM Scaling and Project Scaling models so that projects can continue to follow PPM’s single standard practice while allowing the project team to modify the practices on a project by project basis to more efficiently and effectively deliver smaller and simpler projects. Further information is provided in Chapter 5, section 5.4.5.1.
- Established the Single Project Acceptance Process to support a consistent process for transferring BC Hydro assets from the Capital Infrastructure Project Delivery Business Group to the Integrated Planning Business Group (responsible for maintenance) and the Operations Business Group (responsible for operations).

6.4.12 Forecast Capital Expenditures and Additions are Reduced to Account for Uncertainties

BC Hydro has applied a Portfolio Risk Adjustment to its fiscal 2020 to fiscal 2021 forecast capital expenditures and additions to account for the uncertainty in the schedule and cost of projects. As discussed in sections 6.4.7.5 to 6.4.7.8, the accuracy of forecast capital additions increases with the level of analysis and information on project scope, schedule and cost. Therefore, the largest uncertainties are associated with projects that are currently in early stages of the project lifecycle as their scope, schedule and cost are not as well defined as projects that are in later stages.

The Portfolio Risk Adjustment amount is calculated using a Monte Carlo simulation. A probability distribution is determined, based on historical project delivery performance information. The calculated Portfolio Risk Adjustment amount represents the difference (by fiscal year) between the expected value of the simulated portfolio forecast and the sum of individual project forecasts in the baseline Capital Plan.

As discussed in Chapter 7, section 7.8.2, any differences between the forecast and actual amortization of capital additions are captured in the Amortization of Capital Additions Regulatory Account. This means that the actual amount recovered from ratepayers is ultimately based on the actual capital additions.

6.4.13 Generation Capital Expenditures and Additions

Compared to the forecast in the Previous Application, BC Hydro is forecasting relatively stable expenditures over the test period on average. Forecast capital additions are lower due to the anticipated completion of two major projects in fiscal 2019, as discussed further below.

6.4.13.1 Summary of Generation Capital Expenditures and Additions

The Generation assets actual and planned capital expenditures and capital additions for fiscal 2017 to fiscal 2021 are presented in Table 6-13 and Table 6-14 respectively, below.[305]

Table 6-13 Generation Actual and Plan Capital Expenditures Fiscal 2017 to Fiscal 2021

($ millions)	F2017		F2018		F2019	F2019	F2020	F2021
	RRA	Actual	RRA	Actual	RRA	Forecast	Plan	Plan
Hydroelectric Generation								
Growth	20.0	21.2	2.4	10.2	0.7	4.0	3.2	-

6.4.13.2 Hydroelectric Generation Growth Projects - Expenditures and Additions Are Declining

Generation growth projects are to meet anticipated customer demand (Growth), or are improvements at existing generating stations to increase supply-side efficiency (also known as Resource Smart projects). Over the fiscal 2017 to fiscal 2021 period Hydroelectric Generation Growth capital expenditures and additions are generally decreasing due to the completion of the Mica Unit 5 and Unit 6 Additions project and the change in schedule of the Revelstoke Install Unit 6 project.

Table 6-15 below provides a summary of the fiscal 2020 to fiscal 2021 Growth capital additions and capital expenditures. More information on the project listed in Table 6-15 can be found in Appendix I, page 1, line 1 and Appendix J, page 1.

Table 6-15 Hydroelectric Generation Growth Projects - Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Growth				
G000594	Revelstoke Install Unit 6	-	-	0.6	-
	Projects & Programs Less than $5M	2.7	-	2.7	-
	Total Growth	**2.7**	**-**	**3.2**	**-**

Capital investments included in the Projects and Programs Less than $5 million line are related to project closeout costs for projects placed in-service in the prior test period.

6.4.13.3 Hydroelectric Generation Sustaining Projects Expenditures and Additions Are Declining

Generation redevelopment and rehabilitation projects are to redevelop facilities or significant elements of facilities that are at end of life.

Planned Redevelopment/Rehabilitation capital expenditures and additions over the test period have decreased from the fiscal 2017 to fiscal 2019 period due to the completion of a number of projects including the John Hart Generating Station Replacement and the Ruskin Dam Safety and Powerhouse Upgrade.

Some of BC Hydro's older facilities are relatively mature in their overall lifecycle and have a number of risks that need to be mitigated. These can include issues associated with the major generating equipment, auxiliary systems, buildings, water passages and large civil assets. In many cases, it is beneficial to coordinate risk mitigation activities under a single redevelopment or rehabilitation project rather than undertaking numerous separate projects. The resulting benefits of coordination include improved efficiency in project delivery, reduced project costs, shorter outages and a reduction in the complexity of project management oversight.

Table 6-16 below provides a summary of the fiscal 2020 to fiscal 2021 capital additions and capital expenditures. More information on the projects listed can be found in Appendix I, page1, lines 2 and 3 and Appendix J, page 3.

Projects and Programs Less than $5 million line are related to project closeout costs for projects placed in-service in the prior test period.

6.4.13.4 Dam Safety Projects

Dam Safety projects are focused on mitigating safety risks associated with dams and other water conveyance or retention infrastructure within a hydroelectric setting, as generally described in section 6.4.1.3.

Aging and normal wear and tear of our dams present constant challenges. BC Hydro's aim is to manage the whole fleet of dams so there is no significant deterioration in the risk position and the overall level of risk is kept well within limits considered to be tolerable. Whenever it is possible to make improvements or necessary to take remedial measures, BC Hydro first refers to international and Canadian best practices, seeking to achieve as large an increment to safety as possible, and at the very minimum, not to accept any reduction in the level of safety

306 Project A refers to a project which is confidential due to the sensitive commercial nature of the project information.

while work is in progress. BC Hydro seeks to balance the cost of each possible improvement against the added safety benefits it would achieve.

Table 6-17 below provides a more detailed breakdown of the fiscal 2020 to fiscal 2021 Dam Safety capital additions and capital expenditures that were summarized in Table 6-7 and Table 6-8. More information on the projects listed can be found in Appendix I, page 1, lines 4 to 22 and Appendix J, pages 5 to 25.

	Projects & Programs Less than $5M	10.3	6.7	12.3	7.2
	Total Dam Safety	**49.3**	**44.4**	**68.8**	**130.0**

Capital investments in the Projects and Programs Less than $5 million line include projects to install, replace or rehabilitate instrumentation in dams and to implement miscellaneous upgrades of water conveyances and gates.

Dam Safety capital expenditures decreased over the fiscal 2017 to fiscal 2019 period for two main reasons:

- Completion of a number of projects within the period, including GMS – W.A.C. Bennett Dam Spillway Chute Rehabilitation, GMS – W.A.C. Bennett Dam Riprap Upgrade and Hugh Keenleyside (**HLK**) - Spillway Gate Reliability Upgrade; and
- The initiation and early design progression of a number of large projects, for which the large capital expenditures associated with procurement and construction have yet to arise.

This portfolio of capital expenditures consists mainly of large multiple year projects and is therefore subject to fluctuations in year over year spend. The planned Dam Safety capital expenditures are expected to increase through the test period due to the advancement and increased levels of activity for these large projects.

Relatively high Dam Safety capital additions in fiscal 2018 and fiscal 2019 are due to the completion and the placing in-service of a number of projects within the period, as described above. Capital additions in fiscal 2020 and fiscal 2021 are expected to be lower because the majority of Dam Safety projects will be in various stages of design or construction during this period, with capital additions not expected until after fiscal 2021.

6.4.13.5 GMS-W.A.C. Bennett Dam Riprap Upgrade Stockpile Costs

On November 13, 2015, BC Hydro filed an application with the BCUC to upgrade the riprap on the W.A.C. Bennett Dam. The BCUC accepted the project's expenditure schedule with the exception of the costs associated with Maintenance and Emergency Stockpile (**MES**) of riprap. The BCUC directed that, in future revenue requirement applications, BC Hydro either confirm that no expenditures relating to emergency stockpile riprap are included in the revenue requirements or explain otherwise.[307] In August 2017, BC Hydro notified the BCUC that it was proceeding

[307] BCUC Order No. G-78-16, Appendix A, page 44.

with expenditures for the MES and would seek recovery of the costs in accordance with BCUC Order No. G-78-16.

BC Hydro believes that the MES costs are in the public interest and should be recovered in rates.

The actual cost for the riprap Stockpile was $0.7 million, which is $3.6 million less than the $4.3 million estimated in the November 13, 2015 application and the August 2016 update to the BCUC. BC Hydro was able to substantially reduce the cost by adjusting the size of the rock from Class 1 to Class 3 riprap and by reducing the total volume of rock required.

Based on lessons learned from the placement of the larger Class 1 riprap rock during the first season of riprap placement, BC Hydro determined it was preferable to use smaller rocks for both maintenance and emergency situations. Smaller rocks require equipment that is more readily available within a short timeframe and were produced from the waste material leftover from the quarrying Class 1 riprap rock. This meant that no further quarry expansion or blasting was required. As a result, the only incremental cost for the riprap stockpile was related to sorting the Class 3 rock and transporting it from the quarry to the stockpile area. This Class 3 rock would have otherwise been considered waste material.

After considering further engineering review and the decision to use smaller rock, BC Hydro determined that a reduced amount of rock would be sufficient for maintenance and emergency purposes. The final MES volume was 7,695 tonnes (~4,053 cubic meters) of smaller Class 3 riprap rock, which is approximately 50 per cent less than the 15,000 tonnes (~8,000 cubic meters of Class 1 riprap) included in the November 13, 2015 application.

BC Hydro believes that creating the riprap stockpile for maintenance and emergency purposes is prudent and provides good value to ratepayers. Specifically, this stockpile provides:

- **An inexpensive way to extend the life of the project** – The expected 50-year life of the riprap could be extended by 50 to 100 per cent with proper maintenance and repair, utilizing limestone rock from the MES. Any type of rock has natural variability, such as freeze/thaw splitting or breakage characteristics and a significant storm event could happen at any time, causing damage that could impact the underlying dam structure if it is not quickly identified and addressed. If BC Hydro was required to implement a reactive maintenance program, it would cost considerably more than $0.7 million;
- **Higher quality rock** – A pre-existing sandstone stockpile at the W.A.C. Bennett Dam is not acceptable for maintenance or emergency purposes. Sandstone riprap does not have the same life expectancy as limestone riprap[308] and repairs using sandstone riprap would require subsequent replacement in the future, ultimately leading to higher costs. A temporary fix, in an emergency situation, followed by a subsequent replacement project would also likely require reservoir re-operation which would result in lost revenue or higher energy costs from other sources;
- ***A Readily Available Source of Limestone Riprap*** – As the Riprap Upgrade project has now been completed, the quarry would need to be re-opened to acquire additional limestone rock, which would require additional permitting, consultation with First Nations, and securing a contractor willing to take on the relatively small production. This would likely take one to two years, or more, to complete. While there is a limestone quarry located 170 kilometres from the W.A.C. Bennett Dam, quarrying from this site would also require lengthy consultation, permitting and procurement processes; and
- ***Best practice for maintenance and emergency purposes*** – In 2018, BC Hydro polled the members of the Center for Energy Advancement through

[308] This is based on a 2013 internal engineering review of the suitability of Sand Flat Limestone and Portage Mountain East Sandstone riprap.

Technical Innovation (**CEATI**) Dam Safety Interest Group to confirm whether it was best practice to stockpile rock for maintenance and emergency purposes. BC Hydro received 20 responses, and all respondents, except for those that have ready access to emergency quarry supplies and transportation, indicated that they also maintain maintenance and emergency stockpiles and that this is considered best practice. BC Hydro does not have ready access to maintenance and emergency quarry supplies for the W.A.C. Bennett Dam.

Therefore, in this application, BC Hydro requests the BCUC approval of expenditures related to the MES of riprap for the W.A.C. Bennett Dam.

6.4.13.6 Generation Sustaining – Other Projects

Generation sustaining investments classified as Other Projects are initiated to mitigate or resolve key risks identified with existing assets. These investments can include:

- Projects to replace major generating equipment that is in Poor or Unsatisfactory condition;
- The replacement or upgrade of auxiliary equipment or facility infrastructure such as fire protection systems, Heating, Ventilating and Air Conditioning (**HVAC**) systems, piping systems, roofs, remote town site accommodation and cranes; and
- Projects to address safety and environmental risks or address regulatory compliance.

Sustaining-Other capital expenditures over the fiscal 2017 to fiscal 2021 period are generally increasing due to a large number of investments progressing through early project life-cycle phases. Capital additions fluctuate over the fiscal 2017 to fiscal 2021 period as projects from the previous test period are put in-service.

Table 6-18 below provides a summary of the fiscal 2020 to fiscal 2021 capital additions and capital expenditures. More information on the projects listed can be found in Appendix I, page 1 and 2, lines 23 to 84 and Appendix J, pages 27 to 66.

Table 6-18 Generation Sustaining-Other Projects - Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

	Total Sustaining - Other	**199.4**	**315.3**	**241.0**	**361.1**

Capital investments in the Projects and Programs Less than $5 million line include a large number of smaller less complex investments. In general, these are targeted sustaining investments for specific components or systems that support the generation of electricity. These investments can be broadly classified as follows:

- Auxiliary equipment and plant support systems such as crane and hoist upgrades/replacements, small recoating projects, control systems and instrumentation, pumps, diesels, field breakers, pressure vessels, transformer bushings, unwatering and drainage systems, air and water supply piping, station battery systems, communication upgrades;
- Building infrastructure and associated systems such as roof and HVAC replacements, elevator refurbishment, sanitary and fire protection system upgrades;
- Safety and security such as fall arrest, safe work platforms, arc flash hazards, fencing, signage, public access control and security system upgrades; and
- Environmental projects such as installing fish weirs at Duncan Dam.

6.4.13.7 Non-Integrated Areas – Investments to Sustain Existing Assets

All expenditures in fiscal 2020 to fiscal 2021 in Non-Integrated Areas are to sustain existing assets. Non-Integrated Areas are separate self-contained areas. Each area has its own source of generation (usually diesel generators), associated switchyard, support buildings and distribution network. As the assets age and deteriorate they need to be replaced so that a safe reliable level of service can be maintained to Non-Integrated Area customers. The sustaining investment projects and programs can be classified into the following categories:

- Genset replacements and overhauls;
- Fuel infrastructure upgrades;
- Communication & Control upgrades;
- Station building upgrades; and
- Line building replacements.

Table 6-19 Non-Integrated Areas Generation Projects - Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Non-Integrated Areas				
	Projects & Programs Less than $5M	7.9	5.8	8.7	5.0
	TOTAL Non-Integrated Areas	**7.9**	**5.8**	**8.7**	**5.0**

The forecast capital expenditures and additions are higher than fiscal 2017 to fiscal 2019 as a genset fleet modernization program is completed.

6.4.13.8 Thermal Generation Sustainment Investment

Thermal Generation investments mitigate or resolve key risks identified with existing Thermal Generation assets.

Table 6-20 below provides a summary of the fiscal 2020 to fiscal 2021 capital additions and capital expenditures.

Table 6-20 Thermal Generation Projects - Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Projects & Programs Less than $5M	3.8	6.1	6.6	4.5
	TOTAL Thermal	**3.8**	**6.1**	**6.6**	**4.5**

All Thermal Generation capital investments fall within the Projects and Programs Less than $5 million line. Projects over the test period include investments at Burrard, Fort Nelson and Prince Rupert for facility upgrades, roof replacement, and fire protection system upgrades.

6.4.14 Transmission and Distribution Assets Capital Expenditures and Additions

The actual and plan capital expenditures and additions for fiscal 2017 to fiscal 2021 for Transmission and Distribution, classified by Growth and Sustain categories are provided in Table 6-21 and Table 6-22 below.[309]

[309] Fiscal 2017 and fiscal 2018 variances greater than $10 million are described in Appendix G, section 5.

Table 6-21 Transmission and Distribution Actual and Plan Capital Expenditures Fiscal 2017 to Fiscal 2021

6.4.14.1 Transmission Planned Capital Expenditures and Additions

Transmission capital expenditures and additions include Substation Distribution Asset expenditures and additions. The Substation Distribution Asset costs are tracked separately, enabling the determination of transmission function costs for rate design and other purposes. Table 6-23 and Table 6-24 below provide functional details regarding the actual and plan capital expenditures and additions.[310]

[310] Fiscal 2017 and fiscal 2018 variances greater than $10 million are described in Appendix G, section 5.

6.4.14.2 Transmission Assets Growth Expenditures and Additions

Regional System Reinforcement

The regional transmission systems generally comprise a large portion of the 230 kV system and all of the 138 kV and 60 kV systems. Regional transmission systems include transmission facilities that service localized geographic areas. Transmission Growth projects at this level often involve the installation of additional regional capacity in order to support area load growth and maintain area supply reliability and can include upgrades of, and additions to, lines or substation equipment.

Table 6-25 below provides a summary of the plan capital additions and expenditures for fiscal 2020 to fiscal 2021. More information on the projects listed can be found in Appendix I, page 4, lines 1 to 8 and Appendix J, pages 67 to 80.

Table 6-25 Transmission Regional System Reinforcement Projects Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Regional System Reinforcement				
92525	Fort St. John and Taylor Electric Supply	-	53.4	21.1	3.2
900219	DVES: West End Strategic Property Purchase	80.7	0.0	3.0	0.0
92216	Peace Region Electric Supply (PRES)	-	-	66.1	56.2
93845	Metro North Transmission (MNT)	-	-	-	1.0
92423	Bridge River Transmission Project	-	-	1.7	7.5
94034	West Kelowna Transmission and Westbank Upgrade Projects	-	-	6.8	9.4
900266	East Vancouver - Substation Construction	-	-	3.8	9.1
900598	West End - Substation Construction and System Reinforcement	-	-	-	2.7
	Projects & Programs Less than $5M	3.1	4.8	5.4	2.0
	TOTAL Regional System Reinforcement	**83.8**	**58.2**	**107.9**	**91.1**

Capital investments in the Projects and Programs Less than $5 million line include project closeout costs for projects placed in-service in the fiscal 2017 to fiscal 2019 period, such as the Horne Payne Substation Upgrade project.

Regional System Reinforcement capital expenditures decrease over the fiscal 2020 and fiscal 2021 period from the fiscal 2017 to fiscal 2019 period due to the completion of some projects, such as the Horne Payne Substation Upgrade, the Kamloops Substation Project which were completed at the end of the previous test period, and the progression of on-going projects including the Peace Region Electric Supply Project and the Fort St. John and Taylor Electric Supply Project.

Capital additions vary over the fiscal 2017 to fiscal 2021 period as additions associated with the larger reinforcement projects tend to be lumpy. Capital additions are decreasing over the fiscal 2020 to fiscal 2021 period as newer projects progress through the earlier phases of the project lifecycle into implementation.

Bulk System Reinforcement

The bulk system comprises high voltage transmission lines and related equipment that interconnect the large remote generating stations in the Peace River and Columbia River areas with the major load centres in the Lower Mainland and on Vancouver Island. The bulk system includes the 500 kV transmission system, the transmission connections to Vancouver Island, and interconnections with other utilities through external and internal interties to FortisBC, Rio Tinto Alcan, Alberta and the U.S.

Table 6-26 below provides a summary of the fiscal 2020 to fiscal 2021 capital additions and capital expenditures. More information on the projects listed can be found in Appendix I, page 4, lines 9 to 11 and Appendix J, pages 82 to 86.

Table 6-26 Transmission Bulk System Reinforcement Projects Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Bulk System Reinforcements				
90957	Peace to Kelly Lake Capacitors	-	-	11.5	41.1
900992	Lower Mainland - Capacitive and Reactive Power Reinforcement	-	-	-	0.4
901251	Interior to Lower Mainland - Remedial Action Schemes Installation	-	-	-	0.8
	Projects & Programs Less than $5M	0.1	-	0.5	1.0
	TOTAL Bulk System Reinforcements	**0.1**	**-**	**12.0**	**43.3**

The trend in Bulk System Reinforcement capital expenditures and additions over the fiscal 2017 to fiscal 2021 period is relatively stable, with the exception of fiscal 2018 expenditures and fiscal 2019 additions, due to increased costs of the Interior to Lower Mainland Transmission Line project. Capital expenditures increase over fiscal 2020 to fiscal 2021 due to the Peace to Kelly Lake Capacitors Project.

Station Expansion and Modifications

Station expansion and modification projects replace, upgrade, or add capacity to existing substations to alleviate operational constraints or limitations resulting from local load growth. These projects impact transmission and distribution assets within the substation, and may involve installing additional transformer capacity, adding switchgear, converting to higher voltages, and reconfiguring existing facilities to accommodate increased capacity requirements.

Table 6-27 below provides a summary of the capital additions and capital expenditures for the test period. More information on the projects listed can be found in Appendix I, page 4, lines 12 to 16 and Appendix J, pages 87 to 95.

Table 6-27 Station Expansion and Modification Projects Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Station Expansion & Modification				
93788	Capilano Substation 25Kv Conversion	-	-	1.9	6.0
92907	Mount Lehman Substation Upgrade	-	-	7.3	9.6
92910	Clayburn Substation Upgrade	-	-	1.5	5.2
93632	Project B (Substation)	-	-	0.2	0.0
900816	Pemberton - Substation Upgrade	-	-	-	0.5
	Projects & Programs Less than $5M	2.5	0.5	1.0	1.1
	TOTAL Station Expansion & Modification	**2.5**	**0.5**	**11.9**	**22.5**

Capital investments included in the Projects and Programs Less than $5 million line include closeout costs associated with projects put in-service in the prior test period such as the Arnott Capacity Upgrade, Campbell River Substation Capacity Upgrade, and the South Surrey Area Reinforcement project.

As early phase projects such as Mount Lehman Substation Upgrade, Clayburn Substation Upgrade, and the Capilano Substation 25 kV Conversion progress, the expenditures will start to increase in fiscal 2021. The relatively higher capital additions in fiscal 2018 are due to in-service additions from projects including the Fernie Substation Upgrade and Big Bend Substation.

Feeder Position/Section Additions

Feeder positions and feeder sections are located within substations and supply the interface between the substation and the distribution system for BC Hydro's distribution connected customers. These projects provide additional capacity for distribution customer load growth or for increased operational flexibility.

Table 6-28 Feeder Position/Section Additions Projects Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Feeder Positions / Section Additions				
	Projects & Programs Less than $5M	2.5	0.2	1.6	2.1
	TOTAL Feeder Positions / Section Additions	**2.5**	**0.2**	**1.6**	**2.1**

All Feeder Positions/Section Additions investments within the test period are included in the Projects and Programs Less than $5 million line. Station Expansion and Modifications projects, such as the Mount Lehman Substation Upgrade and the Capilano Substation 25 kV Conversion will also address additional feeder position requirements within the test period.

Generator Interconnections

Generator interconnection projects involve the design and construction of facilities that are required to connect and integrate generation projects to the existing transmission system. The Open Access Transmission Tariff (**OATT**) governs the generator interconnection process, and defines the cost responsibilities between BC Hydro and the generator.

For a new generator the interconnection facilities can range from a simple transmission tap onto an existing transmission circuit, a transmission line termination at an existing switching station / substation, or a new switching station / substation. Associated protection, control, and communication facilities are also usually built. To integrate a generator into a regional network BC Hydro may also need to reinforce the existing transmission lines to enable higher energy flows.

To determine the scope of upgrades required for a project, BC Hydro will perform a series of interconnection studies that identify impacts to the transmission system and the required network upgrades. Under the OATT, the customer is responsible to bring their system to the BC Hydro transmission system, which includes designing, procuring and funding their interconnection facilities. BC Hydro is responsible to design, procure, construct and fund the network upgrades within the BC Hydro transmission system. The customer is required to provide security for the estimated cost of the network upgrades, which is returned over time to the customer per the tariff.

Until recently, the majority of new IPP interconnections resulted from BC Hydro's Standing Offer Program. The program limited the funding BC Hydro provided for network upgrades to a pre-determined threshold amount. The forecasts for interconnection costs for projects already in the program include only the estimated network upgrade costs up to the threshold. They do not include the costs of the network upgrade above the threshold.

Table 6-29 below provides a summary of the plan capital additions and capital expenditures for fiscal 2020 to fiscal 2021. More information on the projects listed can be found in Appendix I, page 4, line 17.

Table 6-29 Generator Interconnection Projects Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Generation Interconnections				
900626	Bremner-Trio Hydro Project	-	7.3	4.1	0.7
	Projects & Programs Less than $5M	1.2	3.0	0.9	2.9
	TOTAL Generation Interconnections	**1.2**	**10.3**	**5.1**	**3.6**

Only those projects with a high probability of proceeding are included as individual projects in the capital forecast.

Transmission Load Interconnections

Transmission Load Interconnection projects involve the design and construction of facilities to connect and supply new transmission loads or to supply an increase in load at an existing transmission customer's facility. Tariff Supplement No. 6 governs the interconnection and supply of these new transmission loads, including assigning responsibilities to BC Hydro customers as to who is responsible to design, build, operate, own and pay for the various facilities required to interconnect and supply a new load.

For a new transmission load customer the interconnection facilities can range from a simple transmission tap onto an existing transmission circuit, a transmission line termination at an existing switching station/substation, or a new switching station/substation and associated protection, control and communication facilities. In addition to the interconnection facilities, BC Hydro may also need to reinforce the existing transmission system to increase the load supply capabilities.

BC Hydro performs a series of interconnection studies to determine the scope of any interconnection facilities required, the potential impacts on the transmission system, and system reinforcements required to supply the new transmission load. These studies are funded by the customer.

Under Tariff Supplement No. 6, the customer is responsible to design, build, own, operate, and pay for the transmission line from their plant to the BC Hydro transmission system. BC Hydro is responsible to design, build, own, and operate the interconnection facilities; however the customer is required to pay for these facilities and this payment is reported as Contribution in Aid, which is discussed further in section 6.4.14.3, page 6-122. BC Hydro is also required to design, build, own, and operate the transmission system reinforcements and BC Hydro provides a revenue offset towards these system reinforcements as stipulated in Tariff Supplement No. 6. If the estimated future revenues cover the costs of the system reinforcements, the customer is required to provide security for the estimated amount of the system reinforcement up front. If the estimated future revenues do not cover the full cost of the system reinforcement then the customer is required to provide security in the amount of the maximum offset allowable and a cash payment for the difference between the estimated cost of the system reinforcement and the maximum offset amount.

Table 6-30 below provides a summary of the capital additions and capital expenditures for the test period. More information on the projects listed can be found in Appendix I, page 4, lines 18 to 21.

Table 6-30 Transmission Load Interconnections Projects Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Transmission Load Interconnections				
94003	UBC Load Increase Stage 2	-	-	17.8	15.0
900861	Customer A	4.6	0.4	3.2	0.4
93786	Customer B	-	-	28.2	26.6
900836	Customer C	-	15.3	8.9	4.3
	Projects & Programs Less than $5M	3.2	0.4	0.6	0.0
	TOTAL Transmission Load Interconnections	**7.8**	**16.1**	**58.7**	**46.3**

Customer driven interconnection projects include commercially sensitive information, and therefore the names of the specific Transmission Load Interconnection projects are filed in confidence with the BCUC.

6.4.14.3 Transmission Sustaining Expenditures and Additions

Circuit Breakers

Circuit breakers are used to isolate sections of the transmission and distribution system and to interrupt high currents under fault conditions. They are the primary protection device on the transmission and distribution system and must be capable of reliably interrupting both load currents and fault currents. The system currently has over 3,900 circuit breakers made up of a variety of different equipment in terms of voltage classes (from 4 kV to 500 kV).

The planned expenditures for the test period are for the replacement of individual circuit breakers and circuit breakers within a station. The timing of the replacements is based on condition, failure rates and risk to the system. Refurbishment of circuit breakers is considered but usually not possible due to obsolescence.

Table 6-31 below provides a summary of the capital additions and capital expenditures for the test period. More information on the projects listed can be found in Appendix I, page 4, lines 22 and 23 and Appendix J, page 97.

Table 6-31 Circuit Breaker Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Circuit Breakers				
900765	BND 60kV CB and Relay Building Replacement	12.5	0.1	0.9	0.1
900243	SPG Metalclad Switchgear Replacement	-	-	2.4	17.2
	Projects & Programs Less than $5M	15.5	11.2	13.1	10.9
	TOTAL Circuit Breakers	**28.0**	**11.3**	**16.3**	**28.2**

Capital investments included in the Projects and Programs Less than $5 million line include closeout costs for program related work from the prior test period and individual replacements bundled, based on a program delivery approach. The programs are bundled by either voltage class, medium and high voltage, or by type, such as metalclad. In some cases there are specific projects to address circuit breaker risks. The fiscal 2020 to fiscal 2021 planned level of capital expenditures and additions for circuit breakers programs are generally lower than the fiscal 2017 to fiscal 2019 period due to the shift towards replacing lower voltage breakers which generally have a lower unit cost.

Other Power Equipment

Other power equipment expenditures are for the replacement or refurbishment of disconnect switches, surge arrestors, power transformers, instrument transformers, shunt reactors, shunt capacitors, synchronous condensers, high-voltage direct current systems, series capacitor stations, cable terminations, and load tap changers. Table 6-32 below provides a summary of the capital additions and capital expenditures for the test period. More information on the projects listed can be found in Appendix I, page 4 and 5, lines 24 to 40 and Appendix J, pages 98 to 108.

Table 6-32 Other Power Equipment Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Other Power Equipment				
92073	500kV Capacitor Bank P&C Upgrades	-	-	4.4	2.8
900575	Barnard 50/60 Feeder Section Replacement	-	-	7.2	12.1
92166	SC Excitation Systems Upgrade - VIT/KLY	-	-	1.9	1.9
93700	Synch Condensor Functional Imp - F17/F18	-	-	2.7	2.8
92618	VIT & KLY Hydrogen Gas Sys - Safety Upg	-	-	1.7	1.8
900247	BR1 T3 & BRT T4A Replacement	-	18.8	2.4	15.2
900564	Hundred Mile House T1/T2 EOL Replacement	-	-	0.7	2.7
93731	JOR T1 & T2 Replacement	-	-	7.8	14.7
93705	KI1 60Kv Renovatin, 4Kv decommission & control room	-	-	0.8	2.0
92478	Mainwaring Station Upgrade	-	-	5.1	5.7
900152	Natal Sub - NTL 60-138 kV Rebuild	-	-	0.8	1.4
92479	Newell Substation Upgrade	-	-	0.6	2.5
900884	Peace Region to Kelly Lake - Reactor Replacement (Phase 1)	3.6	9.3	4.4	10.5
94081	Ah-sin-heek - Substation Replacement	-	-	0.1	2.1
901034	Norgate - Substation Upgrade	-	-	-	0.5
92759	Patricia - Substation Upgrade	-	-	0.3	5.9
900185	Peace Region to Kelly Lake - Reactor Replacement (Phase 2)	-	0.6	-	0.7
	Projects & Programs Less than $5M	18.3	21.8	22.5	19.1
	TOTAL Other Power Equipment	**21.9**	**50.4**	**63.5**	**104.6**

Capital investments included in the Projects and Programs Less than $5 million line include a number of smaller capital investments such as the Dunsmuir Substation Synchronous VAR Control Upgrade, Fort St. James No. 2 Substation DVAR Upgrade, and Sandspit Substation Replacement, as well as programs to address the replacement of disconnects, instrument transformers, metering kits and substation voltage regulators.

Capital expenditures during the test period increase compared to the previous test period mainly due to the progression of integrated projects initiated to address the replacement of multiple power equipment and circuit breakers within a station. Examples of these integrated projects with expenditures in the test period are the Barnard 50/60 Feeder Section Replacement and the Jordan River T1 and T2

Replacement project. The increase in capital additions in fiscal 2021 is mainly due to the Bridge River-T3 (**BR1 T3**) and Bridge River-T4A (**BRT T4A**) Replacement project.

Protection and Control

Protection and Control expenditures are for the replacement of end of life protective relaying and control systems at substations. Protection and Control assets isolate transmission equipment from electrical faults, ensure stability and reliability of the power system, and provide local and remote control and monitoring of the transmission system. Table 6-33 below provides a summary of the fiscal 2020 to fiscal 2021 capital additions and capital expenditures. More information on the projects listed can be found in Appendix I, page 5 lines 41 to 43 and Appendix J, page 109.

Table 6-33 Protection and Control Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Protection and Control				
900625	NERC CIPv5 Compliance at Medium Impact T&D Stations	-	-	3.4	3.5
900250	Control PLC984 and RTU Replacement (WSN)	-	-	3.1	1.7
93687	Control Systems Upgrade (GMS)	-	-	0.6	3.2
	Projects & Programs Less than $5M	11.2	13.1	11.3	7.7
	TOTAL Protection and Control	**11.2**	**13.1**	**18.4**	**16.3**

The majority of the Protection and Control expenditures in the test period are within the Projects and Programs Less than $5 million line. Expenditures within this category include programs to replace end of life Protection and Control assets in various substations including Supervisory Control and Data Acquisition Remote Terminal Units, digital fault recorders and protection relays.

Capital expenditures and additions are increasing in fiscal 2020 and fiscal 2021 in comparison to the fiscal 2017 to fiscal 2019 test period. The majority of the Protection and Control expenditures over the test period are related to the North American Electric Reliability Council Critical Infrastructure Protection v5 (**NERC CIP v5**) Compliance at Medium Impact Transmission Stations Project and the programs needed to replace an aging fleet of end of life Protection and Control assets.

Stations Auxiliary Equipment

Auxiliary equipment expenditures are for the replacement of station equipment used to support the power system, including station cables, bus work and insulators, steel and wood pole structures, equipment foundations, grounding systems, station power supplies, batteries and chargers, air compressors and dryers, buildings and Heating, Ventilating and Air Conditioning (**HVAC**) equipment, perimeter fences, drainage systems, and gravel. Table 6-34 below provides a summary of the fiscal 2020 to fiscal 2021 capital additions and capital expenditures. More information on the projects listed can be found in Appendix I, page 5, lines 44 to 53.

Table 6-34 Station Auxiliary Equipment Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Stations Auxiliary Equipment				
900787	Wood Pole Substation Rep - MTE	5.3	-	2.9	-
900788	Wood Pole Substation Rep - PSN	5.2	-	2.6	-
93690	Stn Service Transfer & AC panels - WSN	10.4	-	0.2	-
93685	Wood Pole Substation Rep - BTA	-	5.9	3.8	0.1
900726	Joseph Creek (JOE) Substation Upgrade	-	-	0.5	6.2
901244	Cathedral Square - Substation HVAC Upgrade	-	-	-	0.5
900724	Woss - Substation Wood Pole Replacement	-	0.1	-	0.1
901045	Canal Flats - Substation Wood Pole Replacement	-	-	-	0.1
901048	Lumby #2 - Substation Wood Pole Replacement	-	-	0.1	3.2
901049	Skookumchuck - Substation Wood Pole Replacement	-	0.0	-	0.1
	Projects & Programs Less than $5M	19.1	20.8	15.6	19.6
	TOTAL Stations Auxiliary Equipment	**40.1**	**26.8**	**25.6**	**29.8**

Capital investments in the Projects and Programs Less than $5 million line include program expenditures to replace substation wood poles, cables, insulators, diesels, building roofs and battery banks. In addition to the programs there are specific projects to address fire risk reduction at Nicola and Dal Grauer substations.

Station Auxiliary Equipment capital expenditures are consistent across the fiscal 2017 to fiscal 2021 period. Capital additions have increased in the test period compared to the fiscal 2017 and fiscal 2019 period due to an increase in Substation Wood Pole Replacement projects and program expenditures.

Stations Risk Mitigation

The Stations Risk Mitigation expenditures address safety, seismic, environment, severe weather and security risks. Each risk is evaluated based on business impact (e.g., reliability, financial, environmental, safety) and probability of occurrence to determine the appropriate magnitude and duration of investment that is required to mitigate the risk. Table 6-35 below provides a summary of the capital additions and capital expenditures in the test period. More information on the projects listed can be found in Appendix I, page 5, lines 54 and 55.

Table 6-35 Station Risk Mitigation Plan Capital Expenditures and Additions Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Stations Risk Mitigation				
92158	Oil Spill Containment - F17/F18 (ALZ / MDN)	-	7.2	2.5	3.6
900766	Project C	-	4.2	3.1	1.1
	Projects & Programs Less than $5M	4.0	8.6	7.3	5.3
	TOTAL Stations Risk Mitigation	**4.0**	**20.0**	**12.9**	**10.0**

Capital investments in the Projects and Programs Less than $5 million line include programs for fire protection, security and seismic upgrades, at various substations.

Stations Risk Mitigation capital expenditures are increasing in fiscal 2020 and fiscal 2021 in comparison to the previous test period. This is primarily attributable to Station Seismic Upgrades in the Projects and Programs Less than $5 million line, and Project C which is a confidential project due to the sensitive commercial nature of the project information.

Telecommunications

BC Hydro operates a telecommunications network to support operation of the transmission, distribution, and generation systems, as well as voice communications for staff in the field. The telecommunications expenditures are for the replacement of telecommunication infrastructure including microwave radio, power line carrier, fibre optic cable, and VHF/UHF radio. Table 6-36 below provides a summary of the capital additions and capital expenditures in the test period. More information on the projects listed can be found in Appendix I, page 5, lines 56 to 61 and Appendix J, pages 111 and 112.

Table 6-36 Telecommunication Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Telecommunications				
92183	Vancouver Island Radio System	-	21.5	9.6	1.9
92863	Underrated Telecom Classifications - NTL	5.3	0.0	3.1	0.0
92758	CPM MW Repeater Building Rep	-	5.1	2.0	1.4
900709	Various Sites - Telecom Analog Private Line Replacement	0.3	2.3	0.4	2.8
93739	Fraser Valley - Telecom System Reliability Upgrade	-	-	0.5	4.0
92768	Various Sites - Telecom MPLS and DACS Upgrade	-	-	2.1	10.6
	Projects & Programs Less than $5M	8.0	8.5	7.7	4.3
	TOTAL Telecommunications	**13.6**	**37.4**	**25.4**	**25.1**

Capital investments in the Projects and Programs Less than $5 million line include programs to address microwave tower corrosion, and telecom battery, charger and power line carrier LMU replacements

Telecommunication capital expenditures increase across the fiscal 2017 to fiscal 2021 period. This is mainly due to the Vancouver Island Radio System Replacement Project and the program Various Telecom MPLS and DACS Upgrades. Capital additions are increasing in fiscal 2020 and fiscal 2021 in comparison to the fiscal 2017 to fiscal 2019 period due to the CHP MW Repeater Building Replacement and the Vancouver Island Radio System Replacement Project.

Cable Sustainment

Underground and submarine cables are generally used where overhead lines are not feasible or where there is a particular requirement of the site to use cables. There are over 400 km of underground or submarine cables on the transmission system. Most of these circuits are located in Vancouver, Burnaby, Coquitlam and Victoria, and include 69 kV, 138 kV, 230 kV and 500 kV voltage levels. These circuits also include the Strait of Georgia crossings from the mainland to Vancouver Island. Cable sustainment expenditures are for the replacement of cables and ancillary equipment (e.g., pumping equipment and duct banks). Table 6-37 below provides a summary of the capital additions and capital expenditures in the test period. More information on the projects listed can be found in Appendix I, page 5, lines 62 and 63 and Appendix J, pages 113 to 115.

Table 6-37 Cable Sustainment Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Cable Sustainment				
901002	2L146 - Cable Replacement	-	-	1.0	1.6
94057	Gulf Islands - Transmission Reinforcement	-	-	-	5.3
	Projects & Programs Less than $5M	4.1	2.3	4.1	2.0
	TOTAL Cable Sustainment	**4.1**	**2.3**	**5.0**	**8.9**

Capital investments in the Projects and Programs Less than $5 million line account for the majority of the Cable Sustainment expenditures over the test period. Investments included in this line item are programs to address cable instrumentation upgrades, submarine cable inspections, and pumping plant refurbishments.

Capital additions are consistent across the fiscal 2017 to fiscal 2021 period.

Overhead Lines Life Extension

The overhead transmission network consists of conductor systems, metal support structures, wood poles, and associated equipment which includes spacer dampers, aircraft warning markers, and disconnect switches. The overhead network has over 18,400 km of transmission lines. These circuits include approximately 23,000 metal support structures and approximately 116,000 wood poles. Overhead lines life extension expenditures cover the replacement or refurbishment of line components.

Table 6-38 below provides a summary of the capital additions and capital expenditures in the test period. More information on the projects listed can be found in Appendix I, page 5, lines 64 to 67 and Appendix J, page 116.

Table 6-38 O/H Lines Life Extension Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	O/H Lines Life Extension				
91224	Copper Conductor Replace - Phase 2	10.6	-	0.3	-
92840	Circuit Refurbishments - F15 - 2L13/14	-	-	2.7	9.9
94035	5L63 Telkwa Relocation	-	-	3.3	12.2
900889	2L048 - Long Span Crossing Refurbishment	0.1	0.2	0.1	0.2
	Projects & Programs Less than $5M	38.4	41.6	39.2	47.8
	TOTAL O/H Lines Life Extension	**49.1**	**41.8**	**45.5**	**70.1**

The majority of the expenditures within the Overhead Lines Life Extension category fall within the Projects and Programs Less than $5 million line. These investments are mainly structured as programs that target assets across all regions of the province. The programs include the replacement of transmission anchor rods, crossing markers, spacer dampers, line disconnect switches, and insulator replacements. The largest of these programs is devoted to wood structure and framing replacements, which includes pole replacements, bracing and crossarms.

Overhead Lines Life Extension capital expenditures increase from fiscal 2019 to fiscal 2021, while capital additions over the same period decrease. This is due to larger projects such as the 5L63 Telkwa Relocation, and the 2L13/14 Circuit Refurbishment projects progressing through the earlier project lifecycle phases, with in-service dates beyond the test period.

Overhead Lines Performance Improvement

Investments in this category are to address transmission lines subject to localized weather conditions causing performance issues. This work is intended to bring the line back to its designed reliability level. Examples include local sections subject to unequal ice loading, high instances of lightning strikes, or salt fog. Currently, the focus of the expenditures is on reducing lightning caused outages by installing transmission arcing horns. Table 6-39 below provides a summary of the capital additions and capital expenditures in the test period.

Table 6-39 O/H Lines Performance Improvement Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	O/H Lines Performance Improvement				
	Projects & Programs Less than $5M	1.4	1.4	1.4	1.4
	TOTAL O/H Lines Performance Improvement	**1.4**	**1.4**	**1.4**	**1.4**

For the fiscal 2017 to fiscal 2021 period, expenditures within the Overhead Lines Life Performance Improvement are for the installation of arcing horns. Capital expenditures and additions are decreasing over the fiscal 2019 to fiscal 2021 period, due to an intentional delay within the program to allow for an engineering review in advance of the installations.

Overhead Lines Risk Mitigation

The Overhead Lines Risk Mitigation program addresses issues and potential events which could put the system at risk of a prolonged outage or pose safety concerns. Currently, the focus is on reducing the risk to public safety and operating concerns associated with deficient transmission line to ground clearances. Civil protective work to protect transmission structures against flooding and slides are also addressed under this program. Table 6-40 below provides a summary of the capital additions and capital expenditures in the test period. More information on the projects listed can be found in Appendix I, page 5, line 68.

Table 6-40 O/H Lines Risk Mitigation Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	OH Lines Risk Mitigation				
901242	2L101 - Structure 67/1 Permanent Restoration	-	6.5	6.0	-
	Projects & Programs Less than $5M	16.2	3.7	4.7	3.6
	TOTAL OH Lines Risk Mitigation	**16.2**	**10.2**	**10.7**	**3.6**

Capital investments in the Projects and Programs Less than $5 million line include programs to address the replacement of automatic splices, civil protective works, and the refurbishment of overhead guy wires.

Capital additions and expenditures are generally decreasing over the fiscal 2019 to fiscal 2021 period. There are slight increases in the fiscal 2018 capital expenditures and the fiscal 2019 capital additions, which is mainly due to the 1L377 Rating Restoration project, and the 60L210 Rating Restoration project.

Rights-of-Way Sustainment

BC Hydro is responsible for managing the rights-of-way and infrastructure that allow access to the power system, including over 16,000 km of resource roads. This includes roads located along BC Hydro's corridors where BC Hydro is the sole maintainer, and also includes industry-maintained roads leading to the Power System facilities where BC Hydro has shared obligations for road maintenance (such as forest service roads, telecom station roads, and other types of permit roads on Crown land). The Rights-of-Way Sustainment program restores roads in poor condition, and replaces road structures if required (such as bridges, gates, culverts, and retaining walls). The program also acquires and renews legal status of rights-of-way for overhead transmission lines throughout the province.

Table 6-41 below provides a summary of the capital additions and capital expenditures in the test period.

Table 6-41 ROW Sustainment Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	ROW Sustainment				
	Projects & Programs Less than $5M	19.3	9.8	9.7	9.8
	TOTAL ROW Sustainment	**19.3**	**9.8**	**9.7**	**9.8**

All of the Rights-of-Way (**ROW**) Sustainment investments within the test period are included in the Projects and Programs Less than $5 million line. These investments include programs for access repairs and rights acquisition, as described above. Capital expenditures for access related investments are consistent over the fiscal 2017 to fiscal 2021 period. Fluctuations within this category are largely due to rights acquisitions.

Third-Party Requested Transmission Line Relocations

Third-party requested line relocations are expenditures initiated when BC Hydro enters into an agreement with a third-party who wishes to have transmission lines relocated. With the exception of relocations requested by the Ministry of Transportation and Infrastructure for highway rerouting or improvement projects, the third-party will pay for all costs incurred, resulting in an offsetting Contributions in Aid of construction for the capital expenditure. For these projects, BC Hydro recovers costs from the Ministry based on the BC Hydro and Ministry of Transportation and Infrastructure protocol agreement. Under this protocol agreement, BC Hydro recovers approximately 50 per cent of the costs incurred for the relocation of 69kV transmission lines. This cost sharing arrangement recognizes the benefit of rights-of-way provided to BC Hydro by the Ministry of Transportation at no cost. Costs for the relocation of transmission lines greater than 100 kV are recovered from the Ministry at full direct cost. BC Hydro may also relocate transmission lines where legally or contractually obligated.

Table 6-42 below provides a summary of the fiscal 2020 to fiscal 2021 capital additions and capital expenditures.

Table 6-42 Third-Party Requested Transmission Line Relocations Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Third Party Requested Transmission Line Relocations				
	Projects & Programs Less than $5M	9.0	9.8	10.0	7.8
	TOTAL Third Party Requested Transmission Line Relocations	**9.0**	**9.8**	**10.0**	**7.8**

All of the Third-Party Requested Transmission Line Relocations investments in fiscal 2020 to fiscal 2021 are included in the Projects and Programs Less than $5 million line. As the number of requests from third-parties can vary between fiscal years, a provision, based on historical averages, is included within the capital plan to account for future requests.

Contributions in Aid

Contributions in Aid are periodic or lump-sum payments or consideration received from customers or third-parties to provide funding towards the cost of construction or acquisition of an asset where the ownership, operation and maintenance responsibilities remain with BC Hydro. Contributions in Aid is further discussed in the Customer Requested Projects and Third-Party Requested Transmission Line Relocations sections above.

Transmission Contributions in Aid amounts are forecast to increase in fiscal 2020 and then decrease in fiscal 2021 due to the timing of expected payments associated with Transmission Load Interconnection projects listed in Appendix I, page 4, lines 18 to 21.

Transmission Contributions in Aid additions are forecast to increase over the test period due to the planned completion of a number of interconnections and Third-Party Requested Transmission Line Relocation projects in fiscal 2021.

6.4.15 Distribution Capital Expenditures and Additions

The Distribution actual and planned capital expenditures and additions for fiscal 2017 to fiscal 2021 are provided in Table 6-43 and Table 6-44, below.[311]

[311] Fiscal 2017 and fiscal 2018 variances greater than $10 million are described in Appendix G, section 5.

Table 6-43 Distribution Actual and Plan Capital Expenditures Fiscal 2017 to Fiscal 2020

6.4.15.1 Distribution Growth Capital Expenditures and Additions

Customer Driven Expenditures

Customer driven expenditures include expenditures to connect residential and commercial load customers (approximately 5,000 design connections and 35,000 simple “express” connections annually), major distribution loads (defined as greater than 5MVA and/or $2 million in interconnection costs) and distribution voltage IPP projects.

Customer driven expenditures are forecast based on historical levels while additions are forecast based on the assumption that most expenditures are capitalized in the year they are incurred. The Customer Capital program is driven by customer connection requests that are “unplanned” projects. The level of economic activity in the province is the single largest influence on the customer capital expenditures.

Housing starts, infrastructure investment, and new industries such as cannabis grow operations have contributed to an unprecedented construction boom over the last three years and therefore unprecedented volumes of distribution customer connection requests. Simple express connections volumes, which are a good indicator of overall customer activity, have risen from 25,536 requests in 2015 to 36,413 in 2018. This has resulted in a customer capital program that is seeing atypical growth year upon year, with customer capital expenditures growing from $170.49 million in fiscal 2016 to a forecast of $234 million in fiscal 2019. Cost increases for materials and civil labour also contribute to higher expenditures.

Annual capital additions are forecast to increase in fiscal 2020 to fiscal 2021 from $232 million to $234 million. Annual capital expenditures are forecast to increase in the test period from $227 million to $239 million due to adjustments for inflationary effects on labour and materials.

There are currently five known customer driven projects greater than $5 million with expenditures in the test period, and the projects are listed in Table 6-45 below. More information on the projects listed can be found in Appendix I, page 7, lines 1 to 5.

Table 6-45 Customer Driven Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Customer Driven

DY-1563	Customer E	-	5.1	3.3	1.7
DY-0981	Customer F	8.8	-	-	-
901241	Customer G	-	8.0	6.2	1.6
DY-1545	Customer H	-	-	3.5	1.8
	Projects & Programs Less than $5M	217.7	220.1	213.1	228.9
	TOTAL Customer Driven	**226.5**	**239.3**	**231.9**	**234.0**

System Expansion and Improvement - Growth

Growth driven system expansion and improvement expenditures address existing capacity constraints and anticipated load growth. BC Hydro is undertaking several projects to increase the capacity and transfer load at the highest risk locations. Table 6-46 below provides a summary of the fiscal 2020 to fiscal 2021 capital additions and capital expenditures. More information on the projects listed can be found in Appendix I, page 7, lines 6 to 19.

Table 6-46 System Expansion and Improvement Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	System Expansion and Improvement				
93639	12F51 & 53 HPN Voltage Conversion (LM-BBY-048)	-	8.3	3.9	-
93640	HPN 12F54, 72Q, 73Q, and 324 Voltage Conversion (LM-BBY-051)	5.3	-	5.3	-
900749	Bringing additional capacity from ARN to Tilbury (FV-FVW-057)	18.8	-	4.5	-
93669	Three new MLE Feeders to offload CBN (LM-FVE-607)	-	8.9	1.0	7.5
900306	HPN 77Q, 323, 326 and 327 Voltage Conversion Preparation (LM-BBY-062)	-	11.0	4.9	0.6
900307	LOH 12F68 Voltage Conversion and Transfer to HPN (LM-BBY-064)	5.7	-	1.7	-
900342	Voltage Conversion Prep for RIM Substation (LM-FVW-718)	-	7.3	2.3	3.6
900386	New MUR Circuit to Offload MUR 12F66 and MUR 12F84 (LM-VAN-020)	-	7.7	3.5	-
900446	WKA New Substation Bring 4 New Feeders (SI-KAM-001)	13.1	-	1.7	-
900452	DUG Extension Along Highway 1 East (SI-KAM-008)	5.5	-	0.5	-
94137	CBL New Feeder South Campbell River (VI-NVI-417)	6.4	-	6.0	-
901132	Two Fleetwood feeders to offload McLellan (FV-FVW-723)	-	13.3	5.7	7.0
901141	Lower Mainland - George Dickie Feeder Voltage Conversion (LM-VAN-066)	-	5.0	2.3	2.6
901253	George Dickie - Voltage Conversion preparation of 4F54, 4F61, 4F64 and 4F65 and cutover to Sperling 12F64 (LM-VAN-094)	-	-	0.6	2.9
	Projects & Programs Less than $5M	25.0	42.8	23.6	25.8
	TOTAL System Expansion and Improvement	**79.8**	**104.3**	**67.5**	**50.0**

This category of investments is subject to year over year fluctuations as a result of the prioritization of work to adjust to changes in the forecast load growth. The majority of capital additions and expenditures in this category are made up of the following categories:

- **New Feeders** - These are projects to construct new feeders and infrastructure to offload heavily loaded existing feeders or to supply distribution customer load growth. The significant areas of new feeder projects includes: Abbotsford, Delta, and Kamloops. BC Hydro is forecasting capital expenditures of $37 million in fiscal 2020 and $17 million in fiscal 2021 and capital additions of $52 million in fiscal 2020 and $37 million in fiscal 2021.
- **Voltage Conversions** - These are projects to convert the distribution primary voltage from 4 kV to 12 kV or from 12 kV to 25 kV. The objective of these investments is to increase existing distribution infrastructure capability to:
  - Enable transmission and substation plans for expansion or redevelopment requiring feeder loads to be transferred to other feeders or substations;
  - Increase system capacity to supply distribution customer load growth;
  - Increase operating flexibility for restoration and planned outages aligned with substation and transmission plans;
  - Increase system efficiency by reducing electrical system losses and improving customer service voltages;
  - Reduce congestion in heavily populated corridors; or
  - Minimize equipment additions and its environmental footprint.

The significant areas of voltage conversion within the test period includes: Vancouver, Burnaby, North Vancouver, Richmond and Surrey. BC Hydro is forecasting capital expenditures of $17 million in fiscal 2020 and $32 million in fiscal 2021, and capital additions of $6 million in fiscal 2020 and $57 million in fiscal 2021.

Uneconomic Extension Assistance

The Uneconomic Extension Assistance program is a legislated fund in the Electric Tariff (section 8.8) which provides financial assistance towards the cost of uneconomic distribution overhead electrical extensions requested by new connection customers to serve principal residences. Table 6-47 below provides a summary of the fiscal 2020 to fiscal 2021 capital additions and capital expenditures.

Table 6-47 Uneconomic Extension Assistance Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Uneconomic Extension Assistance				
	Projects & Programs Less than $5M	0.6	0.6	0.6	0.6
	TOTAL Uneconomic Extension Assistance	**0.6**	**0.6**	**0.6**	**0.6**

Annual capital additions and expenditures for Uneconomic Extension assistance are forecast to remain constant at approximately $0.6 million in fiscal 2020 and fiscal 2021, which is consistent with the fiscal 2017 to fiscal 2019 period.

6.4.15.2 Distribution Sustaining Capital Expenditures and Additions

System Expansion and Improvement - Sustain

System expansion and improvement sustaining expenditures maintain and improve distribution system performance including addressing customer reliability, safety risks and regulatory and legal requirements. Table 6-48 below provides a summary of the fiscal 2020 to fiscal 2021 capital additions and capital expenditures. More information on the projects listed can be found in Appendix I, page 7 lines 20 to 25 and Appendix J, page 118.

Table 6-48 System Expansion and Improvement Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	System Expansion and Improvement				
94143	QNL Voltage Conversion (NI-NC-160)	9.3	-	1.1	-
900557	H-Frame Elimination - Chinatown	13.9	3.7	13.9	3.7
900229	Takla Landing (NI-NEW-287)	9.1	0.2	0.5	0.2
900373	New DGR Circuit for Customer Vaults at Pacific and Howe (LM-VAN-004)	-	6.0	4.4	-
900374	New DGR Circuit for Customer Vaults at Drake and Howe (LM-VAN-005)	-	9.3	3.1	3.4
900391	Downtown Vancouver - Underground Murrin Feeders to Eliminate H-Frames in Gastown	4.4	13.2	4.4	13.2
	Projects & Programs Less than $5M	28.1	43.9	29.2	38.9
	TOTAL System Expansion and Improvement	**64.8**	**76.3**	**56.6**	**59.4**

Year over year fluctuations are the result of prioritization of work with the timing of lower priority work being adjusted. Most of these investments are for various small projects that relate to the following three areas;

- **Customer Reliability** - The objective of customer reliability expenditures is to improve reliability on targeted distribution circuits that are performing poorly. The scope of customer reliability projects may include new standby feeders, feeder ties, as well as circuit undergrounding or reconfiguration, line relocations and protection upgrades. BC Hydro is forecasting capital expenditures of $3 million in fiscal 2020 and $2 million in fiscal 2021, and capital additions of $2 million in fiscal 2020 and $4 million in fiscal 2021.
- **Distribution Automation** - Automation of distribution devices provides operating personnel with remote visibility of system parameters and system status, facilitates remote operability, and in general enables greater flexibility to efficiently operate the system. Expenditures are focused on automation of reclosing and switching devices to enable faster fault isolation and outage restoration, thereby enhancing service reliability, and on automation of voltage management devices to improve power quality. BC Hydro is forecasting

expenditures of $20 million in fiscal 2020 and $18 million in fiscal 2021, and capital additions of $21 million in fiscal 2020 and $20 million in fiscal 2021.

- **Downtown Vancouver Redevelopment** - The Downtown Vancouver Redevelopment Plan is a long-term strategic plan, aligned with the Downtown Vancouver Electric Supply plan described in Appendix K, to convert the downtown core from a 12 kV dual-radial system to a 25 kV open loop system over the next 30-plus years. The Cathedral Square transformer failure in 2007, the manhole fire in 2008, and the Murrin transformer failure in 2013 have demonstrated the considerable supply risk and vulnerability of the aging and congested distribution system in the Downtown Vancouver area. This initiative will start to address the risk of long, high consequence outages in the downtown area. The Plan will replace assets in poor condition with equipment that meets current standards and will introduce automation to provide operational flexibility, reduce congested circuits and reduce outage restoration times. In conjunction with the Downtown Vancouver Redevelopment, BC Hydro will continue with a safety initiative in Downtown Vancouver to eliminate potential hazards to the public. The replacement circuits will be an underground automated open loop system to align with the overall redevelopment initiative. BC Hydro is forecasting expenditures of $31 million in fiscal 2020 and $20 million in fiscal 2021, and capital additions of $24 million in fiscal 2020 and $32 million in fiscal 2021.

Asset Replacement

Distribution asset replacements expenditures address equipment that has reached end of life. The forecast level of capital expenditures and additions for Asset Replacements ranges between $116 million and $130 million annually during the test period and is lower than the fiscal 2017 to fiscal 2019 period. Higher levels of investments in fiscal 2016 to fiscal 2019 have addressed a backlog of assets that have been assessed to be in Poor or Very Poor condition and are at, or approaching, end of life.

Table 6-49 below provides a summary of the fiscal 2020 to fiscal 2021 capital additions and capital expenditures. More information on the projects listed can be found in Appendix I, page 7, line 26 and Appendix J, page 120.

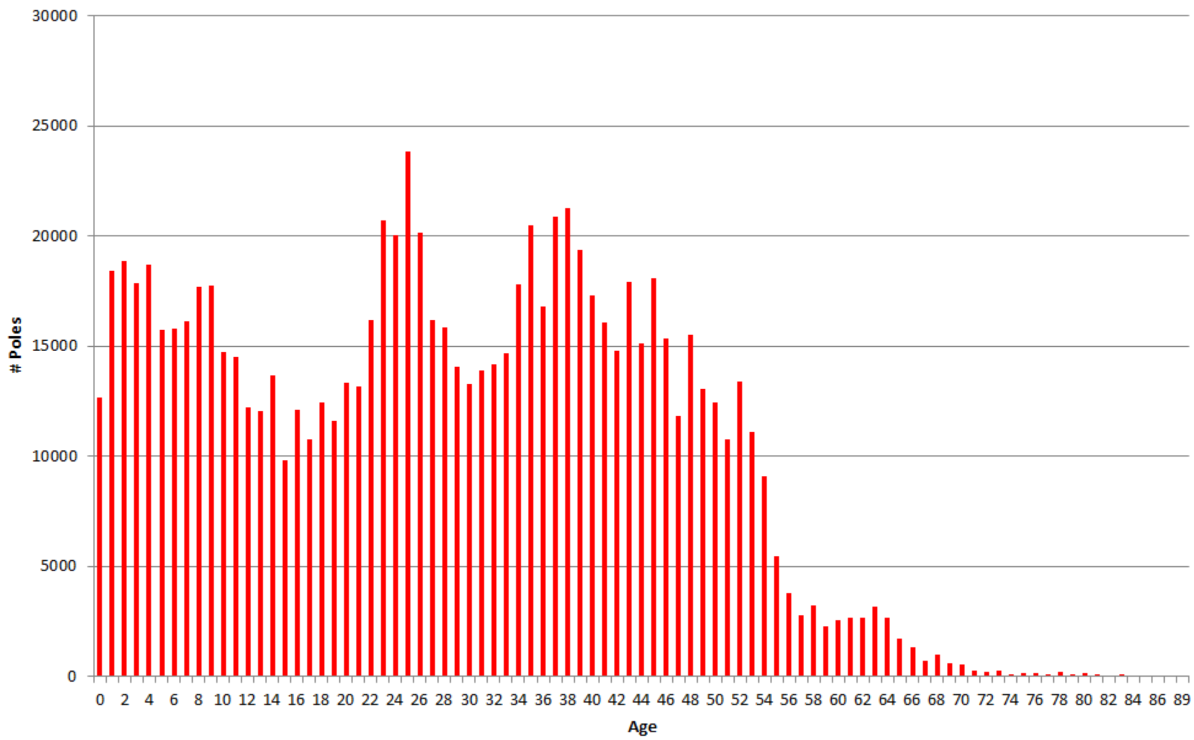
Table 6-49 Asset Replacement Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Asset Replacement				
900556	Various Sites - LED Street Light Conversion	3.8	5.8	4.8	6.1
	Projects & Programs Less than $5M	125.6	113.3	125.0	110.2
	TOTAL Asset Replacement	**129.4**	**119.1**	**129.8**	**116.3**

The majority of capital additions and expenditures in this category consist of recurring programs to address replacement of assets in the following four categories:

- **Poles** - This category covers wood and concrete poles as well as elevated platforms. Poles and platforms at end of life pose a significant risk to crews and the general public and may cause outages on the system. An increasing number of BC Hydro’s approximately 900,000 distribution system wood poles are reaching end of life. More than 96,000 poles are currently greater than 50 years of age compared to 67,000 units that were greater than 50 years of age in fiscal 2014. Overall, from fiscal 2014 to fiscal 2019, the average age of wood poles increased from 28.2 years to 29.0 years. Figure 6-15 below shows the current wood pole age profile by years of age.

Figure 6-15 Current Wood Pole Age Profile



Wood pole end-of-life is identified by a series of inspection programs that run throughout the fiscal year. In the test period, approximately 16,000 wood poles will be replaced. Concrete poles were first installed on the distribution system in the early 1980s. Due to safety issues related to a lack of adequate integral bonding, BC Hydro is replacing all concrete poles. In the test period the remaining concrete poles will be replaced with wood poles. BC Hydro is forecasting expenditures of $76 million in fiscal 2020 and $63 million in fiscal 2021 after recoveries from Telus.

- ***Underground System* -** Underground system assets include feeder cables, submarine cables, residential distribution cables and equipment, transformers and switchgear. Underground systems typically supply densely populated areas. Equipment in poor condition can pose a significant risk to system reliability and to public and worker safety. Detailed condition assessments combined with risk assessments are used to identify replacements of underground system assets. An example is the replacement of live-front transformers, which were installed in the 1960s. Inspections have identified some units that need to be replaced because perforations are developing in the unit enclosures due to corrosion. These openings in the enclosure are significant electrical hazards for the public. In addition to corrosion issues, live-front equipment creates a higher safety risk for workers and is being replaced in order to meet BC Hydro's current safety standards. All remaining live-front transformers are being replaced over the next four years with dead-front units which provide additional safety barriers for workers and the public. Transformers and switchgear with polychlorinated biphenyl (**PCB**) levels at or above 50 ppm are being proactively replaced to ensure all units in the category are removed by the December 31, 2025 Federal Polychlorinated Biphenyl Regulation deadline. BC Hydro will spend $22 million in fiscal 2020 and $19 million in fiscal 2021 to address end of life replacements on the underground system.

- ***Overhead System* -** Overhead system assets include transformers, voltage regulators, circuit reclosers, conductor, and switches including porcelain fuse cut-out switches. Porcelain fused cut-out switches, which are prone to failing, posing a significant falling object safety hazard to workers and the public, will continue to be replaced at a rate of approximately 6,000 units over the test period. The replacement program started in fiscal 2010. BC Hydro also manages a fleet of street lights as part of the distribution overhead system. A five year deployment of light-emitting diode street lights is planned to begin in fiscal 2020 to replace the current fleet of existing high pressure sodium units. Equipment on the overhead system with polychlorinated biphenyl (**PCB**) levels at or above 50 parts per million (ppm) is being proactively replaced to ensure all units in the category are removed by the December 31, 2025 Federal Polychlorinated Biphenyl Regulation deadline. BC Hydro will spend $14 million in fiscal 2020 and $16 million in fiscal 2021 to address end of life replacements on the overhead system.

- ***Trouble*** **-** Trouble capital expenditures are for equipment replacements that meet capitalization rules and resulting from: routine trouble calls, which are day to day restoration of power outages; storms, which are events causing outages over a large geographic area or affecting a large number of customers, or is of extended duration; or damage to plant, which are events where a third-party may be liable for the cost of the system repairs. BC Hydro and contractor crews respond to about 55,000 dispatched calls per year regarding the distribution system. The forecast expenditures are based on historical levels. BC Hydro is forecasting expenditures of $18 million in fiscal 2020 and $18 million in fiscal 2021 to respond to trouble calls.

Beautification

BC Hydro assists municipalities with financial support through the Beautification Program. BC Hydro provides one-third of the cost of converting overhead facilities to underground for select projects in urban municipal areas. The purpose of the fund is to help municipal governments achieve their environmental and community improvement objectives such as:

- Minimize or eliminate environmental concerns;
- Improve visual aesthetics; and
- Accommodate public redevelopment projects.

The forecast expenditures will be offset by contributions from the municipalities by two-thirds.

Table 6-50 Beautification Plan Capital Additions and Expenditures Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Additions Plan F2020	Capital Additions Plan F2021	Capital Expenditures Plan F2020	Capital Expenditures Plan F2021
	Beautification				
	Projects & Programs Less than $5M	1.1	1.1	1.1	1.1
	TOTAL Beautification	**1.1**	**1.1**	**1.1**	**1.1**

Annual capital expenditures and additions are driven by the number of projects submitted to the program by municipalities. Capital expenditures and additions across the fiscal 2017 to fiscal 2021 period remain below $2 million per fiscal.

Contributions in Aid

Contributions in Aid are periodic or lump-sum payments or consideration received from customers or third parties to provide funding toward the cost of construction or acquisition of an asset, where the asset ownership, operation and maintenance responsibilities remain with BC Hydro. Distribution Contributions in Aid are mostly received under the Customer Driven Program for new connection requests in accordance with the Electric Tariff. Contributions in Aid are also received under the Beautification and Uneconomic Extension Assistance programs. All three programs are discussed above.

Distribution Contributions in Aid are forecast to increase from fiscal 2020 to fiscal 2021 together with the increase associated with customer driven investments.

6.5 Technology Capital Investments

The Technology KBU is responsible for the planning, design, delivery and operation of BC Hydro's information technology systems as well as a number of operational technology systems.

BC Hydro has made many improvements to the management of its technology capital program since the Previous Application. These improvements include:

- **Improved business case process:** Clear guidance is provided through the Technology business case development process so that business cases include alternative courses of action, comparison tables and trade-off analysis, as well as the articulation of financial and non-financial benefits, including metrics with baselines, targets, and details on how and when benefits are to be measured;
- **Improved program delivery governance:** Capital program delivery governance has been improved through ongoing monitoring by the Capital Delivery Management Committee. This process includes management of budget re-allocation and ex-plan requests, as described in section 6.3.5 above;
- **Improved delivery performance:** Our capital delivery performance has improved. From fiscal 2016 to fiscal 2018, a total of 94 projects were completed, with total approved first full funding of $135.1 million and total actual costs of $134.5 million - a favourable variance of $0.6 million or 0.4 per cent. These variances are an improvement over the prior test period and compare favourably to industry results. The Project Management Institute's Pulse of the Profession Report stated in its global project management survey that 57 per cent of technology projects are completed on budget; and
- **New benefits realization process:** To address the BCUC's SAP Inquiry recommendations and to meet commitments made during the Previous Application proceeding, BC Hydro has developed a benefits realization process

for identification and tracking of benefits arising from business driven technology projects. This is described further in section 6.5.5 below.

6.5.1 Overview of Technology Capital Assets and Key Drivers

BC Hydro's business requires an extensive technology portfolio, and ongoing investment is critical. Our forecast investments fall into three categories, which correspond with the key drivers of technology investment:

- Manage compliance and security;
- Manage risk and sustain productivity; and
- Enhance business capability.

Each of these categories is explained further below.

6.5.1.1 Ongoing Technology Investment is Key to the Day to Day Operations of BC Hydro

BC Hydro's technology systems provide important support to the organization's day-to-day operations, and include data centres, networks, enterprise and business group applications, mobile phones and mobile applications, geographic information systems, personal devices and desktop software, cyber security devices and monitoring applications, business intelligence and analytics platforms, and a subset of the energy management systems.

Our technology assets are located in two active data centres and two control centres, which together hold approximately 2,500 servers as well as network switches, firewall components, storage and backup systems. Additional assets include software platforms and related licenses, approximately 300 applications and related licenses, approximately 8,200 desktop and laptop computers, and approximately 4,800 mobile phones. In addition, all major BC Hydro facilities have local area networks and BC Hydro has mobile WiFi in 900 fleet vehicles. These assets are maintained through a combination of vendor product support agreements and sustainment investments.

6.5.1.2 Fluctuations in Technology Investment Result from Project Timing, Emergent Priorities and Changes in Business Requirements

While sustained investment in technology is required, the level of investment varies from year to year in response to project timing, emergent priorities and changes in underlying business requirements.

From fiscal 2016 to fiscal 2018, actual average annual Technology capital expenditures were $75 million. Capital expenditures are forecast to be $87.8 million in fiscal 2019 and are planned to be $93.5 million in fiscal 2020. These increased amounts primarily reflect the implementation of the Supply Chain Applications project.

In fiscal 2021, planned capital expenditures decrease to $55 million. This reflects a focus on investments to manage compliance and security and to manage risk and sustain productivity. Additional investments to enhance business capability, as identified and required, will be considered through funding re-allocations and the ex-plan process, which is further described in section 6.3.5.

6.5.2 Three Technology Investment Categories Correspond with Key Drivers

BC Hydro's Technology Strategy and Five-Year Plan, provided as Appendix L, provides guidance for capital investment in each of the three investment categories, described below. These categories correspond with the three main drivers of technology investment.

Table 6-51 below summarizes the key capital investment drivers within each investment category.

Table 6-51 Technology Investment Drivers by Category

Category	Driver
Manage Compliance and Security	**Regulatory Compliance** (Compliance requirements) Investment requirement may come from regulatory bodies such as NERC, WorksafeBC, Canada Revenue Agency, etc. Reliability, safety or legislative requirements justify investment
	Product License Compliance (Contracts) Software licensing renewals or true-ups.
	Cybersecurity Risk (Excessive or increasing risk) Ever-changing threats and vulnerabilities
Manage risk and sustain productivity	**Technology Condition-Based Failure Risk** (Declining condition) Declining asset health increases asset failures. When the consequences are considered (under business-as-usual), a risk profile can be assessed, and value of risk mitigation may justify investment.
	Technology Performance-Based Risk (Declining performance) Obsolescence and declining utilization affect performance. When the consequences of performance problems are evaluated (under business-as-usual), a risk profile can be assessed, and value of risk mitigation may justify investment.
	Operational Risk (Excessive or increasing risk) Safety, Reliability, Environmental or Financial risk may justify investment.
	Reputational Risk (Excessive or increasing risk) Excessive or increasing reputational risk may justify investment.
	Business Growth (Increasing need for technology services) Expansion of technology services through load growth or higher demand for existing services.
Enhance Business Capability	**Enhanced Capability** (Need for new or significantly improved business function) Demand for new capabilities enabled by technology, typically related to automation, business intelligence, communications, and new services.

6.5.3 Technology Capital Investment Planning

Technology capital investment planning includes both top-down and bottom-up processes. The Technology capital plan is guided by the top-down planning process described in section 6.3.2 and is included in the Enterprise planning and prioritization process, discussed in section 6.3.4.

BC Hydro developed the capital investment portfolio for the fiscal 2020 to fiscal 2021 test period using a three-step planning process. This process is designed to ensure our investments are in line with our priorities; that benefits, costs and risks justify investment, and that we are able to deliver on our plans. The process has been improved over the prior test period and future improvements are expected.

6.5.3.1 Step 1 – Identification of Investments

First, investments are identified for inclusion in the portfolio plan. The portfolio plan consists of active investments and new initiatives. Active initiatives are investments initiated in previous years and continue to be tracked through the various stages of execution. New initiatives are based on investment proposals. Each initiative is captured within the portfolio plan as a project, work program or acquisition. Each portfolio entry includes the name, description, prioritization assessment, investment score as well as forecast costs and risks and is accompanied by an Investment Justification document.

6.5.3.2 Step 2 – Formation of Draft Portfolio Plan

Second, once the capital portfolio entries have been fully captured and detailed, a draft portfolio plan is developed. Proposed initiatives are classified as mandatory, committed or prioritized and are then prioritized and subjected to constraints.

- **Mandatory initiatives** are required to meet security, safety, legal, regulatory or tariff compliance, and are not considered for prioritization.
- **Committed initiatives** are active investments and have either proceeded to the implementation phase, or are substantially committed as of the planning date. These initiatives are generally not considered for prioritization, due to cost or risk of undertaking a change in scope or schedule.
- **Prioritized initiatives** are prioritized using the enterprise-wide framework for capital prioritization, discussed in section 6.3.4 and by a technology specific investment score. These scores provide guidance into the development of the portfolio plan, within the enterprise funding allocation.
- **Constraints** include delivery and oversight capacity, business capacity for change, support capacity, technical dependencies and technology maturity. Time may also be a constraint, particularly if risk is expected to escalate, a window of opportunity exists, and/or if there are unmet dependencies.

6.5.3.3 Step 3 - Review, Refinement and Finalization

Third, a series of reviews are conducted on the draft portfolio plan to facilitate dialogue amongst Technology KBU management staff and affected BC Hydro business stakeholders. These reviews consider factors such as strategic alignment, portfolio value and risk and may result in the re-assessment of specific investments, re-design of programs or projects or shifting of timelines.

The Technology capital portfolio plan is dynamic in nature, and actual capital investments in the test period will likely differ for a number of reasons, including:

- Early stage Technology investment proposals include estimates which have a higher degree of uncertainty relative to later-stage business case estimates as technology choice, solution scope and scale, design and timing have not yet been fully examined; and
- Emerging and changing business priorities may require new technology solutions. For example, unplanned technology outages, increased technology risks, and unexpected loss of vendor support for products or services can all impact actual technology investments.

The Technology KBU oversees the implementation of its annual capital plans through monthly capital committee meetings of the Technology KBU leadership team. These committee meetings review portfolio plan variances, reallocate capital as needed, and manage risk adjustments.

6.5.4 Technology Portfolio Delivery Has Been Improved

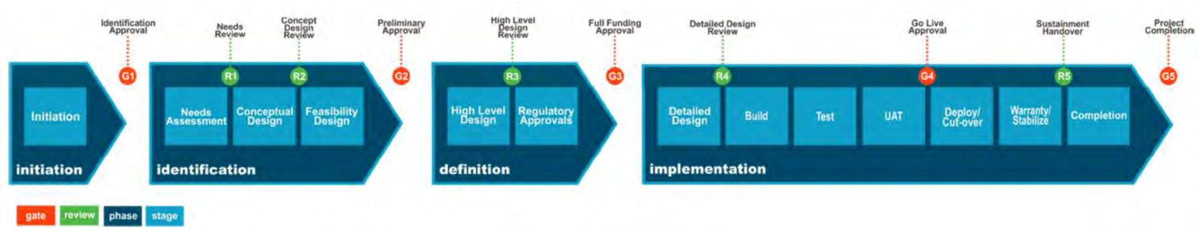
The capital investment portfolio consists of projects, work programs and acquisitions. Investments require approved business cases and adhere to a Technology-specific delivery framework called Information Technology Delivery Standard Practices (**ITDSP**).

6.5.4.1 We Use a Standard Technology Project Delivery Framework that Requires Approvals at Each Phase

ITDSP is used to aid managers, service providers and project teams in delivering successful technology projects. This framework was adopted in 2004 and is updated annually. The framework aligns with PPM Practices, which are discussed further in section 6.4.7 above, and has been adapted to better support the unique character of technology projects.

ITDSP uses standard PPM phases with uniquely defined stages. Gate approval points are positioned at the end of project stages so that management can confirm that the proposed project solution remains in alignment with business drivers, and is ready to progress to the next phase or stage. Each gate is a formal approval point, where key information is presented to the gate board, typically related to cost, schedule, scope, procurement, and risk.

Figure 6-16 Project Lifecycle Sequence from Project Initiation to Completion



The following sections provide a high level summary of the key activities within the project lifecycle phases.

6.5.4.2 Initiation Phase

The primary objective of the Initiation phase is the prioritization of a specific initiative and the decision to prepare a business case. To support the decision to initiate a project, the Project Initiator is responsible for assembling the following information:

- Brief description of the Problem or Opportunity;

- Key business drivers and any associated risks; and
- Estimated funding needs.

A decision is made to form and proceed with a project based on:

- The understanding of the problem or opportunity and the risk to the business;
- Support by the Project Initiator;
- The funding requirement; and
- The potential funding source.

The key outcomes of the Initiation phase are:

- An Identification phase business case;
- A detailed Identification phase project plan; and
- Firm Identification phase costs as well as an initial estimate on the overall project cost.

The Initiation phase concludes when the Identification phase business case is approved.

6.5.4.3 Identification Phase

The Identification phase includes three stages:

- **Needs Assessment** – to confirm the scope and business requirements.
- **Conceptual Design** – to review alternative solutions and select the leading alternative.
- **Feasibility Design** – to evaluate the feasibility of alternative solutions and recommended an alternative to be taken forward to the Definition phase.

The key outcomes of the Identification phase are:

- Approved and prioritized business requirements;
- An assessment of alternative solutions including a recommended solution and confirmed feasibility of the recommended solution;
- Completion of a Process Impact Assessment;
- A Definition phase business case;
- A detailed Definition phase project plan; and
- A firm Definition phase cost as well as a refined range estimate for the overall project cost.

The Identification phase concludes when a decision is made on whether to proceed to the Definition phase (the Preliminary Approval Gate).

6.5.4.4 Definition Phase

The Definition phase includes two stages:

- High Level Design/Blueprint; and
- Regulatory Approvals [312]

The objective of the Definition Phase is to carry out a detailed investigation of the selected alternative as well as to prepare a high level design, project implementation plan and an estimate of the Implementation phase funding, including an Implementation phase business case. This phase also includes securing all required regulatory approvals as well as any key defining agreements.

The key outcomes of the Definition phase are:

[312] Based on BC Hydro's current proposal in the Capital Expenditure Review Proceeding, the threshold for regulatory approvals is an estimated overall budget equal to or greater than $20 million. In these cases, the Project Managers work closely with the Regulatory and Rates KBU to receive regulatory advice.

- Process maps and definition documents;
- A High Level Design/Blueprint (documented in the Architecture Definition Document);
- An Implementation phase business case;
- An Implementation project plan; and
- A firm overall cost estimate range to complete the project.

The Definition phase concludes when a decision is made on whether to proceed to the Implementation Phase (the Full Funding Approval Gate).

6.5.4.5 Implementation Phase

The Implementation phase includes seven stages:

- Detailed Design;
- Build;
- Test;
- User Acceptance Testing
- Deploy/Cut-over;
- Stabilize; and
- Completion.

The objective of the Implementation phase is to complete the detailed design, build, test and commission the solution into service.

The key outcomes of the Implementation phase are:

- A working solution, confirmed through testing, that meets project objectives and is fully transitioned into operation; and

- A Project Completion Report measuring success against the approved business case.

The Go Live Approval Gate represents a decision on whether to proceed to the Deploy/Cut-over stage.

The project is considered complete once the Project Initiator and Project Sponsor have accepted the project results by signing the Project Completion and Evaluation Report.

6.5.4.6 Technology Work Programs and Licenses Are Subject to Work Flow Approval Processes

A Work Program is a program of high volume sustainment or enhancements items, typically with a low cost per item, which utilizes simple work flows on highly standardized and repeatable work units to deliver an overall benefit. Work Programs are typically set up for one fiscal year at a time, for a specific asset or group of assets. As this work is less complex, the ITDSP framework and project life cycle do not apply. Similarly, capital purchases for licences and equipment are also not subject to the ITDSP framework as they are not projects.

6.5.4.7 We Optimize Internal and External Resources

Technology employs two primary delivery models to optimize the use of internal and external market-based delivery capacity:

- Projects are primarily delivered through managed teams, where BC Hydro staff or consultant project managers manage blended teams of employees, vendors and individual contractors; and
- For larger, more complex projects, BC Hydro uses an outsourced model, called the system integrator model, where teams of external service providers provide project delivery and a large number of developer resources are applied to a project.

This resourcing model is appropriate to deliver the capital plan in the test period. The use of blended teams and system integrators allows for rapid scaling of our workforce, as required.

6.5.4.8 Technology Project Delivery Governance

Governance of technology capital delivery is provided by project steering committees, project gate reviews and funding approval, the Executive Team and the Board of Directors.

- Project steering committees provide senior management level direction to projects to assist with resolving complex issues.
- Project gate reviews occur at various points of the project lifecycle. Each gate is a formal approval point where key information on project cost, schedule, scope, procurement and risk is presented to the gate board.
- The Executive Team reviews the delivery portfolio on a monthly basis and approves projects greater than $6 million.
- The Board of Directors approves projects greater than $20 million.

Governance is also provided through BC Hydro’s Management and Accounting Policies, which are discussed in section 6.4.10.

6.5.4.9 Our Technology Project Delivery Performance Has Improved and Compares Well to Industry Results

Figure 6-17 and Table 6-52 below provide a summary of BC Hydro’s performance in delivering technology capital projects by comparing total approved first full funding for projects to total actual project costs.

Figure 6-17 Number of Technology Projects Completed Within Total Approved First Full Funding Amount

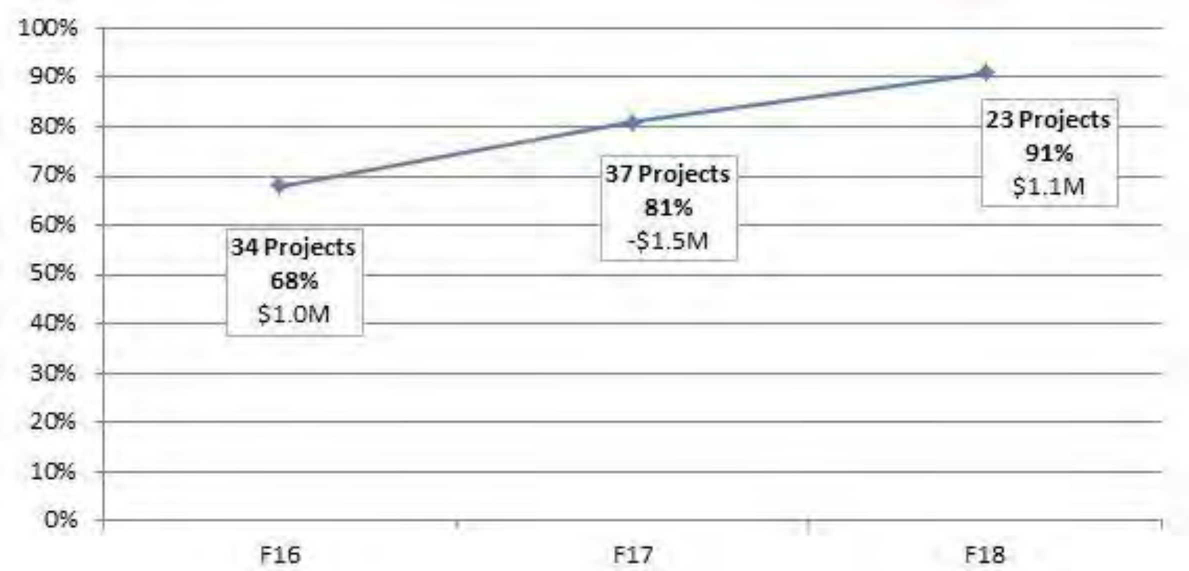


Table 6-52 Number of Technology Projects Completed Within Total Approved First Full Funding Amount

Fiscal Year	No. of Initiatives completed	Percentage of Initiatives Completed within FFF Amount	Cumulative Initiative Cost ($ million)		Variance	
			[A] FFF Amount ($ million)	[B] Actual Final Cost ($ million)	[A – B] ($ million)	[(B – A)/A] (%)
2016	34	68	42.0	41.0	1.0	2.4
2017	37	81	59.6	61.1	(1.5)	(2.5)
2018	23	91	33.5	32.4	1.1	3.3
Total	94		135.1	134.5	(0.6)	(0.4)

From fiscal 2016 to fiscal 2018, a total of 94 projects were completed, with total approved first full funding of $135.1 million and total actual costs of $134.5 million - a favourable variance of $0.6 million or 0.4 per cent.

These results indicate improvement over the period and compare favourably to industry results. The Project Management Institute's Pulse of the Profession Report stated in its global project management survey that 57 per cent of technology projects are completed on budget.

6.5.5 We Have Introduced a Technology Benefits Realization Process

Once a technology project is complete, newly implemented technology capabilities are expected to yield desired business outcomes and measurable benefits. These benefits may be diverse and apply to multiple KBUs. They may occur immediately or over time. BC Hydro has developed a benefits realization process so that benefits claimed in business cases are tracked and realized.

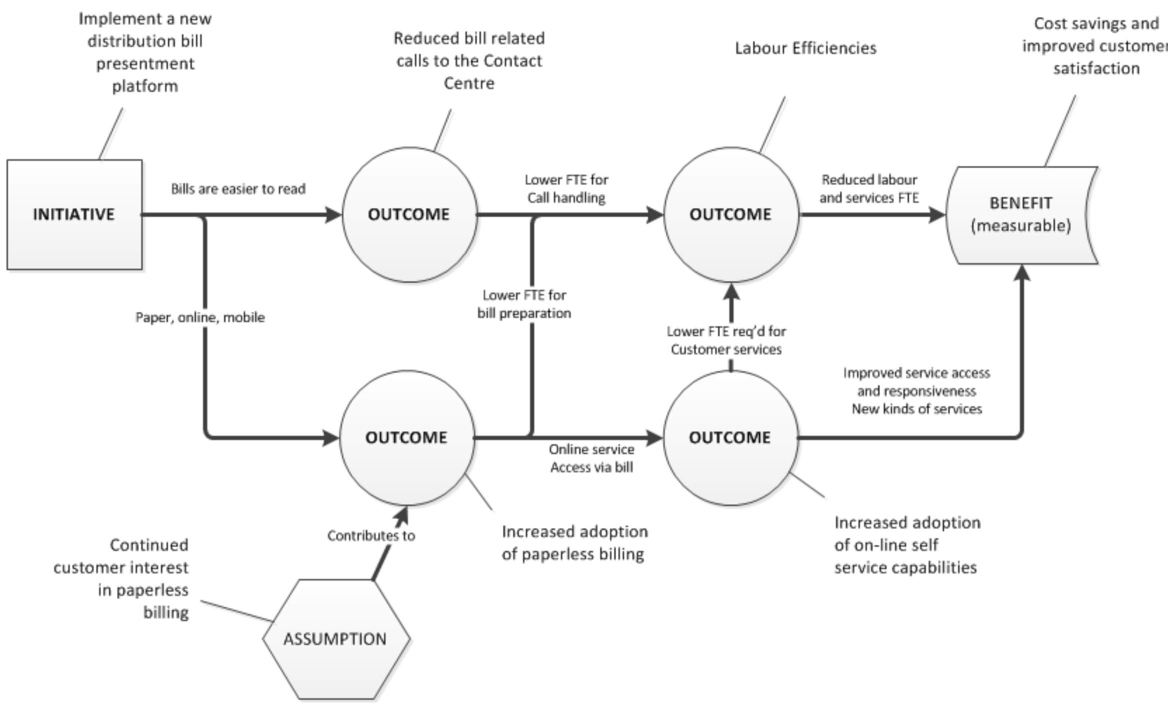
Each technology project has a business case which articulates the need, desired outcomes, and expected incremental benefits and costs. Cost estimates include upfront and ongoing costs, and expected benefits typically include risk mitigation and improved performance.

The use of financial measures such as net present value or return on investment may suggest certainty of financial benefits. For this reason, benefits are not often quantified in dollars, but are assessed using specific metrics that are easier to identify, predict and measure. The sponsor of each business case agrees to the costs and benefits outlined, including the timing of costs and benefits and how they will be measured.

This benefits realization methodology is being piloted on a number of BC Hydro's non-mandatory, business-driven technology initiatives with expected capital expenditures greater than $2 million. Selected benefits identified in each business case are tracked over the life of the asset, for an agreed period of time, or until all material benefits have been realized. Project initiators are required to document completion of outcomes and achievement of benefits on a quarterly basis, during project implementation and following project completion.

Figure 6-18 below provides an example of this approach. In this example, an initiative to implement a new distribution bill formatting platform results in a series of outcomes leading to measurable cost savings and improved customer satisfaction.

Figure 6-18 Benefit Realization Outcome Model (Illustration Only)



The actual outcomes and benefits from operation of a technology asset are tracked over a number of years.

Table 6-53 below identifies the projects selected for this benefits realization pilot in fiscal 2018. The pilot will continue, with additional projects in fiscal 2019 and throughout the test period.

Table 6-53 Benefits Realization Pilot Projects (Fiscal 2018)

Project	Status
Enterprise Billing Infrastructure Project (EBIP)	In Service
Field Access to Safety Information (FASI)	In Service
Fleet and Garage Management System (FGMS)	In Service
Supply Chain Applications (SCA)	Delivery

6.5.6 Technology Capital Expenditures and Additions

Technology capital expenditures and capital additions for fiscal 2017 to fiscal 2021 are presented in Table 6-54 and Table 6-55 below.[313]

Table 6-54 Technology Actual and Plan Capital Expenditures by Functional Category, Fiscal 2017 to Fiscal 2021

($ millions)	F2017		F2018		F2019	F2019	F2020	F2021
	RRA	Actual	RRA	Actual	Plan	Forecast	Plan	Plan
Manage Compliance and Security	12.7	12.5	8.2	13.0	9.6	11.6	14.8	8.1
Manage Risk and Sustain Productivity	70.0	46.0	47.8	38.3	38.6	59.8	68.8	53.1
Enhance Business Capability	13.7	16.4	46.5	19.1	26.4	40.0	34.4	4.8
Total Gross	96.4	75.0	102.5	70.4	74.7	111.3	118.1	66.0
Portfolio Adjustment	(15.1)		(10.2)		1.5	(16.8)	(24.6)	(10.5)
Total Net	81.4	75.0	92.4	70.4	76.2	94.5	93.5	55.5

Table 6-55 Technology Actual and Plan Capital Additions by Category, Fiscal 2017 to Fiscal 2020

($ millions)	F2017		F2018		F2019	F2019	F2020	F2021
	RRA	Actual	RRA	Actual	Plan	Forecast	Plan	Plan
Manage Compliance and Security	16.5	13.3	8.2	9.2	9.6	7.9	19.7	7.6
Manage Risk and Sustain Productivity	72.6	57.8	72.2	51.1	40.1	54.8	72.6	65.7
Enhance Business Capability	7.6	5.9	19.7	11.0	72.5	10.4	73.3	12.3
Total Gross	96.7	77.0	100.0	71.2	122.2	73.1	165.6	85.5
Portfolio Adjustment	(17.6)		(9.9)		(12.2)	(6.4)	(24.6)	(10.5)
Total Net	79.1	77.0	90.1	71.2	110.0	66.7	141.0	75.0

The following lists the categories of planned capital expenditures and additions in the test period.

[313] Fiscal 2017 and fiscal 2018 variances greater than $10 million are described in Appendix G, section 5.

6.5.6.1 Investment to Manage Compliance and Security

Table 6-56 Manage Compliance and Security - Plan Capital Expenditures and Additions for Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Addition Forecast F2020	Capital Addition Forecast F2021	Capital Expenditure Forecast F2020	Capital Expenditure Forecast F2021
	Manage Compliance and Security				
	Projects Over $2 million				
T001549	End of Life Firewall Replacement	3.6	-	2.0	-
T001390	Data Centre Network Security Improvement	2.5	-	2.0	-
T002055	NERC CIPv7	2.3	-	2.3	-
	Programs over $2 million				
T001913	Microsoft Enterprise Agreement True Up F2020-F2021	2.0	2.0	2.0	2.0
T001909	Infrastructure Software F2020-F2021	1.7	1.8	1.7	1.8
	Projects and Programs less than $2 million	7.7	3.8	5.0	4.3
	TOTAL Manage Compliance and Security	19.7	7.6	14.8	8.1

More information on the projects listed above can be found in Appendix I, page 9, lines 1 to 5.

- The End of Life Firewall Replacement project is to upgrade critical network firewalls by identifying and replacing devices at end of vendor support;
- The Data Centre Network Security Improvement project is to assess gaps in the data network segmentation and implement security controls to more effectively segment the network;
- The NERC CIPv7 project is to implement access controls for low impact cyber systems, security requirements for certain portable devices and policies for reliability-related emergencies;
- Microsoft Enterprise Agreement True Up F20-F21 is an annual capital purchase of incremental desktop and server product licenses. Server products include Windows Server, Exchange, Sharepoint, SQL Server, CRM, and others; and

- Infrastructure Software F20-F21 is an annual purchase of incremental perpetual software licenses for personal computers, servers and other assets for products from vendors such as Adobe, Microsoft, VMWare, Symantec, IBM and Oracle.

6.5.6.2 Investment to Manage Risk and Sustain Productivity

Table 6-57 Manage Risk and Sustain Productivity - Plan Capital Expenditures and Additions for Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Addition Forecast F2020	Capital Addition Forecast F2021	Capital Expenditure Forecast F2020	Capital Expenditure Forecast F2021

T001667	Storage Capacity Growth F2020-F2021	3.0	3.5	3.0	3.5
T001915	Provisioning of Mobile Devices F2020-F2021	1.8	1.8	1.8	1.8
T002067	Mobile Vehicle Wifi Refresh F2020	1.5	-	1.5	-
T002068	Mobile Vehicle Wifi Refresh F2021	-	1.8	-	1.8
	Projects and Programs less than $2 million	34.1	22.9	30.9	17.9
	TOTAL Manage Risk and Sustain Productivity	72.6	65.7	68.8	53.1

More information on the projects listed above can be found in Appendix I, page 9, lines 6 to 24.

- The Hydroshare HydroWeb Upgrade project is to upgrade SharePoint from version 2010 to 2016, and upgrade BC Hydro's primary, SharePoint-based intranet and extranet applications;
- The Contact Centre Technology Foundation Refresh project is based on retiring the existing call centre telephony infrastructure and replacing it with a new solution with improved reliability and increased capabilities;
- The Calgary Internet Data Centre (**CIDC**) Network Refresh project is to perform a complete upgrade of data centre infrastructure at BC Hydro's Calgary Internet Data Centre, including computing, storage and networking equipment;
- The SAP HANA-ECC Upgrade is to upgrade SAP to maintain vendor support and adhere to the BC Hydro enterprise application roadmap;
- The Next Generation Desktop (Windows 10) project is primarily to upgrade all BC Hydro personal computers to Windows 10;
- The GE Smallworld GIS 5.x Upgrade project is to upgrade the geographic information system (GIS) versions for the Distribution Analysis and Design, Spatial Asset Management, Geospatial Underground Locate System and PowerGrid applications. BC Hydro's GE Smallworld GIS platform supports a number of strategic and departmental solutions required for operation of the transmission and distribution system. The current GIS versions are no longer vendor-supported, resulting in increasing risk of unplanned outages for these solutions;
- The Meter Data Management System (**MDMS**) v9 Upgrade is to maintain vendor support;

- The Customer Connect Web Enablement project is to extend the existing online express connect capability by enabling online or mobile customers to submit, manage and receive feedback on their design connect applications;
- The Meter Data Management System Improvements project is to make various functional improvements to the Meter Data Management System, including improving the interface architecture with SAP.
- The Lodestar and Enhanced Billing System (Transmission) project is to retire the legacy Lodestar customer information system and supporting transmission bill generation capabilities, which will be replaced with SAP functionality and the recently implemented integration architecture and bill generation solution;
- The SharePoint Workspaces Upgrade project is to modernize and potentially integrate the PPM Workspace and Supply Chain Workspace SharePoint applications, providing upgraded and improved document management and collaboration capabilities;
- The Server Sustainment (Capacity) work program is for the procurement of equipment for the sustainment of Windows and Unix servers at BC Hydro's Kamloops Internet Data Centre (**KIDC**);
- PC Client Refresh is an annual refresh program to replace a subset of the personal computers used by BC Hydro employees for business purposes that are due for replacement;
- Operations PC Inventory is an annual refresh program to for employee personal computers used for business purposes, which require replacement and for new employees requiring a personal computer for business purposes;
- The Storage Capacity Growth work program is for storage expansion at the Kamloops Internet Data Centre, and Fraser Valley Operations centre to meet business application needs;

- Provisioning of Mobile Devices is an annual replacement program for employee smart phones used for business purposes, which require replacement and for new employees requiring a smart phone for business purposes; and
- Mobile Vehicle Wifi Refresh is an annual program to refresh end-of-life Mobile Vehicle WiFi equipment deployed in BC Hydro vehicles to provide field crews with mobile access to BC Hydro's data network.

6.5.6.3 Investment to Enhance Business Capability

Table 6-58 Enhance Business Capability - Plan Capital Expenditures and Additions for Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Addition Forecast F2020	Capital Addition Forecast F2021	Capital Expenditure Forecast F2020	Capital Expenditure Forecast F2021
	Enhance Business Capability				
	Projects Over $2 million				
T001127	Supply Chain Applications	57.4	-	19.0	-
T001851	Stations Work Planning, Scheduling and Work Execution	-	6.4	3.5	2.5
T001637	Asset Investment Planning Tool	-	-	4.2	1.0
T001611	Autodesk Substation Design Suite	2.4	-	0.9	-
T001035	Dam Safety Information System (DSIS)	-	2.2	1.0	0.9
T000625	Fleet Telematics	-	2.2	1.8	0.1
	Programs over $2 million				
	Projects and Programs less than $2 million	13.5	1.5	4.0	0.4
	TOTAL Enhance Business Capability	73.3	12.3	34.4	4.8

More information on the projects listed above can be found in Appendix I, page 9, lines 25 to 30 and Appendix J, page 121.

- The Supply Chain Applications Project is to address process and technology capability gaps, achieving operational efficiencies, reduced material and service costs and an overall reduction in risk;

- The Stations Work Planning, Scheduling and Work Execution project is to allow the Operations Business Group to better accept, bundle, schedule, and execute weekly asset work for a proposed mobile workforce, leading to efficiency gains;
- The Asset Investment Planning Tool project is to enable a consistent, transparent and more objective approach to asset investment planning and management across BC Hydro, leading to improved investment decisions and results;
- The Autodesk Substation Design Suite project is to modernize Generation and Transmission Engineering's substation design work processes to reduce the time it takes to prepare detailed designs and to improve the accuracy of design information, technical collaboration capability, and the quality and efficiency of creating construction work packages;
- The Dam Safety Information System project is to consolidate data from many sources and provide a single interface for Dam Safety Surveillance Engineers to view the conditions of BC Hydro dams; and
- The Fleet Telematics project is to implement a vehicle telematics system that will help to manage capital and operating costs, availability, utilization, and safety related to all BC Hydro vehicles.

6.6 Properties Capital Investments

The Properties KBU is responsible for the supply, operations and maintenance of BC Hydro's headquarters and field offices, which total 101 facilities, comprising approximately 3 million square feet of office and industrial space. These facilities house field crews as well as a wide range of critical functions including system operations, telecommunications, emergency operations, customer contact, materials management, fleet management, and security command centers. BC Hydro's headquarters and field offices provide critical services to BC communities and local industry and must be operational for 24-hour response in all conditions, similar to other emergency services facilities (e.g., fire halls). Facilities managed by the Properties KBU do not include Generation plant buildings or Transmission and Distribution substations, which are included in the Generation and Transmission and Distribution capital plans, respectively.

6.6.1 Properties Portfolio Investments Address Risks and Issues with Existing Assets

The investments in the Properties portfolio are driven by the need to address the issues and risks associated with the existing physical assets and infrastructure. Properties capital investments fall into two general categories:

- **Building Development** - projects include the major refurbishing or rebuilding of field buildings in areas where BC Hydro’s existing facilities are at end of life and/or inadequate to meet operational needs; and
- **Building Improvement** - projects at existing facilities to address operational deficiencies as well as end-of-life replacements of aging building components and systems.

Properties Capital Planning focuses on assessing the health of existing assets and determining operational requirements that cannot be met by the existing asset portfolio, to establish an effective long term capital plan.

Aging Assets

Facilities managed by Properties are, on average, 33 years old, with more than forty per cent of the facilities being greater than 40 years old. Continued investment in these assets in the test period and beyond is required to maintain efficient and effective operation of BC Hydro’s building assets, to limit costly and disruptive failures and to achieve the organization's objectives. All Properties’ projects are classified as Sustaining Capital.

Asset Health

Properties assesses the health of more than 12,000 individual assets at the 101 BC Hydro facilities managed by Properties, based on each asset's current condition (including each facilities seismic withstand), remaining life expectancy, likelihood of failure, and impact of failure. These assets include building envelopes, roofs, HVAC systems, elevators, etc. The results of these assessments identify assets that are at or near end of life. Investments in these assets are considered for inclusion in the capital plan.

Operational Requirements

Properties seeks feedback from key occupant groups in order to capture each group's building-related requirements across the portfolio. These occupants assess their facilities for their ability to meet their operational priorities. This feedback results in proposed investments to address specific operational demands including, for example, inadequate office and operational space, insufficient material storage space, and undersized truck bays.

6.6.2 Properties Bottom – Up Asset Capital Planning Process

The Properties planning process follows a three step bottom-up approach.

Step 1 – Identify the Asset Needs

The first step of this process is to identify the building and asset needs at each of the facilities that should be considered for remediation. This assessment includes reviews of existing asset issues and risks as well as asset condition assessments. This results in a list of proposed projects.

Step 2 – Formation of a Draft Capital Plan

The proposed projects are categorized, ranked by priority and then subjected to any funding constraints, in order to develop a draft capital plan.

Step 3 – Review the Investments in the Capital Plan Period

The draft plan then undergoes a series of reviews of the planned investments across the building portfolio to ensure that investments are appropriately prioritized and timed. This review also allows for validation of the operational requirements by Properties and BC Hydro operations and other KBUs. These reviews may result in a re-assessment of specific projects, or shifting of projects within or beyond the capital plan period.

Properties proposed capital investments are subject to the BC Hydro enterprise-wide framework used to assist in prioritizing capital investment. Investments included in the BC Hydro 10 Year Capital Forecast are selected based on their prioritization score and other constraints, following the BC Hydro enterprise-wide process. Further information is provided in section 6.3.4 above.

Additional information on the Properties capital expenditures for the fiscal 2020 to fiscal 2021 test period is provided in Appendix I, page 10, lines 1 to 7 and Appendix J, pages 123 to 127.

6.6.3 Properties Capital Investment Delivery Aligns With BC Hydro's Standard Approach

The Properties Group will deliver approximately $114 million of BC Hydro's capital expenditures over the test period. The delivery of Properties' capital projects are managed using both internal and external (contracted) resources following normal building construction industry practices. Properties' Capital Delivery processes align with the standard BC Hydro project lifecycle for managing projects, whereby:

- Projects progress through the four phases of delivery: Initiation, Identification, Definition, and Implementation; and
- Gate approvals are formal approval points positioned at the end of key stages in the project lifecycle to allow management to confirm that the proposed

project solution remains in alignment with business drivers and that the project is delivering on key project objectives including cost, schedule, and scope.

6.6.4 Properties Capital Expenditures and Additions

Table 6-59 Properties Actual and Plan Capital Expenditures Fiscal 2017 to Fiscal 2021[314]

($ millions)	F2017		F2018		F2019	F2019	F2020	F2021
	RRA	Actual	RRA	Actual	RRA	Forecast	Plan	Plan
Properties								
Interior Space Renovations	11.6	11.4	11.9	9.9				
Building Development	54.8	48.0	44.4	25.2	69.5	23.7	37.8	39.7
Building Improvements and Other	26.3	23.1	18.8	28.4	18.8	19.8	21.1	15.6
Other Properties	3.0	4.1				-		
Total	95.7	86.6	75.0	63.5	88.3	43.5	58.9	55.3

Table 6-60 Properties Actual and Plan Capital Additions – Fiscal 2017 to Fiscal 2021[314]

($ millions)	F2017		F2018		F2019	F2019	F2020	F2021
	RRA	Actual	RRA	Actual	RRA	Forecast	Plan	Plan
Properties								
Interior Space Renovations	21.6	19.2	11.9	12.1				
Building Development	4.6	8.4	87.5	81.4	6.7	8.9	18.9	40.0
Building Improvements and Other	38.2	26.5	18.8	30.0	18.8	19.8	21.1	15.6
Other Properties	3.9	0.7	-	3.4		-		
Total	68.3	54.8	118.1	126.9	25.5	28.7	40.0	55.6

Capital expenditures in fiscal 2019 are forecast to be $44.8 million below plan as several projects were deferred. The Materials Classification Facility project was put on hold for most of fiscal 2017 as capital funding constraints were being assessed across BC Hydro. This project has now recommenced, but with a delayed start date for construction. The Construction Services/Lower Mainland Transmission Facility project, the Dawson Creek Field Office project, and the Fleet Facility project were all deferred in fiscal 2017 for five years, and are now due to recommence in fiscal 2022 or fiscal 2023.

[314] Fiscal 2017 and fiscal 2018 variances greater than $10 million are described in Appendix G, section 5.

6.6.4.1 Building Development Projects

The planned capital expenditures and additions for fiscal 2020 to fiscal 2021 for Building Development projects are provided in Table 6-61, below.

Table 6-61 Building Development Projects Plan Capital Expenditures and Additions for Fiscal 2020 to Fiscal 2021 ($ million)

Planning ID	Name of Project	Capital Addition Plan F20	Capital Addition Plan F21	Capital Expenditure Plan F20	Capital Expenditure Plan F21
	Building Development				
P201701	Pemberton Field Building Redevelopment	11.0	-	4.8	0.0
P201601	Long Beach Field Building Redevelopment	7.9	-	5.8	0.0
P201702	Materials Management Building Redevelopment	-	11.9	6.2	1.1
P201703	Chilliwack Field Building Redevelopment	-	28.2	12.4	12.3
P201704	Materials Classification Facility Building Redevelopment	-	-	7.1	23.3
P201901	Kamloops Field Building Redevelopment	-	-	1.5	3.0
	TOTAL Building Development	**18.9**	**40.0**	**37.8**	**39.7**

Annual capital expenditures on Building Development projects are lower than in the previous test period, as funding pressures have resulted in the deferral of several projects beyond the test period.

6.6.4.2 Building Improvement Projects

The planned capital expenditures and additions for fiscal 2020 to fiscal 2021 for Building Improvement projects are provided in Table 6-62 below. There are approximately 30 individual projects planned over the test period, at locations across the province. These are grouped below by project type based on the asset categories the individual projects are addressing. The majority of these projects are less than $2 million.

Table 6-62 Building Improvement Projects Plan Capital Expenditures and Additions for Fiscal 2020 to Fiscal 2021 ($ million)

Name of Project Type	Capital Addition Plan F20	Capital Addition Plan F21	Capital Expenditure Plan F20	Capital Expenditure Plan F21
Building Improvements				
Building Envelope	0.4	2.4	0.4	2.4
Elevators	1.7	1.2	1.7	1.2
HVAC	4.0	2.7	4.0	2.7
Interiors	5.4	0.9	5.4	0.9
Life/Safety	0.4	-	0.4	-
Roof	0.7	3.2	0.7	3.2
Storage Buildings	6.1	3.7	6.1	3.7
Yard	2.4	1.6	2.4	1.6
TOTAL Building Improvements	**21.1**	**15.6**	**21.1**	**15.6**

Annual capital expenditures on Building Improvements projects are generally lower than in the previous test period, as funding pressures have resulted in the deferral of multiple projects beyond the test period.

The Interior Space Renovations project work at Dunsmuir and Edmonds offices was completed in fiscal 2018, with the renovation of the final floor at the Edmonds office being completed. Accordingly there are no future expenditures planned.

6.7 Fleet Capital Investments

Fleet is responsible for the acquisition, operational costs, maintenance and disposal of BC Hydro's 3,600 vehicle, trailer and equipment assets relied on by field crews and staff across the province to complete the organization's maintenance and capital work programs and support system reliability. The safety, reliability, and availability of vehicles and equipment are critical to ensure BC Hydro employees are able to safely and efficiently complete diverse types of planned and unplanned work, including restoration work during storms and emergencies.

6.7.1 Fleet Investments Are Managed Using Established Industry Principles and Practices

BC Hydro manages the lifecycle of diverse vehicle and equipment assets using established fleet industry principles and practices. These vehicle and equipment assets include light vehicles (cars, SUVs, pickups and compact vans), medium vehicles (flat deck and service body trucks, walk-in and heavy vans), heavy vehicles (bucket trucks, digger derricks, cranes, heavy flat decks, tractors, fire trucks, and dump trucks), trailers, forklifts, and other types of equipment (herein referred to as vehicles and equipment).The present average age of fleet assets is 5.9 years, with expected planned vehicle and equipment lifespans ranging from 10 to 15 years depending upon asset class.

6.7.2 Fleet Portfolio Investments

Investments in fleet assets are made to sustain reliable operations across the province, minimize total asset lifecycle costs, ensure fitness of given assets for evolving work purposes, and limit safety and operational risks by meeting safety and other regulatory requirements.

6.7.2.1 Vast Majority of Fleet Investments Are Replacements Rather than Upgrades

Fleet investments can be of two major types:

- Replacement of end-of-life vehicles and equipment to reduce financial risks, control lifecycle costs and address age-related mechanical, safety and reliability issues. These sustaining investments form the vast majority of the Fleet capital plan and seek to avoid financial risk of increasing maintenance costs as assets age, including the higher likelihood of costly unplanned maintenance events. It is important to continually maintain the composition of the fleet from the standpoint of average age in order to limit the build-up of high cost, older vehicles and equipment.

- Providing additional or upgraded fleet assets to improve operational productivity, flexibility and safety. This represents a very small portion of fleet capital investments and includes value-based vehicle and equipment purchases via the upgrading or the addition of new assets in response to changing business needs and work methods.

6.7.3 Fleet Assets Capital Planning Has Balanced Affordability and Operational Needs

Fleet Investment Capital Planning for the test period was guided by the principle of balancing affordability and vehicle reliability, while providing support to operate our system safely.

In its capital planning process, BC Hydro identifies and ranks vehicles and equipment for replacement using asset information (asset age/remaining life, mileage, maintenance costs, utilization rates, observed downtime frequency), input from fleet maintenance staff and end-users on asset condition, criticality and operational requirements. End-users also can identify requirements for upgraded or additional fleet assets. This information is used to assemble a list of vehicles and equipment for acquisition planning. The process is initiated in advance of the expected end-of-life replacement criteria (i.e., for a vehicle with a ten-year life replacement planning is started at approximately the seven year mark). The general fleet replacement criteria are established based on historical data, as well as the suggested useful life in a commercial application as determined by BC Hydro fleet data, industry benchmarks and vehicle manufacturers. In addition, the work application and the environmental conditions in which the assets are operated are considered as they have an impact on the actual life of the vehicle.

Through the Application of the enterprise-wide framework for capital prioritization, top-down planning and expenditure guidelines and other constraints, the list of vehicles for replacement, upgrades and vehicle additions are prioritized. Recommended acquisition plans are vetted through senior management.

During the test period, BC Hydro is planning to keep some fleet assets in service for longer periods, which will increase the average age of BC Hydro's fleet. The objective of this approach is to maximize the value of our existing assets to balance affordability and vehicle reliability. While increased asset age is expected to impact the overall condition of fleet assets, creating risks such as lower vehicle reliability and higher maintenance and operating costs, actions such as timely completion of routine preventative maintenance, implementation of fleet telematics and the creation of additional vehicle pools to increase asset utilization will help to mitigate these risks.

To-date, fleet aging has not resulted in a corresponding decline in BC Hydro's overall system performance or customer reliability. If BC Hydro begins to experience an unacceptable increase in fleet asset failures, options include adjusting the level of end-of-life replacement by redirecting funding from other parts of the BC Hydro capital investment portfolio or changing operational or maintenance practices. BC Hydro reviews its capital plan on a regular basis, providing an ongoing opportunity to adjust capital investments in order to respond to new information, including system performance, asset health and risks.

6.7.4 Fleet Capital Expenditures and Additions

Table 6-63 Fleet - Vehicle and Equipment Actual and Plan Capital Expenditures Fiscal 2017 to Fiscal 2021[315]

($ millions)	F2017		F2018		F2019	F2019	F2020	F2021
	RRA	Actual	RRA	Actual	RRA	Forecast	Plan	Plan
Fleet	33.9	26.9	30.9	31.0	29.6	30.2	26.2	27.8

Table 6-64 Fleet - Vehicle and Equipment Actual and Plan Capital Additions Fiscal 2017 to Fiscal 2021[316]

($ millions)	F2017		F2018		F2019	F2019	F2020	F2021
	RRA	Actual	RRA	Actual	RRA	Forecast	Plan	Plan
Fleet	40.3	38.2	32.4	29.8	30.2	30.2	26.2	27.8

[315] Fiscal 2017 and fiscal 2018 variances greater than $10 million are described in Appendix G, section 5.
[316] Fiscal 2017 and fiscal 2018 variances greater than $10 million are described in Appendix G, section 5.

Planned Fleet capital expenditures and additions for fiscal 2020 and fiscal 2021 are less than fiscal 2017 to fiscal 2019 amounts, which reflects BC Hydro's plan to keep some fleet assets in-service for longer periods. BC Hydro believes these investment levels are reasonable based on the age and condition of the fleet assets, expected requirements and mitigation plans.

6.8 Business Support and Other Technology Capital Expenditures and Additions

Business Support and Other Technology includes capital expenditures and additions related to Land Purchases, Materials Management upgrades, Field Operations tools and equipment, Control Centre system upgrades, and workforce training equipment. The individual plans for these different areas with the exception of land purchases are generally less than $5 million per year.

Business Support and Other Technology Capital actual and plan expenditures for fiscal 2017 to fiscal 2021 are provided in Table 6-65 below.[316] More information can be found in Appendix I, page 10, lines 8 to 14 and Appendix J, page 93.

Table 6-65 Business Support and Other Technology Actual and Plan Capital Expenditures Fiscal 2017 to Fiscal 2020

($ millions)	F2017		F2018		F2019	F2019	F2020	F2021

Deferred Capital	-							
Construction Capital	-						27.9	189.4
Total	-	-	-	-	-	-	27.9	189.4

[317] Fiscal 2017 and fiscal 2018 variances greater than $10 million are described in Appendix G, section 5.

The Site C Project will construct a third dam and hydroelectric generating station on the Peace River in northeast B.C. to provide 1,100 megawatts of capacity, and produce about 5,100 gigawatt hours of electricity per year. In December 2014, the Project received approval from the Provincial Government to proceed to construction. On November 1, 2017, the BCUC issued their final report on the Site C Project. This led to a decision from the Provincial Government on December 11, 2017 announcing their approval to proceed with the Site C Project. As part of this announcement, BC Hydro provided a revised cost estimate of $10.7 billion, consisting of a BC Hydro project budget of $9.992 billion and a project reserve of $0.708 billion subject to Treasury Board control. Construction of the Site C Project started in summer 2015, with completion expected in fiscal 2025.

In fiscal 2020 and fiscal 2021 there are planned capital additions of $217 million for transmission related assets. These assets will enhance and increase reliability of BC Hydro’s transmission infrastructure in the area. The effect of those additions on the test period revenue requirements is small, since the assets are being amortized over a 15 to 65 year period, depending on the asset class.

The majority of the planned capital additions for the Site C Project are forecast to enter service in fiscal 2024, at which point they will begin to be recovered in rates.

Fiscal 2020 to Fiscal 2021
Revenue Requirements Application

Chapter 7

Regulatory Accounts

Table of Contents

List of Figures

List of Tables

7.1 Introduction

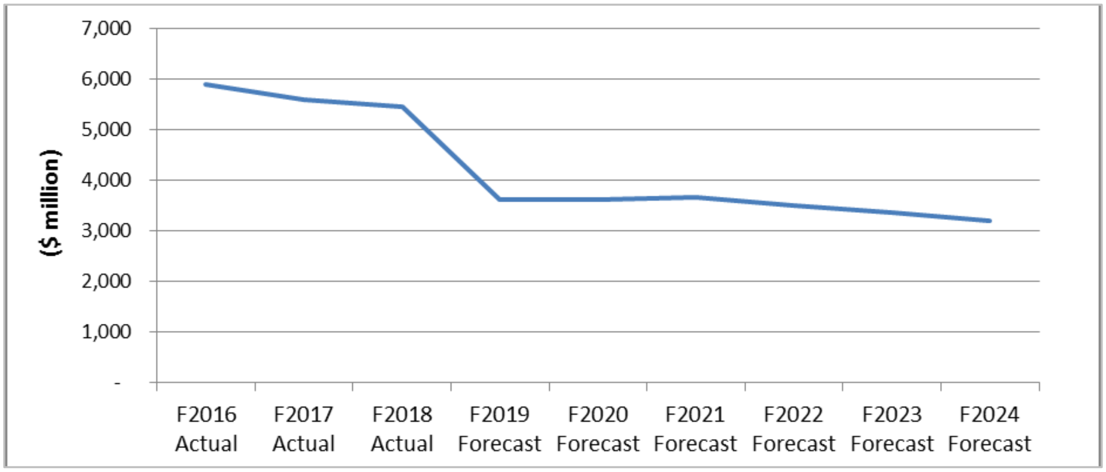
This chapter describes BC Hydro's deferral and regulatory accounts (collectively referred to as regulatory accounts) and our plan to manage them, including our proposals to change or close those accounts. BC Hydro is not requesting approval of any new regulatory accounts in this application.

The general purpose of a regulatory account is to defer costs or revenues for future recovery or refund. In the absence of rate-regulated accounting, these costs or revenues would be recognized in the current accounting period. Regulatory accounts can either be regulatory assets (amounts to be recovered from ratepayers) or regulatory liabilities (amounts to be refunded to ratepayers). Regulatory accounts are not debt, though BC Hydro has often incurred debt to fund the expenditures in regulatory accounts that have not yet been recovered from ratepayers.

BC Hydro's use of regulatory accounts is in accordance with International Financial Reporting Standards (**IFRS**) and in compliance with BCUC Orders and government directions. Rate-regulated accounting is permitted under IFRS 14, *Regulatory Deferral Accounts*.

As shown in Figure 7-1 below, BC Hydro has had three successive years of declining regulatory account balances.

Figure 7-1 Regulatory Account Balances Fiscal 2016 to Fiscal 2018 Actual and Fiscal 2019 to Fiscal 2024 Forecast

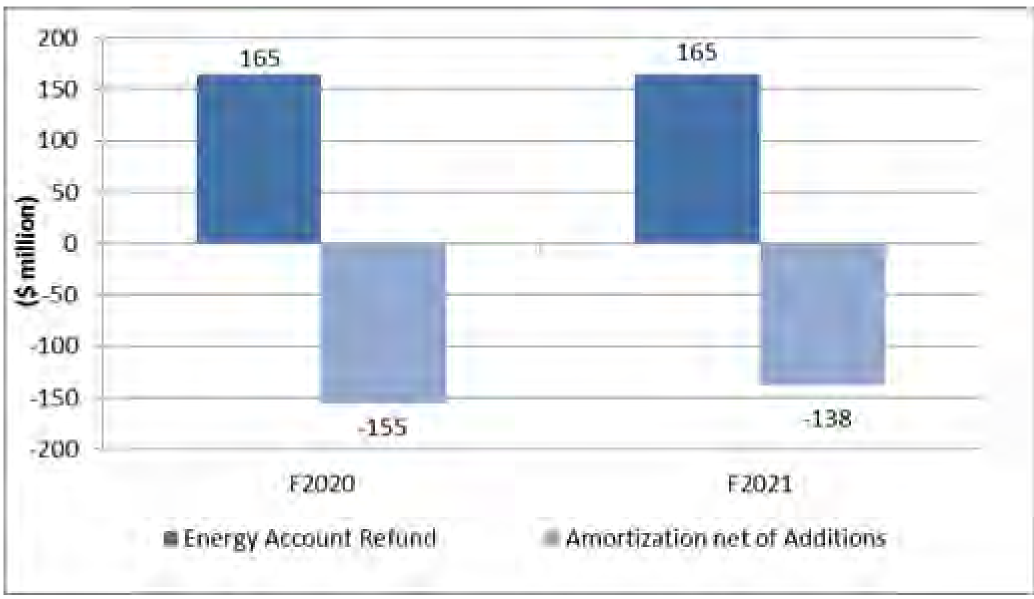


As shown in Figure 7-1 above, BC Hydro's total net regulatory account balance peaked at $5.9 billion in fiscal 2016 and is forecast to be reduced to $3.6 billion at the end of fiscal 2019 (a reduction of $2.3 billion or 39 per cent) and to $3.2 billion at the end of fiscal 2024. In addition, BC Hydro has or has proposed regulatory mechanisms to recover the balances of all but three of its regulatory accounts in rates, within the rate increases proposed for the test period. As discussed in section 7.5.6, the Mining Customer Payment Plan Regulatory Account, the Customer Crisis Fund Regulatory Account and the Site C Regulatory Account do not have approved recovery mechanisms, as recovery mechanisms are not yet required for those accounts.

A key driver of the reduction to the total net regulatory account balance in fiscal 2019 stems from the Comprehensive Review, which resulted in the write-off of the balance of the Rate Smoothing Regulatory Account. Other factors contributing to the reduction include the ongoing recovery of regulatory account balances in rates based on existing recovery mechanisms, reductions to the Trade Income Deferral Account due to higher than planned Powerex net income, and the one-time accounting credit adjustment of $319 million to the Heritage Deferral Account as a result of the adoption of a new IFRS revenue standard in fiscal 2019.[318]

As shown in Figure 7-2 below, over the test period, the balance in BC Hydro's regulatory accounts will continue to be reduced through the ongoing recovery of regulatory account balances in rates based on existing recovery mechanisms (net of additions). The reduction is offset by the proposed refund of the forecast balance in the Cost of Energy Variance Accounts, as discussed in section 7.7.1. As a result, as shown in Figure 7-2 below, there is only a slight overall change in the net regulatory account balance over the test period.

Figure 7-2 Regulatory Account Amortization (Net of Additions), Fiscal 2020 and Fiscal 2021



Almost all of the forecast balance in fiscal 2024 resides in five regulatory accounts that are being recovered (or will be recovered) in rates over a longer period of time as the nature of these accounts are longer term. Further information is provided in section 7.3 below.

[318] Refer to Chapter 7, section 7.7.1 and Chapter 8, section 8.13.2 for further information on this adjustment.

BC Hydro currently has 29 regulatory accounts. In this application, BC Hydro is requesting approval to close two regulatory accounts, which would reduce the total number of regulatory accounts to 27 by the end of fiscal 2021. In addition, BC Hydro will be seeking approval to close the Rock Bay Remediation Regulatory Account in its next revenue requirements application as remediation of the Rock Bay property is complete and the balance in that account will be fully recovered by the end of the subsequent test period.

This chapter is organized around the following key points:

- Section 7.2 explains that the Comprehensive Review has responded to concerns raised by the Auditor General by enhancing the BCUC's oversight of BC Hydro.
- Section 7.3 presents our approach to managing regulatory account balances over the next five years. It shows the actual and forecast closing account balances of the regulatory accounts by year from fiscal 2017 to fiscal 2024. Based on the requests in this application, the total balance in the regulatory accounts is expected to decline by approximately $2.3 billion from fiscal 2018 to fiscal 2024;
- Section 7.4 explains that BC Hydro's use of regulatory accounts is in accordance with IFRS;
- Section 7.5 explains that the types of regulatory accounts used by BC Hydro are consistent with those in the BCUC Regulatory Account Filing Checklist,[319] and outlines considerations to set appropriate mechanisms to ensure the balances in our regulatory accounts are recovered over the appropriate time period;

[319] https://www.bcuc.com/Documents/Guidelines/2017/05-03-2017_RegulatoryAccountFilingChecklist.pdf.

- Section 7.6 outlines criteria for evaluating the establishment of new regulatory accounts;
- Section 7.7 describes the existing regulatory accounts where BC Hydro is requesting changes, outlines the reasons for each request, and provides a description of each regulatory account for context. BC Hydro's requests in this application are summarized in section 7.1.1 below;
- Section 7.8 explains that BC Hydro is not requesting changes to most of its existing regulatory accounts, and provides a description of each unchanged regulatory account for context;
- Section 7.9 explains that BC Hydro applies interest to several regulatory accounts at BC Hydro's weighted average cost of debt in recognition of the carrying costs incurred by BC Hydro; and
- Section 7.10 provides a high-level summary of the information in this chapter for each of BC Hydro's regulatory accounts.

Additional information on the regulatory accounts is also provided in Schedules 2.1 and 2.2 of Appendix A.

7.1.1 BC Hydro Requests Approval of Seven Changes to Existing Regulatory Accounts and to Close Two Existing Accounts

BC Hydro is requesting approval of seven changes related to existing regulatory accounts and to close two existing regulatory accounts. BC Hydro is not requesting approval of any new regulatory accounts in this application.

Specifically, BC Hydro requests BCUC approval to:

- Reduce the Deferral Account Rate Rider (**DARR**) from 5 per cent to 0 per cent on April 1, 2019;
- Refund the forecast fiscal 2019 net closing balance and the forecast fiscal 2020 and fiscal 2021 net additions and net interest applied to the Cost of Energy

Variance Accounts, over the fiscal 2020 to fiscal 2021 test period. This would result in a net credit to the benefit of ratepayers of $329.1 million being amortized into rates during the test period;

- Defer any variances related to the accounting for EPAs determined to be leases under IFRS 16, which are not eligible for deferral treatment under existing orders, to the Non-Heritage Deferral Account;
- Defer any variances between forecast and actual amounts related to the Biomass Energy Program which are not eligible for deferral treatment under existing orders, to the Non-Heritage Deferral Account. This will ensure that BC Hydro recovers its costs with respect to the Biomass Energy Program;[320]
- Continue to defer, on an annual and ongoing basis, any variances between forecast and actual dismantling costs to the Dismantling Cost Regulatory Account, continue to apply interest to the balance of the account and recover the forecast interest charged to the account each year, and continue to recover the forecast account balance at the end of a test period over the next test period;
- Defer low-carbon electrification expenditures to the DSM Regulatory Account, consistent with the Direction to the BCUC Respecting Undertaking Costs;
- Remove the reference to the “Prescribed Standards” from the scope of what may be deferred to the Site C Regulatory Account, as BC Hydro has fully adopted IFRS. This will allow BC Hydro to continue to defer to the Site C Regulatory Account any costs related to the Site C Project that are not able to be capitalized;
- Close the Capital Project Investigation Costs Regulatory Account at the end of fiscal 2021 as its balance will be fully amortized into rates at that time; and

[320] The Government of B.C. has indicated that it intends to provide a direction to the BCUC with respect to the approval of the program documentation and to require the costs associated with the program to be recovered from ratepayers.

- Close the Rate Smoothing Regulatory Account in fiscal 2020 as this account has a zero balance and BC Hydro is not proposing to smooth rates over the fiscal 2020 to fiscal 2021 test period.

7.2 BCUC Oversight Has Been Enhanced

The Comprehensive Review has responded to concerns raised by the Auditor General by enhancing the BCUC's oversight of BC Hydro. Actions taken include repealing a regulation such that BC Hydro will fully adopt IFRS and writing off the balance in the Rate Smoothing Regulatory Account.

7.2.1 Comprehensive Review Makes Significant Efforts to Address Auditor General's Concerns

BC Hydro recognizes the concerns raised by the Auditor General regarding BC Hydro's regulatory accounts. In a report on Rate-Regulated Accounting at BC Hydro, dated February 2019, the Auditor General also expressed concerns with regard to the number of directions issued by the Government of B.C. to the BCUC, which have impacted BC Hydro's regulatory accounts.

BC Hydro and the Government of B.C. have made significant efforts in the Comprehensive Review to address the concerns raised by the Auditor General. Specifically:

- **BCUC oversight has been enhanced:** On February 14, 2019, the Government of B.C. issued its report on Phase One of the Comprehensive Review. The report highlights changes made by the Government of B.C. which have enhanced the BCUC's oversight of BC Hydro. Specifically, the Government of B.C. repealed Directions No. 3, 6, and 7, providing the BCUC with enhanced oversight over BC Hydro's regulatory accounts. The Government of B.C. issued Direction No. 8 to the BCUC which continues to provide direction to the BCUC in certain areas previously covered by Direction No. 7. Further information is provided in Chapter 2, section 2.2.1.

- **BC Hydro has fully adopted IFRS:** In November 2018, the Government of B.C. repealed Part 3 of the Government Organization Accounting Standards Regulation 257/2010. BC Hydro has subsequently fully adopted IFRS, effective for its fiscal year ending March 31, 2019. This is the appropriate basis of accounting for BC Hydro under Canadian generally accepted accounting principles (**CGAAP**) and addressed the one recommendation from the Auditor General's review of rate-regulated accounting at BC Hydro.
- **Rate Smoothing Regulatory Account has been written-off:** As part of the Comprehensive Review, BC Hydro ceased using the Rate Smoothing Regulatory Account at the end of the third quarter of fiscal 2019. The balance of the Rate Smoothing Regulatory Account was written-off in December 2018 in the amount of $1.044 billion, resulting in a reduction to BC Hydro's retained earnings and a forecast net loss for BC Hydro in fiscal 2019. This means that the cost of the write-off is borne by the Government of B.C. as BC Hydro's shareholder, and not by ratepayers. This write-off is a significant driver of the forecast decrease in the net regulatory account balance in fiscal 2019.

7.3 Plan to Manage Regulatory Account Balances

This section outlines our plan to manage our regulatory account balances. At the end of fiscal 2018, BC Hydro had a total of 29 regulatory accounts, with a total net balance of $5.5 billion. Based on existing approved recovery mechanisms and those proposed in this application, BC Hydro is forecasting that the total net balance in the accounts will be reduced to $3.7 billion at the end of fiscal 2021 and to $3.2 billion by the end of fiscal 2024. Almost all of the remaining forecast balance in fiscal 2024 is in five accounts, which are long-term by nature.

A key driver of this reduction is the write-off of the balance in the Rate Smoothing Regulatory Account. Other factors contributing to the reduction in BC Hydro's net regulatory account balance include the ongoing recovery of regulatory account balances in rates based on existing recovery mechanisms, reductions to the Trade

Income Deferral Account due to higher than planned Powerex net income, as well as a one-time accounting credit adjustment of $0.3 billion to the Heritage Deferral Account as a result of the adoption of a new IFRS revenue standard in fiscal 2019. This adjustment is discussed further in section 7.7.1 below and in Chapter 8, section 8.13.2.

BC Hydro's actual and forecast regulatory account balances for the fiscal 2017 to fiscal 2021 period are presented in Table 7-1 below.

Table 7-1 Summary of Regulatory Account Balances, Fiscal 2017 to Fiscal 2018 Actual and Fiscal 2019 to Fiscal 2021 Forecast

	($ million)	F2017 Actual	F2018 Actual	F2019 Forecast	F2020 Forecast	F2021 Forecast
		1	2	3	4	5
1	Opening Balance	5,908	5,597	5,454	3,622	3,632
2	Additions	(17)	34	(39)	165	159
3	Interest	75	62	39	24	28
4	Recoveries / Other	(370)	(238)	(1,832)	(180)	(160)
5	Net Change	(311)	(143)	(1,832)	9	26
6	**Closing Balance**	**5,597**	**5,454**	**3,622**	**3,632**	**3,658**

Table 7-2 below presents the fiscal 2017 and fiscal 2018 actual and fiscal 2019 to fiscal 2024 forecast balances of BC Hydro's regulatory accounts. The table shows that as a result of our plan the forecast balances will continue to decline to fiscal 2024.

BC Hydro currently has a total of 29 regulatory accounts. Table 7-2 provides a list of 30 regulatory accounts, including the Future Removal and Site Restoration Costs Regulatory Account, which is now closed. The Future Removal and Site Restoration

Regulatory Account is included in Table 7-2 as there was a balance in the account in fiscal 2017. In this application, BC Hydro is requesting approval to close two regulatory accounts, which would reduce the total number of regulatory accounts to 27 by the end of fiscal 2021. In addition, BC Hydro will be seeking approval to close the Rock Bay Remediation Regulatory Account in its next revenue requirements application as remediation of the Rock Bay property is complete and the balance in that account will be fully recovered by the end of the subsequent test period.

Almost all of the forecast balances in fiscal 2024 under our plan reside in five regulatory accounts that are being recovered (or will be recovered) over a longer period of time as the nature of these accounts are longer-term:

- The First Nations Provisions Regulatory Account, which is drawn down as annual settlement payments are made over a longer period of time;
- The DSM Regulatory Account for which the expenditures added each year are recovered over the 15-year benefit period for customers;
- The Site C Regulatory Account, which is not yet being recovered in rates as the project is not in-service. In a future application, BC Hydro will propose that the balance in the account be recovered over the average life of the assets once the project is in-service, as that is the period that customers will benefit from those costs; and
- The two IFRS Transition Accounts, which are being amortized into rates over 20 years for the IFRS Pension Regulatory Account and 40 years for the IFRS Property, Plant and Equipment Regulatory Account so that the balances in those accounts are recovered over the same period of time as under the previous CGAAP accounting rules. This means that ratepayers are not subject to higher rates as a result of changes in accounting rules.

The balances shown in Table 7-1 and Table 7-2 for fiscal 2019 onward are forecasts based on current information and assumptions at the time the forecast was prepared and reflect our proposed requests in this application. Actual balances will be different than presented for the following reasons:

- First, the forecast indicates that the balance in the three Cost of Energy Variance Accounts will be reduced to zero by the end of fiscal 2021. These accounts capture the variances between forecast and actual energy costs, forecast and actual revenues from energy sales, and forecast and actual trade income in each fiscal year, which can be positive or negative. Forecasting energy costs, revenues from energy sales and trade income is challenging, due to variables beyond BC Hydro's control, such as weather. Therefore, actual additions will differ from the forecast amounts;
- Second, the Non-Current Pension Costs Regulatory Account captures actuarial gains and losses. Annual actuarial gains and losses are sensitive to changes in market discount rates, rates of return on pension plan assets and significant changes in key actuarial assumptions. This means that annual actuarial gains and losses are subject to large positive and negative fluctuations and therefore actuarial gains or losses at the end of each year are difficult to forecast;
- Third, the forecast DSM Regulatory Account balances are based on the activities and expenditures in the current DSM Plan, which is discussed further in Chapter 10. Forecast balances beyond the test period for the DSM Regulatory Account may differ depending on modifications to the DSM Plan in future test periods; and
- Fourth, BC Hydro has several cash and non-cash variance accounts that capture variances between forecast and actual costs. BC Hydro expects the balances in these accounts will be different than the amounts forecast in this application due to non-controllable factors such as interest rates and weather.

Table 7-3 below sets out the baseline forecast amounts. The variances deferred to BC Hydro's regulatory accounts will be determined from these baseline forecasts.

Table 7-3 Fiscal 2020 to Fiscal 2021 Baseline Forecast Amounts for Regulatory Accounts

	($ million)	Schedule Reference	F2020 Plan	F2021 Plan
			1	2
	Heritage Deferral Account			
1	COE Subject to Deferral to HDA	4.0 L66	327.7	294.2
	Non-Heritage Deferral Account			
2	COE Subject to Deferral to NHDA	4.0 L80	1,571.0	1,637.2
3	Total Rate Revenue	1.0 L23	5,256.5	5,288.3
4	External OATT	15.0 L4	15.4	15.4

13	Dismantling Cost	5.0 L72:L75	67.0	43.0

7.4 BC Hydro's Use of Regulatory Accounts is in Accordance with Accounting Standards

BC Hydro's use of regulatory accounts is in accordance with IFRS and in compliance with BCUC Orders and government directions. Rate-regulated accounting is permitted under IFRS 14, Regulatory Deferral Accounts. As discussed in Chapter 8, section 8.13, BC Hydro applies rate-regulated accounting in accordance with IFRS 14.

Regulatory accounts are commonly used in the utility industry in North America. Regulatory accounts are used to defer differences between forecast and actual costs or revenues, to better match costs and benefits for customers, to smooth out the rate impact of a large, non-recurring cost, or to smooth out rate increases. As discussed below, BC Hydro uses regulatory accounts for these purposes.

7.5 Types of Regulatory Accounts and Amortization Periods

The five types of regulatory accounts used by BC Hydro are consistent with the BCUC Regulatory Account Filing Checklist.[321] The five types of accounts are described below, including a discussion of the relevant considerations when determining the appropriate recovery mechanisms to ensure that the balances in the accounts are recovered over the appropriate time period.

7.5.1 Variance Accounts

Regulatory accounts may be used to capture variances between forecast costs or revenues and actual costs or revenues. For BC Hydro, this includes variances between forecast and actual costs due to non-controllable factors such as water inflow levels, interest rates, discount rates, and market prices of energy, which are difficult to forecast. These types of variances are captured in BC Hydro's cash and non-cash variance accounts, which are discussed below.

BC Hydro believes that it should generally assume financial responsibility for controllable risks and create variance accounts for non-controllable risks. In the Fiscal 2005 to Fiscal 2006 Revenue Requirements Application, BC Hydro proposed the following criteria to assess whether a risk is controllable or non-controllable:[322]

321 https://www.bcuc.com/Documents/Guidelines/2017/05-03-2017_RegulatoryAccountFilingChecklist.pdf. Specifically, when requesting approval for a new regulatory account, the BCUC Regulatory Account Filing Checklist requires that regulated entities classify the regulatory account as either: (a) forecast variance account; (b) rate smoothing account; (c) benefit matching account; (d) retroactive expense account; or (e) other and to identify if the regulatory account is a cash or non-cash account.

322 BC Hydro Fiscal 2005 - Fiscal 2006 Revenue Requirement Application Argument, page 70.

1. BC Hydro's ability to directly or indirectly influence the cost category;
2. The volatility of the cost category;
3. The predictability of the cost category;
4. The materiality of the cost category to the revenue requirement; and
5. The frequency of major exceptions within the cost category.

In its Decision on the Fiscal 2005 to Fiscal 2006 Revenue Requirements Application, the BCUC accepted BC Hydro's proposed criteria but concluded that risk/reward considerations were also a relevant consideration.[323]

BC Hydro is not proposing any changes in this application to the criteria used to assess whether a risk is controllable or non-controllable.

BC Hydro's Cost of Energy Variance Accounts (the Heritage Deferral Account, the Non-Heritage Deferral Account and Trade Income Deferral Account) are examples of variance accounts that defer, for recovery or refund in a future period, differences between forecast and actual costs or revenues. The balances in these accounts are currently recovered through the DARR, which is discussed further in section 7.5.6.

BC Hydro also has cash variance accounts that capture the difference between forecast and actual costs for non-energy related costs that BC Hydro considers to be non-controllable. Examples include the Storm Restoration Costs and the Total Finance Charges regulatory accounts. Amounts transferred to cash variance accounts in a test period are generally recovered over the next test period. This approach is appropriate as these accounts represent costs that provide immediate, rather than long-term benefits.

Lastly, BC Hydro has non-cash variance accounts that capture the differences between forecast and actual non-controllable costs, which are non-cash in nature,

323 BC Hydro Fiscal 2005 to Fiscal 2006 Revenue Requirement Application Decision, pages 29 to 30.

for recovery from or refund to ratepayers in a future period. BC Hydro currently has four non-cash variance accounts: the Foreign Exchange Gains and Losses, the Non-Current Pension Costs, the PEB Current Pension Costs, and the Debt Management regulatory accounts. The recovery period for these variance accounts match the underlying attribute. For example, the Foreign Exchange Gains and Losses Regulatory Account is amortized on a straight-line pool basis over the weighted average life of the related debt and the Non-Current Pension Costs Regulatory Account is amortized over the average remaining service life of employees.

7.5.2 Benefit Matching Accounts

Regulatory accounts are often used to reflect timing differences between when a utility spends money to provide a service or acquire an asset, and when that expenditure provides benefits to ratepayers. The benefit of a particular service or asset may accrue to ratepayers over a long period of time. Regulatory accounts can be used to match the benefit with the cost, thereby supporting intergenerational equity between current and future ratepayers. The amortization period for this type of account will vary depending on the period of time that the benefit of a particular service or asset accrues to ratepayers. The use of this type of regulatory account means that BC Hydro's current customers are not required to pay for the full cost of an asset or service that will provide benefits to customers in the future.

The DSM Regulatory Account is an example of this type of account. Through DSM measures, BC Hydro spends money in current years to reduce the amount of electricity that customers would otherwise use in current and future periods. This results in lower energy costs and delayed or reduced infrastructure costs. The benefits of reduced costs from these DSM measures accrue to future customers. Therefore, the costs of DSM measures are matched to the benefits realized by future customers. DSM costs are deferred and amortized over 15 years, which reflects the average measure life of DSM measures. Further information is provided in Chapter 10, section 10.5.6.

The Site C Regulatory Account is another example of this type of regulatory account. This account defers project investigation costs related to the Site C Project to future years. The Site C Project has a long development period before it will be placed into service and provide benefits to customers. If these project investigation costs had been expensed as incurred, it would have created unfair rate impacts on current ratepayers, prior to the benefits of the project being provided.

7.5.3 Non-Cash Provisions

Non-cash provisions are regulatory accounts set up in response to loss provision liabilities required under IFRS. These provisions are not recovered in rates until actual cash expenditures are made against the provision. At that time, the provision is drawn down by the amount of the expenditure and a corresponding amount is transferred to the matching regulatory account. This amount is then amortized into rates based on the approved amortization method. The provision regulatory accounts remain in place until the loss provision liability is no longer required under IFRS. These accounts are regulatory assets which, subject to BCUC approval, preserve BC Hydro’s ability to collect, in rates, any actual amounts paid in respect of these provisions. BC Hydro currently has three non-cash provision regulatory accounts: the First Nations Provisions, the Environmental Provisions, and the Arrow Water Systems Provision regulatory accounts.

7.5.4 Rate Smoothing Accounts

Concerns about rate impacts can lead to the establishment of a regulatory account to smooth required rate increases over a period of time or to smooth the rate impact of a large, one-time expenditure. The recovery period for this type of account would be determined by the amount and nature of the expenditure, as well as other rate increase pressures that may exist at the time.

Pursuant to Direction No. 7,the BCUC had approved for use, starting in fiscal 2015, a Rate Smoothing Regulatory Account to defer portions of BC Hydro's allowed revenue requirement for recovery in rates in future fiscal years. As part of the Comprehensive Review, BC Hydro ceased using the Rate Smoothing Regulatory Account at the end of the third quarter of fiscal 2019. The balance of the Rate Smoothing Regulatory Account was written-off in December 2018 in the amount of $1.044 billion, resulting in a reduction to BC Hydro's retained earnings and a forecast net loss for BC Hydro in fiscal 2019. This means that the cost of the write-off is borne by the Government of B.C. as BC Hydro's shareholder, and not by ratepayers. As a result, there is a zero balance in the Rate Smoothing Regulatory Account at the beginning of the test period. BC Hydro is not proposing to smooth rates over the fiscal 2020 to fiscal 2021 test period and is requesting BCUC approval to close the existing Rate Smoothing Regulatory Account.

7.5.5 IFRS Transition Accounts

A change in the accounting standards applicable to BC Hydro may create non-controllable financial impacts, requiring a regulatory account to protect customers from sudden and significant rate increases.

In fiscal 2013, BC Hydro transitioned to the Prescribed Standards directed by the Government of B.C.'s Treasury Board. The Prescribed Standards were based on the principles of IFRS, combined with regulatory accounting in accordance with Financial Accounting Standards Board Accounting Standards Codification 980, *Regulated Operations* with one modification. This change impacted the method of accounting for capital overheads. It also required BC Hydro to recognize, on its balance sheet, all unamortized actuarial gains and losses on its pension and other post-employment benefit plans. To recover the financial impact of these changes from customers over a reasonable time period, BC Hydro proposed the establishment of the IFRS Transition regulatory accounts. If BC Hydro had recognized the impact of the transition to IFRS in its rates at the time of the transition, the rate impact for customers in the year of transition, would have been significant.

The recovery periods for the IFRS Transition Accounts are 20 years for the IFRS Pension Regulatory Account and 40 years for the IFRS Property, Plant and Equipment Regulatory Account. These recovery periods mean that the accounts recover the transition costs of pension and capital assets over the same period of time as if the IFRS rules had not come into place as part of the Prescribed Standards.

7.5.6 Summary of Recovery Mechanisms

Table 7-4 below provides a summary of the rationale to determine the appropriate recovery mechanisms for BC Hydro's regulatory accounts.

Table 7-4 Summary of Rationale for Regulatory Account Recovery Mechanisms

Type of Regulatory Account	Rationale for Recovery Mechanism
Variance Accounts:	
Cost of Energy Variance Accounts	The Deferral Account Rate Rider mechanism minimizes intergenerational inequity by being responsive to the changing net balance in the cost of energy variance accounts, while maintaining rate stability for customers to the extent practicable. BC Hydro is proposing to reduce the Deferral Account Rate Rider from 5 per cent to 0 per cent on April 1, 2019 and to refund the forecast fiscal 2019 net closing balance and the forecast fiscal 2020 and fiscal 2021 net additions and net interest applied to the Cost of Energy Variance Accounts over the fiscal 2020 to fiscal 2021 test period.
Other Cash Variance Accounts	To minimize intergenerational inequity, cash variance accounts should be recovered in the subsequent test period.
Non-Cash Variance Accounts	Non-cash variances should be recovered over the remaining period of the associated asset or liability (e.g., estimated average remaining service life of employees or remaining term of debt issuances).
Benefit Matching Accounts	To achieve intergenerational equity, the recovery period should match the future benefit period of the expenditure.
Non-Cash Provisions	Since non-cash provisions are not recovered in rates, no recovery mechanism is required. The provision is drawn down when actual expenditures are charged to the regulatory account.
Rate Smoothing Accounts	Recovery mechanisms can vary based on the purpose of the rate smoothing account. For example, if the purpose of a rate smoothing account is to smooth rates over a specific test period only, the account should be recovered over the related test period. BC Hydro is not proposing to smooth rates over the fiscal 2020 to fiscal 2021 test period.
IFRS Transition Accounts	To smooth the impact of changes in accounting standards, the balances in these accounts should be recovered on the same basis as they would have been recovered under the previous accounting rules.

BC Hydro has BCUC approved recovery mechanisms to collect, in rates, the balances in almost all of its regulatory accounts. The following three regulatory accounts do not have approved recovery mechanisms, as they are not yet required:

1. Mining Customer Payment Plan Regulatory Account – BC Hydro will request a recovery mechanism, if necessary, upon completion of the five year program, which commenced in March 2016. This account currently has a zero balance;
2. Customer Crisis Fund Regulatory Account – BC Hydro will request a recovery mechanism upon completion of the three year pilot program which commenced in May 2018; and
3. Site C Regulatory Account – BC Hydro will request a recovery mechanism for this account in a future application, as the project is not yet in-service.

7.6 Threshold for Establishing New Regulatory Accounts

BC Hydro is not requesting to establish any new regulatory accounts in this application.

However, should a new regulatory account be required in the future, BC Hydro believes that the criteria discussed in section 7.5 continue to be appropriate. With respect to the deferral of differences between forecast and actual costs, BC Hydro continues to believe that it should assume financial responsibility for controllable risks and use regulatory accounts for non-controllable risks. However, to limit the number of regulatory accounts, an objective measure should be used as a threshold for creating a new regulatory account. BC Hydro believes that un-forecast and non-controllable expenditures of greater than $10 million in a fiscal year would be considered material. Therefore, in these cases, a new regulatory account would be warranted to defer the impact for future recovery.

7.7 BC Hydro's Proposed Changes to Regulatory Accounts are Limited

BC Hydro is requesting approval of seven changes related to existing regulatory accounts and to close two existing regulatory accounts. BC Hydro is not requesting approval of any new regulatory accounts in this application.

Specifically, BC Hydro requests BCUC approval to:

- Reduce the DARR from 5 per cent to 0 per cent on April 1, 2019;
- Refund the forecast fiscal 2019 net closing balance and the forecast fiscal 2020 and fiscal 2021 net additions and net interest applied to the Cost of Energy Variance Accounts, over the fiscal 2020 to fiscal 2021 test period. This would result in a net credit to the benefit of ratepayers of $329.1 million being amortized into rates during the test period;
- Defer any variances related to the accounting for EPAs determined to be leases under IFRS 16, which are not eligible for deferral treatment under existing orders, to the Non-Heritage Deferral Account;
- Defer any variances between forecast and actual amounts related to the Biomass Energy Program which are not eligible for deferral treatment under existing orders, to the Non-Heritage Deferral Account. This will ensure that BC Hydro recovers its costs with respect to the Biomass Energy Program;[324]
- Continue to defer, on an annual and ongoing basis, any variances between forecast and actual dismantling costs to the Dismantling Cost Regulatory Account, continue to apply interest to the balance of the account and recover the forecast interest charged to the account each year, and continue to recover the forecast account balance at the end of a test period over the next test period;
- Defer low-carbon electrification expenditures to the DSM Regulatory Account, consistent with the Direction to the BCUC Respecting Undertaking Costs;
- Remove the reference to the “Prescribed Standards” from the scope of what may be deferred to the Site C Regulatory Account, as BC Hydro has fully

[324] The Government of B.C. has indicated that it intends to provide a direction to the BCUC with respect to the approval of the program documentation and to require the costs associated with the program to be recovered from ratepayers.

adopted IFRS. This will allow BC Hydro to continue to defer to the Site C Regulatory Account any costs related to the Site C Project that are not able to be capitalized;

- Close the Capital Project Investigation Costs Regulatory Account at the end of fiscal 2021 as its balance will be fully amortized into rates at that time; and
- Close the Rate Smoothing Regulatory Account in fiscal 2020 as this account has a zero balance and BC Hydro is not proposing to smooth rates over the fiscal 2020 to fiscal 2021 test period.

The sections below provide the rationale for each proposed change to the regulatory accounts. To provide context for to these requests, the sections below include a description of the account, the history of the account and the existing or proposed recovery mechanism or period for the recovery of the account balance.

7.7.1 Cost of Energy Variance Accounts

BC Hydro has three Cost of Energy Variance Accounts that capture the differences between forecast and actual revenues and energy costs: the Heritage Deferral Account, the Non-Heritage Deferral Account and the Trade Income Deferral Account.

The Heritage Deferral Account and Trade Income Deferral Account were created pursuant to Heritage Special Direction No. HC2 and BCUC Order No. G-96-04. Special Direction No. HC2 was repealed in March 2014 and the Heritage Deferral Account and the Trade Income Deferral Account were continued on an ongoing basis through Direction No. 7 and BCUC Order No.G-48-14.

By Order No. G-96-04, the BCUC also approved the establishment of the Non-Heritage Deferral Account and approved the specific cost components eligible for deferral to the Heritage Deferral Account and to the Non-Heritage Deferral Account. Through subsequent Orders, the scope of the Non-Heritage Deferral

Account has been expanded.[325] Notably, by Order No. G-16-09, the BCUC authorized BC Hydro to defer to the Non-Heritage Deferral Account, the variances between forecast and actual cost of energy arising from differences in forecast and actual domestic customer load in fiscal 2009 and fiscal 2010. This was continued through the Fiscal 2011 Negotiated Settlement Agreement and by Order No. G-77-12A to the Fiscal 2012 to Fiscal 2014 Revenue Requirements Application. Direction No. 7 required the BCUC to allow these variances to be deferred to the Non-Heritage Deferral Account on an ongoing basis. Direction No. 7 also required the BCUC to allow BC Hydro to defer costs associated with the decommissioning of portions of Burrard Thermal not required for transmission support services, to the Non-Heritage Deferral Account.

The purpose of the three Cost of Energy Variance Accounts is to defer the differences between forecast and actual revenues and energy costs for recovery or refund to ratepayers in future periods. These differences are non-controllable and can be positive or negative. The variances captured by the Cost of Energy Variance Accounts can be summarized as follows:

- The Heritage Deferral Account captures variances between the forecast and actual cost of Heritage Energy, Market Electricity Purchases, Surplus Sales and Domestic Transmission costs related to Surplus Sales as described in Chapter 4, sections 4.2.2 and 4.2.4. In addition, the Heritage Deferral Account captures variances between forecast and actual costs and revenues for items approved by BCUC Order No. G-96-04, which includes Skagit Valley Treaty revenues.

---

[325] BCUC Order No. G-16-11 approved the deferral of variances between forecast and actual transmission service revenue and non-capital emergency transmission maintenance expenditures over $1 million to the Non-Heritage Deferral Account.
BCUC Order No. G-68-17 approved the deferral of variances between forecast and actual Northwest Transmission Line Supplemental Charge revenues to the Non-Heritage Deferral Account.
BCUC Order No. G-130-18 approved the deferral of the fiscal 2019 Lease revenues arising from the Waneta 2017 Transaction and the revenue associated with capital expenditures made by Teck with respect to Teck's two-third interest in Waneta during the Lease Term to the Non-Heritage Deferral Account. The Order also approved that the variance between forecast and actual water rentals in a given year arising from the Waneta 2017 transaction be excluded from the water rental variances that are currently deferred to the Non-Heritage Deferral Account during the Lease Term.

- The Non-Heritage Deferral Account captures variances between the forecast and actual cost of Non-Heritage Energy which includes IPPs and Long-Term Commitments, and Net Purchases (Sales) from Powerex as described in Chapter 4, sections 4.2.3 and 4.2.4. In addition, the Non-Heritage Deferral Account captures variances between forecast and actual costs and revenues for items approved by BCUC Order No G-96-04, variances between forecast and actual domestic customer load (referred to as the Domestic Revenue Variance), and subsequent Orders as noted above.
- The Trade Income Deferral Account captures variances between the forecast and actual Trade Income as described in Chapter 8, section 8.9.

7.7.1.1 Recovery Mechanism

BC Hydro believes that it continues to be appropriate to defer cost and revenue variances to the Cost of Energy Variance Accounts, consistent with past practice and existing orders. These variances are non-controllable and the deferral of variances ensures that BC Hydro's customers pay the actual costs.

The fiscal 2019 forecast closing balance in the Cost of Energy Variance Accounts is a net credit balance (i.e., amount owing to ratepayers) of $293 million, in part due to a one-time accounting adjustment of $319 million as a result of the adoption of a new IFRS revenue standard in fiscal 2019. The application of IFRS 15, *Revenue from Contracts with Customers*, impacted the recognition of revenues under the Skagit River Agreement, resulting in a retroactive decrease in unearned revenues and a corresponding adjustment to the Heritage Deferral Account to the benefit of ratepayers.[326] Further information is provided in Chapter 8, section 8.13.2.

BC Hydro recovers the balances in the Cost of Energy Variance Accounts using the DARR. Direction No. 7 set the DARR for fiscal 2015 and future fiscal years at

[326] BCUC Order No. G-96-04 approved the deferral of variances between forecast and actual Skagit Valley Treaty revenues to the Heritage Deferral Account. Accordingly, the adjustment was deferred to the Heritage Deferral Account, to the benefit of ratepayers.

5 per cent. However, because Direction No. 7 was repealed and because BC Hydro is forecasting a net credit balance in the accounts for fiscal 2019, BC Hydro is proposing to amortize this balance over the test period. BC Hydro believes that it is appropriate to refund this net credit balance to ratepayers over the fiscal 2020 to fiscal 2021 test period. This would allow ratepayers to realize the benefit of this net credit balance more immediately than if the credit were to be refunded to ratepayers through the DARR.

As these are variance accounts, BC Hydro would not normally forecast additions to the Cost of Energy Variance Accounts. However, over the test period, BC Hydro is forecasting additions to the Non-Heritage Deferral Account for a one-time credit of $18.0 million in fiscal 2020 arising from a transition adjustment related to the adoption of a new IFRS 16, *Leases* standard as described in Chapter 8, section 8.13.3. In addition, BC Hydro is forecasting additions of $3.1 million in fiscal 2020 and $3.5 million in fiscal 2021 related to revenue that BC Hydro is required to recognize for capital expenditures made by Teck with respect to Teck's 2/3 interest in Waneta over the lease period.[327]

Therefore, in this application, BC Hydro is requesting BCUC approval to:

- Reduce the Deferral Account Rate Rider from 5 per cent to 0 per cent on April 1, 2019; and
- Refund the forecast fiscal 2019 net closing balance and the forecast fiscal 2020 and fiscal 2021 net additions and net interest applied to the Cost of Energy Variance Accounts, over the fiscal 2020 to fiscal 2021 test period.

This would result in a net credit to the benefit of ratepayers of $329.1 million being amortized into rates during the test period.

[327] BCUC Order No. G-130-18 approved the deferral of the revenue associated with capital expenditures made by Teck with respect to Teck's two-third interest in Waneta during the Lease Term to the Non-Heritage Deferral Account.

Based on BC Hydro's proposed approach, the forecast balance in each of the Cost of Energy Variance Accounts will be zero at the end of fiscal 2021.

BC Hydro expects to propose to return to the DARR table mechanism approved by the BCUC in the Fiscal 2009 to Fiscal 2010 Revenue Requirements Application in the subsequent test period starting in fiscal 2022.

7.7.1.2 IFRS 16, Leases (Energy Purchase Agreements)

As discussed in Chapter 8, section 8.13.3 of the application, BC Hydro will adopt a new IFRS 16, *Leases* standard, which will become effective for BC Hydro on April 1, 2019. BC Hydro has made estimates based on its preliminary assessment regarding the impacts of IFRS 16 and has included them in this Application. However, the actual impacts of the new standard may vary from these estimates as BC Hydro completes its assessment, including as a result of clarifications and interpretive guidance that may be developed by the International Accounting Standards Board, accounting firms and industry groups to assist in the implementation of the new standard. BC Hydro anticipates that material variances are possible when we complete our assessment of EPAs, including the review by our external auditors. As shown in Chapter 8, section 8.12.1, BC Hydro has deferred positive variances related to EPA capital leases into the Non-Heritage Deferral Account in order to provide the benefit to ratepayers, even though this was not required under existing orders.

Therefore, in this application, BC Hydro requests BCUC approval to:

- Defer any variances related to the accounting for EPAs determined to be leases under IFRS 16, which are not eligible for deferral treatment under existing orders, to the Non-Heritage Deferral Account.

7.7.1.3 Biomass Energy Program

As discussed in Chapter 4, section 4.3.2, the Comprehensive Review included the announcement of the Biomass Energy Program. The Government of B.C. indicated that it intends to provide a direction to the BCUC with respect to the approval of the program documentation and require the costs associated with the Biomass Energy Program to be recovered from ratepayers.

BC Hydro may be required to account for some of the costs associated with the Biomass Energy Program as amounts other than cost of energy (variances related to which would generally be deferred to the Non-Heritage Deferral Account pursuant to existing orders). Until contracts relating to the identified biomass projects are completed, BC Hydro cannot have certainty on the amount of those costs or how to appropriately account for them.

BC Hydro proposes that variances related to the Biomass Energy Program be deferred to the Non-Heritage Deferral Account.

Therefore, in this application, BC Hydro requests BCUC approval to:

- Defer any variances between forecast and actual amounts related to the Biomass Energy Program which are not eligible for deferral treatment under existing orders, to the Non-Heritage Deferral Account. This will allow BC Hydro to recover its costs with respect the Biomass Energy Program.[328]

7.7.2 Dismantling Cost Regulatory Account

By Order No. G-47-18 to the Previous Application, the BCUC approved the deferral of variances between forecast and actual dismantling costs over the fiscal 2017 to fiscal 2019 test period, the application of interest to the account, and the recovery of the forecast account balance at the end of the test period over the next test period. BC Hydro is proposing to continue the Dismantling Cost Regulatory Account on an ongoing basis.

[328] The Government of B.C. has indicated that it intends to provide a direction to the BCUC with respect to the approval of the program documentation and to require the costs associated with the program to be recovered from ratepayers.

In its Decision, the BCUC stated that, in its view, the timing of dismantling activities is largely within BC Hydro's control but that the establishment of the account for the test period would allow BC Hydro to gain more experience with forecasting the timing of expenditures.[329]

BC Hydro is not in a better position now than it was over the last test period to forecast dismantling costs accurately. In BC Hydro's view, the nature of dismantling costs makes them difficult to forecast accurately. As shown in the table below, dismantling cost variances can be positive or negative and continue to be significant in recent years. More specifically, Table 7-5 shows that variances have ranged from $14.1 million below plan to $31.7 million above plan (with a range between -41 per cent to +89 per cent of plan) since fiscal 2012.

Table 7-5 Dismantling Cost Variances Fiscal 2012 to Fiscal 2018 Actual and Fiscal 2019 Forecast

	($ million)	F2012	F2013	F2014	F2015	F2016	F2017	F2018	F2019
		1	2	3	4	5	6	7	8
1	Actual[1]	20.2	16.4	32.2	22.4	24.2	42.4	67.5	44.5
2	RRA Plan	34.3	20.9	21.0	24.6	31.2	39.5	35.7	30.6
3	Variance from Plan (Actual - RRA Plan)	(14.1)	(4.5)	11.2	(2.2)	(7.0)	2.9	31.7	13.9
3	% Variance from Plan	-41%	-21%	53%	-9%	-22%	7%	89%	45%

[1]F2019 is a forecast amount

Actual dismantling costs can vary significantly from planned amounts for a number of reasons.

The rationale for the Dismantling Cost Regulatory Account is the same as the rational for the Amortization of Capital Additions Regulatory Account, which captures variances between forecast and actual amortization of capital additions. Dismantling costs are largely driven by BC Hydro's capital plan and are impacted by capital project schedules. Similar to capital projects, dismantling projects may be forecast

[329] BCUC Decision and Order No. G-47-18, BC Hydro Previous Application (March 1, 2018), pages 62 to 63.

well in advance of the actual work taking place. Project estimates may be from an earlier stage of the project lifecycle and will have different degrees of accuracy depending on the phase of the project.

In addition, actual dismantling costs are expected to differ from forecast amounts due to differences in timing and scope. Dismantling work occurs based on capital project schedules, which can change and cause material shifts in the timing of dismantling expenditures. Any delays or advancements to capital project schedules could result in these expenditures being incurred earlier or later than planned. In addition, as additional work requirements may be determined as activities progress, the full scope and cost of dismantling activities may not be known until the work is underway.

Further, emergency dismantling of assets is sometimes required and unplanned dismantling may be required for projects that were not included in the dismantling cost forecast in a given test period. For example, in fiscal 2018, BC Hydro decommissioned the Salmon River Diversion, which was originally planned to be upgraded, resulting in unplanned dismantling cost expenditures. By Order No. G-96-17, the BCUC approved BC Hydro’s request to decommission the Salmon River Diversion and allowed the decommissioning costs to be transferred to the Dismantling Costs Regulatory Account. This transfer meant that these dismantling costs were appropriately recovered from ratepayers.

BC Hydro believes that it is appropriate to continue to defer, on an ongoing basis, the variances between forecast and actual dismantling costs, for recovery over the next test period. There are significant dismantling costs planned during the test period in the amount of $67 million in fiscal 2020 and $43 million in fiscal 2021. In the absence of the Dismantling Cost Regulatory Account, significant gains or losses could accrue to ratepayers or the Government of B.C. as BC Hydro’s shareholder. Continued use of the account for the test period will mean that ratepayers pay the actual costs of dismantling activities.

Therefore, in this application, BC Hydro is requesting BCUC approval to:

- Continue to defer, on an annual and ongoing basis, any variances between forecast and actual dismantling costs to the Dismantling Cost Regulatory Account;
- Continue to apply interest to balances in the account, consistent with the application of interest to other variance accounts, based on BC Hydro's current weighted average cost of debt;
- Effective starting in fiscal 2020, and on an ongoing basis, recover the forecast interest charged to the Dismantling Cost Regulatory Account each year from the account each year; and
- On an ongoing basis, recover the forecast account balance at the end of a test period over the next test period.

7.7.3 DSM Regulatory Account

By Order No. G-55-95, the BCUC directed the deferral and recovery of costs associated with DSM activities. In accordance with Direction No. 7, BCUC Order No. G-48-14 authorized BC Hydro to continue to defer these costs to the DSM Regulatory Account and to amortize the balance of the account into rates over 15 years, on an ongoing basis.

The Direction to the BCUC Respecting the Authority's TMP Program (Order in Council No. 404, issued on July 14, 2015) specified that BC Hydro be allowed to defer costs incurred related to the Thermo-Mechanical Pulp program, up to $100 million, to the DSM Regulatory Account. BC Hydro's forecast costs related to the Thermo-Mechanical Pulp Program are discussed in Chapter 10.

The Direction to the BCUC Respecting Undertaking Costs (Order in Council No. 100, issued on March 1, 2017) specified that BC Hydro be allowed to defer low-carbon electrification expenditures, to the DSM Regulatory Account.

BC Hydro's forecast costs related to low carbon electrification are discussed in Chapter 10.

In this application, BC Hydro requests BCUC approval to:

- Defer low-carbon electrification expenditures to the DSM Regulatory Account, consistent with the Direction to the BCUC Respecting Undertaking Costs.

7.7.4 Site C Regulatory Account

By Order No. G-143-06, the BCUC approved the creation of a regulatory account related to Site C Project expenditures and approved deferral of project costs incurred in fiscal 2007 and fiscal 2008 to the account. The Fiscal 2009 to Fiscal 2010 Revenue Requirements Application Decision and Fiscal 2011 Revenue Requirement Application Negotiated Settlement Agreement extended the deferral of project costs to the Site C Regulatory Account to the end of fiscal 2011. By Order No. G-77-12A to the Fiscal 2012 to Fiscal 2014 Amended Revenue Requirement Application, the BCUC authorized the deferral of all operating costs incurred related to the Site C Project in fiscal 2012 to fiscal 2014. By Order No. G-48-14, the BCUC authorized the deferral of all operating costs incurred in fiscal 2015 and fiscal 2016.

Following the final investment decision by the Government of B.C. to proceed with the Site C Project, BC Hydro commenced capitalization of costs related to the project starting in January 2015. While BC Hydro has commenced capitalization of costs, certain costs related to the project may not be eligible for capitalization under IFRS. For example, some legal costs are not eligible for capitalization under IFRS.

By Order No. G-47-18 to the Previous Application, the BCUC approved the deferral of any costs related to the Site C Project that are not able to be capitalized under the Prescribed Standards, to the Site C Regulatory Account.

As discussed in Chapter 8, section 8.13, BC Hydro has fully adopted IFRS, effective for its fiscal year ending March 31, 2019. As a result, the reference to the

"Prescribed Standards" should be removed from the scope of what may be deferred to the Site C Regulatory Account. Consistent with the BCUC's prior Orders, this would allow BC Hydro to continue to defer to the Site C Regulatory Account any costs related to the Site C Project that are not able to be capitalized.

As described in Chapter 8, section 8.13.4, as a result of the adoption of IFRS 14, the amortization of the Debt Management Regulatory Account can no longer be classified as finance charges and as such can no longer be included in the calculation of BC Hydro's interest during construction that is applied to capital projects (i.e., capitalized).

For the test period, BC Hydro forecasts that the amount of interest during construction attributable to the Site C Project that can no longer be capitalized is $2.0 million in fiscal 2020 and $2.7 million in fiscal 2021. These are credit amounts as the Debt Management Regulatory Account is currently in a credit balance. As these amounts can no longer be capitalized under IFRS, they would be deferred to the Site C Regulatory Account.

Therefore, in this application, BC Hydro is requesting BCUC approval to remove the reference to the "Prescribed Standards" from the scope of what may be deferred to the Site C Regulatory Account, as BC Hydro has fully adopted IFRS. This will allow BC Hydro to continue to defer to the Site C Regulatory Account any costs related to the Site C Project that are not able to be capitalized.

7.7.5 Capital Project Investigation Costs Regulatory Account

By Order No. G-16-09 to the Fiscal 2009 to Fiscal 2010 Revenue Requirements Application, the BCUC approved the establishment of a regulatory account for capital project investigation costs. The Fiscal 2011 Revenue Requirement Application Negotiated Settlement Agreement provided that additions to the Capital Project Investigation Costs Regulatory Account would be discontinued at the end of fiscal 2011, and that the closing fiscal 2011 balance would be amortized beginning in fiscal 2012. BCUC Order No. G-77-12A approved the amortization of the fiscal 2011 closing balance over a 10 year period, commencing in fiscal 2012. Consistent with BCUC Order No. G-77-12A, the balance in this account will be fully amortized into rates by the end of fiscal 2021.

Therefore, in this application, BC Hydro is requesting BCUC approval to:

- Close the Capital Project Investigation Costs Regulatory Account at the end of fiscal 2021 as its balance will be fully amortized into rates at that time.

7.7.6 Rate Smoothing Regulatory Account

In accordance with Direction No. 7, BCUC Order No. G-48-14 established the Rate Smoothing Regulatory Account in fiscal 2015 to defer, for recovery in rates in future fiscal years, those portions of the allowed revenue requirement in a particular fiscal year that were not to be recovered in rates in that particular fiscal year.

Approved additions to this regulatory account from fiscal 2015 to fiscal 2019 total $1.136 billion. As a result of the Comprehensive Review, BC Hydro ceased using the Rate Smoothing Regulatory Account at the end of the third quarter of fiscal 2019. The balance of the Rate Smoothing Regulatory Account was written-off in December 2018 in the amount of $1.044 billion, resulting in a reduction to BC Hydro’s retained earnings and a forecast net loss for BC Hydro in fiscal 2019. This means that the cost of the write-off is borne by the Government of B.C. as BC Hydro’s shareholder, and not by ratepayers. As a result, there is a zero balance in the Rate Smoothing Regulatory Account at the beginning of the test period. BC Hydro is not proposing to smooth rates over the fiscal 2020 to fiscal 2021 test period.

Therefore, in this application, BC Hydro is requesting BCUC approval to:

- Close the Rate Smoothing Regulatory Account in fiscal 2020 as this account has a zero balance and BC Hydro is not proposing to smooth rates over the fiscal 2020 to fiscal 2021 test period.

7.8 BC Hydro is Not Seeking Changes to Most Regulatory Accounts

Consistent with prior applications, provided below is an overview of the history and recovery periods of the regulatory accounts for which BC Hydro is not seeking any changes.

7.8.1 Storm Restoration Costs Regulatory Account

By Order No. G-16-09 to the Fiscal 2009 to Fiscal 2010 Revenue Requirements Application, the BCUC approved the ongoing deferral of the difference between actual storm related restoration costs and the average of the actual storm restoration costs for the five most recent normal weather years. Fiscal 2014 through fiscal 2018 comprise the five most recent normal weather years and result in an average annual storm restoration cost of $17.8 million. BC Hydro has included this amount for storm restoration costs in its fiscal 2020 and fiscal 2021 operating costs plan.

In recent years, BC Hydro has experienced more frequent storms and extreme weather resulting in higher storm-related expenditures, which has caused the five-year average to increase as shown in Table 7-6 below.

Table 7-6 Storm Restoration Costs Fiscal 2014 to Fiscal 2018 Actual

	($ million)	F2014 Actual	F2015 Actual	F2016 Actual	F2017 Actual	F2018 Actual	F2014-F2018 Average
		1	2	3	4	5	6
1	Storm Restoration Costs	4.6	12.9	23.5	25.3	22.9	**17.8**

By Order No. G-47-18 to the Previous Application, the BCUC approved that interest continue to be applied to the balance of this regulatory account and that the forecast account balance at the end of a test period be recovered over the next test period. Interest is applied to the account based on BC Hydro's weighted average cost of debt and forecast interest is recovered from the account each year.

BC Hydro is not requesting any changes to this account in this application.

7.8.2 Amortization of Capital Additions Regulatory Account

By Order No. G-16-09, the BCUC directed BC Hydro to defer to a regulatory account any differences between forecast and actual amortization of capital additions. In its Decision, the BCUC stated that:

> "the most effective solution to ensuring that amortization charges collected in revenue requirements for the test period appropriately reflect the capital assets that are actually utilized for the benefit of ratepayers during the same test period is to establish a new regulatory account."[330]

The Amortization of Capital Additions Regulatory Account was continued in the Fiscal 2011 Revenue Requirement Application Negotiated Settlement Agreement, the Fiscal 2012 to Fiscal 2014 Amended Revenue Requirements Application and the Fiscal 2015 to Fiscal 2016 Revenue Requirements Rate Application. By Order No. G-47-18 to the Previous Application, the BCUC approved that this regulatory account continue on an ongoing basis, that interest continue to be applied to the balance of this regulatory account, and that the forecast account balance at the end of a test period be recovered over the next test period. Interest is applied to the account based on BC Hydro's weighted average cost of debt and forecast interest is recovered from the account each year.

BC Hydro is not requesting any changes to this account in this application.

7.8.3 Total Finance Charges Regulatory Account

By Order No. G-16-09 to the Fiscal 2009 to Fiscal 2010 Revenue Requirements Application, the BCUC directed BC Hydro to defer to a regulatory account any differences between forecast and actual finance charges for fiscal 2009 and fiscal 2010. The Total Finance Charges Regulatory Account was continued by BCUC decisions on the Fiscal 2011 Revenue Requirement Application Negotiated Settlement Agreement, the Fiscal 2012 to Fiscal 2014 Amended Revenue

[330] Fiscal 2009 to Fiscal 2010 Revenue Requirement Application Decision, page 191.

Requirements Application and the Fiscal 2015 to Fiscal 2016 Revenue Requirements Rate Application. By Order No. G-47-18 to the Previous Application, the BCUC approved the continuation of this regulatory account on an ongoing basis, and that the forecast account balance at the end of a test period be recovered over the next test period.

BC Hydro is not requesting any changes to this account in this application.

7.8.4 Rock Bay Remediation Regulatory Account

By Order No. G-75-11, the BCUC approved the establishment of the Rock Bay Remediation Regulatory Account for the deferral of actual expenditures in fiscal 2011 related to the remediation of BC Hydro's Rock Bay property. By Order No. G-55-12, the account was extended to defer actual remediation costs incurred in fiscal 2012. By Order No. G-57-13, the account was extended to defer actual remediation costs incurred in fiscal 2013.

As required by Direction No. 7, Order No. G-48-14 extended this period to include remediation costs incurred in fiscal 2014 and later fiscal years. Direction No. 6 directed the amortization of specific amounts from the regulatory account in fiscal 2015 and fiscal 2016.

The actual remediation costs deferred to the regulatory account for fiscal 2015 and fiscal 2016 were lower than the amortization amounts specified by Direction No. 6, resulting in a closing credit balance at the end of fiscal 2016. BCUC Order No. G-47-18 to the Previous Application approved the refund of the closing fiscal 2016 credit balance to ratepayers over the fiscal 2017 to fiscal 2019 period.

BCUC Order No. G-47-18 also approved the deferral of actual Rock Bay remediation costs to this regulatory account each year and the amortization of forecast Rock Bay remediation costs from this account each year from fiscal 2017 onwards. The Order also approved that interest continue to be applied to the balance of this regulatory account and that the forecast account balance at the end of a test period be recovered over the next test period. Interest is applied to the account based on BC Hydro's weighted average cost of debt and forecast interest is recovered from the account each year.

Actual remediation costs over the fiscal 2017 to fiscal 2019 period were lower than forecast remediation costs, resulting in a forecast closing credit balance in the account at the end of fiscal 2019 of $20.5 million. Consistent with BCUC Order No. G-47-18, this credit balance will be refunded to ratepayers over the fiscal 2020 to fiscal 2021 test period.

Remediation of the Rock Bay property was completed in fiscal 2019 and BC Hydro is not forecasting the deferral of any further remediation costs to this account over the test period. However, there may be minor variances between fiscal 2019 forecast and actual costs and forecast and actual interest applied to this account during the test period. Therefore, BC Hydro plans to seek BCUC approval to close the account in the next test period, once the balance of the account has been fully recovered.

BC Hydro is not requested any changes to this account in this application.

7.8.5 Arrow Water Systems Regulatory Account

In the mid-1960s, BC Hydro relocated residents affected by the creation of the Hugh Keenleyside Dam and Arrow Lakes Reservoir to the newly constructed towns of Edgewood, Fauquier and Burton as well as the existing town of West Robson, all part of the Regional District of Central Kootenay. BC Hydro built the drinking water systems in Burton, Fauquier, and Edgewood when the towns were constructed, and upgraded and assumed control of the West Robson drinking water system (collectively known as the Arrow Water Systems) to compensate for impacts related to construction of the Keenleyside Dam. On January 4, 2011, BC Hydro divested the assets of the Arrow Water Systems to the Regional District of Central Kootenay.

By Order No. G-90-11, the BCUC approved the deferral of costs related to the divestiture of the Arrow Water Systems and established the Arrow Water Systems Regulatory Account and the Arrow Water Systems Provision Regulatory Account. The Arrow Water Systems Provision Regulatory Account is discussed further in section 7.8.19. Order No. G-48-14 set the amortization for the Arrow Water Systems Regulatory Account at $4.7 million in fiscal 2015 and $4.5 million in fiscal 2016, which reflected divestiture costs incurred to date.

Under the terms of the agreement with the Regional District of Central Kootenay on the divestiture of the Arrow Water Systems assets, BC Hydro makes an annual payment to the Regional District of Central Kootenay. This payment covers the water fees for the residents in the region who had water accounts in good standing with BC Hydro at the time of the transfer. BC Hydro will continue to make these payments until qualified residents are no longer on title for their properties. The cost of these payments is estimated at $0.3 million per year. Consistent with BCUC Order No. G-47-18 to the Previous Application, this amount, and any other expenditures associated with divestiture are transferred from the Arrow Water Systems Provision Regulatory Account to the Arrow Water Systems Regulatory Account and a corresponding amount is amortized annually from the Arrow Water Systems Regulatory Account.

BC Hydro is not requesting any changes to this account in this application.

7.8.6 Remediation Regulatory Account

Starting in fiscal 2013 and in following years, BC Hydro began to incur expenditures related to asbestos remediation at its facilities. By Order No. G-7-13 the BCUC approved the establishment of the Asbestos Remediation Regulatory Account for unplanned asbestos remediation costs in fiscal 2013 and fiscal 2014. In accordance with Direction No. 7, BCUC Order No. G-48-14 authorized BC Hydro to continue to defer variances between forecast and actual asbestos remediation costs, to the account, on an ongoing basis.

By Order No. G-47-18 to the Previous Application, the BCUC approved an expansion of the account scope to include costs incurred related to the compliance with polychlorinated biphenyl regulations. To reflect this change, the BCUC also approved that the name of the account be changed to the Remediation Regulatory Account.

By Order No. G-47-18, the BCUC approved, starting in fiscal 2017, and on an ongoing basis, that actual expenditures related to compliance with polychlorinated biphenyl regulations and asbestos remediation be deferred to this account each year, and forecast expenditures related to compliance polychlorinated biphenyl regulations and asbestos remediation be amortized from this account each year. Order No. G-47-18 also approved that interest continue to be applied to the balances in the account and that the forecast account balance at the end of a test period be recovered over the next test period. Interest is applied to the account based on BC Hydro's weighted average cost of debt and forecast interest is recovered from the account each year.

It continues to be appropriate to defer variances related to asbestos remediation to the Remediation Regulatory Account. The rationale for deferring these variances is the same as the rationale accepted by the BCUC for the deferral of variances related to compliance with polychlorinated biphenyl regulations. In its Decision to the Previous Application, the BCUC stated that:

> *"Although the treatment of PCB is not prescribed by Direction No. 7, as it is for asbestos costs, the Panel concurs with BC Hydro that PCB costs are similar in nature to asbestos costs in that they involve long-term estimates, the actual expenditures are susceptible to variances in amount and timing and differences from forecast due to the timing and scope of work undertaken. Furthermore, the Panel finds the consistent treatment of asbestos and PCB costs is reasonable."*[331]

[331] BCUC Order No. G-47-18, Previous Application, page 65.

BC Hydro is not requesting any changes to this account in this application.

7.8.7 Real Property Sales Regulatory Account

By Order No. G-48-14, the Real Property Sales Regulatory Account was established to defer the variances between BC Hydro's actual and forecast real property gain/loss from real estate sales, with interest to be applied to the account based on BC Hydro's weighted average cost of debt. As described in section 7.9, BC Hydro incurs finance charges related to the balances in regulatory accounts. Accordingly, it is appropriate to apply interest to this regulatory account, consistent with the application of interest to other cash variance accounts.

The timing of completion of real estate transactions is difficult to forecast accurately. The Real Property Sales Regulatory Account smooths the recognition of gains and losses from real property sales that could otherwise impact rates in a particular year.

Since fiscal 2015, BC Hydro has been preparing surplus properties for sale. Activities have included market value appraisals and estimates, investigation and remediation of environmental contamination, working with municipalities on subdivision requirements, and consultation with First Nations.

The 2013 10 Year Rates Plan included a target of $50 million of net gains from real property sales from fiscal 2015 to fiscal 2019. Consistent with this target, BC Hydro included $10 million in forecast net gains from real property sales in each fiscal year in both the Fiscal 2015 to Fiscal 2016 Revenue Requirements Rate Application and the Previous Application.

BC Hydro has increased our net gains target from $50 million to $100 million and extended the timeframe to achieve this target to the end of fiscal 2024. This means that the Real Property Sales Regulatory Account is expected to self-clear based on the forecast gains and losses experienced from fiscal 2020 to fiscal 2024 and is forecast to have a zero balance by the end of fiscal 2024, subject to potential interest charges.

Consistent with this revised target, BC Hydro has included $10 million in forecast net gains from real property sales in both fiscal 2020 and fiscal 2021, in this application.

Pursuant to Direction No. 8, the existing balance in this regulatory account as at March 31, 2019, is recoverable from ratepayers. If this regulatory account was discontinued at the end of fiscal 2019, the balance would be amortized into rates starting in fiscal 2020. However, the revised target of $100 million in net gains from real property sales is expected to clear the balance in this regulatory account by the end of fiscal 2024. Maintaining the Real Property Sales Regulatory Account means that the existing account balance will not be borne by ratepayers.

BC Hydro is not requesting any changes to this account in this application.

7.8.8 Mining Customer Payment Plan Regulatory Account

In accordance with section 3(2) of Order in Council No. 123, issued on February 29, 2016, BCUC Order No. G-34-16 authorized BC Hydro to establish the Mining Customer Payment Plan Regulatory Account to defer to future fiscal years amounts equal to the sum of the following related to mining customers participating in the Mining Customer Payment Plan Program:

(i) The account balances of mining customers, if those account balances are impaired;

(ii) Any other amounts that are payable to BC Hydro by mining customers before the closing date and that are impaired; and

(iii) Any taxes paid by BC Hydro on behalf of mining customers on the account balances referred to in subparagraph (i) and amounts referred to in subparagraph (ii).

This Order arose from the Government of B.C.’s decision to allow companies operating metal and coal mines in B.C. to temporarily defer a portion of their electricity payments during periods of low commodity prices.

BCUC Order No. G-34-16 also directed BC Hydro to reduce the Mining Customer Payment Plan Regulatory Account by an amount collected from an applicable mining customer, and to include in the account, interest determined in a fiscal year at the rate of BC Hydro's weighted average cost of debt in that fiscal year.

BC Hydro is not requesting any changes to this account in this application.

7.8.9 Customer Crisis Fund Regulatory Account

By Order No. G-166-17, the BCUC approved the establishment of the Customer Crisis Fund Regulatory Account.

By Order No. G-5-17 to the 2015 Rate Design Application, the BCUC directed BC Hydro to file a proposal for the establishment of a crisis intervention fund pilot program for residential customers who have arrears with BC Hydro and are unable to pay their electricity bills.[332] By Order No. G-166-17, the BCUC approved the Customer Crisis Fund pilot program on a three year basis.

The costs related to the Customer Crisis Fund pilot program are driven by program participation and could vary from forecast. In addition, there will likely be variations in the timing of revenues and costs over the duration of the Customer Crisis Fund pilot program.

Accordingly, in its application to establish the pilot program, BC Hydro proposed that the net difference between the revenues collected under the Customer Crisis Fund Rate Rider and the incremental costs related to the Customer Crisis Fund pilot program in each fiscal year be transferred to the Customer Crisis Fund Regulatory Account. Any remaining balance in the Customer Crisis Fund Regulatory Account at the end of the Customer Crisis Fund pilot program would be to the account of residential ratepayers. Recovery or refund of the balance will be addressed after

[332] 2015 Rate Design Application Decision, BCUC Order No. G-5-17, pages 97 to 98.

completion of the pilot program. This approach ensures that residential ratepayers only pay the actual net costs of the Customer Crisis Fund pilot program.

BC Hydro is not requesting any changes to this account in this application.

7.8.10 Foreign Exchange Gains and Losses Regulatory Account

By Order No. G-47-02, the BCUC approved the deferral and amortization of foreign exchange gains and losses on the translation of foreign denominated long-term monetary items, using the straight-line pool method, from fiscal 2003 onwards. More specifically, deferred foreign currency translation gains and losses related to long-term debt are amortized over the weighted average remaining term to maturity of the foreign denominated long-term debt portfolio. Deferred foreign currency translation gains and losses related to sinking funds are amortized over the weighted average remaining term to maturity of the sinking fund portfolio.

BC Hydro is not requesting any changes to this account in this application.

7.8.11 Non-Current Pension Costs Regulatory Account

By Order No. G-16-09 to the Fiscal 2009 to Fiscal 2010 Revenue Requirements Application, the BCUC approved the establishment of a regulatory account to defer the difference between forecast and actual non-current pension costs in fiscal 2010. The Fiscal 2011 Revenue Requirement Application Negotiated Settlement Agreement extended this regulatory account for fiscal 2011 and directed that the closing fiscal 2011 balance be amortized over a five-year period, beginning in fiscal 2012.

BCUC Order No. G-77-12A extended the account for fiscal 2012 to fiscal 2014, and expanded the scope of the account to include the difference between forecast and actual non-current other post-employment benefit costs, beginning in fiscal 2012. In accordance with Direction No. 7, BCUC Order No. G-48-14 authorized BC Hydro to continue to defer to the account variances between forecast and actual non-current pension costs, on an ongoing basis.

By Order No. G-47-18 to the Previous Application, the BCUC approved that the portion of the forecast account balance at the start of a test period related to the variances transferred to the account during the previous test period be amortized over the expected average remaining service life (**EARSL**) of the active plan members at the start of the test period. EARSL is determined by BC Hydro's actuary and is currently 12 years.

In accordance with BCUC Order No. G-47-18, the discount rate used to forecast post-employment benefit plan costs is based on the market discount rate in effect at the time the forecast was prepared.

As discussed in section 7.3, actuarial gains and losses are sensitive to changes in market discount rates, rates of return on pension plan assets and significant changes in key actuarial assumptions. This means that annual actuarial gains and losses are subject to large positive and negative fluctuations. For example, the elimination of Medical Services Plan Premiums resulted in significant actuarial gains in fiscal 2018 and fiscal 2019 as shown in Schedule 2.2 of Appendix A. In the absence of regulatory approval to defer actuarial gains and losses to the Non-Current Pension Costs Regulatory Account, this actuarial gain would have been captured in retained earnings and ratepayers would not have received the benefit of this actuarial gain. Accordingly, BC Hydro believes it is appropriate to continue to defer, on an ongoing basis, the variances between its actual and forecast non-current pension costs to the Non-Current Pension Costs Regulatory Account and to continue to amortize these amounts over EARSL.

Please refer to Chapter 5G, section 5G.9 for further information on Non-Current Service Costs.

BC Hydro is not requesting any changes to this account in this application.

7.8.12 PEB Current Pension Costs Regulatory Account

By Order No. G-47-18 to the Previous Application, the BCUC approved the establishment of the Post-Employment Benefit (PEB) Current Pension Costs Regulatory Account to defer the annual variance between forecast and actual costs related to the operating cost portion of post-employment benefits current pension costs, on an ongoing basis. Order No. G-47-18 also approved that the forecast account balance at the end of a test period be recovered over the next test period.

In accordance with BCUC Order No. G-47-18, the discount rate used to forecast post-employment benefit plan costs is based on the market discount rate in effect at the time the forecast was prepared.

Please refer to Chapter 5G, section 5G.9 for further information on Current Service Costs.

BC Hydro is not requesting any changes to this account in this application.

7.8.13 Debt Management Regulatory Account

By Order No. G-42-16, the BCUC approved the establishment of the Debt Management Regulatory Account, to capture mark-to-market gains and losses of financial contracts that hedge future long-term debt. Hedging the interest rate on future long-term debt enables BC Hydro to mitigate interest rate risk on future long-term debt issuances.

Since fiscal 2017, BC Hydro has locked in interest rates on forecast future long-term debt issuances by entering into financial contracts that hedge the interest rate risk in order to create certainty of financing costs associated with future planned expenditures. In accordance with Order No. G-42-16, the gains and losses from financial contracts that hedge future long-term debt are recorded in the Debt Management Regulatory Account and amortized over the remaining term of the associated long-term debt issuances. These gains and losses are amortized in the test period following the test period in which the long-term debt associated with a particular hedge is issued.

BC Hydro is not requesting any changes to this account in this application.

7.8.14 First Nations Costs Regulatory Account

By Order No. G-53-02, the BCUC approved the deferral of costs related to negotiations and settlements with First Nations, and approved the amortization of actual negotiation costs and approved settlement costs, over a ten-year period. Settlement payments transferred to the First Nations Costs Regulatory Account from the First Nations Provisions Regulatory Account are not amortized or recovered in rates, pending BCUC approval to do so. In accordance with BCUC Order No. G-11-08, when a settlement is completed, BC Hydro must submit an application to the BCUC for approval to recover the settlement payment in rates. The nature of these settlements is discussed further in section 7.8.17. BCUC Order No. G-48-14 directed the amortization of specific amounts from the account for fiscal 2015 and fiscal 2016, and also directed that interest be applied on the account going forward.

Actual transfers to the account in fiscal 2015 and fiscal 2016 were different from the amounts on which the specific amortization in BCUC Order No. G-48-14 was based, which resulted in BC Hydro recording higher amortization than if the amortization had been calculated on actual transfers. This resulted in a credit amount which was refunded to ratepayers over the fiscal 2017 to fiscal 2019 period, consistent with BCUC Order No. G-47-18 to the Previous Application.

As described in section 7.9, BC Hydro incurs finance charges related to the balances in regulatory accounts. Accordingly, it is appropriate that interest should be applied to this regulatory account, consistent with the application of interest to other cash variance accounts.

By Order No. G-47-18 to the Previous Application, the BCUC approved, starting in fiscal 2017, and on an ongoing basis that:

(i) Actual lump sum settlement payments be deferred to this account each year, and forecast lump sum settlement payments be amortized over a ten-year period, starting in the year of payment;

(ii) Actual annual settlement payments be deferred to this account each year, and forecast annual settlement payments be amortized in the year of payment;

(iii) Actual negotiation costs be deferred to this account each year, and actual negotiation costs be recovered from the account each year;

(iv) Interest continue to be applied to the balances in the account, consistent with the application of interest to other variance accounts, based on BC Hydro's weighted average cost of debt, and forecast interest charged to the account be amortized from the account each year;

(v) The forecast account balance at the end of a test period related to the difference between the amortization of the forecast annual and lump sum settlement payments and the calculation of amortization based on the actual annual and lump sum settlement payments during that test period be recovered over the next test period; and

(vi) The forecast account balance at the end of a test period related to the difference between the forecast interest recovered and the actual interest charged to the account during that test period be recovered over the next test period.

For items (i) and (ii) above, the year of payment refers to the year the payment is forecast to be made.

BC Hydro is not requesting any changes to this account in this application.

7.8.15 Pre-1996 Contributions in Aid of Construction Regulatory Account

In fiscal 2006 BC Hydro retained Gannett Fleming to complete a depreciation study, which was filed as part of the Fiscal 2007 to Fiscal 2008 Revenue Requirements Application. Gannett Fleming recommended that the amortization period for assets referred to as “Profile ID 99403 Distribution Pre-1996 Contributions in Aid” be increased from the then-approved period of 25 years to 45 years.

However, section 7(iv) of the Fiscal 2007 to Fiscal 2008 Revenue Requirements Application Negotiated Settlement Agreement approved by BCUC Order No. G-143-06 committed BC Hydro to maintain the amortization period for these assets at 25 years. In its financial records BC Hydro changed the amortization period for these assets from 25 to 45 years to match the depreciation study, and implemented the Fiscal 2007 to Fiscal 2008 Revenue Requirements Application Negotiated Settlement Agreement commitment by creating a regulatory account to capture the difference in the revenue requirement impacts of a 45-year amortization period and a 25-year amortization period. This regulatory account will be fully amortized at the end of fiscal 2040.

BC Hydro is not requesting any changes to this account in this application.

7.8.16 SMI Regulatory Account

By Order No. G-64-09, the BCUC approved the establishment of the SMI (Smart Metering and Infrastructure Program) Regulatory Account to defer the operating costs incurred by BC Hydro related to the Smart Metering and Infrastructure Program in fiscal 2009. By Order No. G-67-10, the BCUC approved the deferral of these costs for fiscal 2010. BCUC Order No. G-115-11 authorized BC Hydro to include its actual fiscal 2011 Smart Metering and Infrastructure Program operating costs up to $5.8 million in the SMI Regulatory Account. BCUC Order No. G-77-12A to the Fiscal 2012 to Fiscal 2014 Amended Revenue Requirements Application approved the deferral of actual net operating costs, amortization on capital assets, finance charges, and return on equity related to the SMI program from fiscal 2012 to fiscal 2014, to the SMI Regulatory Account.

By Order No. G-166-13, and in accordance with section 3(2) of Direction No. 4, BC Hydro was directed to defer to the account:

- Program costs;
- Investigation costs and infrastructure costs that are not recovered from eligible customers at premises where a legacy meter or radio-off meter is installed; and
- Costs related to smart meters, which are incurred during the period January 1, 2013 to March 31, 2014.

By Order No. G-48-14 to the Fiscal 2015 to Fiscal 2016 Revenue Requirements Rate Application, the BCUC approved the amortization of specific amounts in fiscal 2015 and fiscal 2016 from the SMI Regulatory Account and also approved deferral of the net operating costs incurred in fiscal 2015 to fiscal 2016 related to the SMI Program, to the account. As the SMI Program is now complete and operationalized, no further additions are being made to this regulatory account.

By Order No. G-47-18 to BC Hydro's Previous Application, the BCUC approved the recovery of the fiscal 2016 closing account balance over a period of 13 years, starting in fiscal 2017, which is the remaining period of the original 15-year amortization period proposed in the Regulatory Accounts Report filed in the Fiscal 2015 to Fiscal 2016 Revenue Requirements Rate Application. The 15-year amortization is based on the average life of SMI assets. BCUC Order No. G-47-18 also approved that interest continue to be applied to the balance of this regulatory account. Interest is applied to the account at BC Hydro's weighted average cost of debt and forecast interest is recovered from the account each year.

BC Hydro is not requesting any changes to this account in this application.

7.8.17 First Nations Provisions Regulatory Account

By Order No. G-56-06, the BCUC approved the establishment of a regulatory asset corresponding to the amount of a loss provision that BC Hydro recorded on its financial statements as required under the accounting standards related to two First Nations claims. By Order No. G-11-08, the BCUC amended the First Nations Provisions Regulatory Account to allow the balance of the regulatory account to reflect loss provisions as required under the accounting standards, related to any First Nations claim, and to allow the periodic adjustment of the balance of the regulatory account to reflect adjustments to the loss provisions required under the accounting standards.

BC Hydro's settlements with First Nations may include both lump sum payments and annual payments. When settlement payments are made, corresponding amounts are transferred from the First Nations Provisions Regulatory Account to the First Nations Costs Regulatory Account, and recovered in rates through amortization of that regulatory account, as discussed in section 7.8.14.

BC Hydro is not requesting any changes to this account in this application.

7.8.18 Environmental Provisions Regulatory Account

By Order No. G-88-10, the BCUC approved the establishment of the Environmental Provisions Regulatory Account in the amount of the loss provision liability recognized by BC Hydro in its financial statements, related to compliance with the polychlorinated biphenyl regulations and remediation of environmental contamination at Rock Bay. Order No. G-88-10 also approved periodic adjustments to the amounts in the regulatory account to match the changes required under the accounting standards in the loss provision liability. By Order No. G-7-13, the terms of the Environmental Provisions Regulatory Account were expanded to include the loss provision liability related to asbestos remediation at BC Hydro's facilities.

As BC Hydro makes actual expenditures related to compliance with the polychlorinated biphenyl regulations, the remediation of Rock Bay and the remediation of asbestos at its facilities, the balance in the Environmental Provisions Regulatory Account is reduced accordingly.

Actual costs of remediation activities at Rock Bay are deferred to the Rock Bay Remediation Regulatory Account as they are incurred, as described in section 7.8.4, and the provision is reduced by an equal amount. Remediation of the Rock Bay property was completed in fiscal 2019, and the balance in the Environmental Provisions Regulatory Account related to Rock Bay has been reduced accordingly.

Actual costs related to asbestos remediation are deferred to the Remediation Regulatory Account as they are incurred, as described in section 7.8.6, and the provision is reduced by an equal amount.

Actual costs related to compliance with polychlorinated biphenyl regulations, were expensed as incurred until the end of fiscal 2016, and the Environmental Provisions Regulatory Account was reduced by an equal amount. By Order No. G-47-18 to the Previous Application, BCUC approved that, starting in fiscal 2017, and on an ongoing basis, actual costs related to compliance with polychlorinated biphenyl regulations be deferred to the Remediation Regulatory Account as they are incurred and the provision be reduced by an equal amount. This is similar to the treatment of the costs associated with asbestos remediation.

The actual balances in the Rock Bay Remediation Regulatory Account and the Remediation Regulatory Account are recovered through the mechanisms discussed in sections 7.8.4 and 7.8.6, respectively.

BC Hydro is not requesting any changes to this account in this application.

7.8.19 Arrow Water Systems Provision Regulatory Account

By Order No. G-90-11, the BCUC approved the establishment of the Arrow Water Systems Provision Regulatory Account and the Arrow Water Systems Regulatory

Account. The Arrow Water Systems Regulatory Account is discussed further in section 7.8.5.

BC Hydro is required under the accounting standards to record a loss provision liability in regards to the divestiture of the Arrow Water Systems. The recording of the loss provision liability and the corresponding Arrow Water Systems Provision regulatory asset preserve BC Hydro's ability to seek recovery of actual costs in rates. As payments are made the provision account is drawn down and corresponding amounts are transferred to the Arrow Water Systems Regulatory Account and amortized into rates. The balance in the Arrow Water Systems Provision Regulatory Account represents BC Hydro's obligation to pay the water fees of the regions qualifying residents until such time that those residents are no longer on title for their properties.

BC Hydro is not requesting any changes to this account in this application.

7.8.20 IFRS Property, Plant and Equipment Regulatory Account

The IFRS Property, Plant and Equipment Regulatory Account enables the deferral of overhead costs that can no longer be capitalized under IFRS, as they are not directly attributable to the construction of an asset. Under CGAAP, costs related to administration and general overhead were eligible for capitalization to Property, Plant, and Equipment.

BCUC Order No. G-77-12A to BC Hydro's Fiscal 2012 to Fiscal 2014 Amended Revenue Requirements Application implemented BC Hydro's proposal that overhead costs that can no longer be capitalized be deferred and transitioned into operating expenditures over ten years to avoid immediate and significant rate impacts. BCUC Order No. G-77-12A implemented this proposal and set the amortization period at 40 years, starting in fiscal 2013.

In the Fiscal 2012 to Fiscal 2014 Amended Revenue Requirements Application, BC Hydro included a proposal to transition the overhead costs that could no longer be capitalized under IFRS into rates over a ten-year period. Under this proposal 100 per cent of ineligible overhead costs were charged to the IFRS Property, Plant and Equipment Regulatory Account in fiscal 2012. Starting in fiscal 2013, the percentage of the ineligible overhead costs to be charged to the regulatory account was reduced by 10 per cent each year.

The actual and forecast annual additions and amortization for the IFRS Property, Plant and Equipment Regulatory Account are set out in Table 7-7 below. As indicated in the table and consistent with BC Hydro's proposal, additions to the account are forecast to be zero by fiscal 2022.

Table 7-7 IFRS Property, Plant and Equipment Regulatory Account

($ million)	Additions	Amortization
Fiscal 2012 Actual	221.8	-
Fiscal 2013 Actual	229.6	4.7
Fiscal 2014 Actual	179.5	8.7
Fiscal 2015 Actual	156.8	15.9
Fiscal 2016 Actual	134.4	19.8
Fiscal 2017 Actual	112.0	23.2
Fiscal 2018 Actual	89.6	26.0
Fiscal 2019 Forecast	67.2	28.2
Fiscal 2020 Plan	44.8	29.9
Fiscal 2021 Plan	22.4	31.0
Fiscal 2022 Plan	0.0	31.6

In the Fiscal 2012 to Fiscal 2014 Amended Revenue Requirements Application, BC Hydro also proposed to amortize the additions to the IFRS Property, Plant and Equipment Regulatory Account over 40 years. This amortization period was based on the composite life of BC Hydro's assets so that the overhead costs would be matched with the benefits of the underlying assets.

If BC Hydro had recognized the impact of the transition to IFRS in rates at the time of the transition, the rate impact for customers would have been immediate and significant. Amortizing these costs over a 40-year period allows these costs to be recovered over a similar period of time as was required under CGAAP, the accounting rules that BC Hydro followed prior to IFRS. Accordingly, a 40-year amortization period also results in approximately the same revenue requirement impact under IFRS as under the previous CGAAP rules. This means that ratepayers are not subject to higher rates as a result of changes in accounting standards. BC Hydro believes that the existing amortization period of 40 years continues to be appropriate.

BC Hydro is not requesting any changes to this account in this application.

7.8.21 IFRS Pension Regulatory Account

Upon the transition to IFRS in fiscal 2013, BC Hydro was required to recognize all unamortized actuarial gains and losses on the pension and other post-employment benefit plans, not previously recognized in its financial statements.

In the Fiscal 2012 to Fiscal 2014 Amended Revenue Requirements Application, BC Hydro requested the establishment of the IFRS Pension Regulatory Account with an opening liability balance equal to the actual unamortized actuarial gains and losses on the pension and other post-employment benefit plans, which BC Hydro had to recognize in its financial statements at the time of conversion to IFRS. BCUC Order No. G-77-12A implemented this request and also set the amortization period at 20 years on a straight-line basis, starting in fiscal 2013.

Amortizing these costs over a 20-year period results in approximately the same revenue requirement impact under IFRS as under the previous CGAAP rules. This means that ratepayers are not subject to higher rates as a result of changes in accounting standards. BC Hydro believes that the existing amortization period of 20 years continues to be appropriate.

BC Hydro is not requesting any changes to this account in this application.

7.9 Application of Interest to Regulatory Accounts

This section explains that it is generally appropriate for regulatory account balances to attract interest at BC Hydro's weighted average cost of debt in recognition that BC Hydro incurs carrying costs.

7.9.1 Rationale for Application of Interest Charge to Regulatory Account Balances

BC Hydro applies the principle of matching costs with benefits to determine whether interest should be applied to a regulatory account balance. This reflects the fact that the carrying costs of maintaining the account balances may have a real financial cost in any particular period that should be recovered in rates. For cash variance regulatory accounts that arise from a direct cash outlay by BC Hydro, the related interest costs are generally included as part of the regulatory accounts. BC Hydro incurs financing charges to carry amounts that were paid in cash but not recovered in rates in the same test period. For some accounts, the interest cost may be immediately expensed from the regulatory account to rates, rather than being deferred and amortized for recovery in future rates.

Variance regulatory accounts such as energy deferral accounts also attract interest because BC Hydro does not forecast variances in the accounts and therefore must fund the variances. In the case of lower than forecast revenues, BC Hydro incurs debt which results in finance charges.

Interest applied to regulatory accounts does not have the effect of increasing or decreasing BC Hydro's allowed net income, as the interest added to regulatory accounts is intended to offset the unbudgeted incremental interest costs that BC Hydro has incurred.

Based on this criteria, BC Hydro applies interest to all regulatory accounts, with the exception of the following accounts:

(a) Non-cash regulatory accounts (such as provisions);

(b) Rate-smoothing regulatory accounts (since the annual transfers to a rate-smoothing regulatory account already reflect the impact of the account on finance charges);

(c) The Total Finance Charges Regulatory Account (since interest costs are part of total finance charges); and

(d) Regulatory accounts that capture timing differences (such as Pre-1996 Contributions).

In addition, interest is not charged to the DSM Regulatory Account, similar to the treatment for capital projects, as DSM expenditures generally go into service in the year of expenditure and BC Hydro does not apply interest on capital projects after they enter service. Lastly, interest is not charged to the Customer Crisis Fund Regulatory Account due to the short-term duration of the pilot program. Table 7-8, below indicates which deferral and regulatory accounts have interest applied to balances.

Table 7-8 Application of Interest to Regulatory Accounts

Regulatory Account	Interest Applied to Balance
Cost of Energy Variance Accounts	
Heritage Deferral Account	Yes
Non Heritage Deferral Account	Yes
Trade Income Deferral Account	Yes
Other Cash Variance Accounts	
Storm Restoration Costs Regulatory Account	Yes
Amortization of Capital Additions Regulatory Account	Yes

IFRS Pension Regulatory Account	No

7.9.2 Interest Rate Applied to Regulatory Accounts

By Order No. G-77-12A to BC Hydro's Fiscal 2012 to Fiscal 2014 Amended Revenue Requirements Application, the BCUC approved that the interest rate applicable to BC Hydro's regulatory account balances in a given year is the weighted average cost of debt in that year. The weighted average cost of debt that is forecast to be applied to the regulatory account balances is 3.88 per cent for fiscal 2020 and 3.82 per cent for fiscal 2021.

7.10 Summary of BC Hydro's Regulatory Accounts and Approach to Recovery

Table 7-9 below provides a summary of the information contained in this chapter for each of BC Hydro's regulatory accounts.

Table 7-9 Summary of BC Hydro's Regulatory Accounts

($ million)		F2019 Forecast	F2021 Forecast	Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate	Accounts to Potentially be Closed by Fiscal 2024
Cost of Energy Variance Accounts							
1	Heritage Deferral Account	(388)	0	Captures variances related to BC Hydro's Heritage Cost of Energy as well as other items approved by the BCUC.	Net Forecast Cost of Energy Variance Account balance is proposed to be refunded to ratepayers during the test period	Credit balance should be refunded to ratepayers over the test period to reduce rate increases. BC Hydro expects to propose utilizing the DARR table mechanism for future balances	
2	Non-Heritage Deferral Account	120	(0)	Captures variances related to BC Hydro's Non-Heritage Cost of Energy (i.e., IPPs) and revenue variances related to Customer Load as well as other items approved by the BCUC.	Net Forecast Cost of Energy Variance Account balance is proposed to be refunded to ratepayers during the test period	Credit balance should be refunded to ratepayers over the test period to reduce rate increases. BC Hydro expects to propose utilizing the DARR table mechanism for future balances.	
3	Trade Income Deferral Account	(24)	(0)	Captures variances between forecast and actual Trade Income (i.e., Powerex)	Net Forecast Cost of Energy Variance Account balance is proposed to be refunded to ratepayers during the test period	Credit balance should be refunded to ratepayers over the test period to reduce rate increases. BC Hydro expects to propose utilizing the DARR table mechanism for future balances.	
	Sub-Total	(293)	(0)				

($ million)		F2019 Forecast	F2021 Forecast	Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate	Accounts to Potentially be Closed by Fiscal 2024
Other Cash Variance Accounts							
4	Storm Restoration Costs	38	0	Captures variances between forecast and actual storm restoration costs.	Next Test Period	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.	
5	Amortization of Capital Additions	20	0	Captures variances between forecast and actual amortization of capital additions.	Next Test Period	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.	
6	Total Finance Charges	(9)	0	Captures variances between forecast and actual finance charges	Next Test Period	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.	
7	Rock Bay Remediation	(21)	(0)	Captures expenditures incurred related to the remediation of the Rock Bay property.	Next Test Period	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.	To be closed in fiscal 2023

($ million)		F2019 Forecast	F2021 Forecast	Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate	Accounts to Potentially be Closed by Fiscal 2024
8	Arrow Water Systems	0	0	Captures costs related to BC Hydro's divestiture of the Arrow Water Systems (drinking water systems) built by BC Hydro during the construction of the Hugh Keenleyside Dam.	As Expenditures are Incurred	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.	Will propose closure in fiscal 2022
9	Remediation	(25)	0	Captures variances between forecast and actual costs incurred related to compliance with Polychlorinated Biphenyl Regulations (PCB) and Asbestos remediation at BC Hydro facilities.	Next Test Period	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.	
10	Real Property Sales	44	31	Captures variances between forecast and actual gain/loss on real estate sales.	Self-clearing (to fiscal 2024)	Smoothes the recognition of gains and losses as sales will not occur uniformly over the 10 years since fiscal 2015	May be closed by fiscal 2024
11	Dismantling Cost	51	0	Captures variances between forecast and actual Dismantling Costs.	Next Test Period	These expenditures provide immediate, rather than long-term benefits and therefore should be recovered over a shorter period of time.	

($ million)		F2019 Forecast	F2021 Forecast	Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate	Accounts to Potentially be Closed by Fiscal 2024
12	Customer Crisis Fund	0	(0)	Captures the net difference between Customer Crisis Fund Rate Rider revenues and BC Hydro's incremental costs related to the Customer Crisis Fund pilot program.	N/A	If necessary, BC Hydro will request a recovery mechanism upon completion of the three year pilot program.	May be closed by fiscal 2024
13	Mining Customer Payment Plan	0	0	Captures any amounts impaired related to mining customers participating in the Mining Customer Payment Plan Program.	N/A	$0 Balance Currently. If necessary, BC Hydro will request a recovery mechanism upon completion of the Program.	May be closed by fiscal 2024
	Sub-Total	99	31				
Non-Cash Variance Accounts							
14	Foreign Exchange Gains/Losses	7	5	Captures foreign exchange gains and losses on the translation of foreign denominated long-term monetary items.	Straight-line Pool Method	The recovery period matches the underlying attribute and should be recovered over a longer period of time (i.e., foreign denominated long-term monetary items).	

($ million)		F2019 Forecast	F2021 Forecast	Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate	Accounts to Potentially be Closed by Fiscal 2024
15	Non-Current Pension Costs	(3)	(35)	Captures variances between forecast and actual non-current pension costs.	Over Average Remaining Service Life of Active Employee Group (EARSL) - currently 12 years	The recovery period matches the underlying attribute and should be recovered over a longer period of time (i.e., remaining life of employee group).	
16	PEB Current Pension Costs	(2)	0	Captures operating cost variances between forecast and actual current pension costs.	Next Test Period	These expenditures provide immediate, rather than long-term benefits (i.e., current pension costs).	
17	Debt Management	(260)	(235)	Captures mark-to-market gains and losses on financial contracts that hedge future long-term debt.	Over remaining term of associated long-term debt issuances	The recovery period matches the underlying attribute (i.e., long-term debt Issuance).	
	Sub-Total	(258)	(265)				
Benefit Matching Accounts							
18	DSM	927	950	Captures expenditures associated with Demand-Side Management activities. These expenditures result in future energy savings.	Over 15 years	Matches the future benefit period for customers, which is the average measure life of DSM initiatives.	

($ million)		F2019 Forecast	F2021 Forecast	Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate	Accounts to Potentially be Closed by Fiscal 2024
19	First Nations Costs	85	56	Captures First Nations annual and lump sum settlement payments and negotiation costs.	Over 10 years for lump sum settlement payments	Lump sum settlements are amortized over a longer period of time than annual settlement payments, which are amortized each year.	
20	Site C	491	526	Captures costs related to the Site C project prior to the final investment decision to proceed with the project, and costs that are not eligible for capitalization thereafter.	N/A	BC Hydro will request a recovery mechanism once the Site C Project is in-service.	
21	Pre-1996 Contributions in Aid of Construction	83	73	Captures the difference between the 25-year amortization period required for regulatory purposes and the 45-year amortization period required for financial reporting for this asset class.	Over 45 years (to fiscal 2040)	Matches the 45-year amortization period determined in a depreciation study filed in the Fiscal 2007 - Fiscal 2008 Revenue Requirements Application.	

($ million)		F2019 Forecast	F2021 Forecast	Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate	Accounts to Potentially be Closed by Fiscal 2024
22	Capital Project Investigation Costs	10	0	Captured capital project investigation costs over fiscal 2009 to fiscal 2011. No further additions are being made to this account.	Over 10 years (to fiscal 2021)	Will be fully amortized and closed in fiscal 2021	To be closed in fiscal 2021
23	SMI	217	174	Captured operating costs related to the SMI Program. The SMI Program is complete and no further additions are being made to this account.	Over 15 years (to fiscal 2029)	Matches the future benefit period for customers, which is the average life of the SMI assets.	
	Sub-Total	1,814	1,778				

($ million)		F2019 Forecast	F2021 Forecast	Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate	Accounts to Potentially be Closed by Fiscal 2024
Non-Cash Provisions							
24	First Nations Provisions	420	428	Regulatory provision established for BC Hydro's liability in respect of First Nations claims.	Amounts recovered in First Nations Costs Regulatory Account as settlement payments are made	Since non-cash provisions are not recovered in rates, no recovery mechanism is required. The provision is drawn down when actual expenditures are charged to the regulatory account and the amounts are recovered from the corresponding expenditure regulatory account (i.e., First Nations Costs Regulatory Account).	
25	Environmental Provisions	276	194	Regulatory provision established for BC Hydro's liability in respect of compliance with Polychlorinated Biphenyl Regulations, remediation of environmental contamination at Rock Bay and asbestos remediation at BC Hydro facilities.	Amounts recovered in Remediation and Rock Bay Regulatory Accounts as expenditures are incurred	Since non-cash provisions are not recovered in rates, no recovery mechanism is required. The provision is drawn down when actual expenditures are charged to the regulatory account and the amounts are recovered from the corresponding expenditure regulatory account (i.e., Remediation Regulatory Account (PCB and Asbestos) and the Rock Bay Remediation Regulatory Account).	

($ million)		F2019 Forecast	F2021 Forecast	Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate	Accounts to Potentially be Closed by Fiscal 2024
26	Arrow Water Systems Provision	3	2	Regulatory provision established for BC Hydro's liability in respect of the divestiture of the Arrow Water Systems (drinking water systems) to the Regional District of Central Kootenay.	Amounts recovered in Arrow Water Systems Regulatory Account as expenditures are incurred	Since non-cash provisions are not recovered in rates, no recovery mechanism is required. The provision is drawn down when actual expenditures are charged to the regulatory account and the amounts are recovered from the corresponding expenditure regulatory account (i.e., Arrow Water Systems Regulatory Account).	Will propose closure in fiscal 2022
	Sub-Total	699	624				
Rate Smoothing Accounts							
27	Rate Smoothing	0	0	Captured portions of the allowed revenue requirement that were not recovered in rates in that particular fiscal year.	N/A	Balance in account written-off in December 2018.	To be closed in Fiscal 2020
	Sub-Total	0	0				

($ million)		F2019 Forecast	F2021 Forecast	Description of Account	Approved/ Proposed Recovery Mechanism	Why is the Recovery Mechanism Appropriate	Accounts to Potentially be Closed by Fiscal 2024
IFRS Transition Accounts							
28	IFRS Property, Plant and Equipment	1,064	1,071	Captures capital overhead costs that were eligible for capitalization under CGAAP, but can no longer be capitalized under IFRS.	Rolling 40 year period (to fiscal 2061)	Recovered on the same basis as under the previous CGAAP accounting rules. Therefore ratepayers are not impacted by higher rates as a result of changes in accounting standards.	
29	IFRS Pension	497	421	Captures unamortized gains/losses on BC Hydro's pension plans that were required to be recognized in BC Hydro's financial statements upon transition to IFRS.	Over 20 years (to fiscal 2032)	Recovered on the same basis as under the previous CGAAP accounting rules. Therefore ratepayers are not impacted by higher rates as a result of changes in accounting standards.

Fiscal 2020 to Fiscal 2021
Revenue Requirement Application

Chapter 8

Other Revenue Requirements Items

Table of Contents

List of Tables

8.1 Other Revenue Requirements Items

This chapter describes the other revenue requirements items, including amortization expense, return on equity, capital structure, finance charges, taxes, miscellaneous and inter-segment revenues, subsidiary net income, the allocation of BC Hydro's business support costs, and provisions and other. This chapter also explains accounting changes required due to the full adoption of the International Financial Reporting Standards **(IFRS)** in fiscal 2019.

8.2 Amortization Expense

Depreciation and amortization is the allocation of the original cost of assets over their estimated service lives. BC Hydro's forecast amortization expense is shown in Appendix A, Schedule 7.0, and includes:

- The amortization of property, plant and equipment in service;
- Amortization related to agreements that are recognized as leases under the new IFRS 16, *Leases* standard, which is discussed in sections 8.12.1 and 8.13.3;
- Amortization of the following regulatory accounts:
  - DSM Regulatory Account;
  - Pre-1996 Contributions in Aid of Construction Regulatory Account; and
  - Amortization of Capital Additions Regulatory Account.

Amortization expense is summarized in Table 8-1 below. Amortization expense is forecast to increase by $105 million from $955 million in the fiscal 2019 RRA Plan to $1.06 billion in fiscal 2021, primarily due to the following:

- An increase of approximately $75 million in amortization related to higher forecast capital additions, as described in Chapter 6;

- An increase of approximately $14 million as a result of higher amortization of the Amortization of Capital Additions Regulatory Account, mainly due to the deferral in fiscal 2019 of amortization related to BC Hydro’s purchase of the remaining two-thirds interest in the Waneta Dam; and
- An increase of approximately $11 million in amortization related to agreements that are recognized as leases under the new IFRS 16, *Leases* standard.

Property, plant and equipment in service are amortized on an individual component-by-component basis over the expected useful lives of the assets using the straight-line method, under which amortization expense is recognized evenly over the expected useful life of an asset. The depreciation rates used in this Application are the same as those previously approved by the BCUC, with the exception of certain property, plant and equipment at the Burrard synchronous condense facility, and the following new asset classes:

- Water Rights;
- Infrastructure Rights; and
- LED Streetlights.

In addition, new asset classes will be created as a result of the adoption of the new IFRS 16, *Leases* standard in fiscal 2020. These leases will be amortized over the lease term in accordance with IFRS 16, which will depend on the terms of the agreement.

8.2.1 Burrard Synchronous Condense Facility Depreciation Rates

The BCUC reviewed and approved the depreciation rates related to certain property, plant and equipment at the Burrard synchronous condense facility for fiscal 2017, fiscal 2018 and fiscal 2019 in the Previous Application proceeding. In this Application, BC Hydro is seeking approval for the depreciation rates of certain property, plant and equipment at the Burrard synchronous condense facility for fiscal 2020 and fiscal 2021. Table 8-2 provides the detailed depreciation rates for the Burrard synchronous condense facility for each year of the test period for which BC Hydro is seeking BCUC approval. The depreciation rates shown in Table 8-2 for a given fiscal year are applied against the net book value of the asset at the beginning of that fiscal year. The methodology used to determine the depreciation rates for fiscal 2020 and fiscal 2021 is consistent with the methodology underlying the depreciation rates approved by the BCUC in its Decision on the Previous Application.

Table 8-2 Burrard Synchronous Condense Facility Depreciation Rates

Class of Property, Plant and Equipment		F2020 Depreciation Rate (%/year)	F2021 Depreciation Rate (%/year)

8.2.2 New Asset Classes and Depreciation Rates

Table 8-3 provides the expected useful life and depreciation rates for new asset classes for which BC Hydro is seeking approval in this Application. The new asset classes are required for new assets that are not within the scope of existing asset classes. The asset class numbers, names, expected useful lives, and the resulting depreciation rates are provided in the table below.

Table 8-3 New Asset Classes Expected Useful Life and Depreciation Rates

Class of Property, Plant and Equipment or Intangible Asset	Expected Useful Life (Years)	Depreciation Rate (%/year)
C11640 Water Rights (finite)	40	2.5
C11650 Infrastructure Rights	35	2.9
C59503 LED Streetlights	20	5.0

Water Rights (finite)

The majority of BC Hydro's water licenses were issued in perpetuity; however, a small number (approximately 20 to 25) of licenses have a finite term of 40 years. The term of some of these licences is expiring and BC Hydro will incur costs to obtain new licences. The costs associated with the original water licences were included in the cost of the generating facility property, plant and equipment because the costs were not separately identifiable from the other approval costs of the generating facility.

The costs directly attributable to the renewal of finite term water licenses are appropriate to capitalize because the water licenses meet the recognition criteria for intangible assets. The finite term water license intangible assets will be amortized over the 40-year term of each license. A new asset class for renewal costs associated with finite term water licenses is being established because an existing asset class does not exist for these separately identifiable intangible assets.

Infrastructure Rights

BC Hydro is undertaking voltage conversion projects in certain areas of the distribution system. In order to realize the economic benefits of the system upgrade, BC Hydro must be able to connect the system to the customer's electrical infrastructure. Due to space limitations in certain areas, the transformer and the switchgear are located in the customer premises and are owned and operated by the customer. Therefore, the customer-owned equipment must be upgraded to enable the customer to receive the electricity at the new, higher voltage. BC Hydro incurs the costs to connect the customer to the system in order to realize the benefits of the system upgrade.

The costs incurred by BC Hydro represent a contribution to the customer. The contributions are eligible for capitalization as they meet the criteria for recognizing intangible assets. BC Hydro has not incurred such costs in the past; therefore, an asset class did not exist. A new asset class named Infrastructure Rights has been established with a 35-year useful life that is representative of the benefit period for the intangible asset based on the approximate life of the underlying assets.

LED Street Lights

BC Hydro-owned street light assets currently have high-pressure sodium (**HPS**) lights (luminaires). BC Hydro will be replacing the HPS luminaires with LED units in future years. Currently, the street lights (including the luminaires) are included in one asset class and the cost of replacing luminaries is expensed. The luminaire is essentially a light bulb which is low cost and has a short life. The cost of the LED unit is much higher than the cost of a luminaire and the life of the LED unit is significantly longer, estimated at 20 years. As the LED unit is a significant part of the street light, a new component asset class with a 20-year life is being established.

Forecast capital additions over fiscal 2019 to fiscal 2021 for each asset class are provided below in Table 8-4 below.

Table 8-4 New Asset Classes Forecast Capital Additions

($ million)	F2019 Forecast	F2020 Plan	F2021 Plan
C11640 Water Rights (finite)	-	-	5.3
C11650 Infrastructure Rights	5.7	20.5	12.8
C59503 LED Streetlights	-	3.8	5.8
Total	**5.7**	**24.3**	**23.9**

8.2.3 New Asset Classes – Leases

New asset classes will be created as a result of the adoption of the new IFRS 16, *Leases* standard in fiscal 2020. These leases will be recognized as assets and amortized over the lease term in accordance with IFRS 16, which will depend on the terms of the agreement. In this Application, BC Hydro is seeking approval to amortize the assets within these three new asset classes over the lease term in accordance with IFRS 16.

Further information on IFRS 16, *Leases* can be found in section 8.12.1 and 8.13.3.

Table 8-5 New Asset Classes, IFRS 16 *Leases* Expected Useful Life and Depreciation Rates

Class of Property, Plant and Equipment or Intangible Asset	Expected Useful Life (Years)	Depreciation Rate (%/year)
C95010 ROU - Land and buildings	Over the Lease Term	Varies for each agreement
C95020 ROU - Generation Assets	Over the Lease Term	Varies for each agreement
C95030 ROU - Miscellaneous	Over the Lease Term	Varies for each agreement

8.3 Return on Equity

BC Hydro's return on equity is prescribed by section 3 of Direction No. 8 as a specific dollar amount of $712 million per fiscal year in each of fiscal 2020 and fiscal 2021. Specifically, Direction No. 8 requires that the BCUC must allow BC Hydro to collect sufficient revenue in each fiscal year to achieve an annual rate of return on deemed equity to yield a distributable surplus of $712 million for fiscal 2020 and fiscal 2021. This dollar amount is consistent with the dollar amount of BC Hydro's allowed return on equity for fiscal 2019.

For fiscal 2022 onwards, the BCUC will be able to determine BC Hydro's Return on Equity. In the Comprehensive Review Report, the Government of B.C. indicated that it may provide policy guidance to the BCUC to inform this process.

The calculation of the BC Hydro's return on equity for the test period is set out in Appendix A, Schedule 9, and is an allowed return on equity percentage of 10.32 per cent in fiscal 2020 and 10.14 per cent in fiscal 2021.

8.4 Capital Structure

BC Hydro's capital structure is prescribed by Direction No. 8.

Pursuant to the definition of "deemed equity" in section 1 of Direction No. 8, BC Hydro's equity is deemed to be 30 per cent of rate base, which is also defined in section 1 of Direction No. 8.

As noted in section 8.3, BC Hydro's return on equity for fiscal 2020 and fiscal 2021 is a specific dollar amount of $712 million per fiscal year, and as a result BC Hydro's return on equity as a specific dollar amount is no longer linked to changes in deemed equity, and therefore rate base.

BC Hydro's dividend payment to the Province is prescribed by Heritage Special Directive No. HC1. Pursuant to Order in Council No. 095 issued on March 14, 2014, for fiscal 2018 and subsequent years, the payment to the Province will be reduced by $100 million per year based on the payment in the immediate preceding fiscal year until it reaches zero and will thereafter remain at zero until BC Hydro achieves a 60:40 debt to equity ratio. As shown on Appendix A, Schedule 9, line 3, BC Hydro's forecast dividend payment to the Province for fiscal 2019 is $59 million and is zero for each of fiscal 2020 and fiscal 2021. BC Hydro's forecast debt to equity ratio for fiscal 2020 and fiscal 2021 is shown on Appendix A, Schedule 9, lines 18 and 19.

8.5 Finance Charges

Finance charges are primarily comprised of interest charges on BC Hydro's debt. In addition, finance charges include interest related to leases recognized as lease obligations under IFRS 16, *Leases* as described in section 8.13.3 and non-current pension costs as described in Chapter 5G, section 5G.9. Total finance charges are calculated net of sinking fund income, finance charges capitalized to unfinished construction (interest during construction) and interest applied to regulatory accounts.

BC Hydro's long-term debt is comprised of bonds and revolving borrowings obtained under agreement with the Government of B.C. BC Hydro's debt is either held or guaranteed by the Government of B.C.

BC Hydro uses financial instruments, principally interest rate and foreign currency swaps, to manage interest rate and foreign exchange risks related to existing debt and forecast future debt issuances.

Since fiscal 2017, BC Hydro has locked in interest rates on forecast future long-term debt issuances by entering into financial contracts that hedge the interest rate risk. In accordance with BCUC Order No. G-42-16, mark-to-market gains and losses related to interest rate hedges of future debt are captured in the Debt Management Regulatory Account and are amortized over the term of the associated long-term debt issuances as shown on Appendix A, Schedule 2.2. Further information regarding the Debt Management Regulatory Account can be found in Chapter 7 section 7.8.13.

To forecast finance charges, BC Hydro uses a number of market variables and economic forecasts of short and long-term interest rates and foreign exchange rates. For debt that will be issued in the future and has already been hedged, BC Hydro uses the hedged rate in the forecast. The weighted average forecast hedged interest rate is 3.40 per cent for fiscal 2020 and 3.45 per cent for fiscal 2021.

For debt that will be issued in the future that is unhedged, BC Hydro uses economic forecasts that are developed and provided by the Treasury Board of the Government of B.C. The following table shows the forecast interest rates for unhedged debt and the forecast foreign exchange rate for fiscal 2020 to fiscal 2021.

Table 8-6 Forecast Interest Rates and Forecast Foreign Exchange Rate

	F2020 Plan	F2021 Plan
Canadian Short-term Interest Rate (%)	2.37	2.59
U.S. Short-term Interest Rate (%)	3.12	3.25
Canadian Long-term Interest Rate (%)	3.50	3.86
U.S. Long-term Interest Rate (%)	3.92	4.02
USD$/CAD$ Exchange Rate	0.7910	0.7973

Source: Treasury Board Forecast, October 2018.

Foreign currency-denominated monetary assets and liabilities are translated into Canadian dollars at the rate of exchange prevailing at the balance sheet date.

As shown on Appendix A, Schedule 2.2, gains and losses arising from the translation of unhedged foreign denominated long-term monetary items are included in the Foreign Exchange Gains and Losses Regulatory Account and are amortized on a straight-line pool basis in accordance with BCUC Order No. G-47-02. Further information regarding the Foreign Exchange Gains and Losses Regulatory Account can be found in Chapter 7, section 7.8.10.

As shown on Appendix A, Schedule 2.2, variances between forecast and actual non-current pension costs are deferred to the Non-Current Pension Costs Regulatory Account in accordance with BCUC Order No. G-48-14 and are amortized over the expected average remaining service life of the active plan members. Further information regarding the Non-Current Pension Costs Regulatory Account can be found in Chapter 7, section 7.8.11.

Forecast finance charges are shown on Appendix A, Schedule 8.0 and are summarized in Table 8-7 below.

Current finance charges are forecast to increase from $556 million in the fiscal 2019 RRA Plan to $662 million in fiscal 2021. The principal drivers of the net $107 million increase in finance charges are:

- A decrease of $123 million in the recovery of the credit balances in regulatory accounts, primarily related to the Total Finance Charges Regulatory Account and the Foreign Exchange Gains and Losses Regulatory Account;
- An increase in forecast borrowing costs of approximately $60 million resulting from the forecast increase in BC Hydro's debt over the test period largely driven by capital expenditures;

These increases are partially offset by:

- A forecast increase in interest during construction of approximately $88 million, which reduces finance charges.

Table 8-7 Finance Charges

($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
		1	2	3	4	5	6	7	8
Total Gross Finance Charges	8.0 L1	708.8	579.2	735.0	805.9	773.8	684.6	757.5	726.9
Total Finance Charge Reg. Acct Additions	8.0 L21	0.0	12.6	0.0	25.1	0.0	(28.8)	0.0	0.0
Other Regulatory Account Additions	.0 L3-L8+L2	(27.1)	162.4	(14.4)	(46.9)	(17.7)	78.8	(19.2)	(19.5)
Interest on Regulatory Accounts	8.0 L25	(75.8)	(75.3)	(68.3)	(61.6)	(60.1)	(38.6)	(24.3)	(27.6)
Regulatory Account Recoveries	8.0 L31	(101.3)	(174.9)	(139.9)	(209.4)	(140.5)	(140.4)	(16.6)	(17.6)
Total Current Finance Charges	8.0 L32	504.6	504.0	512.4	513.1	555.5	555.6	697.5	662.3

Since fiscal 2012, forecast interest during construction and the interest applied to regulatory accounts in a given year have both been based on BC Hydro's forecast weighted average cost of debt in that year.[333] As described in section 8.13.4, as a result of the adoption of IFRS 14, *Regulatory Deferral Accounts*, interest during construction cannot include the amortization of regulatory accounts. As a result,

[333] As required under IFRS International Accounting Standard 23 Borrowing Costs for the determination of capitalization of borrowing costs.

BC Hydro's forecast interest during construction will be based on a forecast weighted average cost of debt rate which excludes the amortization of the Debt Management Regulatory Account (referred to in this Application as the interest during construction rate). Forecast interest applied to BC Hydro's regulatory accounts will continue to be based on BC Hydro's forecast weighted average cost of debt including the amortization of the Debt Management Regulatory Account (referred to in this Application as the weighted average cost of debt rate).

8.6 Taxes

Taxes include school taxes and grants-in-lieu of general taxes.

The *Hydro and Power Authority Act* exempts BC Hydro from all property taxes other than those levied in respect of schools. School taxes are based on the assessed value of taxable assets as prepared by B.C. Assessment and tax rates that are established by the Province of British Columbia.

School taxes are paid on all assessable property except for BC Hydro's generation facilities on the Peace, Pend d'Oreille, and Columbia rivers.

The *Hydro and Power Authority Act* authorizes BC Hydro to pay grants-in-lieu of general municipal, regional district and local improvement taxes. Order in Council No. 266/2016 and Order in Council No. 533/2017 set out the formula used to calculate the grant payments. Annual grants paid include the following items:

- General grants equivalent to municipal, regional district and local improvement taxes on the assessed value of all land of BC Hydro and on the assessed value of improvements such as office buildings, field service buildings and substation control buildings. Assessed values of generating plants, substation equipment, transmission lines and distribution lines are excluded from this calculation;

- Revenue grants equal to 1 per cent of gross revenue from sales of electricity within the province, excluding revenue from power sold to other distribution systems for resale; and
- Special grants on dams, reservoirs and powerhouses. These grants are based on installed generating capacity, or imputed nameplate capacity in the case of storage dams.

Forecast school taxes and grants-in-lieu are shown on Appendix A, Schedule 6.0 and are summarized in the table below. Over the test period, taxes are forecast to increase compared to the fiscal 2019 RRA Plan primarily as a result of the following factors:

- Increased assessed property values for land, buildings, and electric system assets;
- The completion of new capital projects that are subject to taxation such as the John Hart Generating Station Replacement project;
- Increased forecast revenues from electricity sales for which 1 per cent is paid as a grant; and
- Increases to provincial and municipal taxation rates.

Table 8-8 Taxes

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan

8.7 Miscellaneous Revenues

Miscellaneous revenues include revenues from amortization of contributions in aid of construction, lease and other revenues related to BC Hydro's purchase of the remaining two-thirds interest in the Waneta Dam from Teck Metals Ltd. (**the Waneta 2017 Transaction**), external transmission revenues under the Open Access Transmission Tariff, meter/transformer rentals and power factor surcharges, late payment charges, building rentals, interconnections, Customer Crisis Fund rate rider revenues, and other revenues.

Forecast Miscellaneous Revenues for the test period are shown on Appendix A, Schedule 15.0 and are summarized in the table below.

Over the test period, Miscellaneous revenues are expected to increase by approximately $103 million compared to the fiscal 2019 RRA plan primarily due to approximately $87 million of lease and other revenues related to BC Hydro's purchase of the remaining two-thirds interest in the Waneta Dam. Miscellaneous revenues related to the Waneta 2017 Transaction can be found on Appendix A, Schedule 15.0, lines 20 to 25.

Table 8-9 Miscellaneous Revenues

($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
		1	2	3	4	5	6	7	8
Total Gross Miscellaneous Revenue	15.0 L39	137.1	143.1	138.3	143.7	140.6	202.9	240.8	247.2

Total Current Miscellaneous Revenue	15.0 L42	137.1	143.4	138.3	143.7	140.6	151.6	237.7	243.7

8.8 Inter-Segment Revenues

Inter-Segment revenues include the following allocations:

- The allocation of business support costs to Powerex as discussed in section 8.10;
- The allocation of point-to-point transmission costs to Powerex under the Transfer Pricing Agreement; and
- An allocation of BC Hydro's cost of point-to-point transmission, which relates to transmission costs for domestic exports and transmission costs related to BC Hydro's Skagit Valley Treaty obligations to the U.S. border.

Forecast Inter-Segment revenues for the test period are shown on Appendix A, Schedule 3.0 and are provided in the table below. Over the test period, total Inter-Segment revenues are relatively consistent compared to the fiscal 2019 RRA Plan.

Table 8-10 Inter-Segment Revenues

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Powerex - Corporate Allocation	3.0 L47	(2.8)	(2.8)	(2.8)	(2.8)	(2.9)	(2.9)	(2.9)	(2.9)
2	Mark to Market Losses (Gains)	3.0 L48	0.0	(0.2)	0.0	(1.0)	0.0	0.0	0.0	0.0
3	Powerex PTP Charges	3.0 L49	(11.8)	(9.6)	(10.1)	(21.2)	(16.6)	(26.7)	(32.5)	(32.5)
4	BC Hydro PTP Charges	3.0 L50	(47.8)	(44.3)	(51.4)	(41.3)	(45.9)	(34.7)	(33.6)	(37.2)
5	Total Current Inter-Segment Revenues	3.0 L51	(62.5)	(56.9)	(64.3)	(66.4)	(65.3)	(64.3)	(69.0)	(72.6)

8.9 Subsidiary Net Income

Section 6 of Direction No. 7 required that the net income of BC Hydro's subsidiaries be included for the purpose of setting BC Hydro's rates. Although Direction No. 7 has been repealed, BC Hydro continues to include the net income of BC Hydro's subsidiaries in its revenue requirements and continues to define Trade Income on the same basis as previously defined in Direction No. 7.[334]

The inclusion of subsidiary net income in BC Hydro's revenue requirements reduces the overall revenue requirements.

BC Hydro has two subsidiaries in this regard: Powerex Corp. (**Powerex**) and Powertech Labs Inc. (**Powertech**).

In the test period, Trade Income is forecast at $120.6 million per year in fiscal 2020 and fiscal 2021 (net of BC Hydro's allocation of business support costs as described in section 8.10), and is reflective of Powerex's average net income over the last five years (i.e., fiscal years 2014 through 2018). Using a five-year average as the basis of forecasting Trade Income is consistent with prior revenue requirement applications and is reasonable given the year-to-year volatility in market conditions.

Forecast subsidiary net income for the test period is shown on Appendix A, Schedule 3.0 and is provided in the table below.

Table 8-11 Subsidiary Net Income

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Powerex Net Income	1.0 L17	(115.2)	(130.2)	(115.2)	(136.6)	(115.1)	(205.3)	(120.6)	(120.6)
2	Powertech Net Income	1.0 L18	(4.5)	(2.1)	(4.8)	(3.1)	(5.1)	(3.3)	(3.4)	(3.7)
3	Total Gross Subsidiary Net Income	1.0 L19	(119.7)	(132.4)	(119.9)	(139.6)	(120.2)	(208.6)	(124.0)	(124.3)
4	Deferral Account Additions	2.1 L16	0.0	15.1	0.0	21.4	0.0	90.2	0.0	0.0
5	Deferral Account Recoveries	2.1 L18	48.9	48.9	50.6	50.5	52.9	62.9	(12.6)	(12.6)
6	Total Current Subsidiary Net Income	3.0 L55+L56	(70.8)	(68.4)	(69.3)	(67.7)	(67.3)	(55.6)	(136.6)	(136.9)

Variances between forecast and actual Trade Income are deferred to the Trade Income Deferral Account in accordance with BCUC Order No. G-96-04. However, if actual Trade Income in a given fiscal year is less than zero (i.e., a net loss), the transfer to the Trade Income Deferral Account would be the difference between the

[334] Trade Income is the greater of (a) the amount that is equal to BC Hydro's consolidated net income, less BC Hydro's non-consolidated net income, less the net income of BC Hydro's subsidiaries except Powerex, less the amount that BC Hydro's consolidated net income changes due to foreign currency translation gains and losses on intercompany balances between BC Hydro and Powerex; and (b) zero.

forecast Trade Income and zero. This means that a net loss in Trade Income would be borne the Government of B.C. as BC Hydro's shareholder and therefore ratepayers do not bear the risk of losses in Trade Income.

8.10 Allocation of Business Support Costs

For the purpose of determining the Transmission Revenue Requirement (as described in Chapter 9), BC Hydro's business support costs are allocated to generation, transmission, distribution, and customer care functions as shown on Appendix A, Schedule 3.1.

Business support costs are expenditures that are required to support BC Hydro's Plan, Build, and Operate work functions. These are the costs related to BC Hydro's Support work function (e.g., finance, technology, human resources, communications, regulatory, safety, legal, etc.) The costs reside in several business groups across the company and include the costs associated with the following:

- Finance, Technology, Supply Chain Business Group;
- People, Customer, Corporate Affairs Business Group (excluding Customer Service KBU and Power Acquisitions and Contract Management KBU costs);
- Safety Business Group;
- Other which includes Legal, President and Chief Operating Officer, Corporate Costs, and Capitalized Costs;
- Amortization, taxes, and non-tariff revenue relating to the above business groups; and
- The operating costs of the Properties KBU, which resides in the Capital Infrastructure Project Delivery Business Group.

As shown on Appendix A, Schedule 3.1, the following business support costs are first assigned to the transmission, distribution, generation and customer care functions:

- Insurance costs are allocated based on the assets covered by the policies and the risks associated with the operations of the respective functions; and
- Fleet vehicle costs are allocated based on usage.

Non-current pension costs and the remaining business support costs are then allocated to the each of the functions based on the average of their proportionate shares of expenditures (operating costs and capital) and FTEs.

BC Hydro has allocated $2.9 million of business support costs to Powerex for each of fiscal 2020 and fiscal 2021, in accordance with Directive 9 of the BCUC's Decision on our Fiscal 2009 to Fiscal 2010 Revenue Requirements Application.

The forecast allocation of business support costs for the test period is summarized in the table below.

Table 8-12 Allocation of Business Support Costs

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Business Support Costs		(384.8)	(372.7)	(331.0)	(331.6)	(352.2)	(355.2)	(662.1)	(691.0)
2	Allocation to functional groups:									
3	Generation	3.1 L54 / L49	94.5	90.9	79.2	79.4	85.5	85.6	172.8	183.5
4	Transmission	3.1 L55 / L50	121.4	117.7	102.4	102.6	109.2	99.2	188.2	195.2
5	Distribution	3.1 L56 / L51	142.3	138.6	126.1	126.2	132.8	132.2	231.3	239.3
6	Customer Care	3.1 L57 / L52	23.8	22.8	20.5	20.5	21.8	35.4	66.9	70.2
7	Total Allocated Costs	3.1 L58 / L53	382.0	369.9	328.2	328.7	349.3	352.4	659.2	688.1
8	Powerex	3.1 L14	2.8	2.8	2.8	2.8	2.9	2.9	2.9	2.9
9	Allocation of Business Support Costs		384.8	372.7	331.0	331.6	352.2	355.2	662.1	691.0
10	Business Support Costs Fully Allocated		0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0

For columns 1 to 5, refer to Schedule 3.1, lines 14 and 54 to 58. For columns 6 to 8, refer to Schedule 3.1, lines 14 and 49 to 53.

Business support costs are lower in the fiscal 2019 RRA plan compared to the fiscal 2020 and fiscal 2021 plan, primarily because BC Hydro is no longer transferring portions of its approved revenue requirement to the Rate Smoothing Regulatory Account, for recovery in rates in future fiscal years. Transfers to the Rate

Smoothing Regulatory Account reduced the amount of revenue collected in rates over fiscal 2015 to fiscal 2019, and were allocated to business support costs. This means that business support costs were lower than they otherwise would have been in the absence of these transfers. As shown in Appendix A, Schedule 5.0, line 90, the fiscal 2019 RRA plan includes planned transfers to the Rate Smoothing Regulatory Account in the amount of $321.4 million.

Going forward, BC Hydro is not deferring portions of its approved revenue requirements to the Rate Smoothing Regulatory Account, for recovery in future fiscal years. This means that there are no longer similar transfers being allocated to lower the business support costs, which, in turn, results in an increase in those costs in fiscal 2020 to fiscal 2021.

As an outcome of the Comprehensive Review, BC Hydro ceased using the Rate Smoothing Regulatory Account at the end of the third quarter of fiscal 2019. The balance of the Rate Smoothing Regulatory Account was written-off in December 2018 in the amount of $1.044 billion, resulting in a reduction to BC Hydro's retained earnings and a forecast net loss for BC Hydro in fiscal 2019. This means the cost of the write-off is borne by the Government of B.C., as BC Hydro's shareholder, and not by ratepayers, which will take pressure off rates in future fiscal years when BC Hydro would have otherwise recovered the outstanding balance. BC Hydro is not proposing to smooth rates over the fiscal 2020 to fiscal 2021 test period and is requesting BCUC approval to close the existing Rate Smoothing Regulatory Account.

8.11 Provisions and Other

“Provisions and Other” includes gains and losses on capital assets, dismantling costs, non-cash provision expenses and other costs that are not within the scope of other Nature View[335] expense items on BC Hydro's financial statements.

Gains and losses on capital assets include mass asset retirements, capital asset write-offs, and project write-offs.

As part of the project life-cycle progression, the project drivers, scope and leading alternative are generally revisited and re-confirmed prior to advancing into the next phase. As part of this process, there are times when decisions are made to cancel a project, change the project’s leading alternative, or reduce key project scope. These project changes can occur for various reasons including evolving asset or system needs and changes to the project cost relative to benefits. These decisions can result in capital expenditure write-offs (project write-offs), in whole or in part, if the capital costs incurred no longer have future benefit. These decisions are effective project and investment management practices and are the result of mature portfolio management practices to ensure our capital investments are prudent.

BC Hydro makes every effort to reduce and avoid project write-offs through the effective use of the early project investigation process as well as making write-off decisions as early as possible in the project lifecycle.

The fiscal 2020 to fiscal 2021 forecast for project write-offs was developed based on an evaluation of historical trends for capital project write-offs as of percentage of capital spend between fiscal 2016 to fiscal 2018. The average of the three-year historical actuals was approximately 0.9 per cent of capital expenditures. This was considered as a starting point for future year forecasts, with a decrease of 0.1 per cent per fiscal year in the test period as an estimated impact of our process

[335] Under the Nature View presentation, costs are classified by their nature (i.e., labour, materials, services, energy purchases, water rentals, amortization, etc.), rather than by their function.

improvement efforts to decrease project write-offs by identifying risks to capital expenditure write-offs earlier in the project lifecycle.

Following this forecasting methodology, the forecast for project write-offs is $9.9 million in fiscal 2020 based on 0.8 per cent of the annual capital expenditures and $9.7 million in fiscal 2021 based on 0.7 per cent of the annual capital expenditures. The annual capital expenditures used for this calculation exclude the Site C Project and the 2017 Waneta Transaction.

Forecast Provisions and Other are shown on Appendix A, Schedule 5.0 and are also summarized in the table below.

Table 8-13 Provisions and Other

	($ million)	Schedule Reference	F2017 RRA	F2017 Actual	F2018 RRA	F2018 Actual	F2019 RRA	F2019 Forecast	F2020 Plan	F2021 Plan
			1	2	3	4	5	6	7	8
1	Total Gross Provisions & Other	5.0 L110	66.0	63.6	61.0	152.3	51.7	82.3	108.2	87.0
2	Deferral Account Additions	5.0 L102	0.0	0.0	0.0	(1.6)	0.0	0.0	0.0	0.0
3	Regulatory Account Transfers	5.0 L109	(1.2)	19.5	10.0	(35.4)	14.0	(16.7)	8.1	8.1
	Regulatory Account Recoveries									
4	Remediation, Dismantling and Other	5.0 L78:L89	40.8	39.2	32.5	34.0	30.9	30.9	50.9	47.7
5	Rate Smoothing	5.0 L90	(216.5)	(201.2)	(311.0)	(326.2)	(321.4)	814.9	0.0	0.0
6	Total Current Provisions & Other	5.0 L92	(111.0)	(79.0)	(207.5)	(177.0)	(224.8)	911.4	167.1	142.8

Over the test period, Provisions and Other are forecast to increase compared to the fiscal 2019 RRA plan primarily due to higher planned dismantling costs, capital asset write-offs and project write-offs, which are included in line 1 of Table 8-13. The fiscal 2020 Plan amount for dismantling costs is higher than the fiscal 2021 Plan due to forecast dismantling costs in fiscal 2020 related to the John Hart Generating Station Replacement project in that year.

Additionally, Current Provisions and Other are increasing, compared with fiscal 2019 RRA plan, due to higher regulatory account recoveries associated with dismantling cost variances which were transferred to the Dismantling Cost Regulatory Account during fiscal 2018 and fiscal 2019, and which are included in line 4 of Table 8-13.

Also, as shown in line 5 of Table 8-13, for revenue requirement modelling purposes, and only until the end of fiscal 2019, transfers to and from the Rate Smoothing Regulatory Account are included in Provisions and Other (as shown in Appendix A, Schedule 5, line 90). For external reporting purposes, transfers to the Rate Smoothing Regulatory Account are included in Domestic Revenues.

As an outcome of the Comprehensive Review, BC Hydro ceased using the Rate Smoothing Account at the end of the third quarter of fiscal 2019. The balance of the Rate Smoothing Regulatory Account was written-off in December 2018. In this Application, BC Hydro is requesting approval to close the Rate Smoothing Regulatory Account in fiscal 2020 as this account has a zero balance.

8.12 Accounting Policy Matters

8.12.1 Accounting Treatment of Certain Electricity Purchase Agreements

BC Hydro is required to review all EPAs to determine whether the EPAs are leases under IFRS. As identified in section 8.13.3, a new Leases standard, IFRS 16, is effective for fiscal 2020.

The fiscal 2020 to fiscal 2021 forecast includes one EPA accounted for as a lease under IFRS 16, *Leases*. Prior to fiscal 2020, this EPA was an operating lease under IAS 17, *Leases*. The costs related to this EPA were previously classified as cost of energy. The IFRS 16 lease treatment of the EPA results in payments under the EPA being classified as amortization and finance charges.

Table 8-14 below indicates the classification of costs associated with the Electricity Purchase Agreement and also has references to the financial schedules in Appendix A where the costs of the Electricity Purchase Agreement is included.

Table 8-14 Treatment of the Qualifying Electricity Purchase Agreement

($ million)	Schedule Reference	F2020 Plan	F2021 Plan
Amortization	7.0 L11	30.2	30.2
Finance Charges	8.0 L15	4.2	2.8
Total		**34.4**	**33.0**

During the Previous Application, BC Hydro advised the BCUC that the commercial operation date for two EPAs classified as capital leases was delayed.[336] In addition, one EPA was reassessed due to an extension agreement, and it was determined that the EPA should be treated as an operating lease for the period following the extension in fiscal 2018. These events resulted in favorable variances of $12.8 million in fiscal 2017 and $53.0 million in fiscal 2018 which were deferred to the Non-Heritage Deferral Account. The deferral to the Non-Heritage Deferral Account was not required under existing regulatory orders, but was done to provide the benefit to ratepayers.

Table 8-15 below shows the impact of the delayed commercial operation date and lease extension in fiscal 2017 and fiscal 2018, including the deferral of $12.8 million and $53.0 million respectively into the Non-Heritage Deferral Account.

Table 8-15 Income Statement Impact from Delayed Commercial Operation Date and Lease Extension

8.13 International Financial Reporting Standards (IFRS)

BC Hydro prepares its financial statements in accordance with IFRS, effective for its fiscal year ending March 31, 2019 and has prepared the Application in accordance with IFRS in effect as at April 1, 2019.

BC Hydro fully adopted IFRS in fiscal 2019 subsequent to Treasury Board Regulation 231/2018 (issued on November 7, 2018), which repealed Part 3 of Government Organization Accounting Standards Regulation 257/2010. Previously, under Part 3 of Government Organization Accounting Standards Regulation 257/2010, BC Hydro prepared its financial statements in accordance with the principles of IFRS, combined with regulatory accounting in accordance with Financial Accounting Standards Board Accounting Standards Codification 980, *Regulated Operations* (collectively, the “Prescribed Standards”). As part of BC Hydro fully adopting IFRS in fiscal 2019, BC Hydro elected to adopt IFRS 14, *Regulatory Deferral Accounts* to allow BC Hydro to continue to use rate-regulated accounting. BC Hydro adopted IFRS including the interim rate regulated accounting standard, IFRS 14, *Regulatory Deferral Accounts*, effective for its fiscal year ending March 31, 2019.

In fiscal 2019, BC Hydro adopted two new IFRS standards that were effective beginning in fiscal 2019:

- IFRS 9, *Financial Instruments*; and
- IFRS 15, *Revenue from Contracts with Customers*.

The International Accounting Standards Board has issued a new standard relevant to the test period covered by this Application:

- IFRS 16, *Leases* – effective in fiscal 2020 for BC Hydro.

Significant impacts of the IFRS adoption are identified below.

8.13.1 IFRS 9, Financial Instruments

IFRS 9 Financial Instruments replaced IAS 39, *Financial Instruments: Recognition and Measurement*.

The adoption of IFRS 9 resulted in some additional financial statement note disclosure, but did not result in any material changes to BC Hydro's financial statements or this Application.

8.13.2 IFRS 15, Revenue from Contracts with Customers

IFRS 15, *Revenue from Contracts with Customers* replaced IAS 18, *Revenue*, IAS 11, *Construction Contracts* and IFRIC 18, *Transfers of Assets from Customers*.

The adoption of IFRS 15 impacted the accounting for two contracts, the Skagit River Agreement and a Tariff Supplement No. 37 Northwest Transmission Line Supplemental Charge agreement.

Under the terms of the Skagit River Agreement, the customer makes 35 annual payments for electricity provided by BC Hydro over 80 years. When a customer makes payments in advance of services being provided, a financing arrangement is considered to exist under IFRS 15. IFRS 15 requires that the payments under a financing arrangement are adjusted for the time value of money (e.g., interest) based on the interest rate in effect at the inception of the contract. The objective of the financing adjustment is to recognize revenue at an amount that reflects the price that a customer would have paid for the goods or services if the customer had paid cash for those goods or services when (or as) they are provided to the customer. The financing adjustment results in higher revenues and higher interest expenses recognized over the term of the contract.

BC Hydro recognized a $319 million reduction in unearned revenue, at April 1, 2018, as a result of the financing adjustment under IFRS 15. Unearned revenue decreased because BC Hydro earned more revenue (net of interest expense) to date under IFRS 15 than under IAS 18. By Order No. G-96-04, BCUC approved the deferral of variances related to Skagit Valley Treaty revenues to the Heritage Deferral Account. Accordingly, the impact related to this accounting change was deferred to the Heritage Deferral Account, to the benefit of ratepayers (i.e., a decrease in the balance of the Heritage Deferral Account).

Tariff Supplement No. 37 enables BC Hydro to recover its costs incurred in constructing the Northwest Transmission Line from customers receiving electricity or generator interconnection service by means of the Northwest Transmission Line. Tariff Supplement No. 37 permits customers to make payments in installments over a shorter period than the expected term of service to the customer. IFRS 15 includes new guidance that permits the recognition of a receivable only when the entity has an unconditional right to the payment. As BC Hydro is required to deliver future services associated with these installment payments, BC Hydro does not have an unconditional right to payment; therefore, the payments due cannot be recognized as a receivable under IFRS 15. In this case, the right to consideration would be unconditional if BC Hydro was not required to continue to supply electricity to the customer. Prior to the adoption of IFRS 15, BC Hydro recognized a receivable and unearned revenue associated with the future payments due under the Tariff Supplement No. 37 agreement.

As a result, BC Hydro recognized a decrease of $51 million in non-current receivables and a decrease of $47 million in unearned revenue attributable to an installment agreement at April 1, 2018. The net difference of $4 million was recognized as a $1 million decrease in the Non-Heritage Deferral Account[337] balance and a $5 million increase in the Total Finance Charges Regulatory Account[338] balance, consistent with existing orders.

There are changes to the ongoing measurement of revenue and interest charges relating to these agreements as a result of the application of IFRS 15 for fiscal 2019. The fiscal 2019 variances in revenue and interest expense as a result of these changes were similarly deferred to in the Heritage Deferral Account, the Non-Heritage Deferral Account and the Total Finance Charges Regulatory Account as described above, consistent with existing orders.

8.13.3 IFRS 16, Leases

IFRS 16, *Leases* replaces the existing standard IAS 17, *Leases* and IFRIC 4, *Determining Whether an Arrangement Contains a Lease* for annual periods beginning on or after January 1, 2019. IFRS 16 eliminates the classification of leases as either operating or capital leases required under IAS 17, and instead, introduces a single lease accounting model for lessees. Under the new single lease model, a lessee will recognize the lease assets and lease liabilities on the balance sheet initially measured at the present value of the lease payments, with the exception of leases with a duration of twelve months or less and leases with low

[337] Variances between forecast and actual revenues related to Tariff Supplement No. 37 Northwest Transmission Line Supplemental Charge are deferred to the Non-Heritage Deferral Account, in accordance with BCUC Order No. G-68-17.

[338] Variances between forecast and actual finance charges are deferred to the Total Finance Charges Regulatory Account, in accordance with BCUC Order No. G-47-18.

value. IFRS 16 will also cause expenses to be higher at the beginning and lower towards the end of a lease, even when payments are consistent throughout the term because the interest expense declines over time as the liability balance is drawn down.

BC Hydro has currently determined that all existing EPAs, except one, are not leases under IFRS 16. Upon transition to IFRS 16 on April 1, 2019, BC Hydro expects to derecognize three existing EPAs and recognize one EPA lease. The forecast adjustment at transition for these EPAs is shown in the table below.

Table 8-16 Electricity Purchase Agreements Forecast Adjustment at Transition

Financial Statement Item Debit/(Credit)	IFRS 16 Adjustment at April 1, 2019 ($ million)
Prepaid Lease	(17.7)
Property, Plant and Equipment	(617.7)
Right-of-Use Assets	93.1
Lease Obligations	560.4
Net change	**(18.0)**

The net credit adjustment, estimated in the amount of $18 million, will be recorded as a decrease to the balance in the Non-Heritage Deferral Account in fiscal 2020, to the benefit of ratepayers. This is not required under existing orders, but is being done to provide the benefit to ratepayers.

The table below presents the classification and measurement of the forecast expenses associated with these agreements under IFRS 16 and IAS 17 for fiscal 2020 and fiscal 2021.

Table 8-17 IFRS 16 and IFRS 17 Forecast Expenses

($ million)	Three EPA Leases Derecognized		One EPA Lease Recognized	
	F2020	F2021	F2020	F2021
IAS 17				
Operating expenses	54.5	55.1		
Grants and Taxes	2.5	2.6		
Depreciation	22.8	22.8		
Finance Charges	41.7	40.8		
Cost of Energy	7.5	8.5	39.6	39.5
Total	**129.0**	**129.9**	**39.6**	**39.5**
IFRS 16				
Depreciation			30.2	30.2
Finance Charges			4.2	2.8
Cost of Energy	118.6	120.3		
Total	**118.6**	**120.3**	**34.4**	**33.0**
Net Change	**(10.4)**	**(9.6)**	**(5.2)**	**(6.5)**

With respect to EPAs, BC Hydro has made estimates based on its preliminary assessment regarding the impacts of IFRS 16 (which will become effective for BC Hydro on April 1, 2019) and has included them in this application. However, the actual impacts of the new standard may vary from these estimates as BC Hydro completes its assessment, including as a result of clarifications and interpretive guidance that may be developed by the International Accounting Standards Board, accounting firms and industry groups to assist in the implementation of the new standard. BC Hydro anticipates that material variances are possible when we complete our assessment of EPAs, including the review by our external auditors. As shown in section 8.12.1, BC Hydro has deferred positive variances related to EPA capital leases into the Non-Heritage Deferral Account in order to provide the benefit to ratepayers, even though this was not required under existing orders. Accordingly, BC Hydro requests BCUC approval to defer to the Non-Heritage Deferral Account, any variances related to the accounting for EPAs determined to be leases under IFRS 16, that are not eligible for deferral treatment under existing orders.

In addition, BC Hydro has performed a review of all significant non-EPA agreements potentially within the scope of IFRS 16 and has currently determined that five agreements, mainly property lease/rental agreements, will be required to be recognized as leases under IFRS 16. The forecast adjustment at transition for these agreements is shown in the table below.

Table 8-18 IFRS 16, *Leases* Forecast Adjustment at Transition

Financial Statement Item Debit/(Credit)	IFRS 16 Adjustment at April 1, 2019 ($ million)
Right-of use asset	16.8
Lease obligation	(17.6)
Net Change	**0.8**

The table below presents the classification and measurement of the forecast expenses associated with these agreements under IFRS 16 and IAS 17 for fiscal 2020 and fiscal 2021.

Table 8-19 IFRS 16 and IFRS 17 Forecast Expenses

	F2020 ($ million)	F2021 ($ million)
IAS 17		
Operating expenses	3.9	3.9
IFRS 16		
Depreciation	3.1	3.2
Finance Charges	1.0	1.0
Total	4.2	4.2
Net Change	**0.3**	**0.3**

8.13.4 IFRS 14, Regulatory Deferral Accounts

As a result of BC Hydro's adoption of IFRS 14, *Regulatory Deferral Accounts,* the interest during construction rate will differ from the weighted average cost of debt rate used for applying interest to applicable regulatory accounts, starting in fiscal 2020.

IFRS 14 requires BC Hydro to implement presentation and disclosure changes to its financial statements. IFRS 14 requires regulatory deferral account balances and changes to balances to be presented separately from non-regulatory amounts on the balance sheet and the income statement.

Prior to the adoption of IFRS 14, BC Hydro expected to classify the amortization of the Debt Management Regulatory Account as finance charges, include this amortization in the calculation of BC Hydro's weighted average cost of debt, which is used to apply interest during construction to capital projects and interest to applicable regulatory accounts. BC Hydro's expectation that it would include Debt Management Regulatory Account amortization in the determination of its weighted average cost of debt was reflected in BCUC Order No. G-42-16 to the Debt Management Regulatory Account which authorized that: "Amounts amortized to finance charges from the DMRA are also eligible to be included in the calculation of Interest During Construction." Therefore, upon initiation of amortization of the Debt Management Regulatory Account in fiscal 2020, consistent with BCUC Order No. G-42-16, BC Hydro expected to allocate a portion of the amortization to capital asset balances beginning in fiscal 2020.

However, under IFRS 14, the Debt Management Regulatory Account amortization is required to be presented separately from non-regulatory items and therefore cannot be netted against finance charges. As a result, the IFRS 14 requirement for separation of regulatory balances and transactions from non-regulatory items requires that the Debt Management Regulatory Account amortization be excluded from the interest during construction calculation used for capitalizing borrowing costs to capital assets. To be compliant with IFRS, BC Hydro will not be permitted to include Debt Management Regulatory Account amortization in the determination of the weighted average cost of borrowing for applying interest during construction as it had expected and communicated to the BCUC. Therefore, for the purposes of applying interest during construction, BC Hydro will calculate its weighted average cost of borrowing excluding Debt Management Regulatory Account amortization and will refer to this as the interest during construction rate.

BC Hydro will continue to calculate the weighted average cost of debt rate to be used for applying interest to the balances of regulatory accounts, as applicable. This rate will include Debt Management Regulatory Account amortization. It will also be used to determine the amount of the Debt Management Regulatory Account amortization that would have been capitalized to the Site C Project had the interest during construction rate included Debt Management Regulatory Account amortization. This amount would be deferred to the Site C Regulatory Account as described below.

In its Decision on our Previous Application the BCUC approved that any costs related to the Site C Project that are not able to be capitalized, be deferred to the Site C Regulatory Account. Accordingly, the forecast amounts related to the Debt Management Regulatory Account amortization that would otherwise have been included as part of the forecast interest during construction amount related specifically to the Site C Project, would be eligible to be deferred to the Site C Regulatory Account. The annual impact related to the Site C Project is approximately $2.0 million in fiscal 2020 and $2.7 million in fiscal 2021.

Furthermore, this treatment is consistent with BCUC Order No. G-42-16, which approved the establishment of the Debt Management Regulatory Account and that approved the inclusion of the Debt Management Regulatory Account amortization in the calculation of interest during construction.

Fiscal 2020 to Fiscal 2021
Revenue Requirements Application

Chapter 9

Transmission Revenue Requirement

Table of Contents

List of Figures

List of Tables

9.1 Introduction

This chapter describes how BC Hydro's proposed Open Access Transmission Tariff (**OATT**) rates are determined to recover BC Hydro's Transmission Revenue Requirement (**TRR**), consistent with past Orders of the BCUC. The rates charged under the OATT are for Network Integration Transmission Service (**NITS**), Point-To-Point (**PTP**) Transmission Service and Ancillary Services, as set out in Appendix EE and summarized in Table 9-8 . As the main users of the transmission system, BC Hydro and Powerex account for approximately 98.5 per cent of the revenue collected through the OATT. External transmission customers account for approximately 1.5 per cent of the revenue.

The rates charged under the OATT are designed to collect the TRR, which is the sum of BC Hydro's net transmission function costs, as calculated using a cost of service methodology. The cost of service methodology is consistent with the method used in BC Hydro's previous revenue requirement applications. It is also consistent with the method previously used by the British Columbia Transmission Corporation (**BCTC**), and the method approved in the BCUC's 1998 Decision accompanying Order No. G-43-98 related to BC Hydro's Application for Approval of Wholesale Transmission Services. The design of the OATT rates is also consistent with previously approved OATT rates. The proposed OATT rates are just and reasonable and should be approved as sought.

This chapter is organized as follows:

- Section 9.2 describes how the TRR is determined through the direct assignment or allocation of transmission-related costs to the transmission function, based on cost causation principles and consistent with past practice;
- Section 9.3 sets out the proposed OATT rates and describes how the rates were derived, consistent with past practice;
- Section 9.4 explains the forecast of PTP revenue; and

- Section 9.5 presents the proposed OATT rates for the test period.

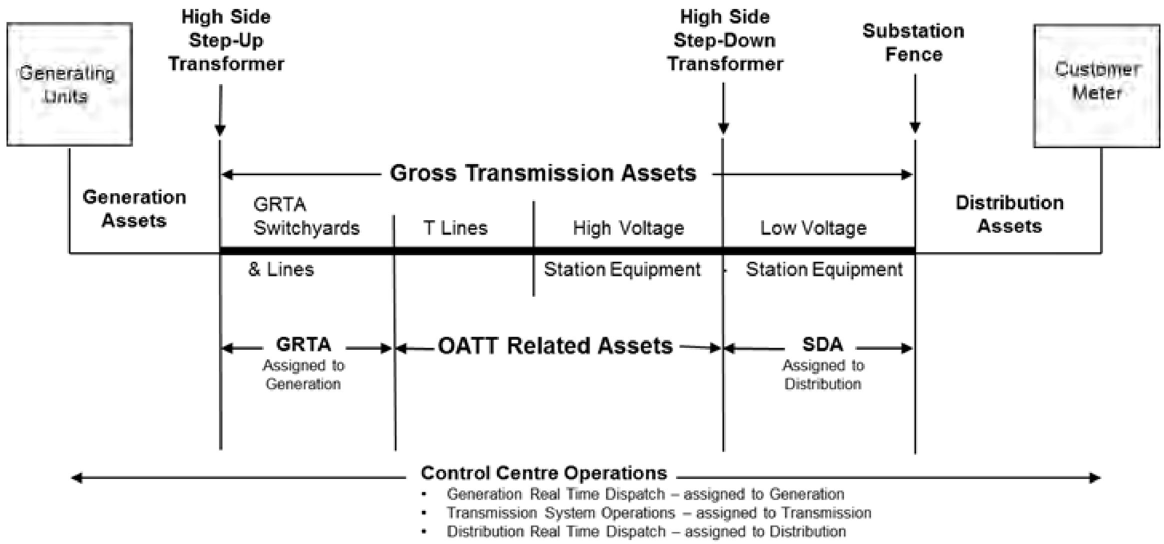
9.2 Transmission Revenue Requirements are Calculated using a Cost of Service Allocation Methodology Consistent with Past Orders

BC Hydro's TRR is BC Hydro's net transmission-related costs, as determined through an allocation or direct assignment of BC Hydro's costs. The cost of service methodology used to derive the TRR is based on cost causation and is consistent with the methodology. The methodology is consistent with that previous methodology used by BC Hydro and BCTC and approved in the BCUC's 1998 Decision accompanying Order No. G-43-98 related to BC Hydro's Application for Approval of Wholesale Transmission Services.

9.2.1 Transmission Revenue Requirement Overview

The TRR includes the current costs associated with BC Hydro's OATT Related Assets, which are the transmission lines and high-voltage station equipment used to provide transmission service pursuant to the OATT. As shown by the asset boundaries in Figure 9-1, BC Hydro's Gross Transmission Assets include assets from the high voltage side of the step-up transformers located at the generation stations to the substation fence at distribution voltage. Both Generation Related Transmission Assets (**GRTA**) and Substation Distribution Assets (**SDA**) must be excluded from the Gross Transmission Assets to arrive at the OATT Related Assets.

Figure 9-1 Asset Boundary for Transmission Revenue Requirement and OATT Rates



Using fiscal 2020 as an example, Figure 9-2 illustrates the allocation and direct assignment of costs to establish the gross transmission costs related to the Gross Transmission Assets in Figure 9-1, the TRR related to the OATT Related Assets in Figure 9-1, and the recovery of the TRR through the proposed OATT rates.

Figure 9-2 Fiscal 2020 Transmission Revenue Requirement Components ($ million) with References to Appendix A Financial Schedules

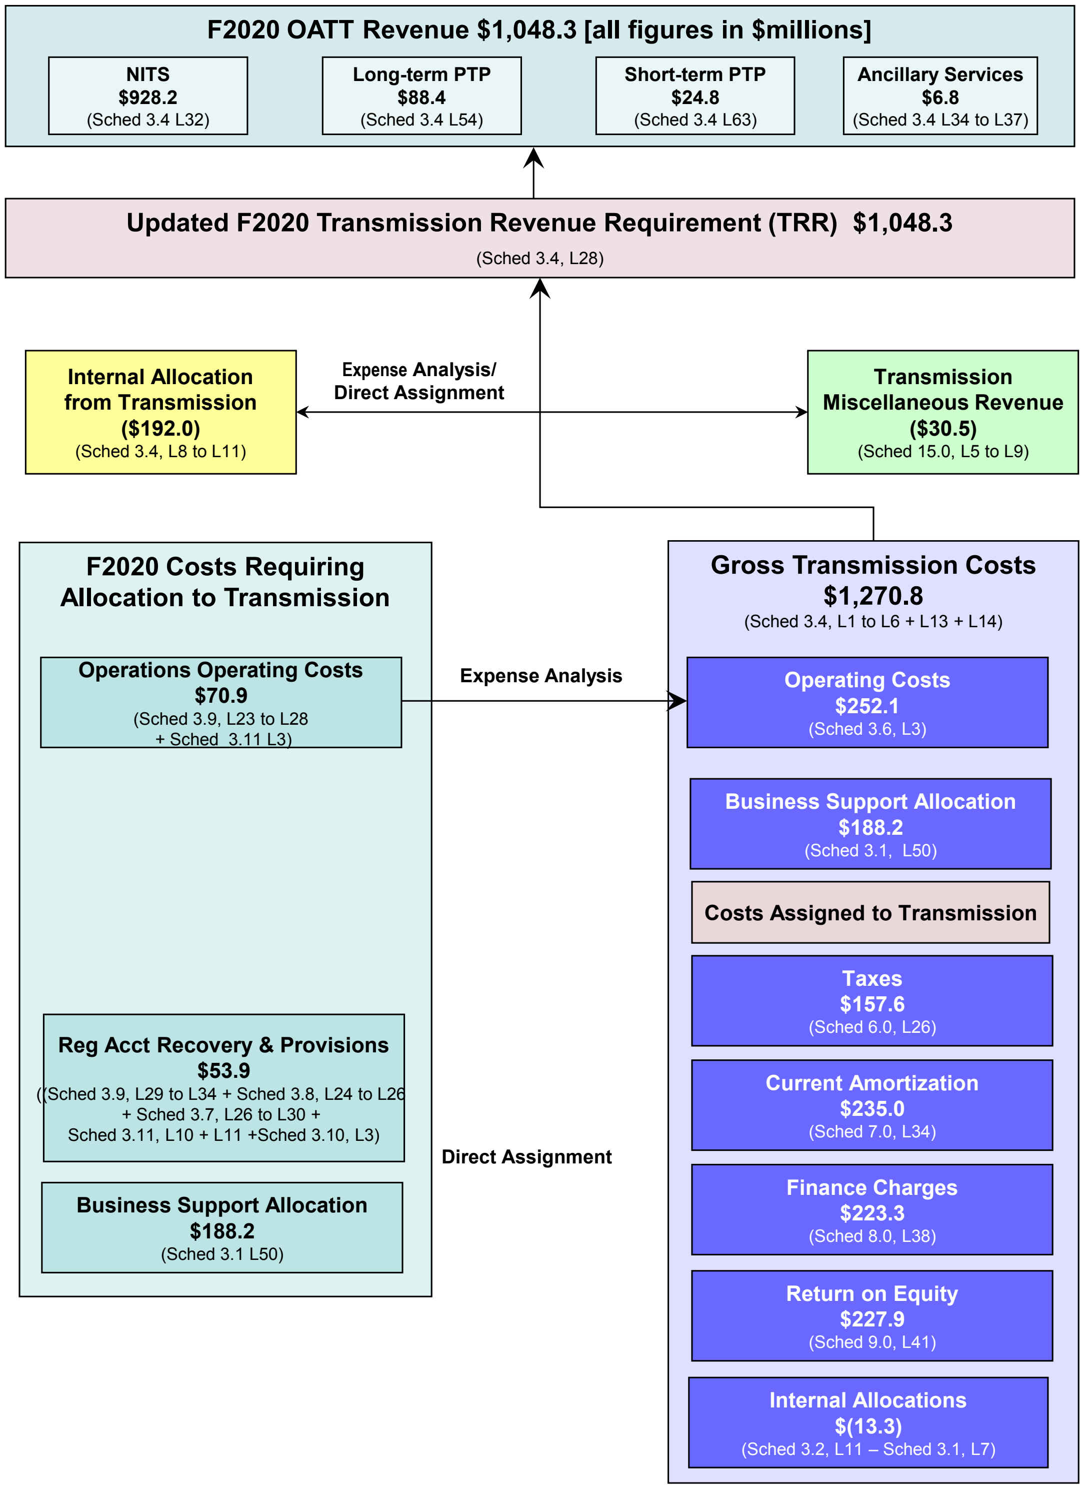


Table 9-1 sets out the cost components that make up the TRR from fiscal 2017 through fiscal 2021. The fiscal 2017, fiscal 2018, and fiscal 2019 approved amounts represent the plan amounts from the Previous Application, as reflected in the OATT rate schedules included in BC Hydro's compliance filing pursuant to BCUC Order No. G-47-18.

The 13 per cent increase in Gross Transmission Costs and 15 per cent increase in the TRR from fiscal 2019 RRA to the fiscal 2020 plan is due to several factors:

- ***Business Support Costs***: As with the general rate increase, a significant driver of the increase in the TRR is an end to the practice of rate smoothing, as a result of the Comprehensive Review. Business support costs are lower in the fiscal 2019 RRA plan compared to the fiscal 2020 and fiscal 2021 plan, primarily because BC Hydro is no longer transferring portions of its approved revenue requirement to the Rate Smoothing Regulatory Account, for recovery in rates in future fiscal years. Transfers to the Rate Smoothing Regulatory Account reduced the amount of revenue collected in rates over the fiscal 2015 to fiscal 2019 period, and were allocated to business support costs. This means that business support costs were lower than they otherwise would have been in the absence of these transfers.[339]

  As a result, business support costs allocated to gross transmission are increasing by approximately 72 per cent from fiscal 2019 RRA to fiscal 2020 plan. Business support costs are discussed further in Chapter 8, section 8.10 and their allocation to gross transmission is discussed in section 9.2.7;

- ***Finance Charges***: A credit balance in the Total Finance Charges Regulatory Account was refunded to ratepayers over the fiscal 2017 to fiscal 2019 period,

[339] As shown in Appendix A, Schedule 5.0, line 90, the fiscal 2019 RRA Plan includes planned transfers to the Rate Smoothing Regulatory Account in the amount of $321.4 million.

which resulted in lower finance charges in fiscal 2019. In this application, forecast finance charges are increasing primarily because this credit balance has now been returned to ratepayers and is no longer offsetting total finance charges in this test period. The other main reason for the increase in finance charges is an increase to forecast borrowing costs, primarily due recent capital expenditures. These increases are partially offset by a decrease in finance charges related to an increase in interest during construction. As a result, finance charges allocated to gross transmission increase by 16.9 per cent from the fiscal 2019 RRA to the fiscal 2020 Plan. Finance charges are discussed further in Chapter 8, section 8.5 and their allocation to gross transmission is discussed in section 9.2.6.2;

- ***Amortization***: Current amortization cost, including demand side management amortization, allocated to gross transmission is increasing by 1.8 per cent from the fiscal 2019 RRA to the fiscal 2020 plan. Amortization is discussed further in Chapter 8, section 8.2 and its allocation to gross transmission is discussed in section 9.2.6.2;
- ***Operating Costs and Provisions:*** Operating costs and provisions allocated to gross transmission have increased by 5.8 per cent from the fiscal 2019 RRA to the fiscal 2020 plan. Operating costs are discussed further in Chapter 5 and Provisions are discussed in Chapter 8, section 8.11. The allocation of these costs to gross transmission is described in section 9.2.5; and
- ***Taxes***: As with the general rate increase, taxes paid by BC Hydro are increasing due to increased assessed property values, the completion of new capital projects that are subject to taxation and increases to provincial and municipal taxation rates. The resulting taxes allocated to gross transmission increase by approximately 7.1 per cent from the fiscal 2019 RRA to the fiscal 2020 plan. Taxes are discussed further in Chapter 8, section 8.6 and the allocation of taxes to gross transmission is described in section 9.2.6.1.

The following factors are offsetting the increase in gross transmission costs and OATT rates:

- ***Return on Equity***: Return on Equity allocated to gross transmission is decreasing by 6.9 per cent from the fiscal 2019 RRA to the fiscal 2020 plan. Return on Equity is discussed further in Chapter 8, section 8.3 and its allocation to gross transmission is described in section 9.2.6.2; and
- ***Miscellaneous Revenues***: As discussed further in section 9.2.10,certain miscellaneous transmission revenues offset the TRR and OATT rates. However, there is no reduction to the TRR from the lease and other revenues related to BC Hydro's Waneta acquisition (discussed further in Chapter 4, section 4.2.3), as these revenues are non-transmission revenues.

The following factors offset the general revenue requirements but do not offset the gross transmission cost or TRR:

- ***Subsidiary Net Income***: Subsidiary net income does not reduce the gross transmission cost or TRR. Gross transmission has no energy component, which means that net income from BC Hydro's energy trading subsidiary, Powerex, does not reduce the TRR. Costs and revenues associated with our subsidiary Powertech, also do not reduce the TRR as they are not transmission related;
- ***Cost of Energy***: As gross transmission has no cost of energy component, there is no offset to gross transmission or the TRR due to the proposed refund of the credit balance of the Heritage Deferral Account and Non-Heritage Deferral Account, as discussed in Chapter 7, section 7.7.1; and
- ***Deferral Account Rate Rider (DARR)***: There is no offset to OATT rates associated with the reduction of the DARR from 5 per cent to 0 per cent on April 1, 2019. OATT rates have never been subject to the DARR and the elimination of the DARR has no OATT customer bill impact.

The allocation or direct assignment of the components of the TRR is discussed in the sections below.

9.2.2 Allocation of Operating Costs to Gross Transmission

Consistent with past practice, current operating costs and provisions are directly assigned or allocated to the transmission function based on cost causation.

The following business groups currently carry out transmission functions:

1. Integrated Planning Business Group (discussed in Chapter 5A);
2. Capital Infrastructure Project Delivery Business Group (discussed in Chapter 5B);
3. Operations Business Group (discussed in Chapter 5C); and
4. Finance, Technology, Supply Chain Business Group (discussed in Chapter 5E);

The sections below describe how the operating costs for each of these Business Groups are allocated to the Generation, Transmission and Distribution functions.

9.2.2.1 Functions of the KBUs in the Integrated Planning Business Group

Integrated Planning Business Group operating costs are functionalized as follows:

- Energy Planning and Analytics KBU operating costs are allocated between the Generation, Transmission, Distribution functions and to business support;
- Dam Safety KBU operating costs are directly assigned to the Generation function;
- Line Asset Planning KBU operating costs are allocated between the Generation, Transmission and Distribution functions;
- Engineering KBU operating costs are allocated between the Generation, Transmission and Distribution functions;
- Stations Asset Planning KBU operating costs are allocated between the Generation, Transmission and Distribution functions; and

- Interconnections and Shared Assets KBU operating costs are allocated between the Transmission and Distribution functions.

9.2.2.2 Functions of the KBUs in the Capital Infrastructure Project Delivery Business Group

Capital Infrastructure Project Delivery Business Group operating costs are functionalized as follows:

- Project Delivery KBU operating costs are allocated between the Generation, Transmission and Distribution functions;
- Indigenous Relations KBU operating costs are allocated between the Generation, Transmission and Distribution functions and to business support;
- Environment KBU operating costs are allocated between the Generation, Transmission and Distribution functions and to business support; and
- Properties KBU operating costs are allocated between the Generation, Transmission and Distribution functions and to business support.

9.2.2.3 Functions of the KBUs in the Operations Business Group

Operations Business Group operating costs are functionalized as follows:

- Line Field Operations KBU operating costs are allocated between the Generation, Transmission, and Distribution functions;
- Stations Field Operations KBU operating costs are allocated between the Generation, Transmission and Distribution functions;
- T&D System Operations KBU operating costs are allocated between the Generation, Transmission and Distribution functions;
- Generation System Operations KBU operating costs are directly assigned to the Generation function;

- Program and Contract Management KBU operating costs are allocated between the Generation, Transmission and Distribution functions;
- Distribution Design and Customer Connections KBU operating costs are directly assigned to the Distribution function; and
- Construction Services KBU operating costs are allocated between the Generation, Transmission and Distribution functions.

9.2.2.4 Functions of the KBUs in the Finance, Technology, Supply Chain Business Group

The Materials Management Department and Fleet Services Department, both part of the Supply Chain KBU, are functionalized as follows:

- Materials Management Department operating costs are allocated between the Generation, Transmission and Distribution functions; and
- Fleet Services Department operating costs are allocated between the Generation, Transmission Distribution and Customer Service functions.

The remainder of the Finance, Technology, Supply Chain Business Group operating costs are functionalized as business support, based on corporate allocators.

9.2.3 Activities of the KBUs by Function

The portion of the operating costs and the internal allocations relating to the transmission function are calculated by determining the relevant functional activity of each KBU within the Business Groups. The functional activities performed by the relevant Business Groups are shown in Table 9-2.

Table 9-2 KBU Functional Activities

1	**Generation Function:**	
	(i)	Generation Real-time Dispatch
	(ii)	Generation Related Transmission Assets
	(iii)	Generation Other
2	**Transmission Function:**	
	(i)	Scheduling, System Control and Dispatch Service (OATT Rate Schedule 03)
	(ii)	Transmission Other
3	**Distribution Function:**	
	(i)	Substation Distribution Assets
	(ii)	Distribution Real-time Dispatch
	(iii)	Distribution Other

9.2.4 Methodologies for Allocating Costs to Functional Activities

Where possible, costs are directly assigned to one of the functional activities shown in Table 9-2. Where direct assignment is not possible, costs are allocated to the functional activities, using one or more of the following parameters to develop allocation factors:

(i) Planned expenditures for maintenance and/or capital programs that are representative of the work a KBU expects to undertake during the test period;

(ii) Historical expenditures for work performed by a KBU;

(iii) Work performed by Full-Time Equivalents (**FTEs**) within a KBU;

(iv) Manager and financial analyst interviews; and

(v) Direct allocation of certain specific activity costs.

In most cases, functionalization at the Director and Vice President levels is based on a roll-up of the overall allocation of the Departments or KBUs for which they are responsible.

Functionalization for provisions and other is based on an analysis of related current and historical capital programs.

Table 9-3 summarizes the allocation approach used for each KBU or Department in the Integrated Planning, Capital Infrastructure Project Delivery, Operations, and Finance, Technology, Supply Chain Business Groups.

Table 9-3 Allocation of Costs to Functional Activities

KBU/Department	Basis of Allocation to Functional Activities
Integrated Planning Business Group	
Energy Planning and Analytics	Direct assignment and manager interviews
Dam Safety	Direct assignment to generation function
Line Asset Planning	Direct assignment, maintenance and capital programs, and manager interviews
Engineering	Direct assignment, capital programs and manager interviews
Stations Asset Planning	Direct assignment, maintenance and capital programs, and manager interviews
Interconnections and Shared Assets	Direct assignment and manager interviews
Business Unit Support	Direct assignment roll-up of overall allocation
Capital Infrastructure Project Delivery Business Group	
Project Delivery	Capital programs managed by the Project Delivery KBU and manager interviews
Indigenous Relations	Activity analysis and manager interviews
Environment	Direct assignment and manager interviews
Properties	Direct assignment and manager interviews
Business Unit Support	Direct assignment roll-up of overall allocation
Operations Business Group	
Line Field Operations	Direct assignment, maintenance and capital programs, specific activity analysis and manager interviews
Stations Field Operations	Direct assignment, maintenance and capital programs, specific activity analysis, and manager interviews
T&D System Operations	Direct assignment, specific activity analysis, and manager interviews
Generation System Operations	Direct assignment to generation function
Program and Contract Management	Specific activity analysis, maintenance and capital programs, and manager interviews
Distribution Design and Customer Connections	Direct assignment to distribution function
Construction Services	Maintenance and capital programs, specific activity analysis, and manager interviews
Business Support	Direct assignment roll-up of overall allocation

KBU/Department	Basis of Allocation to Functional Activities
Finance, Technology, Supply Chain Business Group	
Materials Management	Manager interviews
Fleet Services	Manager interviews

9.2.5 Resulting Portion of Business Groups Assigned to Gross Transmission Operating Costs

As a result of the above analysis, operating costs and provisions were assigned to gross transmission, as shown in line 1 of Table 9-1 and line 1 of Appendix A, Schedule 3.4, as follows:

- 34 per cent of the Integrated Planning Business Group operating costs;
- 20 per cent of the Capital Infrastructure Project Delivery Business Group operating costs;
- 25 per cent of the Operations Business Group operating costs;
- 19 per cent of the Materials Management Department operating costs; and
- 32 per cent of the Fleet Services Department operating costs.

Portions of the total costs allocated to gross transmission from the Integrated Planning, Capital Infrastructure and Project Delivery and Operations Business Groups are subsequently allocated to generation and distribution, as discussed in section 9.2.9 below.

As shown on line 1 of Table 9-1, the current operating costs and provisions allocation to gross transmission have increased by 5.8 per cent from fiscal 2019 RRA to fiscal 2020 plan. Operating costs are discussed in Chapter 5 and provisions are discussed in Chapter 8, section 8.11.

9.2.6 Costs Directly Assigned to Gross Transmission

9.2.6.1 Taxes

Taxes are directly assigned to the gross transmission function as shown on line 2 of Appendix A, Schedule 3.4. Taxes that are directly assigned to the gross transmission function also include taxes related to Generation Related Transmission Assets (**GRTA**) and to Substation Distribution Assets (**SDA**). To derive the taxes specific to the OATT Related Assets, taxes are further allocated through direct assignment and asset analysis. These taxes are included in the internal allocations to GRTA and to SDA on line 8 and line 11 of Appendix A, Schedule 3.4. As shown on line 2 of Table 9-1 and on line 26 of Appendix A Schedule 6.0, there has been a 7.1 per cent increase in the Taxes allocated to gross transmission from fiscal 2019 RRA to fiscal 2020 plan. Taxes are discussed in Chapter 8, section 8.6.

9.2.6.2 Amortization, Finance Charges and Return on Equity

Amortization, finance charges and return on equity are directly assigned to gross transmission and are shown on lines 3, 4 and 5, respectively of Appendix A, Schedule 3.4. Amortization, Finance Charges and Return On Equity are discussed in Chapter 8, sections 8.2, 8.3 and 8.5, respectively.

The amortization assigned to gross transmission includes amortization related to GRTA, SDA, OATT Related Assets and five per cent of demand-side management amortization. As approved by Order No. G-47-16,[340] demand-side management amortization is directly assigned to transmission. The remaining gross transmission amortization has been allocated to the functional activities using allocation factors derived from asset analysis. As shown on line 3 of Table 9-1 and on line 34 of

[340] In Order No. G-47-16, issued on March 31, 2016, the BCUC approved a Cost of Service Study and Rate Class Segmentation Negotiated Settlement Agreement, as part of BC Hydro's 2015 Rate Design Application. In section 8 on page 11 of the Negotiated Settlement Agreement appended to Order No. G-47-16, the negotiating parties agreed it was appropriate to functionalize five per cent of DSM costs to transmission, subject to BC Hydro revisiting the functionalization between generation, transmission and distribution in its fiscal 2019 Cost of Service Study.

Appendix A Schedule 7.0, there has been a 1.8 per cent increase in the current amortization cost allocation to gross transmission from fiscal 2019 RRA to fiscal 2020 plan.

The Finance Charges and Return On Equity assigned to gross transmission are allocated to the functional activities shown in Table 9-2 based on the average rate base for each fiscal year. As shown on line 4 of Table 9-1 and on line 38 of Appendix A Schedule 8.0, there has been a 16.9 per cent increase in the current Finance Charges allocated to gross transmission from fiscal 2019 RRA to fiscal 2020 plan. As shown on line 5 of Table 9-1 and on line 41 of Appendix A Schedule 9.0, there has been a 6.9 per cent decrease in the Return on Equity allocated to gross transmission from fiscal 2019 RRA to fiscal 2020 plan.

9.2.7 Business Support Cost Allocation

The current business support costs assigned to gross transmission are shown on line 6 of Appendix A, Schedule 3.4. As shown on line 6 of Table 9-1 and on line 44 of Appendix A, Schedule 3.1, there has been a 72.3 per cent increase in the current business support cost allocation to gross transmission from fiscal 2019 RRA to fiscal 2020 plan. Business support costs are discussed in Chapter 8, section 8.10.

Business support costs are allocated to the generation, transmission and, distribution functional activities shown in Table 9-2, using allocation factors derived from FTEs and activity analysis.

9.2.8 Internal Allocations to Transmission

The following costs are also assigned to transmission:

1. Generation operating costs relating to the generation ancillary services that BC Hydro provides to OATT customers, as shown on line 8 of Table 9-1 and on line 13 of Appendix A, Schedule 3.4;

2. Capitalized Overhead, as shown on and line 9 of Table 9-1 and on line 7 of Appendix A, Schedule 3.1; and
3. A one-time allocation associated with the write-off the balance of the Rate Smoothing Regulatory Account in fiscal 2019 forecast only, as shown on line 10 of Appendix A, Schedule 3.1. This is offset by a reduction in the allocation of Return on Equity, as shown on line 41 of Appendix A, Schedule 9.0.

These costs are functionalized directly to transmission and are not allocated further through the internal allocations from gross transmission, discussed in section 9.2.9 below.

9.2.9 Internal Allocations from Gross Transmission

Internal allocations from gross transmission are shown on lines 11 to 15 of Table 9-1 and on lines 8 to 11 of Appendix A, Schedule 3.4. These internal allocations are described below.

9.2.9.1 Generation Related Transmission Asset Allocation

By Letter No. L-92-07, the BCUC accepted that a fixed charge of $43.3 million was appropriate for Generation Related Transmission Asset costs, and that re-evaluations of Generation Related Transmission Asset costs were not required.

The $43.3 million internal allocation of Generation Related Transmission Asset costs from the transmission function to the generation function is shown on line 13 of Table 9-1 and on line 8 of Appendix A, Schedule 3.4.

9.2.9.2 Generation Real Time Dispatch

Generation real time dispatch activities performed by the T&D System Operations KBU include generation control, water conveyance, alarm monitoring, notification and reporting services, data services and Supervisory Control and Data Acquisition system services. These control centre activities support the operation of the generation and transmission systems. Manager interviews were conducted to derive the allocation of the total cost for this activity.

The overall determination of the Real Time Dispatch revenue requirement is required to establish the Scheduling and Dispatch rate for OATT Rate Schedule 03. These costs are assumed to be transmission costs for the purpose of determining the Scheduling and Dispatch rate. A portion is then allocated to generation, representing Generation Real Time Dispatch. The internal allocation of generation real time dispatch costs from the transmission function to generation is shown on line 14 of Table 9-1 and on line 9 of Appendix A, Schedule 3.4.

9.2.9.3 Distribution Real Time Dispatch

Distribution real time dispatch supports the operation of the distribution system, and includes activities performed by the control centre within the T&D System Operations KBU. This activity supports the operation of the distribution system from inside the substation fence, downstream of the high- side of the step down transformer, outside the substation fence, and also supports restoration of the distribution system outages. The cost for distribution real time dispatch includes costs for the restoration centre and an allocation of business support costs assigned to gross transmission and to the T&D System Operations KBU. Manager interviews were conducted to derive the allocation of the total cost for this activity.

Generation Real Time Dispatch costs are assumed to be transmission costs for the purpose of determining the Scheduling and Dispatch rate. A portion is then allocated to distribution, representing Distribution Real Time Dispatch. The internal allocation of distribution real time dispatch costs from the transmission function to distribution is shown on line 15 of Table 9-1 and on line 10 of Appendix A, Schedule 3.4.

9.2.9.4 Substation Distribution Asset Allocation

All substation assets, including distribution specific substation assets, are recorded as transmission property. Substations with both transmission and distribution functions include assets common to both functions, such as buildings and fences as well as heating, ventilation and air conditioning equipment.

The Substation Distribution Asset allocation is necessary to transfer the distribution-related portion of the substation costs, including an allocation of common assets, to the distribution function. To determine an appropriate share of gross transmission costs to allocate to Substation Distribution Assets, allocation factors are determined using asset analysis, maintenance, capital expenditures, manager interviews and direct assignment. The costs allocated to the Substation Distribution Asset functional activity include operating costs, capital related expenses, taxes and business support costs.

The internal allocation of Substation Distribution Asset costs from gross transmission to distribution is shown on line 16 of Table 9-1 and on line 11 of Appendix A, Schedule 3.4.

9.2.10 Miscellaneous Revenue

The miscellaneous revenue functionalized to transmission is shown on lines 17 to 22 of Table 9-1 and on line 7 of Appendix A, Schedule 3.4.

Miscellaneous revenue continues to be directly assigned to the transmission function, as shown on lines 4 to 9 of Appendix A, Schedule 15.0.

9.2.10.1 External OATT Revenue

External OATT revenue consists of revenue from external parties (i.e., parties other than BC Hydro and Powerex) for PTP Transmission Service and Ancillary Services such as Scheduling, System Control and Dispatch Service.

The forecast of total external OATT revenue is based on fiscal 2018 actual volumes, adjusted for known changes to long- term contracts. The forecast is summarized on lines 70 to 73 of Appendix A, Schedule 3.4, and reflected on line 4 of Appendix A, Schedule 15.0. External OATT revenue remains a component of the TRR and is not deducted from gross transmission costs in Table 9-1.

9.2.10.2 FortisBC General Wheeling Agreement

Wheeling is the transportation of electricity from one utility's service area to another's. Wheeling revenue is collected from FortisBC in accordance with the General Wheeling Agreement. The charges for the wheeling of electricity from the Point of Supply to the Creston, Okanagan and Princeton Points of Interconnection are set out in BC Hydro’s Rate Schedule 3817. In accordance with the General Wheeling Agreement, the forecast of wheeling revenue for the test period reflects annual rate increases equal to the forecast increases in the Consumer Price Index and expected increases in volumes, based on the nomination provided by FortisBC.

The forecast of wheeling revenue from FortisBC is shown on line 18 of Table 9-1 and on line 5 of Appendix A, Schedule 15.0.

9.2.10.3 Secondary Revenue

Secondary revenue is revenue received from external parties for the non-electric use of transmission assets, such as facility and digital communications site rentals.

The forecast of secondary revenue is shown on line 19 of Table 9-1 and on line 6 of Appendix A, Schedule 15.0.

9.2.10.4 Interconnection Revenue

Interconnection revenue consists of payments for engineering studies done by BC Hydro for generator and load interconnection customers connecting to the transmission system. Under the OATT, BC Hydro conducts engineering studies for customers requesting service, and the customers pay for the engineering studies.

The forecast of transmission interconnection revenue is shown on line 20 of Table 9-1 and on line 7 of Appendix A, Schedule 15.0.

9.2.10.5 Amortization of Contributions

Amortization of Contributions revenue relates to contributions from external parties toward the construction of capital assets.

The forecast of Amortization of Contributions revenue is shown on line 21 of Table 9-1 and on line 8 of Appendix A, Schedule 15.0. Details of the components of Amortization of Contributions are shown on Appendix A, Schedule 11, line 15 plus line 16, minus line 12.

9.2.10.6 Northwest Transmission Line Supplemental Charge

The costs to construct the Northwest Transmission Line are recovered from customers taking service on the line, in accordance with Electric Tariff Supplement No. 37. As the capitalized costs of the Northwest Transmission Line are a component of the gross transmission costs, they are offset by the amortized contributions from customers connected to the line.

The forecast Northwest Transmission Line Supplemental Charge revenue is shown on line 22 of Table 9-1 and on line 9 of Appendix A, Schedule 15.0.

9.3 OATT Rates are Set to Recover Transmission Revenue Requirements Consistent with Past Orders

The TRR is calculated by subtracting internal allocations and miscellaneous revenues (except external OATT revenue) from gross transmission and is recovered through BC Hydro's OATT rate schedules, for the following services:

1. Network Integration Transmission Service (**NITS**);
2. Point-To-Point (**PTP**)Transmission Service; and
3. Ancillary Services.

Approximately 1.5 per cent of the total TRR collected under the OATT is collected from customers external to BC Hydro and Powerex. As BC Hydro is the only NITS customer, the entire NITS rate, plus PTP and ancillary services used by BC Hydro, are ultimately recovered through BC Hydro's bundled service rates. Revenues from PTP services paid by Powerex reduce the revenue requirement to be recovered from the BC Hydro NITS service. Revenues from PTP and ancillary services used by external parties reduce the revenue requirement to be recovered through bundled service rates.

The calculation of the OATT rates is consistent with the design of the OATT rates previously approved by BCUC and the past practice of BC Hydro and BCTC.

9.3.1 Network Integration Transmission Service (NITS)

NITS is a flexible transmission service which allows the NITS customer to integrate, economically dispatch and regulate its designated generation resources to serve its designated loads, as well as deliver energy from non-designated generation resources on an as-available basis. This flexible use of the network to integrate resources and loads is different than PTP service, which is the reservation and transmission of capacity and energy on a firm or non-firm basis from point A to point B.

The NITS charge is designed to recover the TRR, less any revenues from PTP and Ancillary services, as illustrated in the following equation:

$$\text{Monthly NITS Charge} = \frac{\text{TRR} - (\text{PTP Revenue} + \text{Ancillary Services Revenue})}{12\ \text{months}}$$

The derivation of the monthly NITS charge is shown in Table 9-4 below.

Table 9-4 Calculation of Monthly NITS Charge

		Reference	F2017 RRA ($ million)	F2018 RRA ($ million)	F2019 RRA ($ million)	F2020 Plan ($ million)	F2021 Plan ($ million)
			1	2	3	4	5
1	**TRR**	Schedule 3.4 L28	**913.5**	**907.2**	**930.7**	**1,048.3**	**1,047.6**
2	**Less PTP and Ancillary Services Revenue:**						
3	PTP Revenue	Schedule 3.4 L69	(97.2)	(96.8)	(99.7)	(113.3)	(114.2)
4	Ancillary Service	Schedule 3.4 L35 to L38	(5.4)	(5.3)	(5.3)	(6.8)	(6.9)
5	**Total PTP and Ancillary Services Revenue**	L3+L4	**(102.6)**	**(102.1)**	**(105.0)**	**(120.0)**	**(121.1)**
6	**NITS Revenue Requirement**	Schedule 3.4 L32	**810.8**	**805.1**	**825.6**	**928.2**	**926.5**
7	**Monthly NITS Charge**	Schedule 3.4 L33	**67.6**	**67.1**	**68.8**	**77.4**	**77.2**

9.3.2 PTP Transmission Service

PTP service is the reservation and transmission of capacity and energy, on a firm or non-firm basis, from point A to point B, on the transmission system.

The PTP Service rate is designed to recover the cost of the TRR if PTP transmission service were used to transfer the maximum capacity supply on the system. In theory, if there were no NITS customer, the PTP charge would recover the TRR, less ancillary service revenue. Specifically, based on the approved rate design, the PTP Transmission Service rate is based on the following:

$$\text{PTP Rate} = \frac{\text{(TRR - Ancillary Services Revenue)}}{\text{(Maximum Capacity Supply)}}$$

The billing determinant for the long-term PTP Transmission Service rate is BC Hydro's Maximum Capacity Supply, which is BC Hydro's total dependable capacity including planned resources.

The derivation of the PTP Transmission Service rate is shown in Table 9-5 below.

Table 9-5 Calculation of the PTP Transmission Service Rate

		Reference	F2017 RRA ($ million)	F2018 RRA ($ million)	F2019 RRA ($ million)	F2020 Plan ($ million)	F2021 Plan ($ million)
			3	4	5	4	5

9.3.3 Ancillary Services

9.3.3.1 Scheduling, System Control and Dispatch

Scheduling, System Control and Dispatch services include:

- Pre-scheduling, Settlements and Billing - transactional processing through market operation and business systems to ensure accurate transmission schedules are confirmed for customers, followed by timely invoicing, accounting and performance reporting;
- Revenue Reporting and Forecasting - providing monthly and annual revenue reports for OATT services and provision of the historical information and forecasts for future years, as required for determination of revenue requirements and rate setting; and
- Real-Time Scheduling - managing the transmission reservations and energy schedules in real-time. Interchange Operators coordinate with Bonneville Power Administration and the Alberta Electric System Operator at least every hour to

match schedules and reach a net interchange schedule which is incorporated into the Automatic Generation Control system to maintain energy balance.

The Scheduling, System Control and Dispatch rate is a volume-driven rate, calculated as the total cost for Scheduling, System Control and Dispatch, divided by the total forecasted volumes for NITS, long-term PTP and short-term PTP services.

The derivation of the Scheduling, System Control and Dispatch rate is shown in Table 9-6 below.

Table 9-6 Calculation of Scheduling, System Control and Dispatch Rate

		Schedule Reference	F2017 RRA	F2018 RRA	F2019 RRA	F2020 Plan	F2021 Plan
			3	4	5	4	5
1	**PTP Volumes (MWh)**						
2	Long-Term PTP	Schedule 3.4 L51	9,355,680	9,355,680	9,355,680	9,881,280	9,881,280
3	Short Term PTP	Schedule 3.4 L60	10,052,378	10,480,466	10,908,554	9,939,991	10,324,607
4	**Total PTP Volumes**		19,408,058	19,836,146	20,264,234	19,821,271	20,205,887

6	**Total Volumes**	**Schedule 3.4 L47**	27,733,779	28,161,867	28,589,955	29,388,173	29,772,789
7	**Scheduling, Control and Dispatch Cost ($ million)**	Schedule 3.4 L46	2.9	2.8	2.9	3.9	4.0
8	**Scheduling Fee[341] ($/MWh)**	**(L8/L7) =Schedule 3.4 L48**	0.105	0.100	0.100	0.133	0.136

9.3.3.2 Other Ancillary Services

BC Hydro provides ancillary generation services for OATT customers. Other ancillary services include energy imbalance service, loss compensation service, spinning and supplemental operating reserve services, and reactive power service.

[341] Scheduling, System Control and Dispatch rate.

The revenue from these other external ancillary services is shown on line 36 of Appendix A, Schedule 3.4.

9.4 PTP Revenue Forecast

The long-term PTP revenue is derived from the forecast long-term PTP volumes and the proposed long-term PTP rates. The forecasts of long-term PTP volumes are based on committed long-term transmission contracts.

The short-term PTP (including non-firm PTP) revenue forecast reflects the discounting of short-term PTP rates on export and wheel-through transactions. The applicable rates are $3.00/MWh during High (Heavy) Load Hours and $1.00/MWh during Low (Light) Load Hours, Sundays and North American Electricity Reliability Corporation (NERC) holidays. The forecast of external short-term PTP volumes are based on fiscal 2018 actual volumes. The internal short- term PTP volumes are based on the Energy Studies model, which is discussed further in Chapter 4, section 4.4.

Table 9-7 summarizes the forecast PTP revenue and volumes.

Table 9-7 Summary of Forecast PTP Revenue and Volumes

		Schedule Reference	F2017 RRA	F2018 RRA	F2019 RRA	F2020 Plan	F2021 Plan
			1	2	3	4	5
1	**PTP Revenue ($ million)**						
2	Long Term PTP	Schedule 3.4 L54	74.8	73.3	75.3	88.4	88.4
3	Short-Term PTP	Schedule 3.4 L63	22.5	23.4	24.4	24.8	25.8
4	**Total PTP Revenue**	**Schedule 3.4 L69**	97.3	96.7	99.7	113.3	114.2
5	**PTP Volumes (MWh)**						
6	Long-Term PTP	Schedule 3.4 L51	9,355,680	9,355,680	9,355,680	9,881,280	9,881,280
7	Short Term PTP	Schedule 3.4 L60	10,052,378	10,480,466	10,908,554	9,939,991	10,324,607
8	**Total PTP Volumes**		19,408,058	19,836,146	20,264,234	19,821,271	20,205,887
9	**PTP Average Price ($/MWh)**						
10	Long Term PTP	Schedule 3.4 L57	7.99	7.84	8.05	8.95	8.95
11	Short Term PTP	Schedule 3.4 L66	2.24	2.24	2.24	2.50	2.50

9.5 Proposed OATT Rates

Table 9-8 summarizes the proposed OATT rates. Overall, there is an 11.1 per cent increase in the long-term PTP rate between fiscal 2019 RRA and fiscal 2020 plan. This is due to the increase in allocated costs to the TRR, as discussed above. As the billing determinant in line 5 of Table 9-5 has increased by only 1.2 per cent over this same period, the increase to the TRR results in an increase in the undiscounted PTP service rates.

BC Hydro believes that the proposed OATT rates, which reflect the TRR and are derived through an established methodology, are just and reasonable and should be approved as sought.

Table 9-8 Proposed OATT Rates
Fiscal 2020 to Fiscal 2021

	Rate Schedule	Rate Class	Reference	F2020 Plan	F2021 Plan
				1	2
1	Attachment H	**NITS Revenue Requirement ($)**	Schedule 3.4 L32	928,236,000	926,484,000
2	RS 00	**NITS Monthly Rate ($)**	Schedule 3.4 L33	77,353,000	77,207,000
3	RS 01	**Long Term Firm Point-to-Point**			
4		Yearly - $/MW of Reserved Capacity per year	Schedule 3.4 L41	78,433	78,375
5		**Short Term Firm and Non-Firm Maximum Price for Delivery**			
6		Monthly - $/MW of Reserved Capacity per month	Schedule 3.4 L42	6,536.12	6,531.23

Fiscal 2020 to Fiscal 2021

Revenue Requirements Application

Chapter 10

Demand-Side Management

Table of Contents

List of Figures

List of Tables

10.1 Introduction

In this chapter, BC Hydro sets out the information and analysis in support of our proposed fiscal 2020 to fiscal 2021 demand-side measures expenditure schedule. We are requesting that the BCUC accept this schedule under section 44.2 of the *Utilities Commission Act*. The proposed expenditure schedule includes expenditures on demand-side measures that we anticipate making over the fiscal 2020 to fiscal 2021 test period. This includes expenditures on the thermo-mechanical pulp program.[342]

In addition to the proposed demand-side measures expenditure schedule, BC Hydro anticipates expenditures on low-carbon electrification undertakings over the same period.[343] BC Hydro requests that these expenditures be deferred to the Demand Side Management (**DSM**) Regulatory Account, consistent with the Direction to the BCUC Respecting Undertaking Costs (B.C. Reg. 77/2017). The expenditures for low-carbon electrification undertakings are presented together with expenditures for demand-side measures as all of these expenditures will help customers manage their energy use and are considered part of BC Hydro's overall demand-side management.

Our proposed demand-side measures expenditure schedule responds to the BCUC's Decision on our Previous Application by increasing expenditures for the residential sector by approximately 50 per cent and providing a new program for customers in Non-Integrated Areas, while staying within a similar overall portfolio spending envelope. It also continues our moderation approach, providing broad customer access to conservation and energy management opportunities and

[342] Expenditures for the Thermo-Mechanical Pulp program are shown separately, since the costs of this program are covered by the Direction to the British Columbia Utilities Commission Respecting the Authority's TMP Program (B.C. Reg. 139/2015). A copy of this direction is provided in Appendix D.

[343] Expenditures for low-carbon electrification undertakings are shown separately, since these costs are covered by the Direction to the British Columbia Utilities Commission Respecting Undertaking Costs (OIC 100/2017) and the Greenhouse Gas Reduction Regulation (B.C. Reg. 102/2012) as amended by OIC 101/2017. In this application, BC Hydro is requesting confirmation of the deferral treatment of low-carbon electrification expenditures. Copies of the low-carbon electrification directions are provided in Appendix D.

managing the overall level of expenditures to limit forecast rate increases while BC Hydro is in an energy surplus.

The expenditures associated with demand-side measures as well as expenditures for low-carbon electrification are shown in Table 10-1 below.

Table 10-1 Fiscal 2020 to Fiscal 2021 Demand-Side Measures Expenditure Schedule and Low-Carbon Electrification Expenditures

	Expenditure ($ million)
Fiscal 2020 Demand-Side Measures	90.8
Fiscal 2021 Demand-Side Measures	89.1
Thermo-Mechanical Pulp (Fiscal 2020-Fiscal 2021)	27.2[344]
Two-Year Total (for section 44.2 acceptance)	**207.1**
Low-Carbon Electrification (Fiscal 2020-Fiscal 2021)	28.0
Two-Year Total (including Low-Carbon Electrification)	**235.1**

The Fiscal 2020 to Fiscal 2022 Demand Side Management Business Plan,[345] provided as Appendix X, provides details on the demand-side measures initiatives and expenditures, including the thermo-mechanical pulp program. Details on our low-carbon electrification undertakings are provided in Appendix Y.

The remainder of this Chapter is organized around the following key points:

- Section 10.2 reviews the outcomes of the fiscal 2017 to fiscal 2019 traditional DSM initiatives and low-carbon electrification undertakings and BC Hydro's response to directives from the Previous Application.
- Section 10.3 explains that BC Hydro is complying with the regulatory and legislative framework applicable to BC Hydro's traditional DSM and low-carbon electrification expenditures.

[344] All expenditures related to Thermo-Mechanical Pulp are forecasted to occur in fiscal 2021.

[345] BC Hydro's DSM business plans are developed on an annual basis, covering a rolling three-year period. This provides continuity for the planning and implementation of DSM activities. The DSM expenditure request supported in this chapter covers the first two years of the Fiscal 2020 to Fiscal 2022 Demand-Side Management Business Plan, aligning with the test period of this Revenue Requirements Application.

- Section 10.4 presents BC Hydro's approach for determining the level of expenditures during the test period.
- Section 10.5 presents an overview of BC Hydro's expenditures over the test period, the anticipated energy and capacity impacts as well as the cost-effectiveness and other benefits of the plan. This section also sets outs BC Hydro's request to revise the approach to allocating portfolio-level costs to programs, provides evidence on the persistence of DSM savings and describes how BC Hydro has re-categorized its energy management activities into a new program called Energy Management Activities within each sector.
- Section 10.6 demonstrates that BC Hydro manages the performance of the plan in a comprehensive manner, including tracking a number of performance metrics and regular management oversight and reporting.

10.1.1 Overview of DSM

Figure 10-1 below shows the various components of BC Hydro's demand-side management. As a concept, DSM can refer to any of these components. In this application, BC Hydro has defined DSM as including each of the components shown below.

Figure 10-1 Demand Side Management Components

Historically, industry efforts have focused on energy efficiency and conservation as well as capacity-focused initiatives, which BC Hydro refers to as “traditional DSM.” These traditional DSM programs are a low cost resource that help to lower utility costs for customers, and support multiple *Clean Energy Act* energy objectives. In addition to being an energy resource, BC Hydro’s DSM initiatives engage customers, help them save money on their bills and enhance BC Hydro’s relationships with customers and stakeholders. DSM also improves the competitiveness of commercial and industrial customers by reducing their operating costs and helps to create jobs and other economic benefits. In addition, BC Hydro’s capacity-focussed DSM initiatives identify opportunities to learn how to reduce capacity constraints on the grid. The adequacy and cost-effectiveness of traditional DSM is subject to the Demand-Side Measures Regulation. A copy of this regulation is provided in Appendix D.

As of fiscal 2018, BC Hydro’s DSM initiatives also include low-carbon electrification undertakings aimed at reducing greenhouse gas (**GHG**) emissions by encouraging consumers to switch from higher carbon sources of energy to electricity. These initiatives are included to provide a complete picture of BC Hydro’s DSM initiatives.

All of our DSM initiatives help customers manage their electricity consumption. Where appropriate, low-carbon electrification undertakings are administered with our existing DSM programs to achieve efficiencies and make it easy for customers. The regulatory treatment and cost-effectiveness metrics for low-carbon electrification are set out under the Greenhouse Gas Reduction Regulation. A copy of this regulation is provided in Appendix D. Low-carbon electrification undertakings are described further in section 10.4.3 and in Appendix Y.

10.1.2 Overview of our DSM Plan

Consistent with BC Hydro's approach in the Previous Application, the DSM Plan continues the moderation approach for traditional DSM as discussed in section 10.4.1. The moderation approach is designed to be a cost-effective strategy given BC Hydro's current energy surplus. The average portfolio utility cost of the DSM Plan is less than the market price of export electricity. This means that the DSM Plan provides a net benefit for customers by reducing our overall revenue requirements.

While the funding envelope and programs for traditional DSM remain similar to the DSM Plan presented in the Previous Application, BC Hydro has made modifications to its DSM programs in response to BCUC directives, the Government of B.C.'s priorities around affordability and changes in the Demand-Side Measures Regulation. These program changes have resulted in increased expenditures for the residential sector, while staying within the overall portfolio spending envelope.

Specifically, BC Hydro has taken steps to increase participation in our Low Income program, expanded the Home Renovation Rebate program, and launched a new Non-Integrated Areas program through a re-allocation of expenditures from the commercial and industrial sectors. In addition, to be consistent with a recent change in the Demand-Side Measures Regulation, we have also re-categorized our energy management activities into a new program called Energy Management Activities for each sector.[346] We have also reviewed industry practice on codes and standards attribution and made some changes to improve the presentation of codes and standards savings in our DSM Plan. These program and initiative modifications are discussed further in section 10.4.4.

Capacity-focussed pilots and trials will also continue over the next two years. This is described further in section 10.4.2.

10.2 Fiscal 2017 to Fiscal 2019 DSM Results and Response to BCUC Directives

Over the past three years, we have continued the implementation of traditional DSM initiatives, including exploration of capacity-focussed initiatives, while starting to advance low-carbon electrification undertakings. We have achieved our traditional DSM targets for those years, and have addressed the BCUC's directives from our Previous Application. BC Hydro's expenditures on low carbon electrification undertakings were consistent with the requirements set out under the Greenhouse Gas Reduction (Clean Energy) Regulation (B.C. Reg. 102/2012).

10.2.1 Results and Achievements from Fiscal 2017 to Fiscal 2019

Table 10-2 and Table 10-3 below provide the savings and electrification results and associated expenditures compared to plan values for fiscal 2017 to fiscal 2019. In Table 10-2, the Plan Values represent the planned amounts described in BC Hydro's Previous Application, and accepted by the BCUC. Actual results represent the results that were actually achieved. Energy savings and new incremental capacity have been achieved through a combination of codes and standards,[347] rate structures, and programs.

[346] In March 2017, the B.C. Government revised the Demand-Side Measures Regulation to add an Energy Management Program category. To align with this change, BC Hydro has re-categorized relevant activities and expenditures into this new category. This re-categorizing did not result in any expenditure changes for those activities or any changes to the overall Plan budget.

[347] Cost-effectiveness metrics within this application will exclude the impact of codes and standards savings. See section 10.2.3 for further discussion.

Table 10-2 Traditional DSM Incremental Savings and Expenditures[348]

	New Incremental Energy Savings (GWh/year)		New Incremental Associated Capacity Savings (MW)		Expenditures ($ million)	
	Plan Values	**Actual**	**Plan Values**	**Actual**	**Plan Values**	**Actual**
F2017	701	772	131	132	113.7	97.4
F2018	621	719	111	127	119.5	82.3
F2019	736	TBD	123	TBD	127.9	TBD

Table 10-3 Low-Carbon Electrification Incremental Load and Expenditures

	New Incremental Load (GWh/year)		New Incremental Associated Capacity Load (MW)		Expenditures ($ million)	
	Plan Values	**Actual**	**Plan Values**	**Actual**	**Plan Values**	**Actual**
F2017	n/a	n/a	n/a	n/a	n/a	n/a[349]
F2018	n/a	n/a	n/a	n/a	n/a	0.22
F2019	110	TBD	16	TBD	9.4	TBD

A full reporting of the historical energy impacts and expenditures is provided in Appendix Z for traditional DSM and Appendix BB for the low-carbon electrification undertakings.

10.2.2 BC Hydro Has Increased Residential Initiatives

In Directive 21 of its Decision on our Previous Application, the BCUC recommended that BC Hydro consider more targeted DSM programs directed at residential

[348] Values are new incremental savings in each year, rather than net savings. In previous applications, net savings (new incremental savings minus persistence drop-off) were presented. Using new incremental Plan and Actual savings values, better aligns with the new incremental expenditures being made each year. This approach is also consistent with BC Hydro's Service Plan goals.

[349] Approximately $0.2 million of the actual Fiscal 2017 DSM expenditures shown in Table 10-2 was spent on initial exploration of low carbon electrification initiatives, as noted in BCUC IR 2.323.2 of the Fiscal 2017 to Fiscal 2019 Revenue Requirements Application proceeding.

customers. This directive arose from a concern over "the relatively low level of DSM spending for residential customers (including low-income customers)".[350]

In response, BC Hydro has increased expenditures for the residential sector and non-integrated areas in the DSM Plan for fiscal 2020 and fiscal 2021, while staying within the overall portfolio spending envelope. Compared to the plan presented in the Previous Application, expenditures targeted at the residential sector have increased by approximately 50 per cent. As a result of these increased residential expenditures, the overall program spending allocated to the residential sector has improved. This is shown in Table 10-4 below.[351]

Table 10-4 DSM Program Spend by Sector

	Residential (including low income) (%)	Commercial and light industrial[352] (%)	Large Industrial (%)
BC Hydro percentage of DSM program spend by sector (excluding Thermo-Mechanical Pulp program)			
F2014 to F2016 Actual	17	51	32
F2017 to F2018 Actual and F2019 Forecast	19	57	24
F2020 to F2021 Forecast	30	38	32
BC Hydro Allocation of DSM costs for cost recovery purposes			
Allocation of DSM costs	40	35	25

Participation targets for the Low Income Program have also been increased, with revised criteria and new measures introduced to allow more homes to qualify. In addition, BC Hydro has pre-qualified community events for Energy Saving Kit

350 BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 81.

351 Capacity-focused pilots are excluded from the calculations.

352 DSM to the light industrial sector has been delivered through the Power Smart Partners – Distribution and the Leaders in Energy Management – Distribution offers. Accordingly, expenditures for those offers have been re-allocated to the Commercial and light industrial column. Likewise, for the fiscal 2020 to fiscal 2021 Forecast, distribution customer expenditures have been re-allocated from the Leaders in Energy Management – Industrial offer. These allocations are consistent with the allocations in BC Hydro's Fully Allocated Cost of Service (**FACOS**).

distribution. Lastly, outreach through BC Hydro's Crisis Fund has also included steps to increase awareness of the Low Income Program with potential participants.

The Home Renovation Rebate Program has been augmented with additional measures and increased incentives. In addition, a new program for customers living in non-integrated areas of BC Hydro's service territory has been launched. Further details on these residential programs can be found in section 5 of Appendix X.

10.2.3 BC Hydro Has Reviewed Industry Practice for Codes and Standards Attribution

In Directive 22 of its Decision on our Previous Application, the BCUC directed BC Hydro to review if its approach for attributing savings that occur from the implementation of codes and standards was consistent with industry practice. This directive arose from a concern that the cost-effectiveness results for codes and standards could be over-stated or that other program cost-effectiveness results could be understated.[353]

In response, BC Hydro commissioned an assessment of the industry practice for attributing savings that occur from the implementation of codes and standards. The resulting report by the Cadmus Group is attached as Appendix CC. The report concluded that industry practice regarding codes and standards attribution is varied and evolving and that the different approaches stem from different regulatory and business drivers facing utilities. Approaches include:

- Not quantifying, nor attributing, any savings from codes and standards;
- Quantifying savings from codes and standards to reflect their impact on load forecasts and revenue requirements, without determining the portion of those savings that should be 'attributed' to the utility;

[353] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), pages 81 to 82.

- Attributing a portion of the savings from codes and standards to utility efforts, with the common approach being to attribute those savings to a stand-alone utility "Codes and Standards" program.[354] This differs from the Demand Side Measures Regulation approach, which is to attribute a portion of the codes and standards benefits directly to an individual incentive program (i.e., new construction), impacting the program's cost-effectiveness but not the energy savings claimed by that program.

Based on the Cadmus Group report, BC Hydro has taken the following steps to improve the presentation of our treatment of codes and standards savings in this application:

- First, we have excluded codes and standards savings from benefit-cost calculations and levelized costs. This means that those results are not distorted at the portfolio level by the codes and standards savings; and
- Second, BC Hydro is not attributing codes and standards savings to individual programs. Instead, codes and standards savings are presented as a stand-alone bucket of energy and associated capacity savings, separate from programs. BC Hydro is not claiming these savings (or a portion of them) as a credit towards DSM cost effectiveness calculations. Rather, a forecast of codes and standards savings is provided and incorporated into BC Hydro's Load Forecast. As shown in the Cadmus report, this aligns with the approach taken in the two Canadian jurisdictions (Ontario and Manitoba).

While BC Hydro has specific activities that directly support the achievement of codes and standards savings, we have chosen not to quantify that contribution through a formal attribution claim at this time. The time and effort required to assess and defend an attribution claim is not necessary, since all of our traditional DSM

[354] Rather than quantify and defend an attribution amount, BC Hydro's approach has been to determine what level of attribution would be required to make our codes and standards expenditures cost-effective. A savings attribution of approximately 1 per cent would result in the utility expenditures being deemed cost-effective.

initiatives are already cost effective. However, BC Hydro does have extensive codes and standards support activities as outlined in section 9 of Appendix X. In addition, many of BC Hydro's DSM programs help to prime the marketplace for the introduction of codes and standards.

10.2.4 BC Hydro Has Increased Activities in Non-Integrated Areas

In Directive 23 of its Decision on our Previous Application, the BCUC directed BC Hydro to include a line item in our Annual Report on DSM Activities to reflect the non-integrated areas activities that are tracked separately.[355] This directive was implemented starting with the F2018 Annual Report. This report is provided in Appendix Z.

Directive 23 also directed BC Hydro to include the following in its next DSM application:

- An update of how BC Hydro has addressed the DSM concerns raised above by Non-Integrated Areas Ratepayers Group (**NIARG**) and Zone II Ratepayers Group (**Zone II**) regarding the non-integrated areas; and
- An estimate of the difference in cost-effectiveness test results of programs available to customers in the non-integrated areas compared to the integrated areas.[356]

During the Previous Application proceeding, NIARG and Zone II submitted that BC Hydro should address opportunities in the non-integrated areas given the unique geographic and market barriers to participation and so that those communities benefit from DSM expenditures.

In response, BC Hydro has recently launched a new Non-Integrated Areas program to increase support for these remote and predominantly Indigenous communities.

[355] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), pages 82 to 84.

[356] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), pages 82 to 84.

This program is described in section 5.5 of Appendix X. The design and development of this program was informed by pilot work activities that were undertaken from fiscal 2017 to fiscal 2019. In addition, BC Hydro committed to further engagement with NIARG and Zone II and indigenous communities in general. BC Hydro engaged both NIARG and Zone II through its Low Income Advisory Council[357] and continues to work with indigenous communities on the specific issues and barriers they face with respect to conservation and energy management.

An estimate of the difference in cost-effectiveness test results of programs available to customers in the non-integrated areas compared to the integrated areas is provided in Table 10-5 below. The DSM cost-effectiveness tests and how to interpret results are described in section 10.5.3. While the net levelized cost of the Non-Integrated Areas program is higher than the integrated system programs, there is a higher avoided cost of energy for the Non-Integrated Areas due to on the cost of diesel generation. Both the Non-Integrated Areas program and the integrated systems programs have positive benefit-cost ratios.

Table 10-5 Cost Effectiveness Comparison of Non-Integrated Areas and Integrated System Programs

	Net Levelized Cost (non-integrated areas) ($/MWh)	Benefit-Cost Ratio (non-integrated areas)	Net Levelized Cost (integrated system programs ($/MWh)	Benefit-Cost Ratio (integrated system programs)
Utility Cost	175	1.8	11	1.7
Total Resource Cost	117	2.2	-11	3.6

[357] Consultation through this group was encouraged by the BCUC in their Decision on BC Hydro's Fiscal 2017 to Fiscal 2019 Revenue Requirements Application.

10.3 DSM Aligned with Legal and Regulatory Frameworks

This section describes the relevant legal and regulatory framework for traditional DSM and low-carbon electrification undertakings. It also identifies how BC Hydro's DSM initiatives are aligned with these requirements.

10.3.1 BC Hydro's Traditional DSM Complies with the Framework under Section 44.2 of the Utilities Commission Act

BC Hydro is requesting that the BCUC accept our proposed fiscal 2020 to fiscal 2021 demand-side measures expenditure schedule under section 44.2 of the *Utilities Commission Act*.

Under section 44.2 of the *Utilities Commission Act*, the BCUC must accept an expenditure schedule if it considers that making the expenditures would be in the public interest. Otherwise, the BCUC must reject the schedule. Alternatively, the BCUC may accept or reject a part of the expenditure schedule. However, section 44.2 does not provide the Commission with the authority to direct BC Hydro to file a DSM expenditure schedule, make additions to a DSM expenditure schedule, or change the design of a particular DSM program.

Section 44.2 sets out the factors that the BCUC must consider when deciding whether to accept a demand-side measures expenditure schedule filed by a public utility. Specifically, the BCUC must consider:

- The interests of persons in British Columbia who receive or may receive service from BC Hydro;
- British Columbia's energy objectives as set out in section 2 of the *Clean Energy Act*;
- An applicable Integrated Resource Plan approved under section 4 of the *Clean Energy Act*; and

- The extent to which the demand-side measures are cost-effective within the meaning prescribed by the Demand-Side Measures Regulation.[358]

BC Hydro's traditional DSM supports each of these factors as discussed below.

10.3.1.1 Traditional DSM Is in the Interest of Persons who Receive or May Receive Service

This Application demonstrates that our proposed traditional DSM expenditures are in the interests of persons in B.C. who receive or may receive service from BC Hydro. For instance, BC Hydro's proposed expenditures reflect a broad and cost effective range of demand-side management initiatives that provide significant energy savings and capacity benefits and provide customers with the opportunity to save electricity and lower their bills, while reducing BC Hydro's revenue requirements.

10.3.1.2 Traditional DSM Supports Energy Objectives

A summary of how BC Hydro's proposed DSM Plan supports the applicable energy objectives in the *Clean Energy Act* is provided in Table 10-6 below:

Table 10-6 DSM Plan Alignment with BC Energy Objectives

Energy Objective	DSM Plan
To achieve electricity self-sufficiency	The DSM Plan's forecast energy and capacity savings will contribute to BC Hydro maintaining electricity self-sufficiency in 2020 and in each year thereafter.
… reducing its expected increase in demand for electricity by the year 2020 by at least 66 per cent	The DSM Plan is forecast to reduce BC Hydro's increase in electricity demand by the end of fiscal 2021 by approximately 103 per cent.
To use and foster the development of innovative technologies that support energy conservation	Both DSM programs and the Codes and Standards initiatives will use and foster the development of innovative technologies supporting energy conservation. Refer to Appendix X for more detail.

[358] B.C. Reg. 326/2008 (Ministerial Order M271), B.C. Reg. 228/2011 (Ministerial Oder M335), B.C. Reg. 141/2014 (Ministerial Order M233) and B.C. Reg. 117/2017 (Ministerial Order M138). A copy is provided in Appendix D.

Energy Objective	DSM Plan
To ensure that BC Hydro's rates remain among the most competitive	The moderation strategy outlined in section 10.4.1 reduces rates relative to the DSM investment level for fiscal 2020 to fiscal 2021 that was contemplated in the 2013 Integrated Resource Plan.
To reduce B.C. GHG emissions	Customers in some DSM programs are forecasted to reduce their natural gas usage along with their electricity usage. The new Non Integrated Areas Program is also expected to reduce GHG emissions by reducing diesel generation. Reductions of 5,000 tonnes of CO2e/year are forecasted to result from traditional DSM.
To encourage communities to reduce GHG emissions and use energy efficiently	BC Hydro's Codes and Standards initiatives provide support to communities (including Indigenous communities) to incorporate electricity efficiency into community energy planning and implement energy efficiency policies and projects.
To encourage economic development and the creation and retention of jobs	BC Hydro's current DSM efforts create significant economic activity and jobs within the province, estimated at 11,600 person-years of employment over the next 10 years.

10.3.1.3 Traditional DSM Continues Moderation Approach Consistent with the 2013 Integrated Resource Plan

The selected level of DSM expenditures continues a moderation approach that was recommended in the 2013 Integrated Resource Plan (**IRP**) for fiscal 2014 to fiscal 2016. This moderation strategy was subsequently continued for fiscal 2017 to fiscal 2019 in response to an extended energy surplus and to limiting forecast rate increases. The BCUC found that the moderation approach was a balanced response to these circumstances and accepted BC Hydro's proposed expenditure schedule.[359] In this application, BC Hydro has continued the moderation approach given the ongoing energy surplus and to limit forecast rate increases. The proposed expenditure schedule continues to provide customers with broad opportunities to save electricity and reduce their bills. It also continues to meet the target set out in the *Clean Energy Act* and supports government priorities. Lastly, it maintains the

[359] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 78.

ability to ramp up DSM activities in the future in response to the next IRP or the Government of B.C.'s CleanBC Plan.

10.3.1.4 Traditional DSM Meets Adequacy Requirements Under the Demand-Side Measures Regulations

As discussed in Chapter 2, section 2.2.2, Government intends to propose amendments to the *Hydro and Power Authority Act* and the *Clean Energy Act* so that section 44.1 of the *Utilities Commission Act* applies to BC Hydro.

The proposed application of section 44.1 of the *Utilities Commission Act* to BC Hydro would require BC Hydro's demand-side measures to meet the adequacy requirements set out in the Demand-Side Measures Regulation under the *Utilities Commission Act*. These adequacy requirements set out the measures that a demand-side management portfolio must include in order to be considered adequate. While BC Hydro is not currently required to meet these adequacy requirements, our demand-side management plans have been consistent with them. Table 10-7 below shows how BC Hydro's traditional DSM aligns with the adequacy requirements set out in the Demand Side Measures Regulation.

Table 10-7 Traditional DSM Alignment with Adequacy Requirements in the Demand-Side Measures Regulation

Adequacy Requirements	DSM Plan
Demand-side measure for low income households	BC Hydro's Low Income Program assists residents of low income households, low-income housing providers, and Indigenous communities with reducing their energy consumption. Annual funding has been increased compared to the fiscal 2017 to fiscal 2019 period. A further description of this offer is provided on page 30 of Appendix X.
Demand-side measure for rental accommodations	BC Hydro offers a combination of programs that are available to rental accommodations. Renters with BC Hydro accounts participate in our Team Power Smart offer which helps to develop energy efficient behaviours. Renters also represent a significant portion of the participants in our Low Income program. Over the past two years, approximately 35 per cent of Energy Savings Kit participants have been renters and approximately 75 per cent of Energy Conservation Assistance Program participants have been renters. Renters also participate in our Retail program, purchasing products such as appliances and lighting technologies. These initiatives are contained within our residential sector initiatives, described on page 29 of Appendix X.
An education program for schools	Our Public Awareness Supporting Initiative provides school education programs across the province to engage teachers and students. This initiative is described on page 80 of Appendix X.
An education program for post-secondary institutions	BC Hydro partners with post-secondary institutions and industry associations who develop and deliver new training and education programs. This partnership is delivered through our Commercial Energy Management activities, described on page 54 of Appendix X.
Financial or other resources provided to support development of or compliance with standards	BC Hydro supports the development of and compliance with standards through its Codes and Standards initiatives, described on page 74 of Appendix X. The Demand-Side Measures Regulation requires expenditures in this area to be either an average of 1 per cent of a public utility's plan portfolio's expenditures per year or an average of $2 million per year. BC Hydro's DSM Plan meets this requirement. Annual expenditures of $5.2 million are planned to support governments, standards-making bodies, and regulatory bodies in the development and compliance of codes and standards.
Demand-side measures to support adoption of step codes by local government and first nations	BC Hydro supports the adoption of step codes through its Codes and Standards initiatives, described on page 74 of Appendix X.

10.3.1.5 Traditional DSM Is Cost-Effective Under the Demand-Side Measures Regulation

BC Hydro's expenditures for traditional DSM are cost-effective under the Utility Cost Test and the Total Resource Cost Test as prescribed by section 4 of the Demand-Side Measures Regulation. Refer to section 10.5.3 for more information.

10.3.2 Recovery of BC Hydro's Thermo-Mechanical Pulp Expenditures Is Required by Direction

BC Hydro's Thermo-Mechanical Pulp Program provides funding to increase the electrical efficiency of mills that use thermo-mechanical pulping processes. Expenditures for this program are made under the Direction to the BCUC Respecting the Authority's TMP Program.[360] This direction requires the BCUC to allow BC Hydro to recover up to $100 million in costs incurred to carry out the program. Further, the Direction requires the BCUC to allow BC Hydro to defer these costs to the Demand Side Management Regulatory Account. Due to this direction, our demand-side measures expenditure schedule lists Thermo-Mechanical Pulp Program expenditures separately.

10.3.3 Regulatory Framework for Low-Carbon Electrification

Section 18 of the *Clean Energy Act* requires the BCUC to allow BC Hydro to collect sufficient revenue to recover costs incurred for prescribed undertakings. Section 4 of the Greenhouse Gas Reduction Regulation (B.C. Reg. 102/2012) (**GGRR**), issued under the *Clean Energy Act*, defines a number of classes of electrification prescribed undertakings.

This section refers to BC Hydro's undertakings that fall within one or more classes defined in sections 4(3)(a), 4(3)(b), 4(3)(c), and 4(3)(d) of the GGRR, which are further described in Appendix Y. Undertakings are in a class of undertakings defined in subsections 4(3)(a) to 4(3)(b) of the GGRR if they satisfy a cost-effectiveness test defined in subsection 4(1) of the GGRR.

[360] A copy of the Direction to the BCUC respecting the Authority's TMP Program is included in Appendix D.

A Direction to the BCUC Respecting Undertaking Costs, issued under section 3 of the *Utilities Commission Act* (B.C. Reg. 77/2017), requires the BCUC to allow BC Hydro to defer the costs incurred for prescribed undertakings to the DSM Regulatory Account. In this application, BC Hydro is requesting BCUC approval to defer low carbon electrification expenditures to the DSM Regulatory Account.

BC Hydro's low-carbon electrification undertakings also support the B.C. Energy Objectives as outlined in Table 10-8.

Table 10-8 Low-Carbon Electrification Plan Alignment with BC Energy Objectives

Energy Objective	Low-Carbon Electrification Plan
To ensure that BC Hydro's rates remain among the most competitive	The incremental revenue from low-carbon electrification undertakings reduces forecast rate increases.
To reduce B.C. GHG emissions	BC Hydro's planned low-carbon electrification undertakings are forecast to result in natural gas and other fossil fuel savings. These savings will reduce B.C. GHG emissions by approximately 350,000 tonnes of CO^2e/year.
To encourage the switching from one kind of energy source or use to another that decreases GHG emissions in B.C.	BC Hydro's planned low-carbon electrification undertakings are focused on reducing GHG emissions.
To encourage economic development and the creation and retention of jobs	BC Hydro's planned low-carbon electrification undertakings create economic activity and jobs within the province.

10.4 Overall Level of Fiscal 2020 to Fiscal 2021 DSM Expenditures Reflects a Reasonable and Balanced Approach

This section sets out how BC Hydro determined a reasonable and balanced level of forecast fiscal 2020 and fiscal 2021 expenditures for traditional DSM and low-carbon electrification.

10.4.1 Moderation Approach Remains Appropriate

BC Hydro has maintained its moderation approach to energy efficiency and conservation as outlined in the Previous Application. In its Decision, the BCUC determined that this moderation approach provided "a balanced response to a reduction in the load forecast and the need to meet certain targets under the 2013 10 Year Rates Plan." [361]

The reasons for the moderation approach that were described in the Previous Application continue to exist. BC Hydro remains in an energy surplus position and we continue to manage upward pressure on rates to limit forecast rate increases.

The moderation approach means that the DSM Plan maintains the overall funding envelope for DSM. However, changes have been made within this funding envelope. For example, to increase expenditures in the residential sector in response to recommendations from the BCUC, BC Hydro reduced expenditures in other sectors. The proposed expenditure schedule provides customers with broad opportunities to save electricity and reduce their bills. It also continues to meet the target set out in the *Clean Energy Act* and supports government priorities. Lastly, it maintains the ability to ramp up DSM activities in the future in response to the next IRP or the Government of B.C.'s CleanBC Plan.

To develop the DSM Plan for fiscal 2020 and fiscal 2021, consistent with this moderation strategy, BC Hydro used the forecast market price for electricity exports ($30/MWh) as a screening filter for the utility cost of non-specified DSM programs. Specified programs required by the Demand-Side Measures Regulation were not subject to this requirement. This market priced screening filter was also used to develop the proposed DSM expenditure schedule in the Previous Application. In its Decision, the BCUC found that "given the energy surplus situation, the use of a market priced screening filter to identify cost-effective DSM is reasonable."[362]

The use of a market priced screening filter means that all non-specified programs within the DSM Plan contribute to a reduction in BC Hydro's overall revenue

[361] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 78.

[362] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 78.

requirements while BC Hydro is in an energy surplus. This is because the energy savings from the DSM program are less than the price BC Hydro could receive on the market for any resulting surplus energy.

Maintaining the moderation strategy also allows future decisions on the level of demand side management to be informed by BC Hydro's next IRP and the Government's CleanBC Plan. As explained in Chapter 2, section 2.2.2, BC Hydro's next IRP will be submitted to the BCUC by February 28, 2021.

BC Hydro's next IRP will consider a recently completed Conservation Potential Review. BC Hydro worked with FortisBC Energy Inc., FortisBC Inc., Pacific Northern Gas and Navigant Consulting Ltd. to perform the review. The review estimated the technical and economic conservation potential for both electricity and natural gas in B.C., over the next 20 years, in each utility's service territory. In addition, it provided a model that allows BC Hydro to develop market potential estimates. Once developed, these market potential results will be used to support future, long-term planning work such as the creation of DSM options for the next IRP.

10.4.2 BC Hydro Has Extended the Funding Period for Capacity-Focused Initiatives

The DSM Plan continues to include capacity-focused pilots and trial offers that were identified in the Previous Application. These pilots and trial offers are focused on shifting the timing of peak demand in areas where BC Hydro faces capacity constraints. In the Previous Application, BC Hydro proposed a total budget of $38.6 million for these initiatives from fiscal 2017 to fiscal 2019. This DSM Plan extends that budget to fiscal 2021 but reduces the overall total by 12 per cent to $34 million. Table 10-9 below shows the annual breakout of the current expenditure plan, compared to the Fiscal 2017 to Fiscal 2019 Plan.

Table 10-9 Capacity-Focused Expenditures

	Original Expenditures from F2017 to F2019 Revenue Requirements Application ($ million)	Revised Expenditures ($million)
F2017	10.0 (plan)	8.4 (actual)
F2018	14.2 (plan)	6.9 (actual)
F2019	14.4 (plan)	7.4 (plan)
F2020	0.0	6.9 (plan)
F2021	0.0	4.3 (plan)
Total	**38.6**	**33.9**

BC Hydro decided to extend the time period to assess capacity-focused pilots and trial offers due to the complexity of assessing the impacts and value of capacity-focused DSM to BC Hydro's system. This also provides more time to incorporate past learnings into new activities, consider changing technologies and accommodate the long lead times required for some customer projects.

Within this proposed budget, BC Hydro will continue to conduct demand response trials in the residential, commercial and industrial sectors. BC Hydro plans to test different solutions in a number of constrained substation areas. The objective of these tests will be to determine whether the combination of demand response activities and targeted energy efficiency offers can shift the timing of peak demand in a constrained local area.

10.4.3 BC Hydro Builds on EfficiencyBC Program Funding for Low-Carbon Electrification Undertakings

Since the Previous Application, there have been a number of developments on low-carbon electrification.

Beginning in fiscal 2018, BC Hydro moved forward with several initial Low-Carbon Electrification DSM Programs/Projects (collectively referred to as "Initial LCE Projects") to assess and support immediate low carbon electrification opportunities among our customers. These Initial LCE Projects also:

- Helped us gain a greater understanding of the technology, market, and barriers that customers and BC Hydro would face when developing low carbon electrification options; and
- Provided BC Hydro with the ability to act early and capture time-sensitive opportunities that could help inform the development of a broader low carbon electrification plan.

Further details are provided in Appendix Y, including information on where BC Hydro expects to incur expenditures in fiscal 2019 and beyond.

In fiscal 2019, Government launched the EfficiencyBC program to reduce greenhouse gas emissions in the province. This $24 million, government funded program provides financial incentives to help households and businesses save energy and reduce greenhouse gas emissions by switching to high-efficiency heating equipment and making building-envelope improvements. BC Hydro is delivering the fuel switching component of the EfficiencyBC program on Government of B.C.'s behalf, within our service territory. This component helps customers switch from fossil fuels to electricity. The expenditures associated with implementing the EfficiencyBC program are borne by the Government of B.C. and not by ratepayers.

Coinciding with the delivery of the fuel switching component of the EfficiencyBC program and further to the Initial LCE Projects, BC Hydro has developed a new BC Hydro funded low carbon electrification program (referred to as "BC Hydro LCE Program"), which has been coordinated to align, and not overlap with, government funded greenhouse gas emissions reduction programs. Specifically, the program has been developed to reach customers not addressed by EfficiencyBC or by Government funded transportation programs. The BC Hydro LCE Program is described further in Appendix Y.

Should Government bring forward additional programs in the future that would overlap with activities planned or underway with funding from BC Hydro, we can make adjustments to our plans so that any overlap is needed and by design.

BC Hydro expects to develop a future plan for low carbon electrification that is informed by the learning gained through Initial LCE Projects and the BC Hydro LCE Program as well as Government of B.C.'s CleanBC Plan.

10.4.4 Modifications to the Fiscal 2017 to Fiscal 2019 DSM Plan

As described in Appendix X, BC Hydro has made a number of changes to the DSM Plan in response to BCUC direction, to support Government priorities related to residential affordability and to respond to changes to the Demand-Side Measures Regulation. These changes were made by re-allocating expenditures within the overall traditional DSM funding envelope.

These changes include:

- Launching a new Non-Integrated Areas program;
- Taking steps to increase participation for the Low-Income program;
- Increasing Home Renovation Rebate offers, including expanding heat pump measures to benefit customers in regions without access to natural gas;
- Launching a new Social Housing initiative for qualified social housing providers;
- Reducing commercial and industrial program budgets;
- Re-categorizing energy management activities into a new program called Energy Management Activities within each sector, to align with the Demand-Side Measures Regulation;[363] and
- Improving the presentation of codes and standards savings to make it more understandable.

[363] The expenditure shifts resulting from this re-categorizing are reconciled in section 10.5.7.

Please refer to section 2.3 of Appendix X for a discussion of the program changes, and section 10.2.3 for a discussion of codes and standards.

10.5 Fiscal 2020 to Fiscal 2021 Planned Expenditures, Energy and Capacity Impacts, Cost-Effectiveness and Other Benefits

This section describes the forecast expenditures and energy and capacity impacts, as well as the cost-effectiveness and other benefits of BC Hydro's DSM initiatives. This section also sets out BC Hydro's request to revise the previously directed approach to allocating portfolio-level costs to programs, provides evidence on the persistence of DSM savings in support of the current 15-year amortization period for DSM expenditures in rates, and describes how BC Hydro has re-categorized its energy management activities into a new program called Energy Management Activities within each sector.

10.5.1 Forecast Expenditures and Energy and Capacity Impacts

The tables below provide the expenditures as well as the energy and capacity impacts of various programs. Table 10-10 provides a detailed breakdown of planned expenditures. Table 10-11 provides a detailed breakdown of the energy impacts. Table 10-12 provides a detailed breakdown of the capacity impacts.

Table 10-10 Fiscal 2020 to Fiscal 2021 Expenditure Summary ($ million)

	F2020 Plan	F2021 Plan	Total
Rate Structures	0.5	0.5	1.0
Programs

Total New Incremental Associated Capacity Savings	128	147
New Incremental Associated Capacity Growth (MW)		
Low-Carbon Electrification	33	16

10.5.2 Other Benefits

In addition to energy and capacity impacts, additional benefits will also be achieved. These benefits include a reduction in BC Hydro's overall revenue requirements, economic development and environmental benefits as well as customer benefits. These benefits are outlined in section 3.3 of Appendix X and summarized below. The values provided are for a ten-year period (fiscal 2020 to fiscal 2029):

- GDP impacts of $1.1 billion;
- Employment of 11,600 person-years;
- Provincial revenue of $115 million; and
- Non-energy customer benefits such as reduced waste generation or product losses, reduced maintenance costs, and extended equipment life.

In addition, BC Hydro's traditional DSM programs are forecast to reduce the province's GHG emissions as customers reduce their natural gas usage along with their electricity usage. The new Non-Integrated Areas Program is also expected to reduce GHG emissions by reducing diesel generation. Overall, at the end of fiscal 2021, savings of 5,000 tonnes of CO^2e/year are forecast from traditional DSM. In addition, the low-carbon electrification undertakings for fiscal 2020 to fiscal 2021 are anticipated to save approximately 350,000 tonnes of CO^2e/year by supporting fuel switching.

10.5.3 BC Hydro's Traditional DSM is Cost-Effective

The Utility Cost and Total Resource Cost tests are standard cost tests used in the DSM industry to assess cost effectiveness. The results of cost-effectiveness tests are typically expressed in a benefit-cost ratio. A ratio of greater than 1.0 means that benefits exceed costs and that the DSM program or portfolio is cost effective under that particular test.

The results of the cost-effectiveness tests can also be expressed as a levelized cost of energy (dollar per MWh of energy saved). In calculating the costs for this metric, any non-energy benefits, such as capacity benefits, are subtracted from the DSM implementation costs to get a net cost, which is then expressed on a per MWh basis. For levelized costs, a lower result is better. A negative net levelized cost indicates that non-energy benefits exceed the DSM costs. A larger negative value is better than a smaller negative value or any positive value. The resulting levelized cost can be compared to a value such as the market price of electricity, or to the levelized cost of energy for new supply-side resources.

The Utility Cost Test indicates the impact of a DSM initiative or portfolio on the utility's revenue requirements. The benefits included in the Utility Cost test reflect the value to the utility of the electricity saved through DSM initiatives. The costs in the Utility Cost Test represent the cost to BC Hydro of implementing DSM initiatives. If the benefits exceed the costs, the impact of DSM will be to lower BC Hydro's revenue requirements. Consistent with the Previous Application, BC Hydro is using the export market price to value the energy savings in this test period. This approach ensures that even surplus energy resulting from DSM would have a positive impact on BC Hydro's revenue requirements. BC Hydro applies this test as a screening filter to prioritize DSM investments and to inform BC Hydro's business decisions.

The price of electricity on the wholesale market is approximately $30 per MWh. A levelized utility cost of DSM that is less than $30 per MWh means that the energy savings from DSM cost less than the price BC Hydro could receive on the market for selling any surplus energy resulting from DSM. DSM with a levelized utility cost less than $30 per MWh reduces BC Hydro's overall revenue requirements and overall customer bills.

The Total Resource Cost Test is presented because the Demand-Side Measures Regulation stipulates that the BCUC is required to use this test for determinations of cost-effectiveness. Costs in the Total Resource Cost Test include both BC Hydro's costs and the cost to participants of implementing DSM initiatives. The benefits reflect the benefits to participating customers and the benefits represented by the avoided cost of electricity supply resulting from DSM savings. Participant non-electricity benefits (e.g., operation and maintenance savings resulting from the installation of a more efficient technology, or natural gas savings that result from a building upgrade) are also included. If the benefits exceed the costs, this indicates that DSM is a lower-cost resource than other supply side resource options, as defined by the Regulation.

The Demand-Side Measures Regulation requires that a long-run marginal cost (**LRMC**) of acquiring electricity from clean or renewable resources in British Columbia be used to assess the cost-effectiveness of demand-side measures.[364] This means that the market price cannot be used for this test. The Total Resource Cost Test can also be used to assess how a DSM initiative or portfolio compares to the cost of other supply side resource options. However, as BC Hydro is in a period

[364] Specifically, section 4 (1.1(b)) of the Demand-Side Measures Regulation states that the avoided electricity cost respecting a demand-side measure is an amount that the Commission is satisfied represents the authority's long-run marginal cost of acquiring electricity generated from clean or renewable resources in British Columbia.

of energy surplus, we are not choosing between DSM and other supply side resource options as part of an acquisition process.

For the purposes of assessing the Total Resource Cost Test under the Demand-Side Measures Regulation, recognizing that BC Hydro is not using this test to inform an energy acquisition process, BC Hydro used an avoided cost of $105 per MWh, based on BC Hydro's last LRMC presented in the Previous Application. This value is based on an outdated assessment of greenfield wind projects, including BC Hydro's cost to integrate and deliver energy to the load centre (Lower Mainland). It is an outdated value that is no longer correct and should not be given any weight.

BC Hydro has not updated the LRMC for this application but plans to do so in the next IRP[365]. Internal decisions on demand-side measures are based on the Utility Cost Test at market price and not on the LRMC.

The cost-effectiveness of BC Hydro's DSM initiatives, as demonstrated by their benefit-cost ratios and levelized costs, is provided in Table 10-13 below.

[365] As discussed in Chapter 2, section 2.2.2., the Government of B.C. issued the BC Hydro Integrated Resource Plan Regulation (B.C., Reg. 266/2018) under the *Clean Energy Act* prescribing February 28, 2021 as the date for BC Hydro's next IRP.

Table 10-13 Benefit-Cost Ratios and Net Levelized Costs ($/MWh)

	Benefit-Cost Ratios		Net Levelized Costs ($/MWh)	
	Utility Cost Test (Market Price at $30 per MWh)	Modified Total Resource Cost Test (LRMC at $105 per MWh)	Utility Cost ($)	Total Resource Cost ($)
Codes and Standards	n/a	n/a	n/a	n/a
Rate Structures	11.1	1.4	(4)	73
Programs (including TMP)	1.7	3.6	12	(11)
Total Portfolio (including TMP, excluding Codes and Standards savings[366])	1.1	2.5	27	14

As shown in Table 10-13 above:

- The net levelized utility cost of $27 per MWh is lower than the market price of $30 per MWh. This means that BC Hydro's DSM portfolio is cost-effective under the Utility Cost Test; and
- BC Hydro's DSM initiatives have a Total Resource Cost Test result of $14 per MWh. This means that BC Hydro's DSM portfolio would still be cost-effective under the Demand-Side Measures Regulation, even with a significant decrease in the value of the LRMC of acquiring electricity generated from clean or renewal resources in British Columbia, compared to the value used.

Under the Demand-Side Measures Regulation, the cost-effectiveness of "specified demand-side measures" is determined by whether the portfolio as a whole is cost effective. Table 10-13 demonstrates that the portfolio as a whole is cost-effective. Accordingly, our specified demand-side measures are also determined to be cost-effective. Specified demand-side measures include the Public Awareness

[366] As described in section 10.2.3, codes and standards savings are not included in the calculation of portfolio level cost-effectiveness and levelized costs.

Supporting Initiative, sector Energy Management Activities, technology innovation activities, and codes and standards support.

10.5.4 BC Hydro's Low-Carbon Electrification Undertakings are Cost Effective

BC Hydro has chosen to engage in undertakings that are within one or more class of undertakings defined in sections 4(3)(a), 4(3)(b), 4(3)(c) or 4(3)(d) of the GGRR. Undertakings are in a class of undertakings defined in section 4(3)(a) and 4(3)(b) of the GGRR if they meet the cost-effectiveness test. The cost-effectiveness test requires that each undertaking that is an undertaking within the class of undertakings defined by subsections 4(3)(a) or 4(3)(b) of the GGRR must have a positive net present value (**NPV**), with the measure of a program's NPV being that of all of the programs that fall within the class of undertakings described in subsections 4(3)(a) and 4(3)(b) of the GGRR. Specifically, benefits mean all revenues BC Hydro expects to earn as a result of implementing LCE programs/projects falling under subsections 4(3)(a) or 4(3)(b), less revenues that would have been earned from the sale of that electricity to export markets. Costs mean all the costs BC Hydro expects to incur to implement LCE programs falling under subsections 4(3)(a) or 4(3)(b), including development and administration costs. The GGRR cost-effectiveness test is measured only at the time BC Hydro decides to carry out a program/project. There is no other cost-effectiveness test applicable to prescribed undertakings.

The NPV of all of BC Hydro's programs/projects prescribed under section 4(3)(a) and 4(3)(b) of the GGRR including BC Hydro's proposed low carbon electrification expenditures for fiscal 2020 and fiscal 2021 is $134.7 million, which indicates that these undertakings are cost-effective. Further details are shown in Appendix Y.

10.5.5 Direction 61 Regarding Allocation of Portfolio Costs to Programs Should be Rescinded

In this application, BC Hydro is requesting that Directive 61 from the BCUC's decision on BC Hydro's Fiscal 2005 to Fiscal 2006 Revenue Requirements Application (**Directive 61**) be rescinded. Directive 61 requires portfolio-level costs to be allocated to programs. It states:

> "Portfolio Level Costs should be allocated to programs, and BC Hydro is directed to use the same allocation methodology based on kWh savings as used in Exhibit B1-81."

To assess cost effectiveness in previous applications, BC Hydro allocated a prorated amount of costs from portfolio-level initiatives to the cost of each program based on the energy savings, as required by Directive 61.

In this application, BC Hydro has only attributed costs to programs if they are necessary to operate the program. As further explained below, this approach is more consistent with the Demand-Side Measures Regulation and industry practice, and also facilitates more appropriate marginal cost decision making when designing a DSM portfolio.

10.5.5.1 Directive 61 is Inconsistent with the Demand Side Measures Regulation

As the BCUC indicated in its decision on BC Hydro's Previous Application:

> "The Demand-Side Measures Regulation defines the DSM cost tests to be used by the Commission in evaluating a DSM allocation under section 44.2 (5.1) (d) of the UCA".[367]

Since Directive 61 was issued, the cost effectiveness testing of DSM expenditures has become subject to the Demand Side Measures Regulation. Section 4 of the Demand-Side Measures Regulation prescribes how the industry-standard cost-effectiveness tests are to be applied, including specifying the use of the Total

[367] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 73.

Resource Cost, the avoided capacity cost, and the attribution of non-energy benefits. The attribution of portfolio-level costs to programs is not endorsed by the Demand-Side Measures Regulation or the Guide to the Demand-Side Measures Regulation published by Government.

In addition, the Directive 61 approach is inconsistent with section 4(4) of the Demand-Side Measures Regulation which requires that "specified demand-side measures", which include energy efficiency training, community engagement and energy management programs, be evaluated at a portfolio-level. Directive 61 is inconsistent with this requirement as these types of programs could be considered portfolio-level costs which are required to be allocated to programs.

10.5.5.2 Directive 61 is Inconsistent with Industry Practice

Directive 61 is also inconsistent with industry practice. Industry practice does not suggest that there should be an attribution of portfolio-level costs to individual programs. The recent National Standard Practice Manual states that "fixed portfolio-level costs should not be allocated to programs for the purpose of assessing the cost-effectiveness of individual programs".[368] BC Hydro also notes that FortisBC Energy Inc. is not required to allocate portfolio-level costs to programs.[369]

10.5.5.3 Directive 61 is Not Appropriate for Marginal Decision Making

Allocating portfolio-level costs to programs is not appropriate for marginal decision-making because this allocation overstates a program's incremental costs when assessing cost-effectiveness. This is because the portfolio-level costs are not causally connected to the program, but arbitrarily allocated to programs based on the percentage of savings of the portfolio. The inclusion of portfolio-level costs could

[368] https://nationalefficiencyscreening.org/wp-content/uploads/2017/05/NSPM_May-2017_final.pdf (page 85).

[369] FortisBC Energy Inc.'s 2019-2022 DSM Expenditures Plan application, page 29 outlines the treatment of specified demand-side measures within cost-effectiveness tests, and Appendix A, pages 5 and 53, outline treatment of portfolio level costs and enabling costs. FortisBC's application was approved by BCUC Order No. G-10-19.

shift the result for a program from a net benefit to a net cost, which could lead to a decision not to implement the individual program. This shift could result in a program with a net benefit not being implemented. For this reason, it is more appropriate to only consider portfolio-level costs when looking at the cost effectiveness of the overall portfolio, not the cost effectiveness of individual programs. This allows decisions on individual programs to be based entirely on the merits of the program itself.

In summary, BC Hydro is requesting that the BCUC rescind Directive 61 because it is inconsistent with the Demand-Side Measures Regulation and industry practice and because it is not appropriate for marginal decision-making.

10.5.6 Persistence of Energy Impacts Supports Existing Amortization Period

Section 7 (d) of Direction No. 7 provided direction to the BCUC on the amortization period of the DSM Regulatory Account. As explained in Chapter 2, section 2.2.1, as a result of the Comprehensive Review, Direction No. 7 to the BCUC has been repealed. In addition, as explained in Chapter 2, section 2.6.4, the Direction to the BCUC Respecting Undertaking Costs requires the BCUC to allow BC Hydro to defer the costs incurred for prescribed undertakings to the DSM Regulatory Account. Consistent with this direction, BC Hydro is requesting BCUC approval to defer low carbon electrification expenditures for prescribed undertakings pursuant to section 18 of the *Utilities Commission Act* to the DSM Regulatory Account.

The 15-year amortization period of the DSM Regulatory Account is based on the average measure life of DSM initiatives. The inclusion of the expenditures for low carbon electrification undertakings in the DSM Regulatory Account means that low-carbon electrification expenditures now impact the average measure life of DSM initiatives captured in the account. Accordingly, in this application, BC Hydro has reviewed the average measure life of DSM initiatives.

BC Hydro applies a standardized approach to assess the effective measure life of individual DSM initiatives. This standardization supports uniform application of the effective measure life (also referred to as persistence) of energy impacts from a DSM activity. It also provides consistency in the planning, estimating, reporting, evaluation and calculation of cost effectiveness and supports effective and efficient quality assurance.

To determine effective measure life values, BC Hydro uses credible third-party research including research from the Public Service Commission of Wisconsin, the California Public Utilities Commission, the 2001 Database for Energy Efficiency Resources, and Skumatz Economic Research Associates Inc. Where there is no existing reference to effective measure life, BC Hydro has recommended a value based on our professional judgment and experience.

Table 10-14 provides the weighted average measure life of DSM impacts over the fiscal 2020 to fiscal 2021 test period and over the next 10 years (fiscal 2020 to fiscal 2029).[370]

[370] A ten-year period was selected to improve the stability of the accounting treatment by de-emphasizing individual projects, which can affect the average measure life in individual years.

Table 10-14 Average Measure Life (years)[371]

	2-Year Period F2020-F2021		10-Year Period F2020-F2029	
	GWh Weighted	$ Weighted	GWh Weighted	$ Weighted
Codes and Standards	30.0	30.0	30.0	30.0
Conservation Rates	1.3	1.3	1.2	1.2
DSM Programs	10.4	12.2	11.8	13.2
Low-Carbon Electrification	27.0	24.9	24.4	19.8
Codes and Standards, Conservation Rates, and DSM Programs	**18.7**	**13.5**	**17.9**	**14.7**
DSM Programs and Low-Carbon Electrification	**17.1**	**15.0**	**16.2**	**15.0**

The values in Table 10-14 above are considered to be conservative as the calculation equates the effective measure life of a DSM initiative with the persistence of the savings attributable to the utility program. However, some customers will re-install an efficient measure when the initial measure has reached its end-of-life, rather than revert to an inefficient measure. In these cases, the persistence of the DSM initiative continues beyond the effective measure life. In recognition of this effect, the California Public Utilities Commission uses a deemed assumption that 50 per cent of savings persist beyond the expiration of the measure's life in its Energy Efficiency Policy Manual.[372]

Based on the estimated average measure lives of DSM impacts shown in Table 10-14, BC Hydro believes that the existing amortization period of 15 years for the DSM Regulatory Account remains appropriate. The DSM Regulatory Account is discussed further in Chapter 7, section 7.7.3.

[371] The average measure life is based on the median number of years that the measure installed is still in place and operable. Factors considered include field conditions, obsolescence, building remodeling, renovation, demolition and occupancy changes. Measure life assumptions are documented in the Demand-Side Management Standard, "Effective Measure Life and Persistence".

[372] http://www.cpuc.ca.gov/uploadedFiles/CPUC_Public_Website/Content/Utilities_and_Industries/Energy_-_Electricity_and_Natural_Gas/EEPolicyManualV5forPDF.pdf, page 34.

10.5.7 Re-categorizing of Energy Management Activities Aligns with Demand-Side Measures Regulation

The *Demand-Side Measures Regulation* was amended in 2017 to include an "Energy Management Program" (meaning a program to assist customers to optimize energy use) as a "Specified Demand-Side Measure". To align with this change, BC Hydro re-categorized its energy management activities into a new program called Energy Management Activities within each sector.

Energy Management Activities are different from most other programs because they do not offer incentives to customers to adopt a particular measure. Rather, in direct and indirect ways, they assist customers in managing and optimizing their energy use. BC Hydro strives to provide assistance to customers in a holistic manner by bringing energy specialists directly into customer operations, increasing customers' knowledge of their options, encouraging behavior change, and providing knowledgeable trades in the industry that can help customers make the right choices.

Table 10-15 below shows the expenditure effect of the re-categorization. As shown, there is no net change to sector or portfolio budgets as a result of this exercise.

Table 10-15 Energy Management Activity Expenditures

	F2020 Expenditures Before Energy Management Re-categorizing ($ million)	F2020 Expenditures After Energy Management Re-categorizing ($ million)	F2020 Expenditure Differences ($ million)	F2021 Expenditures Before Energy Management Re-categorizing ($ million)	F2021 Expenditures After Energy Management Re-categorizing ($ million)	F2021 Expenditure Differences ($ million)

10.6 BC Hydro Appropriately Manages its Traditional DSM Initiatives and Low-Carbon Electrification Undertakings

This section provides an overview of BC Hydro's management activities to monitor and assess performance results, and keep the initiatives on track. Further details of these management activities are provided in Appendix X.

10.6.1 Delivery Risks are Identified and Mitigated

BC Hydro's approach to the management of traditional DSM and low-carbon electrification undertakings is informed by the identification and assessment of delivery risks and the development of mitigation measures at various stages of DSM implementation. Risks are assessed and mitigated at the initiative level as well as at the portfolio level.

A detailed discussion of delivery risks and mitigation is provided in section 4.2 of Appendix X.

10.6.2 Performance is Comprehensively Managed

BC Hydro manages the performance of DSM initiatives in a comprehensive manner. This includes tracking a number of performance metrics as well as regular management oversight and reporting, as described below.

- Electricity and capacity savings are confirmed through a series of activities including technical review, site inspection, measurement and verification, and evaluation. These activities are intended to improve the accuracy of the savings estimates and reduce exposure to risks. Section 4.3 of Appendix X describes these activities. A more detailed overview of the measurement and verification, and evaluation activities as well as the annual evaluation summary reports to the BCUC is provided in Appendix AA.

- For low-carbon electrification undertakings, load growth and GHG impacts are confirmed through a similar series of activities as shown in section 4.3. of Appendix X.
- Savings and load growth impacts are reported to the BCUC through two annual reports. Savings are reported in the Annual DSM Reports to the BCUC (Appendix Z) while load growth is reported in the Greenhouse Gas Reduction Regulation Annual Reports (Appendix BB).
- BC Hydro's DSM governance process includes regular reporting to the Executive Team and the Board of Directors. This is described further in section 4.1.3 of Appendix X.

10.6.3 Recent Audit Found that Processes and Controls Are in Place

In fiscal 2017, BC Hydro's Audit Services department engaged experts from GDS Canada Consulting Ltd. to help assess whether effective processes and controls were in place for our DSM activities and programs. GDS Canada Consulting Ltd. has over 40 years of experience in market evaluations and managing energy efficiency programs. The internal audit found that processes and controls are in place for planning, program development, implementation and evaluation.

Chapter 11

Performance Based Regulation

Table of Contents

List of Figures

List of Tables

11.1 Executive Summary

British Columbia Hydro and Power Authority (**BC Hydro**) files this report on Performance Based Regulation (**PBR**) in response to Directive 28 from the British Columbia Utilities Commission (**BCUC**) in its Decision on BC Hydro's Previous Application. [373]

11.1.1 Scope of this Report

In its Decision on our Previous Application, the BCUC acknowledged previous cost cutting measures by BC Hydro and the potential for further savings through the Government of B.C.'s Comprehensive Review. However, it expressed concern regarding BC Hydro's base operating costs and suggested that a rate setting mechanism, like PBR, could help BC Hydro accomplish its cost control objectives and provide incentives to improve productivity while maintaining service quality. [374]

The BCUC recommended that BC Hydro consider a PBR plan and directed a PBR report to be filed, addressing the following issues:

- A discussion of the types of PBR plans that may be suitable for BC Hydro (i.e., Revenue Cap, Price Cap, hybrid);
- The length of PBR term that may be appropriate;
- A discussion of potential earnings sharing mechanisms that may be suitable for BC Hydro;
- The appropriateness of off-ramps;

11.1.2 Our Approach to this Report

FortisBC, an investor-owned natural gas and electric utilities in British Columbia, are currently operating under PBR. In its Decision on FortisBC's 2014 to 2018 PBR Application, the BCUC stated:

> "The Commission Panel is not looking at this Application from a short–term viewpoint. We see an opportunity to make significant change over the long term with the way regulation is conducted in this jurisdiction and the way in which revenue requirements are determined."[376]

BC Hydro agrees that the shift from cost of service regulation to PBR would be significant. It would represent a significant change for all stakeholders, including BC Hydro, interveners and the BCUC. We believe that the adoption of PBR for BC Hydro should be carefully considered.

Accordingly, to assist us in identifying the opportunities and challenges associated with the adoption of PBR for BC Hydro, we retained Dr. Dennis Weisman, Ph.D., a recognized expert in PBR.

At BC Hydro's request, Dr. Weisman completed a whitepaper titled *"A Report on the Theory and Practice of Performance-Based Regulation",* which outlines the theory and application of a successful approach to PBR. The whitepaper is included as Appendix FF and referenced throughout this report. Dr. Weisman also previously co-wrote a paper with Dr. David Sappington titled *"Assessing the Treatment of*

[375] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 111 (paraphrased and re-ordered).

[376] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 14.

Capital Expenditures in Performance-Based Regulation Plans", which was commissioned by the Edmonton Power Corporation (**EPCOR**) and filed with the Alberta Utilities Commission in 2016. This paper is included as Appendix GG.

BC Hydro's report is divided into three parts.

- First, in section 11.2, we provide an overview of cost of service regulation and PBR as well as a discussion of the different roles of the regulator, interveners and the utility under both approaches.
- Second, in sections 11.3 through 11.7, we provide our initial conclusions in response to the issues raised by the BCUC. These initial conclusions provide a framework for a PBR plan, should the BCUC decide to adopt PBR for BC Hydro.
- Third, in section 11.8, we review the potential implications of adopting PBR and conclude that BC Hydro should continue to be regulated through cost of service regulation at this time.

11.1.3 PBR is a Different Approach to Regulation

BC Hydro is currently regulated through a cost of service approach. Under this approach, BC Hydro submits evidence to the BCUC regarding the costs we expect to incur to provide safe, reliable, affordable and clean electricity to our customers. The BCUC reviews these costs and sets rates to allow BC Hydro to recover only those costs that it determines to be prudently incurred plus a reasonable rate of return (net income).

In simple terms, PBR involves setting rates through a formula. This formula de-links costs and rates for a specified period of time. A typical approach to PBR in the electricity industry is a hybrid plan where some costs are subject to a PBR formula and other costs are set through cost of service regulation.

Under PBR, a cost of service review would be conducted first, to set BC Hydro's base costs. In subsequent years, cost components subject to PBR would be determined by applying a formula to adjust the previous year's costs for the effects of inflation and productivity improvements. This means that the amount of revenue recovered through rates in subsequent years would be independent from BC Hydro's costs, rather than dependent on them.

Once the base costs are established, the BCUC would not focus on reviewing the cost components subject to PBR. Instead, the BCUC would design and implement mechanisms to incent the discovery of new savings. This shift in focus would provide BC Hydro with increased autonomy from detailed regulatory reviews. If BC Hydro were able to discover efficiencies over and above what is required to meet the formula, BC Hydro or the Government of B.C. (our shareholder) would retain those savings or share them with our customers, until rates were "re-based" to reflect the cost of service at the end of the PBR term.

By allowing BC Hydro to retain all or a portion of the savings over and above what is required to meet the formula, PBR would aim to incent a process through which new savings - that were not previously identified under cost of service regulation - are discovered.

A key difference between these two approaches is the role of BC Hydro, the BCUC and interveners. Under cost of service regulation, BC Hydro must provide a forecast of the costs that it expects to incur and then justify the reasonableness of those costs. The BCUC's role is to acquire information to determine which expenditures are prudent and which expenditures are imprudent. Interveners support this process by submitting information requests and arguments from a customer's perspective.

In contrast, PBR is predicated on providing greater autonomy to the utility. Under PBR, the BCUC's role would be to provide a framework to incent efficient behaviour and then allow BC Hydro to manage its expenditures within that framework without performing a detailed regulatory review that would second guess the decisions made. In exchange for this increased autonomy, BC Hydro would assume both the risk that the PBR formula would not sufficiently fund certain costs as well as the opportunity to retain additional savings, if new efficiencies were discovered, over and above what was required to meet the formula.

11.1.4 Summary of BC Hydro's Responses

We have reviewed the potential implications of adopting PBR and concluded that, at this time, BC Hydro should continue to be regulated through cost of service regulation, for the following four reasons:

- First, cost of service regulation should be given the opportunity to work. BC Hydro believes that unconstrained cost of service proceedings would address the issues raised by the BCUC in its Decision on our Previous Application.
- Second, given that BC Hydro is only now returning to enhanced regulation, it is likely to be more challenging to secure stakeholder support for the principles of PBR. BC Hydro believes that the most effective way to build the familiarity and comfort required to secure stakeholder support for the principles of PBR is through successive cost of service proceedings.
- Third, cost of service regulation is more intuitive and accessible, while PBR is more esotetic and relies heavily on specialized expertise.
- Fourth, BC Hydro does not have a mandate to maximize profits, which can dull the additional "carrot" incentive that PBR attempts to provide. This does not mean that BC Hydro will not seek out and find additional efficiencies in future years. Rather, it means that the incentive to find these efficiencies would come, as it does today, from the obligation and commitment on the part of management to deliver on its mandate within the budget set by the BCUC, and not from the opportunity to increase earnings.

BC Hydro respectfully recommends that the BCUC use this Revenue Requirements Application proceeding to engage interveners to canvass their views.

Should the BCUC decide to adopt PBR for BC Hydro, this report provides the following initial conclusions in response to the issues the BCUC has asked BC Hydro to address. These initial conclusions provide a framework for a PBR plan.

- **Types of PBR Plans:** The most suitable PBR plan for BC Hydro would be a hybrid plan, in which certain costs are subject to a PBR formula and other costs are “carved out” from the formula and reviewed through cost of service regulation. This hybrid plan should be more broad-based than targeted and should “carve out” items over which BC Hydro has little or no control. It will be important to appropriately align the roles and responsibilities of BC Hydro and the BCUC to maintain the distinction between cost of service regulation and PBR under this hybrid approach. The PBR formula should be a revenue cap which caps BC Hydro’s total allowed revenue.
- **Creating and Sharing Benefits Under PBR:** The goal of adopting PBR is to incent a process through which savings – that were not previously identified under cost of service regulation – are discovered. The strength of the incentives provided depends on the extent to which the amount of revenue recovered through rates is independent from BC Hydro’s costs, rather than dependent on them. The PBR term should be at least five years as a longer term would provide stronger incentives. There are trade-offs if stretch factors or Earnings Sharing Mechanisms are used to manage the allocation of benefits during the PBR term. A stretch factor would maintain the distinction between PBR and cost of service regulation and would not counteract the stronger financial incentives for efficient performance that PBR attempts to provide. An Earnings Sharing Mechanism reduces the strength of incentives; however, if an Earnings Sharing Mechanism is desired, then one with a “deadband” would provide stronger incentives than one that shares a set percentage of all earnings above

BC Hydro's allowed net income. Both financial and performance re-openers or off-ramps should be used. The financial triggers should be high enough to incent the vigorous pursuit of efficiencies while remaining low enough to provide a safeguard against excessive profits or losses.

- **Managing Capital and Other Costs under PBR:** A variety of approaches may be used to manage capital spending and other costs incurred by BC Hydro under a PBR plan. Each approach has trade-offs between the incentives provided, the degree of regulatory oversight and the level of certainty that funding will be sufficient to support the required investment. In this chapter, we identify areas where "adders" to the PBR formula or "carve outs" from the formula may be required; however, the appropriate approach should be determined in the context of an overall PBR plan proposal and not in isolation.
- **Monitoring the PBR Plan:** A number of the performance metrics already included in BC Hydro's Service Plan are likely appropriate as key performance indicators to monitor progress under PBR. Some additional customer service and emergency response metrics may need to be added. An Annual Review process, similar to the one adopted by the BCUC for FortisBC, would likely be appropriate for BC Hydro.
- **Implementing the PBR Plan:** BC Hydro has filed a cost of service Revenue Requirements Application for fiscal 2020 and fiscal 2021. BC Hydro suggests that the BCUC provide its decision on the adoption of PBR for BC Hydro in its decision on this Revenue Requirements Application. We believe that BC Hydro should continue to be regulated through cost of service regulation at this time. However, if the BCUC decides to adopt PBR for BC Hydro, following this Revenue Requirements Application proceeding, BC Hydro could file a proposed PBR plan, using fiscal 2021 as the base year, by February 2021. The consultation process on a PBR plan for BC Hydro could be similar to the model used for BC Hydro's 2015 Rate Design Application. A negotiated settlement

process to identify areas of common agreement, prior to BC Hydro's submission of a proposed PBR plan, may help to secure intervener and stakeholder support for elements of the proposed plan and streamline the subsequent regulatory review process.

11.2 PBR is a Different Approach to Regulation

In the following sections, BC Hydro provides an overview of cost of service regulation and PBR as well as a discussion of the different roles of the regulator, interveners and the utility under both approaches.

11.2.1 Overview of Cost of Service Regulation and PBR

BC Hydro's rates are currently set through cost of service regulation. Under cost of service regulation, BC Hydro applies to the BCUC to set rates for a certain period and submits evidence regarding the costs we expect to incur to provide safe, reliable, affordable and clean electricity to our customers. This is referred to as our "revenue requirements". The BCUC reviews these costs and sets rates to recover only those costs that it determines to be prudently incurred plus a reasonable rate of return (net income).

BC Hydro has made considerable progress in identifying cost savings under cost of service regulation. We have achieved cost reductions through the 2011 Government of B.C. review and the 2013 10 Year Rates Plan. In addition, the Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (**Previous Application**) provided an opportunity for oversight by the BCUC and interveners.

In its Decision on BC Hydro's Previous Application, the BCUC approved our revenue requirements but expressed concerns regarding base operating costs stating:

> "The Panel recognizes that in some cases, comparing forecast cost increases to the rate of inflation may be considered an appropriate measure for evaluating the reasonableness of forecast cost increases in the test period. This method is likely more suitable in situations where a regulator has consistently

> been empowered to oversee all aspects of the utility's forecast and historical expenditures through proceedings in which the underlying base costs were initially established. However, given the Commission's limited involvement in the approval of BC Hydro's recent revenue requirements, the Panel does not have a high degree of comfort in BC Hydro's starting point, being the 2016 base operating costs." [377]

The BCUC went on to suggest that a rate setting mechanism that could help BC Hydro to accomplish its cost control objectives would be of value, stating:

> "Performance Based Rate (PBR) setting mechanisms are implemented successfully in many jurisdictions, particularly in Canada, including BC. PBR provides incentives for utilities to improve productivity and create efficiencies to allow for rates to be more effectively managed, while maintaining service quality."[378]

While cost of service regulation sets rates to recover only those costs that the regulator determines to be prudent, PBR de-links rates and costs for a specified period of time.[379] The premise underlying this break is that since the utility has the strongest understanding of its costs and operations, the regulator should not focus on trying to collect and review this information. Instead, PBR shifts the regulator's focus to the design and implementation of rules that will incent the utility to discover all possible efficiencies and productivity improvements. [380] This shift in focus provides the utility with increased autonomy from detailed regulatory reviews. [381]

While the starting point for PBR is typically a cost of service review to establish a base year, rates in subsequent years are then determined by applying a formula which adjusts the previous year's rates for the effects of inflation and productivity

[377] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 33.
[378] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 110.
[379] Appendix FF, page 8.
[380] Appendix FF, pages 4 to 6.
[381] Appendix FF, page 5.

improvements, through an inflation factor and a productivity factor. [382] This means that the amount of revenue recovered through rates in subsequent years is largely de-linked from the utility's costs over the term of the PBR plan.[383] If a utility is able to discover efficiencies over and above what is required to meet the formula adjustments, it retains all or a portion of those savings until rates are re-based at the end of the PBR term. At that point, some or all of the efficiencies are reflected in customer rates in future years.[384]

By allowing a utility to retain all or a portion of the savings over and above what is required to meet the formula, PBR aims to incent a process through which new savings - that were not previously identified under cost of service regulation - are discovered. [385] The effect of this process is to go beyond the "static" efficiencies that are discovered through aligning costs and prices under cost of service regulation and emulate what would happen in a competitive market where, in an effort to increase their market share, rival producers would continually discover new ways to reduce their costs, achieving "dynamic" efficiencies.[386]

11.2.2 PBR's Use of Incentives and Greater Utility Autonomy Alters the Roles and Responsibilities of All Stakeholders

A key difference between cost of service regulation and PBR is the role of the utility, the regulator and interveners.

Under cost of service regulation, the utility must provide a forecast of the costs that it expects to incur and then justify the reasonableness of those costs. The regulator's role is to determine which expenditures are prudent and which expenditures are imprudent. Interveners support this process by submitting information requests and arguments from a customer's perspective. PBR is premised on the idea that this

[382] Schmidt, page 2.
[383] Appendix FF, pages 8 to 10 and 49 to 50.
[384] Appendix FF, page 8.
[385] Appendix FF, page 5.
[386] Appendix FF, page 22.

approach may have limitations. This concept is explained by Professor Alfred Kahn in *The Economics of Regulation: Principles and Institutions*:

> "Effective regulation of operating expenses and capital outlays would require a detailed, day-by-day, transaction-by-transaction, and decision-by-decision review of every aspect of the company's operation. Commissions could only do so only if they were prepared completely to duplicate the role of management itself." [387]

Under PBR, the regulator's role is to provide a framework and allow the utility the necessary autonomy to manage its expenditures within that framework. As explained by Dr. Michael Schmidt in *Performance-Based Ratemaking: Theory and Practice*:

> "A desirable aspect of price cap regulation lies in the fact that the regulatory authority no longer has to second-guess the utilities' operations and evaluate the prudence of its investment decisions and operating practices. Second-guessing is a difficult task because it is generally recognized that the utility has superior information regarding its business operations including opportunities for reducing costs. Therefore, the regulator must resist-second guessing the utility and rely on the PBR."[388]

These different roles create different responsibilities for both the regulator and the utility. For example, under cost of service regulation, the utility must outline its forecast costs in detail, because it must prove to the regulator that the costs are reasonable. At the same time, the regulator has a responsibility to acquire information to evaluate the prudency of expenditures. However, under PBR, the utility does not have to demonstrate the reasonableness of forecast costs each year and the regulator has a responsibility to resist acquiring and evaluating information so that it does not second guess the decisions of the utility. In exchange for this increased autonomy from detailed regulatory review, the utility assumes greater risk

387 Alfred E. Kahn, The Economics of Regulation: Principles and Institutions, Volume I, New York: John Wiley and Sons, 1970, pages 29 to 30.

388 Dr. Michael R. Schmidt, Performance-Based Ratemaking: Theory and Practice, Public Utilities Reports, Inc., 2000, page 101.

and is provided with the opportunity to retain additional savings.[389] Figure 11-1 provides a matrix of respective responsibilities under both cost of service regulation and PBR:

Figure 11-1 Regulator and Utility Responsibilities under Cost of Service Regulation and PBR

	Regulator	Utility
Cost of Service Regulation	Acquire information to evaluate prudency of expenditures	Provide information so that prudency can be evaluated
Performance Based Regulation	Create a framework and resist second guessing the utility's decisions	Assume greater risk in exchange for greater autonomy from detailed regulatory review

As Dr. Weisman explains, aligning these roles and responsibilities is critical to maintaining the distinction between cost of service regulation and PBR:

> "It follows that if the firm is uncertain as to whether regulatory commitments will be honored, there may be little practical difference between PBR and [cost of service regulation]. In this manner a weak regulatory commitment undermines the superior incentive properties of PBR." [390]

11.3 Suitable Types of PBR Plans if PBR is Adopted

In response to the BCUC's request, this section discusses the types of PBR plans that may be suitable, if the BCUC decides to adopt PBR for BC Hydro.

There are various approaches to designing a PBR plan. A PBR plan may subject all costs to the PBR formula and may include "adders" if there are forecast costs that are not sufficiently funded by the formula. Alternatively, a PBR plan may be a "hybrid" where some costs are subject to the PBR formula and some costs are "carved out" and set through cost of service regulation. In addition, the PBR formula can set a price cap which caps the allowed rate increase or a revenue cap which

[389] Appendix FF, page 11.
[390] Appendix FF, page 50.

caps the allowed total revenue. We believe that the most suitable PBR plan for BC Hydro would be a hybrid plan and that the PBR formula should be a revenue cap.

Under PBR, an inflation factor (or "I" factor) escalates the utility's rates or revenue by an inflation index.[391] As the BCUC has noted, there are many considerations when establishing the appropriate inflation index including which indexes are most suitable, the appropriate allocation between labour and non-labour costs, the weighting of operating and capital costs, and whether to use forecast values, forecast values with a "true-up" or actual values from the previous year.[392]

A productivity factor (or "X" factor) offsets the inflation factor and is meant to represent the average productivity gains of a representative industry peer group, so that they can be passed on to customers through lower rates. It is important to recognize that the "productivity" measure used in the PBR formula means the amount of "output" (energy) per unit of "input" (cost). This means that productivity increases either when the amount of output increases and the amount of input remains the same, or when the amount of output remains the same and the amount of input decreases. Therefore, investments that increase the amount of energy produced tend to increase productivity while investments required for the reliability or sustainment of the electricity system or to support customer service, tend to decrease productivity because they increase costs but do not increase the amount of energy produced.

Dr. Weisman emphasizes that the productivity factor applied to electric utilities under PBR must account for these dynamics, stating:

> "…when productivity growth is declining over time, a backward-looking X factor (one based on historical data) is likely to overestimate the industry's capabilities going forward. This

[391] Appendix FF, page 31.
[392] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), pages 31 to 34.

> may well explain why PBR plans were not renewed or prematurely terminated in the electric power industry… backward-looking X factors in the electricity sector may well result in decreasing price-cost margins over time that would render it more difficult to fund capital requirements…"[393]

The productivity factor is meant to pass average industry productivity gains on to consumers and to be independent of the utility's own performance. This means that while the utility's past performance may inform the productivity factor at the start of a PBR plan, it cannot be used repeatedly. Rather, ongoing adjustments to the productivity factor should be based on a representative peer group of utilities in the same industry. The selection of peer group is fundamental to the fairness of the PBR plan, since benchmarking against utilities that are not facing the same operating circumstances could result in a formula that is too aggressive or too lenient. [394]

Lastly, a PBR formula typically includes an unforeseen factor (or "Z" factor) which allows rates to be adjusted to reflect one-time external events that are beyond the control of the utility. [395] The BCUC has previously determined that Z factors should be included as part of the PBR formula and that the following criteria should determine whether an event qualifies to be reflected in rates through the Z factor:

> 1. "The costs/savings must be attributable entirely to events outside the control of a prudently operated utility;
>
> 2. The costs/savings must be directly related to the exogenous event and clearly outside the base upon which the rates were originally derived;
>
> 3. The impact of the event was unforeseen;
>
> 4. The costs must be prudently incurred; and

[393] Appendix FF, pages 16 to 17.
[394] Appendix FF, pages 53 to 54.
[395] Appendix FF, page 32.

5. The costs/savings related to each exogenous event must exceed the Commission-defined materiality threshold." [396]

The BCUC has determined that materiality thresholds are a necessary component of "Z" factor criteria[397] and that these thresholds should be non-aggregated,[398] which means that multiple individual events below the threshold cannot be added together to meet the threshold and receive "Z" factor treatment. However, Dr. Weisman cautions that a non-aggregated materiality threshold may lead to "death by a thousand cuts."[399]

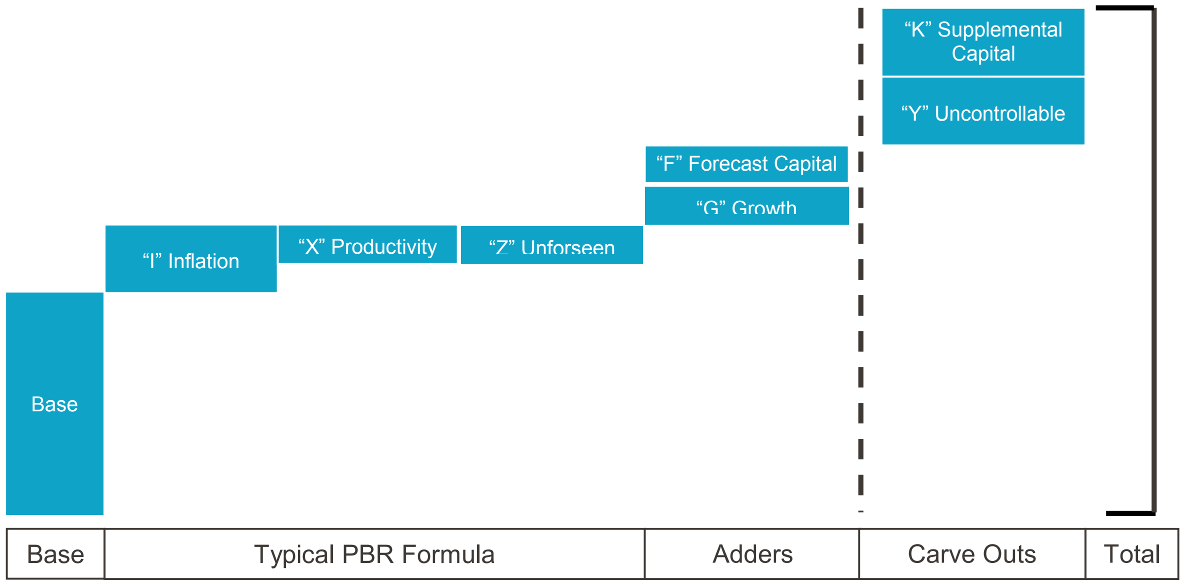
11.3.1 The PBR Plan Should be a Hybrid Approach

As discussed in section 11.2.1, the PBR formula adjusts rates for inflation and productivity improvements.

However, this adjustment may not be able to provide sufficient funding for all of a utility's forecast costs. For example, large capital projects may require "lumpy" investments and energy costs can fluctuate significantly. In these cases, "adders" or "carve outs" may be used. As Dr. Weisman observes, this is common in the electricity industry as the standard PBR formula does not account for recurring expenditures over which the utility has no control and may not generate sufficient revenues to adequately fund required capital investments. [400] Figure 11-2 provides a visual demonstration of how some common "adders" or "carve outs" may be used in combination with the adjustment for inflation and productivity improvements:

[396] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 94.
[397] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 95.
[398] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 96.
[399] Rebuttal Testimony of Dennis L. Weisman, Ph.D., Alberta Utilities Commission, Application No. 1606029, Proceeding ID No. 566, Rate Regulation Initiative (April 4, 2012), page 21.
[400] Appendix FF, page 33.

Figure 11-2 Common "Adders" and "Carve Outs" Under PBR



"Adders" refers to factors that are part of the PBR formula and are intended to increase the amount of funding that the formula provides. "Carve outs" refers to factors that remove costs from the formula entirely. Costs that are "carved out" of the PBR formula are subject to regulatory oversight on a cost of service basis, since those costs flow directly through to rates.[401] Accordingly, "carving out" certain costs results in a "hybrid" approach where some of the utility's costs are subject to the PBR formula and other costs are determined through cost of service regulation.

A PBR formula with "adders" may include the following factors:

- A growth factor (or "G" factor) adds to the escalation provided by the inflation factor so that rates reflect the additional costs required to serve new customers.[402] The BCUC has previously stated that it is "reasonable to conclude that there are cost increases associated with growth" but has noted some complexities including that costs may only increase when a certain

---
[401] *Id.*
[402] Appendix FF, page 27.

threshold of growth is reached and that those costs may not increase or decrease in a linear manner. [403]

- A forward-looking factor (also referred to as a “K-bar” or “F” factor) captures forecast costs associated with capital projects that are partially, but not fully, funded through the PBR formula. [404]

A hybrid approach with “carve outs” from the PBR formula may include the following factors:

- An uncontrollable factor (or “Y” factor) reflects recurring expenses that are beyond the control of the utility and should be fully reflected through an adjustment to rates. [405] Examples of items that may be included under a “Y” factor are interest, taxes and post-employment benefit costs. [406] In its 2016 PBR Decision, the Alberta Utilities Commission established the following criteria for “Y” factor treatment:

> “(i) The costs must be attributable to events outside management’s control.
>
> (ii) The costs must be material. They must have a significant influence on the operation of the [utility]; otherwise the costs should be expensed or recognized as income, in the normal course of business.
>
> (iii) The costs should not have a significant influence on the inflation factor in the PBR formulas.
>
> (iv) The costs must be prudently incurred.

[403] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), pages 116 to 117.
[404] Appendix GG, pages 32 to 33.
[405] Appendix FF, page 33.
[406] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), pages 97 to 98.

(v) All costs must be of a recurring nature, and there must be the potential for a high level of variability in the annual financial impacts."[407]

In British Columbia, the BCUC has previously observed that the research undertaken to determine expected productivity improvements that should be reflected through the "X" factor must be aligned with the scope of the "Y" factor.[408] In other words, the scope of items covered by the "X" factor must not overlap with the scope of items captured by the "Y" factor, otherwise those costs may be "double counted" in the resulting adjustment to rates.

- A supplemental capital factor (also referred to as "capital tracker" or "K" factor) reflects capital investment required to adequately sustain infrastructure or meet new demand that cannot be accommodated within the adjustment made to rates for inflation and productivity improvements. In other words, capital that is "supplemental" to what can be accommodated under the constraints of the PBR formula. [409]

As Dr. Weisman observes, regulators have struggled to strike the appropriate balance between the capital that is included under the PBR formula and the capital that is supplemental and funded through an adjustment to rates by the "K" factor. [410] Section 11.5.1 provides a summary of the trade-offs between various approaches to managing capital spending under a PBR plan. These approaches may include the use of "adders" such as "G" or "F" factors or the use of "carve outs" such as a "K" factor. In some cases, these factors may be used together. For example, a "F" factor may be used to capture forecast costs associated with capital projects that are partially, but not fully, funded through the PBR formula and the "K" factor may be used to capture costs associated with unique lifecycle capital replacement projects

[407] Alberta Utilities Commission, Errata to Decision 20414-D01-2016, 2018-2022 Performance-Based Regulation Plans for Alberta Electric and Gas Distribution Utilities (February 6, 2017), page 89.
[408] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 103.
[409] Appendix FF, page 33.
[410] Appendix FF, pages 46 to 47.

or projects required by external parties, which are outside the normal course of business and therefore not captured at all within the PBR formula.[411]

Overall, we believe that a hybrid approach, which includes some "carve outs" from the PBR formula, would be appropriate for BC Hydro given our capital investment requirements and various uncontrollable costs, which are discussed further in section 11.5.

Dr. Weisman emphasizes that PBR is not "one-size-fits-all",[412] citing a survey by Professor Graeme Guthrie, which concluded that:

> "The two most important lessons to be drawn from the literature surveyed here are that there is no single combination of regulatory settings that is best in all situations and that the various components of a regulatory scheme are interrelated. The most appropriate regulatory scheme for a given situation will depend on the characteristics of the firm and industry being regulated, as well as the institutional environment."[413]

Accordingly, Dr. Weisman provides some principles to guide the design of a PBR approach that appropriately reflects the unique circumstances of a utility:

- It should be more broad-based than targeted so that a utility does not devote excessive attention to those items covered by the PBR formula at the expense of items that are "carved out" of the formula[414] and so that the utility is not incented to make inefficient decisions to push additional costs outside of the PBR formula;[415]
- Items over which the utility has little or no control should be "carved out" of the PBR formula;[416]

- With regards to capital projects, the productivity improvements assumed by the "X" factor must recognize that increased investment is required in the electricity industry. This investment is necessary to refurbish aging infrastructure and to improve seismic safety so that existing assets may keep producing the same results. These types of investments result in negative productivity improvements, as the amount of resources inputted increases but the output remains the same. Setting a "X" factor that recognizes this trend is important so that as much capital as feasible may be included within the PBR formula. Otherwise, excessive amounts of supplemental capital may need to flow directly through to rates, through the "K" factor, which may weaken the incentives to discover new efficiencies in the planning and delivery of capital projects.[417]

11.3.2 The PBR Formula Should be a Revenue Cap

As explained by the BCUC in its Decision on FortisBC's 2014 to 2018 PBR Application, the PBR formula generally takes the form of a price cap or a revenue cap. Under a price cap, a utility's rates are determined by the previous year's rates as adjusted by the PBR formula. Under a revenue cap, the utility's total allowed revenue is determined by the previous year's total allowed revenue as adjusted by the PBR formula. The primary difference between these two approaches is that under a price cap, the utility's allowed revenue fluctuates as demand fluctuates (e.g., if load is less than forecast then allowed revenue will also be less) while under a revenue cap, allowed revenue is decoupled from demand and remains constant regardless of whether load is more or less than forecast. In other words, under a price cap, the utility assumes the risk associated with changes in demand while under a revenue cap, customers assume the risk associated with changes in demand.[418]

[417] Appendix FF, page 47.
[418] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 19.

As explained in the BCUC's decision on BC Hydro's Fiscal 2009 to Fiscal 2010 Revenue Requirements Application, prior to fiscal 2009, BC Hydro assumed the risk associated with changes in demand as "variances from forecast were expected to be symmetrical and fall within a range of $20 million on an annual basis". However, based on the asymmetry and volatility in load actually experienced from fiscal 2005 to fiscal 2008 and the expectation that volatility may increase in future years, BC Hydro proposed that the net impact of load variances be included in the Non-Heritage Deferral Account starting in fiscal 2009, transferring the risk associated with changes in demand from BC Hydro to customers.[419] In Directive 31, the BCUC approved this request.[420] Direction No. 7 required the BCUC to continue to allow BC Hydro to defer the variances between actual and forecast cost of energy arising from differences between actual and forecast domestic customer load to the Non-Heritage Deferral Account.[421]

A revenue cap would recognize the continued uncertainty around the load forecast.[422] A revenue cap is also consistent with the approach that the BCUC has previously approved for FortisBC's natural gas and electricity utilities.[423] Accordingly, we believe that a revenue cap would be most suitable for BC Hydro.

11.4 Sharing Benefits Under PBR

The BCUC has asked for a discussion of a number of mechanisms that can be used to allocate the benefits achieved under PBR between BC Hydro and our customers. In this section, we address those mechanisms as well as others that may be included in a PBR plan as follows:

- Section 11.4.1 - PBR Term and Efficiency Carry-Over Mechanisms;

419 BCUC Decision, BC Hydro Fiscal 2009 to Fiscal 2010 Revenue Requirements (March 13, 2009), page 166.
420 BCUC Decision, BC Hydro Fiscal 2009 to Fiscal 2010 Revenue Requirements (March 13, 2009), page 232.
421 Direction No. 7, section 7 (c) (i).
422 BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), Appendix GG, page 13.
423 BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 21.

- Section 11.4.2 – Stretch Factors and Earnings Sharing Mechanisms; and
- Section 11.4.3 – Off-Ramps and Re-Openers.

It is important to recognize that mechanisms to allocate benefits achieved under PBR may affect the strength of the incentives provided to discover those benefits in the first place.

The strength of the incentives provided depends on the extent to which the amount of revenue recovered through rates is de-linked from a utility's costs, over the term of the PBR plan. Incentives are weak when the utility has the ability to pass along cost changes in the form of rate changes and are strengthened as this ability becomes more limited.[424]

It is important to recognize that the current cost of service approach to regulating BC Hydro already provides some limitation on the ability to pass along cost changes in the form of rate changes. For example, as BC Hydro's revenue requirements applications are submitted on a forecast basis and cover multiple years, rates are set independently of BC Hydro's actual costs over the test period. This means that unexpected cost pressures that arise during the test period must be managed and fully absorbed by BC Hydro within its existing approved revenue requirement, unless there is a regulatory mechanism in place to defer the impact.

Dr. Weisman explains that the strength of the incentives provided, depends on the mechanisms for allocating benefits and that adopting PBR does not automatically result in stronger incentives:

> "Whereas traditional cost-of-service regulation is frequently treated in the literature as a discrete alternative to PBR, these two types of regulatory regimes are best understood in terms of lying along a continuum based on the strength of the incentives for efficient performance. The textbook model of [cost of service

[424] Appendix FF, pages 8 to 10 and 49 to 50.

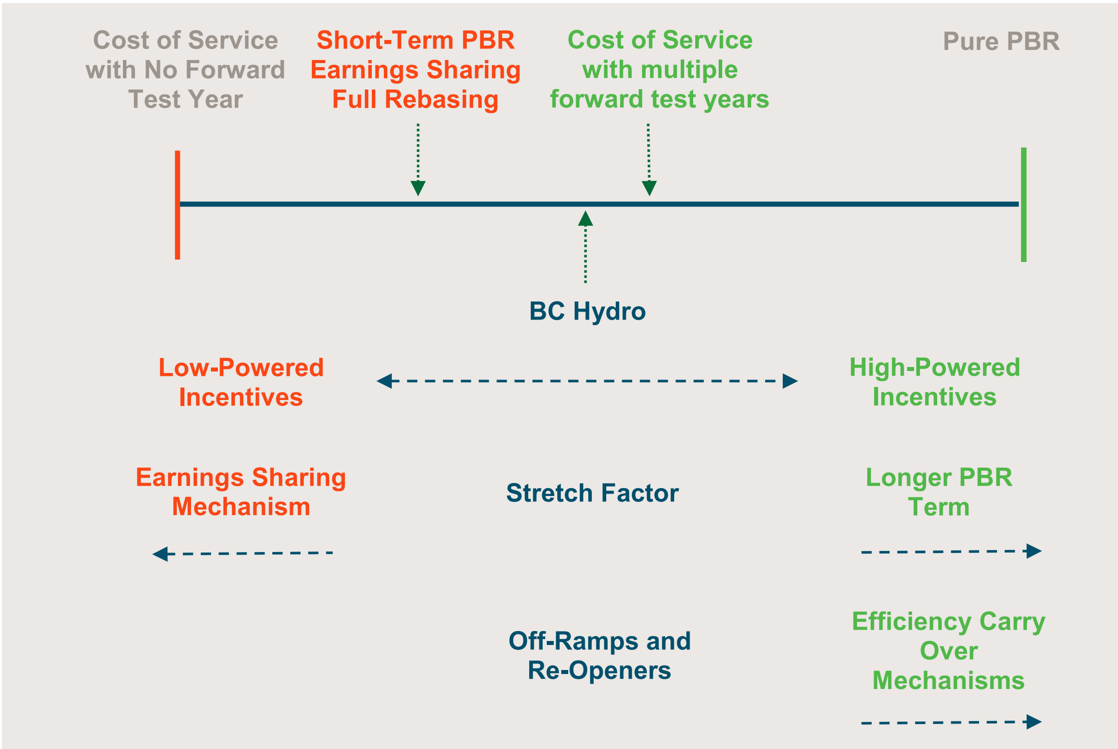
> regulation] with no regulatory lag[425] contemplates instantaneous rate reductions that serve to normalize excess returns. This regulatory regime lies at the far left on this continuum indicating extremely weak (low-powered) incentives. In contrast, long-term PBR with no earnings sharing or rebasing lies at the far right on this continuum indicating extremely strong (high-powered) incentives. Notably, [cost of service regulation] with a long regulatory lag may reside on this continuum to the right of a short-term PBR regime that incorporates a narrow deadband, pronounced earnings sharing and a full-rebasing of rates at the end of the PBR term. In this special case, [cost of service regulation] exhibits more high-powered incentives than PBR."[426]

Figure 11-3 indicates BC Hydro's current position on this continuum and shows how various mechanisms may increase, decrease or maintain the strength of incentives for efficient performance.

[425] In the context of PBR, "regulatory lag" means the length of time between rate reviews (e.g., the "regulatory lag for BC Hydro's Fiscal 2017 to Fiscal 2019 cost of service Revenue Requirements Application was three years). PBR aims to increase regulatory lag to strengthen financial incentives for efficient performance.

[426] Appendix FF, page 1.

Figure 11-3 Relative Incentive Power of BC Hydro's Current Regulatory Framework



In this section, we conclude that the PBR term should be at least five years as a longer term would provide stronger incentives. We also identify the trade-offs associated with using stretch factors or Earnings Sharing Mechanisms to manage the allocation of benefits during the PBR term. We conclude that a stretch factor would maintain the distinction between PBR and cost of service regulation and would not counteract the stronger financial incentives for efficient performance that PBR attempts to provide. If an Earnings Sharing Mechanism were to be included in the PBR plan, a mechanism with a "deadband" would provide stronger incentives than one which shares a set percentage of all earnings above or below the allowed net income. We also conclude that both financial and performance re-openers or off-ramps should be used. The financial triggers should be high enough to incent the vigorous pursuit of efficiencies while remaining low enough to provide a safeguard against excessive earnings or losses.

For simplicity, the discussion below focuses on benefits; however, it is important to note that the opportunity for customers to share in greater benefits is typically accompanied by increased exposure to risk. In other words, as customers receive a greater share of the benefits under PBR, through the mechanisms described below, they would also become exposed to more risks and the prospect of increased costs – through higher rates - should those risks materialize. Conversely, as BC Hydro's share of any benefits achieved under PBR increases, customers should become more insulated from potential risks and the corresponding costs.[427]

11.4.1 PBR Term and Efficiency Carry-Over Mechanisms

The BCUC has asked BC Hydro to discuss the appropriate length of a PBR term.

The PBR term refers to the period from the outset of PBR to "re-basing", when rates are "trued up" to reflect the utility's new cost of service. Through re-basing, some or all of the gains made under PBR are passed on to customers through lower rates in future years. The PBR term helps to determine how the benefits of PBR are shared between the utility and customers because it sets the minimum length of time that must pass before some or all of those benefits are transferred to customers, through re-based rates.

Two important considerations should inform the length of the PBR term:

- First, as the length of the PBR term increases, the incentives for the utility to achieve efficiencies also increases. This is because the utility retains those efficiencies for a longer period of time before some or all of the savings are transferred to customers, through re-based rates. [428]
- Second, the PBR term must be long enough to allow the utility to undertake the changes and investments necessary to discover and achieve additional efficiencies. If the PBR term is too short, re-based rates may reflect the costs of

[427] Appendix FF, page 11.
[428] Appendix FF, page 33.

additional investments made but not the expected efficiencies from those investments.[429] The BCUC has previously recognized this benefit of a longer PBR term, stating:

> "Efficiencies that require upfront costs in order to deliver a stream of benefits over a period of years are, in the Panel's view, more likely to be pursued under a PBR with a longer time period."[430]

Even with a longer PBR term, some cost effective investments may still be challenging to undertake if all of the benefits achieved from those investments are passed on to customers when rates are re-based. For example, towards the end of the PBR term, the payback period before rates are re-based becomes very short and some investments may require a payback period that is longer than the actual PBR term.[431] Efficiency Carry-Over Mechanisms address this issue by allowing the utility to carry-over a portion of its realized savings (or losses) into the next PBR term.[432]

The BCUC has previously recognized the potential value of Efficiency Carry-Over Mechanisms as a means of incenting the development of efficiency initiatives throughout the PBR term, provided that they balance the interests of the utility and its customers, are limited to specific investments where a longer payback period is required, and are applied on a case by case basis.[433]

BC Hydro's Previous Application under cost of service regulation was for a three-year period. As Dr. Weisman explains, the amount of time between when rates are re-based determines the relative strength of the incentives for efficiency between

[429] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 22.
[430] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 26.
[431] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 121-122.
[432] Appendix FF, page 42.
[433] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 128.

PBR and cost of service regulation.[434] In other words, all else equal, a PBR term of three years may provide no greater incentives for efficiency than the status quo.

Accordingly, BC Hydro suggests that the PBR term should be a minimum of five years and that Efficiency Carry-Over Mechanisms should be included in the PBR plan.

11.4.2 Stretch Factors and Earnings Sharing Mechanisms

While the PBR Term and Efficiency Carry-Over Mechanisms determine when and how rates are re-based so that the benefits achieved under PBR are transferred to customers, a PBR plan may also provide ways to share benefits with customers before rates are re-based. While the BCUC specifically asked BC Hydro to discuss potential Earning Sharing Mechanisms, we have also included a discussion on stretch factors, which are an alternative to Earnings Sharing Mechanisms.

As discussed in section 11.2.1, the objective of PBR is to provide stronger incentives than cost of service regulation so that the utility achieves new efficiencies that would not have otherwise been discovered. A stretch factor attempts to forecast these expected benefits in advance and immediately pass the savings on through lower rates to guarantee customers a share of the benefits from the stronger performance incentives that are expected under the PBR plan.[435] It is implemented by increasing the assumed productivity improvements in the PBR formula.[436] A stretch factor may be used to account for the relative efficiency for a utility at the beginning of a PBR plan.[437] In other words, if a utility is inefficient when it enters PBR, it may be subject to a high stretch factor, whereas a utility that has already been seeking out efficiencies would be subject to a lower stretch factor or none at all. Appendix T of this application provides a benchmarking study on BC Hydro's operating costs,

[434] Appendix FF, pages 1 and 33.
[435] State Performance-Based Regulation Using Multiyear Rate Plans for U.S. Electric Utilities, MN Lowry, M Makos, J Deason, L Schwartz, page 4.2.
[436] Appendix FF, page 32.
[437] Appendix FF, pages 55 to 57.

completed by The Brattle Group. This study indicates that BC Hydro's operating costs compare favourably to those of an appropriate peer group and it should be considered when establishing whether any stretch factor is appropriate for BC Hydro.

While the stretch factor applied to each utility may be the same or different, it is set independent of the utility's performance during the PBR term. In other words, during the PBR term, the amount of benefits shared with customers, through the stretch factor, remains the same regardless of the actual level of efficiencies achieved by the utility.

Dr. Weisman observes that any stretch factor is ultimately a judgement call and there is no consensus that it is possible to develop a stretch factor in a scientifically rigorous manner.[438] As Dr. Weisman notes, regulators have taken different approaches to determining the appropriate stretch factor:

- the Alberta Utilities Commission has concluded that there is no definitive analytical source to determine the size of a stretch factor;
- the BCUC has determined that a stretch factor is judgement based and ordered FortisBC to conduct a benchmarking study to inform its judgement; and
- the Ontario Energy Board uses benchmarking studies to evaluate the efficiency of utilities relative to their peer group, in order to inform the selection of an appropriate stretch factor.[439]

While a stretch factor attempts to forecast benefits in advance so that they can be shared with customers immediately through lower rates, an Earnings Sharing Mechanism provides a way to share actual benefits achieved with customers, during the PBR term, before rates are re-based.[440] In this sense, a stretch factor and an Earnings Sharing Mechanism both provide ways to deliver benefits to customers and

[438] Appendix FF, page 55.
[439] Appendix FF, page 55.
[440] Appendix FF, page 36.

may be considered complementary to each other or alternatives to each other.[441] If a PBR plan already includes other mechanisms to share benefits and risks during the PBR term (such as a stretch factor or a Z factor, which is discussed in section 11.3 or regulatory accounts, which are discussed in section 11.5.8), an Earnings Sharing Mechanism may not be required.[442]

A key difference between an Earnings Sharing Mechanism and a stretch factor is that while a stretch factor is set independent of the utility's performance during the PBR term, an Earnings Sharing Mechanism, by sharing actual benefits achieved, is dependent on the utility's performance during the PBR term.

An Earnings Sharing Mechanism may be a set percentage of all earnings achieved above the allowed net income or it may be triggered or adjusted at certain thresholds so that the benefits retained by the utility, prior to rates being re-based, remain within acceptable bounds.[443] The utility's share may be constant or it may increase or decrease as certain thresholds are reached.[444] As discussed in section 11.4.3, off-ramps and re-openers are another option to keep the benefits retained by the utility within acceptable bounds. An Earnings Sharing Mechanism typically takes the form of a refund or an offset to rates or allowed revenue in the subsequent year.[445]

In *Designing Incentive Regulation*, Dr. Sappington suggests that establishing a "deadband" so that an Earnings Sharing Mechanism is not triggered until earnings reach a certain threshold above or below the utility's allowed net income, is preferable to a mechanism that shares a set percentage of all earnings above or below the allowed net income. A 2015 survey commissioned by the Edison Electric

444 Schmidt, page 73.
445 Schmidt, page 77.

Institute indicates that among utilities that have an Earnings Sharing Mechanism, most have a “deadband”. [446] As Dr. Sappington explains:

> “A common form of profit-sharing establishes a band…around the target rate of return. Within that band, the firm retains all of the returns it generates. Just outside of this band, sharing occurs... A sharing scheme like this has many attributes. In the immediate range around the target rate of return, the firm faces ideal incentives to foster cost reduction. Every dollar in reduced operating costs accrues to the firm, which provides strong incentives for the firm to minimize production costs. The incentives are less strong outside of this immediate range, but some incentives still remain.” [447]

The BCUC has previously approved both a stretch factor and an Earnings Sharing Mechanism. With regards to earnings sharing, the BCUC has stated that:

> “The Panel notes that the purpose of implementing a PBR mechanism is to provide an environment where efficiencies are created through actions initiated by the utility. Accordingly, there is an expectation that all things being equal, the Fortis utilities will, over the course of this PBR, generate efficiency savings resulting in earnings which allow them to exceed the approved [return on equity]… To deny the customer the opportunity of sharing these savings would not be in their interest.”[448]

While PBR can and should benefit all stakeholders, including customers, through the discovery of new savings not previously identified under cost of service regulation,[449] Dr. Weisman cautions that distributing benefits to customers during the PBR term may prevent those benefits from being discovered in the first place.[450] As explained in his article *Is There ‘Hope’ for Price Cap Regulation?:*

---

[446] Of 25 utilities surveyed by Pacific Economics Group Research LLC, 13 have no Earnings Sharing Mechanism. Of the 12 utilities that have an Earnings Sharing Mechanism, only four do not have a “deadband”. (Alternative Regulation for Emerging Utility Challenges: 2015 Update, Pacific Economics Group Research LLC, Table 7).

[447] David E.M. Sappington, “Designing Incentive Regulation” *Review of Industrial Organization*, Volume 9, 1994, page 263.

[448] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 120 to121.

[449] Appendix FF, pages 12 to 13.

[450] Appendix FF, pages 48 to 50.

> "The key point, however, is that higher than normal earnings no longer (necessarily) imply rates that are not "just and reasonable." These higher than normal earnings may simply reflect the stronger incentives for efficient performance under price cap vis a vis earnings regulation. Should this be the case, these additional earnings would not exist but for the regulator's commitment to allow the regulated firm to be the residual claimant for its realized efficiency gains." [451]

Further as explained in *"Efficiency as a Discovery Process: Why Enhanced Incentives Outperform Regulatory Mandates":*

> "A common refrain is that because utilities have a "statutory obligation" to be efficient, any additional rewards for achieving efficient behavior through incentive regulation are unnecessary - and serve only to foster an inequitable distribution of efficiency gains between regulated firms and customers… the achievement of performance gains is first and foremost a "discovery process" in which more efficient operating practices and superior use of technology are learned over time. It is the recognition of this discovery process that leads to the conclusion that the efficiency gains realized under incentive regulation need not imply that the firm was knowingly inefficient under cost-of-service regulation. To the contrary, it is quite plausible that the firm under [cost of service regulation] was as efficient as it knew how to be."[452]

Weakening the incentives provided under PBR by incorporating an Earnings Sharing Mechanism should logically lead to a reduction in the assumed productivity improvements in the PBR formula, resulting in rates being higher than they otherwise would have been.[453] Earnings sharing may also reduce the actual efficiencies achieved under PBR, resulting in fewer actual benefits being passed on to customers through rate re-basing at the end of the PBR term.[454] Dr. Weisman notes that empirical analyses suggest that earnings sharing decreases the benefits

[451] Dennis L. Weisman, "Is There 'Hope' for Price Cap Regulation?" *Information Economics and Policy*, Volume 14(3), 2002 at 363-64.

[452] Dennis L. Weisman and Johannes P. Pfeifenberger, "Efficiency as a Discovery Process: Why Enhanced Incentives Outperform Regulatory Mandates," *The Electricity Journal,* Volume 16(1). January/February 2003, page 59.

[453] Appendix FF, pages 37 to 38.

[454] *Id*.

achieved under PBR[455] and that the Federal Communications Commission has recognized the trade-off between earnings sharing and assumed productivity improvements under the PBR formula. [456] Further, as noted in *State Performance-Based Regulation Using Multiyear Rate Plans for U.S. Electric Utilities*:

> "Some [plans] contain menus of provisions from which utilities can choose…a utility might, for example, have a choice between (1) a low [productivity] factor and an earnings sharing mechanism and (2) a higher productivity factor and no earnings sharing."[457]

By weakening the incentives to discover new efficiencies and re-establishing a link between costs and rates, PBR with earnings sharing blurs the distinction between PBR and cost of service regulation. As the former Chair of the Massachusetts regulatory Commission once observed:

> "The [Massachusetts regulatory] commission decided that earnings sharing was not appropriate because it introduces many of the cost-of-service disincentives for efficiency that price cap regulation is designed to eliminate. The commission also did not want to have to rule on the prudence of investments in an increasingly risky and speculative industry, which would have been required for an earnings calculation. Also, earning sharing would require an annual review of earnings, which the Commission thought would be a significant administrative burden."[458]

As explained in section 11.2.2, a key difference between cost of service regulation and PBR is the role of the BCUC. Under cost of service regulation, the BCUC's role is to acquire information to determine which expenditures are prudent and which expenditures are imprudent. Under PBR, the BCUC's role would be to provide a framework and allow BC Hydro to manage its expenditures within that framework

455 Appendix FF, pages 38 to 39.

457 Lowry et al., page 4.11.

458 Paul Vasington, "Incentive Regulation in Practice: A Massachusetts Case Study," *Review of Network Economics,* Volume 2(4), 2003, page 459.

without performing a detailed regulatory review that would second guess the decisions made. Dr. Weisman provides the following example which demonstrates why earnings sharing may blur this distinction:

> "A possible example of this phenomenon occurred in the aftermath of the epic floods that plagued the Midwest in the summer of 1993. After scrutinizing how Southwestern Bell allocated its resources in responding to this natural disaster, the Missouri Public Service Commission ordered cost disallowances that had the effect of moving the company's financial returns from the non-sharing range to the sharing range. These events prompted Southwestern Bell to move expeditiously across its five states with initiatives to eliminate earnings sharing from its price cap regulation plans."[459]

In other words, in the absence of an earnings sharing mechanism, the utility is assumed to have the appropriate financial incentives to make the most cost effective decisions. However, the presence of an earnings sharing mechanism may encourage second-guessing of those decisions so that the mechanism is triggered or results in a different allocation of costs. In this environment, PBR may not be distinct from cost of service regulation.

The Alberta Utilities Commission and the Ontario Energy Board have both rejected earnings sharing in favour of re-openers and off-ramps, which are discussed further in section 11.4.3. In its 2012 Decision, the Alberta Utilities Commission stated:

> "The Commission generally agrees with Dr. Weisman and Dr. Schoech that PBR plans with an [Earnings Sharing Mechanism] provide weaker incentives for efficiency gains, in part because costs and rates are no longer completely decoupled… In the Commission's view, the safeguards offered by an [Earnings Sharing Mechanism] do not outweigh the negative efficiency incentives that would be re-introduced into the PBR plan as a result of the incorporation of an [Earnings Sharing Mechanism]… Accordingly, the Commission finds that [Earnings sharing Mechanisms] as proposed by the parties, are not warranted as an additional safeguard and the disincentives

[459] Appendix FF, page 38, footnote 88.

> they will introduce are inconsistent with the objectives of PBR."[460]

Despite the economic drawbacks, sharing benefits during the PBR term may have some advantages. One potential advantage is to provide stability to the PBR plan by aligning the interests of the utility and its customers in a tangible way. [461] In other words, with earnings sharing, customers benefit from efficiencies discovered at the same time as the utility. As Dr. Weisman and Dr. Sappington observe in *Designing Incentive Regulation for the Telecommunications Industry:*

> Political support for a policy can be garnered when consumers benefit financially in direct, visible ways precisely when the regulated firm benefits, as is the case under earnings-sharing plans. Widespread political support for a policy can ensure its long-term survival and thus a continued flow of benefits to all parties. A sustained flow of moderate gains can often serve all parties better than can a short-lived spurt of particularly large gains." [462]

As Dr. Schmidt observes, striking the appropriate balance between providing incentives under PBR while assuring the stability and acceptance of the PBR plan among all stakeholders is a difficult challenge:

> "Economic theory and common sense tell us that a utility's best incentive to pursue productivity enhancing investments would be to allow the utility to retain 100 percent of the benefits of those investments. Anything less… will result in the utility foregoing some portion of what would otherwise be beneficial investments. Yet earnings sharing is a tool that can be seen to have different goals… The most challenging task faced by regulators and utilities is drawing the appropriate balance between following economic theory and these other goals."[463]

[460] Alberta Utilities Commission Decision 2012-237, Rate Regulation Initiative, Distribution Performance-Based Regulation (September 12, 2012), paragraphs 816, 818 and 822.

[461] Appendix FF, pages 36 to 37.

[462] David E. M. Sappington and Dennis L. Weisman, Designing Incentive Regulation for the Telecommunications Industry, Cambridge MA: The MIT Press, 1996, page 334.

[463] Schmidt, page 73.

Dr. Weisman observes that the economic evidence suggests that the costs of earnings sharing outweigh the benefits, but adds that some of the concerns with earnings sharing may be mitigated if it is temporary and intended to facilitate a successful transition from cost of service regulation to PBR:

> "Evaluating the various economic arguments both for and against earnings sharing, the weight of the evidence does not support including a traditional [earnings sharing mechanism] in a PBR plan. The net economic gains from replacing [cost of service regulation] with PBR that includes earnings sharing are likely to be small. Whereas regulators, consumer groups and sometimes even regulated firms may be comforted by the "safety net" that earnings sharing provides, it is the very presence of that "safety net" that undercuts the performance of PBR… The significant resources required to design and implement a PBR regime with earnings sharing would be difficult to justify when the expected benefits in terms of improved efficiency and innovation are so limited… it is conceivable that some of these concerns may be mitigated if PBR with earnings sharing is merely a transitional regulatory regime that represents an intermediate step along a dynamic path toward pure PBR… The outstanding question is whether such an intermediate step is warranted in light of the decisions of other Canadian regulatory commissions to forego earnings sharing for both electric power and telecommunications companies".[464]

Table 11-1 provides a summary of the advantages and disadvantages of stretch factors and Earnings Sharing Mechanisms.

[464] Appendix FF, pages 39 to 41.

Table 11-1 Advantages and Disadvantages of Stretch Factors and Earnings Sharing Mechanisms

	Advantages	Disadvantages
Stretch Factor	Does not weaken the incentive to find efficiencies because it is set independent of the utility's performance.	Ultimately a judgement call. No consensus that it is possible to develop a stretch factor in a scientifically rigorous manner.
Earnings Sharing Mechanism	Provides stability to the PBR plan by allowing customers to benefit from the discovery of new efficiencies at the same time as the utility. May help with the transition from cost of service regulation to PBR.	Weakens the incentives for efficiency because it re-establishes the link between rates and costs and is dependent on the utility's performance. Logically leads to a reduction in the assumed productivity improvements resulting in higher rates. May reduce the actual efficiencies achieved under PBR, resulting in fewer actual benefits being passed on to customers through rate re-basing at the end of the PBR term.

A stretch factor would maintain the distinction between PBR and cost of service regulation and would not counteract the stronger financial incentives for efficient performance that PBR attempts to provide. If an Earnings Sharing Mechanism were to be included in the PBR plan, a mechanism with a "deadband" would provide stronger incentives for efficient performance than one which shares a set percentage of all earnings above or below the allowed net income.

11.4.3 Off-Ramps and Re-Openers

Off-ramps and re-openers provide a way to intervene early, prior to rate re-basing, to adjust or reset the PBR plan, in the event that the benefits (or penalties) experienced by the utility during the PBR term, become excessive.

Re-openers provide an opportunity to investigate and modify a specific component of the PBR plan while off-ramps provide an opportunity to investigate and modify the entirety of the PBR plan, including possible termination of PBR for the utility.[465]

An off-ramp or re-opener that is triggered if a utility's earnings are above or below a certain threshold is an alternative to earnings sharing.[466] Thresholds are typically set

[465] Appendix FF, page 44 to 45.

using “basis points” where one basis point is equal to one one-hundredth of a percentage point (e.g., 100 basis points equals 1 per cent). Under this approach, if the benefits or costs realized under PBR are excessive, rather than transferring those benefits or costs to customers prior to rates being re-based, a re-opener or off-ramp can be triggered to adjust part or all of the PBR plan or to terminate the PBR plan.

Both the Alberta Utilities Commission and Ontario Energy Board favour this approach over earnings sharing during the PBR term.[467] As Dr. Weisman observes:

> “When the utility perceives that the probability of triggering these reopeners is negligible, which it will be with a sufficiently wide deadband, it will have virtually the same incentives for superior performance as if it were operating under a pure PBR regime. Nonetheless, sufficient earnings safeguards remain in place should returns diverge too far from target levels.”[468]

The BCUC has recognized the importance of balanced thresholds for triggering off-ramps or re-openers, stating:

> “With respect to the financial trigger… it should strike a balance between being high enough to incent the utility to vigorously pursue efficiencies and savings while being low enough to provide a safeguard for customers and the utility if either profits or losses become excessive”.[469]

The Alberta Utilities Commission has set its financial trigger for a re-opener at +/- 300 basis points (3 per cent) for two consecutive years or +/- 500 basis points (5 per cent) in any one year. The Ontario Energy Board has set its financial trigger at +/- 300 basis points (3 per cent). The BCUC set FortisBC’s financial trigger at

466 Appendix FF, pages 41 to 42.
467 *Id.*
468 *Id.*
469 BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 155.

+/- 150 basis points (1.5 per cent) for two consecutive years or +/- 200 basis points (2 per cent) in any one year, after accounting for 50 per cent earnings sharing.[470]

The BCUC and the Ontario Energy Board have also determined that it is appropriate to use off-ramps or re-openers to address unacceptable performance levels,[471, 472] however, the Alberta Utilities Commission has determined that it has appropriate tools to address service quality performance issues and that a degradation in service quality should not trigger a re-opener or off-ramp.[473]

BC Hydro believes that both financial and service quality triggers are appropriate. With respect to financial triggers, we agree with the BCUC that a balance should be struck between being high enough to incent the vigorous pursuit of efficiencies and being low enough to provide a safeguard against excessive profits or losses. If this balance is struck, using off-ramps or re-openers rather than an Earnings Sharing Mechanism, to keep earnings within acceptable bounds would maintain the distinction between PBR and cost of service regulation and would not counteract the stronger financial incentives for efficient performance that PBR attempts to provide.

We believe that the appropriate financial and performance triggers for BC Hydro should be determined through a PBR application process.

11.5 Managing Capital and Other Costs Under PBR

As discussed in section 11.3.1, a PBR plan may have "adders" to the formula or "carve outs" from the formula that all interact to determine how costs are managed. It is critically important for the assumed productivity improvements in the PBR formula to reflect the capital investment requirements of the utility and for the "adders" or "carve outs" to appropriately capture expenditures that are not covered by the PBR formula, without becoming excessive.

There are inherent trade-offs with any approach. PBR aims to provide the utility with stronger incentives to discover new efficiencies and increased autonomy from detailed regulatory reviews, but the revenue cap set by the PBR formula may not adequately fund all of the utility's expenditures. "Adding" to the formula or "carving out" certain costs from the formula may provide more adequate funding for necessary investments. When costs are "carved out", the BCUC and interveners may have more ability to review those expenditures; however, the incentives and discretion provided by the PBR plan are decreased, which could limit the incremental efficiencies achieved.

Although the BCUC has asked BC Hydro to specifically discuss how capital spending could be managed under PBR, the discussion below addresses a number of our cost components as similar issues and trade-offs exist in a number of areas.

Table 11-2 provides a summary of this discussion, indicating the cost components that could likely be managed through the PBR formula, potentially with some "adders" or "carve outs" as well as cost components that may need to be "carved out" entirely.

Table 11-2 Management of Various Cost Components under a PBR Plan

Likely subject to PBR formula with some "adders" or "carve outs"	Various options – approach best determined through PBR application process	Likely "carved out" from the PBR formula entirely

		Taxes
		Finance Charges
		Demand Side Management
		Revenues and Subsidiary Net Income

11.5.1 Capital Expenditures

BC Hydro's capital expenditures include power system growth, redevelopment, dam safety, and sustaining expenditures along with technology, properties and fleet investments. Capital expenditures do not impact rates until a capital project is placed in service and becomes a capital addition, and the expenditure is amortized.

Our infrastructure is aging, requiring ongoing investments to maintain the safety and reliability of the electricity system. In addition, we must meet growing local, regional and system-wide demands from our customers as well as increased customer service expectations and changing technology requirements. To meet these requirements, we prepare an annual Capital Plan, which provides guidance and constraints for bottom-up capital planning.

The following issues would need to be carefully considered when designing an approach to capital expenditures under PBR for BC Hydro:

- Scope - Capital investment requirements can change significantly within a short timeframe due to project investigation work, market conditions, resource availability and scheduling, engagement with stakeholders and changing regulatory and environmental requirements;
- Asset Health – Historical capital expenditures are not an accurate predictor of future capital expenditures as future requirements are driven by asset health

and where assets are in their lifecycle. As explained in *State Performance-Based Regulation Using Multiyear Rate Plans for U.S. Electric Utilities*:

> "…in the short to medium run a utility's productivity growth is driven by the position of the utility in the cycle of asset replacement. Productivity growth will be slower to the extent that the need for replacement [capital expenditures] is large relative to the existing stock of capital."[474]

- Risk – If short-term asset replacements are deferred due to insufficient funding, increased costs and risks will develop over the long-term; and
- Customer Demand – BC Hydro has an obligation to serve all customers.

In support of their *Next Generation PBR Plan* which was filed in 2016 with the Alberta Utilities Commission, EPCOR commissioned Dr. Sappington and Dr. Weisman to review options for the treatment of capital expenditures in PBR plans. In their report titled *Assessing the Treatment of Capital Expenditures in Performance-Based Regulation Plans*, which is included as Appendix GG, Dr. Sappington and Dr. Weisman identified seven potential PBR-based options. The plans range from "carving out" all capital expenditures from the PBR formula and conducting a cost of service based review to including all capital expenditures within a PBR formula. A number of in-between options are also explored with trade-offs between the incentives provided, the degree of regulatory oversight and the level of certainty that funding will be sufficient to support the required investment.

The BCUC has previously recognized the potential consequences of "carving out" excessive amounts of supplemental capital, stating:

> "In the Panel's view, the more capital excluded from formula spending, the fewer benefits of PBR accrue to ratepayers and shareholders alike. Excluding significant amounts of capital reduces the ability of the utility to achieve operational efficiencies. However, it also provides opportunities for a utility

[474] Lowry et al., page B.10.

> to game the system such as by combining smaller projects into larger projects that will be excluded from the formula."[475]

Dr. Weisman also cautions that a PBR plan which "carves out" all capital expenditures from the PBR formula may encourage inefficient capital-labour substitution.[476] For example, capital upgrade projects could replace more cost effective operating maintenance programs.

While a broad and inclusive approach to capital may be preferable, the BCUC has also determined that a less inclusive approach may be appropriate in certain circumstances, stating:

> "By applying the formula driven spending envelope to smaller capital projects only, and providing for funding of larger capital projects outside of the formula, there is less risk of needed projects being underfunded. In addition, this approach also mitigates the risk of lumpy capital spending patterns by excluding any projects that are large enough to potentially distort the amount of formula spending and result in gains or losses to either ratepayers or shareholders."[477]

Dr. Sappington and Dr. Weisman evaluated each potential approach to managing capital expenditures based on the degree to which it:

- Avoided elements of traditional rate of return regulation and provided strong incentives for efficiency;
- Provided sufficient funding for required capital investments in a comprehensive and principled manner; and
- Was simple, transparent, and reduced the regulatory burden for all parties relative to cost of service regulation.

[476] Appendix FF, page 46

[477] BCUC, FortisBC Energy Inc. and FortisBC Inc. Multi-Year Performance Based Ratemaking Plans for 2014 through 2019 Approved by Decisions and Orders G-138-14 and G-139-14 Capital Exclusion Criteria under PBR – Compliance Filing, page 7 to 8.

Table 11-3 provides a summary of this evaluation.

Table 11-3 Assessing the Treatment of Capital Expenditures in PBR Plans

Option	Strong Incentives	Sufficient Funding	Reduced Regulatory Burden
A. Operating costs are subject to PBR but capital costs are subject to cost of service regulation with a mid-term update.	No	Yes	No
B. Same as A but no mid-term update.	No	Yes	No
C. All costs subject to PBR with a "K" factor adjustment to reflect the costs of unique lifecycle replacement projects or projects required by external parties as well as projects inadequately funded by the PBR formula. Projects included in the "K" factor must exceed a non-aggregated materiality threshold. A true-up between forecast and actual capital costs occurs for "K" factor projects only.	Possibly	Yes	Possibly
D. Same as C but the "K" factor does not include projects inadequately funded by the PBR formula and the materiality threshold is aggregated.	Possibly	No	Possibly
E. All costs subject to PBR with a "F" factor adjustment to reflect the extent to which the PBR formula is insufficient for required capital investments and a "K" factor adjustment to reflect unique lifecycle replacement projects or projects required by external parties. The "F" factor adjustment is set at the beginning of the PBR term and does not change while the "K" factor can be trued up annually to reflect actual capital costs.	Yes	Possibly	Yes
F. Same as E but the "K" factor is not trued up annually. Rather, a mid-term review, limited to unique lifecycle replacement projects that were not known at the start of the PBR term, is conducted to determine the required "K" factor adjustment.	Yes	Possibly	Yes

Option	Strong Incentives	Sufficient Funding	Reduced Regulatory Burden
G. All costs subject to PBR but the “X” factor (productivity factor) for capital is determined based on a moving average of the company’s historical capital expenditures. No “F” or “K” factor adjustments are permitted unless corrections are required in response to unforeseeable “Z” factor events.	Possibly	No	Yes

Table 11-3 and Appendix GG provide an indication of the relative merits of each approach. We have not attempted to evaluate which of these options may be most appropriate for the management of capital expenditures under a PBR plan for BC Hydro. This evaluation should be conducted through a PBR application process.

The best way to manage capital expenditures under a PBR plan may be to adopt different approaches for different types of capital expenditures. As Dr. Weisman observes:

> “The specific attributes of each element of production may give rise to either a different form of PBR (price caps versus revenue caps) or specific design attributes for the PBR regime. For example, generation is typically characterized by more “lumpy” capital investments and this may require special provisions for capital within the PBR regime (e.g., capital trackers). Conversely, the generally smoother investment profiles commonly associated with transmission and distribution elements may allow for a more limited scope of special provisions for capital in the PBR regime.” [478]

The Alberta Utilities Commission has revised the extent to which special provisions like “adders” or “carve outs” are necessary to accommodate transmission capital expenditures within a PBR plan.

In 2009, the Alberta Utilities Commission approved a formula-based ratemaking plan (similar to PBR) for Enmax, which included transmission expenditures, stating:

[478] Appendix FF, page 30

> "The Commission agrees… that [a PBR] mechanism is not as well suited to transmission in Alberta as it is to distribution. Nevertheless, the Commission considers that it is in the public interest to approve an incentive regulation plan for transmission in order to promote efficiency of operations and efficiency of the regulatory process. The Commission has recognized some of the effects of the structure of the regulatory framework for transmission in determining the X factor. The structure of the regulatory framework for transmission also requires specific adjustments in [a PBR] plan to recognize capital additions each year." [479]

However, in 2012, Enmax applied to re-open the plan for its transmission function as its return on equity was below the established threshold. In its 2014 Decision on this application, the Alberta Utilities Commission stated:

> "Accordingly, the Commission finds that the significant increase in capital additions beginning in 2010 was the event that triggered the re-opener. Following… the increase in capital additions, the [growth] factor was unable to achieve its intended objective of allowing for the recovery of the revenue requirement related to the transmission capital expenditures made by ENMAX during the [plan] term that exceed the revenue available from rate increases permitted under the I-X mechanism." [480]

Finally, in 2012, the Alberta Utilities Commission denied a proposal by EPCOR to include transmission services in its PBR plan, opting instead to continue to regulate transmission under cost of service regulation.[481] However, Dr. Weisman notes that this decision may be re-visited in the future.[482]

It may also be appropriate to adopt a different approach for managing generation, transmission or distribution capital expenditures that are approved through processes that are separate from the PBR plan. Currently BC Hydro must obtain a

[479] Alberta Utilities Commission Decision 2009-035, Enmax Power Corporation, 2007-2016 Formula Based Ratemaking (March 25, 2009), paragraph 222.
[480] Alberta Utilities Commission Decision 2014-100, Enmax Power Corporation Formula-Based Ratemaking Transmission Tariff Re-opener (April 15, 2014), paragraph 54.
[481] Alberta Utilities Commission Decision 2012-237, Rate Regulation Initiative, Distribution Performance-Based Regulation (September 12, 2012), paragraphs 68 to 74.
[482] Appendix FF, page 30.

separate Certificate of Public Convenience and Necessity (**CPCN**) for significant system extensions. BC Hydro also seeks acceptance of capital expenditure schedules under section 44.2 of the *Utilities Commission Act* for many other large capital investments.[483] The BCUC has previously rejected the idea of aligning CPCN criteria with the criteria to establish which capital expenditures should be "carved out" from the PBR formula, stating:

> "…the use of [Certificate of Public Convenience and Necessity] criteria as an exclusion criterion for the PBR formula is arbitrary. Further, the CPCN requirements do not differentiate between routine capital projects and projects that are not routine. Therefore, they are not a good indicator of the exogenous nature of the capital project." [484]

BC Hydro agrees that criteria established for one purpose cannot be arbitrarily used for another purpose. However, it may be appropriate to consider how criteria may be aligned to allow for a specific "adder" or "carve out" within a PBR plan for projects that have obtained a CPCN. In the absence of a specific mechanism, a project may be approved through a CPCN proceeding and subsequently captured within the PBR formula. The PBR formula may produce a rate adjustment that is not sufficient to fully fund the cost of that project. Conversely, a project may be considered in determining the productivity factor for the PBR formula and then not proceed because it was not approved in a separate proceeding. In this case, the funding envelope produced by the PBR formula may be too large.

11.5.2 Cost of Energy

BC Hydro's Cost of Energy are largely uncontrollable and we expect that it may be appropriate to "carve out" the cost of energy from the PBR formula.

BC Hydro's costs of energy include:

- Water rentals;

[483] BC Hydro Initial Proposal, Review of the Regulatory Oversight of Capital Expenditures and Projects, page 1.
[484] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 171.

- Market electricity purchases;
- Natural gas for thermal generation;
- Domestic transmission costs;
- Columbia River Treaty Related Agreements;
- Water rental remissions;
- Independent Power Producers (**IPPs**) and Long-Term Commitments
- Costs to supply Non-Integrated Areas;
- Gas and other transportation costs;
- Market electricity purchases;
- Surplus sales; and
- Net Purchases (Sales) from Powerex.

Water rentals are set by the *Water Sustainability Act* and are similar to taxes in that government sets the rental rates and receives the rental revenues. The generation of energy subject to water rentals is also based on a number of non-controllable factors such as water inflows, storage availability and system load requirements.

Market electricity purchases are determined by forward market prices and purchase volume. BC Hydro is generally a price-taker on any market purchases and the amount of market energy that we acquire is influenced by a number of volatile factors such as weather and water inflows.

Natural gas commodity costs to supply our thermal generating facilities are based on system load requirements, gas volumes and market commodity prices which are beyond our control.

Domestic Transmission costs include costs associated with surplus sales as well as our obligations under the Skagit Valley Treaty. Costs related to Columbia River

Treaty Agreements, Surplus Sales and Remissions represent offsets to our energy costs and are not directly controllable by BC Hydro.

Costs related to IPPs and Long-Term Commitments are generally long term supply contracts with established prices and fixed take or pay terms. As discussed in our Previous Application and in Chapter 4, section 4.3.2 of this application, we have taken a number of steps to manage the volume and costs of our IPP commitments.[485] However, further cost reduction opportunities are limited as government directions have mandated cost recovery in rates for most energy supply contracts.

BC Hydro also incurs costs to supply non-integrated areas, including IPP supply costs and costs to provide service through diesel generation. IPP supply costs are generally fixed and diesel fuel costs are determined by the spot fuel market where BC Hydro is a price-taker.

Based on the issues discussed above, we expect that it may be appropriate to “carve out” the cost of energy from the PBR formula and have those costs flow directly to rates through the “Y” factor.

11.5.3 Operating Costs

As discussed in section 5.5.1 of this application, BC Hydro considers base operating costs to be the key measure for the assessment of our overall operating costs.[486] The operating costs that are excluded from base operating costs vary significantly from year to year and we expect that it would be appropriate to include those costs in the “Y” factor. Therefore, the remainder of this section is focused on base operating costs.

[485] BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, section 1.5.6.

[486] Base operating costs are defined as “personnel, materials and external services expenses included in income that are incurred in the day to day operating of BC Hydro’s electric utility, net of recoveries, capitalized costs and reclassification adjustments.” Further information is provided in Chapter 5, section 5.5.1.

Labour costs account for approximately 52 per cent of total base operating costs, services approximately 42 per cent, and materials and supplies approximately 6 per cent. If PBR were adopted for BC Hydro, the labour cost index used to help determine the inflation factor would need to recognize that BC Hydro is subject to the bargaining mandate for the broader public sector as determined by the British Columbia Public Sector Employers Association.

As discussed in our Previous Application, BC Hydro has already taken significant steps to reduce its base operating costs under cost of service regulation[487] and as a result, opportunities for further reductions may be limited.

In addition, some base operating costs are beyond our control and would likely need to be included in a "Y" factor. Some examples include:

- Storm restoration costs;
- Regulatory compliance costs (e.g., Mandatory Reliability Standards and North American Electric Reliability Corporation Critical Infrastructure Protection);
- Mandatory memberships (e.g., Western Electricity Coordinating Council);
- Employer taxes such as the employer health tax or the Canada Pension Plan premium; and
- Current service pension costs.

In addition, there are some cases where operating costs would need to be adjusted for one-time events or increases through a "Z" factor. Some examples include:

- New regulatory compliance costs (e.g., new WorkSafe BC requirements or new environmental standards); and
- Significant weather events.

[487] BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, sections 1.5.2 and 1.6.1.5.

11.5.4 Taxes

BC Hydro pays school taxes, taxes related to energy purchase agreements that are classified as capital leases for accounting purposes, and grants-in-lieu to municipal, regional district and local governments.

School taxes are based on assessed property values and tax rates established by government. Grants-in-lieu are based on assessed property values as well as revenue grants equal to 1 per cent of gross revenue from domestic energy sales, which are based on forecast sales revenue increases. We expect that these costs will increase much faster than inflation in the future. Given this and the fact that these costs are uncontrollable, we expect that it would be appropriate to include all taxes within the “Y” factor.

11.5.5 Finance Charges

Finance charges reflect the cost of BC Hydro’s debt portfolio, and are primarily composed of interest charges on debt, excluding sinking fund income, charges capitalized to unfinished construction, and interest allocated to regulatory accounts.

Interest costs are heavily influenced by the nature of our debt portfolio, long and short term interest rates and Canada/US exchange rates.

As discussed in our Previous Application, BC Hydro has implemented a debt management strategy, which aims to lock in interest rates by entering into future debt hedges to mitigate interest rate risk. Any gains or losses from future debt hedges are recorded in the Debt Management Regulatory Account and amortized into rates over the remaining term of the associated long-term debt issuances.[488]

As discussed in section 11.3, an inflation index may use forecast values, forecast values with a “true-up” or actual values from the previous year. The selected approach under a PBR plan for BC Hydro would need to recognize that actual interest rates have varied significantly from forecast interest rates in recent years. If

[488] BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, section 7.5.13.

the inflation index is not based on actual values or does not include a “true-up” mechanism, we expect that finance charges would need to be “carved out” from the PBR formula through the “Y” factor to avoid the potential for significant gains or losses to BC Hydro if there continues to be a large difference between actual and forecast interest rates.

In addition, as BC Hydro’s overall debt is influenced by its amount of capital expenditures, we expect that if some or all capital expenditures are “carved out” from the PBR formula, finance charges may need to be “carved out” as well.

11.5.6 Demand Side Management

BC Hydro has undertaken a broad range of demand side management programs over the past 25 years. These programs help our customers reduce their energy consumption and save money, while also reducing our need to acquire new energy supply resources. While there are a range of options to manage demand side management expenditures under a PBR plan, the most common approach is to “carve out” these expenditures from the PBR formula.

BC Hydro’s demand side management plan is influenced by government policy and legislation. For example, the Demand- Side Measures Regulation under the *Utilities Commission Act* defines measures that we are required to undertake for our demand side management plan to be considered adequate and also provides detailed guidance on how the cost-effectiveness of demand side management measures is to be determined.

In addition, government sets policy targets for demand side management, such as the *Clean Energy Act* objective to reduce the expected increase in demand for electricity by the year 2020 by at least 66 per cent.

Under section 44.2 of the *Utilities Commission Act*, BC Hydro may apply to the BCUC for a public interest acceptance of demand side management expenditures by filing a demand side measures expenditure schedule. The BCUC may accept or reject BC Hydro's proposed expenditure schedule but cannot modify programs or require a specific level of spending.

Demand side management expenditures are deferred to the Demand Side Management Regulatory Account and amortized into rates over a 15-year period. As explained in Chapter 10 of our Previous Application, we reduced our demand side management expenditures and eliminated or revised programs that were not cost effective, to take pressure off rates and to reflect reduced forecast system needs.

The BCUC issued the following directives with regards to demand side management in its Decision on our Previous Application:[489]

- Directive 20 accepted BC Hydro's proposed demand side management expenditure schedule;
- Directive 21 recommended that BC Hydro consider more targeted programs directed at residential customers in the next demand side management application; and
- Directive 23 directed BC Hydro to provide an update on how concerns raised regarding demand side management for Non-Integrated Areas have been addressed in its next demand side management application.

Including demand side management expenditures within a PBR formula may run counter to Directives 21 and 23 and to the adequacy requirements as set out in the Demand Side Measures Regulation. Programs developed to broaden access or target specific customer groups may be less cost effective than other opportunities available to BC Hydro. As a result, including demand side management expenditures within the PBR formula could incent adjustments that limit, rather than expand, customer access to demand side management programs.

[489] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 117.

In addition to traditional demand side management, BC Hydro has recently been exploring low carbon electrification programs. These programs support the reduction of greenhouse gas emissions by encouraging the use of electricity instead of more carbon intensive fuels. Low carbon electrification expenditures, meeting requirements under the *Greenhouse Gas Reductions Regulation* under the *Clean Energy Act*, are considered to be prescribed undertakings.[490] The *Clean Energy Act* requires the BCUC to set rates that allow for cost recovery of prescribed undertakings.[491]

The options to manage demand side management spending within a PBR plan are similar to the options to manage capital expenditures with the same inherent trade-offs between the incentives provided, the degree of regulatory oversight and the level of certainty that funding will be sufficient to support the desired investments. While Table 11-3 provides a wide range of options, an approach similar to options A or B, where demand side management expenditures are completely "carved out" of the PBR formula, appears to be the most common approach.[492] This is also the approach that the BCUC has adopted for FortisBC.[493] Accordingly, we expect that it would be appropriate to "carve out" demand side management expenditures from the PBR formula.

11.5.7 Revenues and Subsidiary Net Income

As outlined in Chapter 8 of this application, BC Hydro receives miscellaneous revenues, inter-segment revenues, revenue from other utilities and net income from its subsidiaries Powerex and Powertech. [494] These items are uncontrollable and we expect that it would be appropriate to capture them through the "Y factor."

490 Greenhouse Gas Reduction Regulation, section 4.
491 *Clean Energy Act*, section 18.
492 A survey by IndEco Strategic Consulting and Navigant Consulting canvassed 12 leading jurisdictions across North America and found that none of them included demand side management as part of the PBR formula. (DSM in North American gas utilities, IndEco Strategic Consulting and Navigant Consulting, page 6).

494 BC Hydro, Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, pages 8-11 and 8-12.

11.5.8 Regulatory Accounts

The BCUC's guidelines identify four situations where it is appropriate to use regulatory accounts:[495]

- To capture the variance between forecast costs or revenues and actual costs or revenues (variance accounts);
- To defer recovery of costs to a future period, when the benefits of those cost are realized, if they provide long-term benefits to current and future ratepayers (benefit matching accounts);
- To mitigate rate shock resulting from the impact of large forecast one-time items or resulting from forecast overall general rate increases or to reduce rate volatility (rate smoothing accounts); and
- To recover or refund certain uncontrollable costs or revenues that materialize after the occurrence of an unforeseeable event (retroactive expense account);

The BCUC's guidelines also recognize that there may be other situations that require a regulatory account. BC Hydro has two types of accounts that fall into this category:[496]

- Non-cash provision accounts: To recognize a non-cash provision in order to create a regulatory asset to match an accounting liability that is required under the accounting standards, prior to the actual expenditure of funds; and
- IFRS transition accounts: To defer the impact of a required change in the accounting treatment of costs to ensure proper recovery of those costs in rates.

The existing balances in BC Hydro's regulatory accounts should not be subject to a PBR formula because they represent past costs and their recovery in rates is required by Direction No. 8 to the BCUC. BC Hydro has no ability to find further

[495] BCUC Regulatory Account Filing Checklist (May 3, 2017).
[496] BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, pages 7 to 9.

efficiencies on costs that have already been incurred. Accordingly, the amortization of existing balances from BC Hydro's regulatory accounts should remain unchanged and flow into rates through the "Y factor."

With regards to the future use and amortization of regulatory accounts, the adoption of PBR would not change the period of time over which the benefit of a particular service or asset accrues to ratepayers, the requirement for loss provision liabilities or the potential for non-controllable financial impacts from a change in the accounting standards applicable to BC Hydro. Therefore, BC Hydro expects that there would be no reason to consider changes to its benefit matching accounts, non-cash provision accounts or IFRS transition accounts under PBR.

With regards to BC Hydro's variance accounts, these accounts reflect examples of appropriate "Y" factor costs, as discussed throughout section 11.5. There are various recovery mechanisms and periods in place for these accounts. In its Decision on FortisBC's 2014 to 2018 PBR Application, the BCUC noted that there must be a mechanism to manage variances between forecast and actual costs captured by the "Y" factor but determined that regulatory accounts are not necessarily required in all cases as small variances could be "trued-up" each year without a significant rate impact.[497] BC Hydro does not believe that the adoption of PBR should prompt a change to recovery mechanisms or periods and that opportunities to "true-up" small variances on an annual basis are best explored within a PBR application process.

BC Hydro does not currently have any retroactive expense regulatory accounts. Under a PBR plan, any unforeseeable costs or revenues would be captured by a "Z" factor and if those costs or revenues were to be recovered in rates over a period longer than one year, a retroactive expense regulatory account may be required.

[497] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), pages 107 to 109.

With regards to rate smoothing, as part of the Comprehensive Review, BC Hydro ceased using the Rate Smoothing Regulatory Account at the end of the third quarter of fiscal 2019. BC Hydro is not proposing to smooth rates over the fiscal 2020 to fiscal 2021 test period and is requesting BCUC approval to close the Rate Smoothing Regulatory Account.

11.6 Monitoring the PBR Plan

In response to the BCUC's request, this section provides a list of potential key performance indicators to assist BC Hydro and the BCUC to evaluate progress during the PBR term as well as a proposed Annual Review process.

11.6.1 Potential Key Performance Indicators

In its Decision on FortisBC's 2014 to 2018 PBR Application, the BCUC determined that earnings must be linked to the achievement of key performance indicators (also referred to as service quality standards) so that there are consequences if efforts to discover further efficiencies result in failure to achieve reasonable performance. Specifically, the BCUC stated:

> "The PBR is being approved with incentives for the utility to create efficiencies and reduce unnecessary cost. However, if [operating and maintenance costs] and maintenance capital are too tightly constrained this may result in a degradation of key service level areas. Therefore, the Panel considers that incentives related to reducing costs and creating efficiencies need to be counter balanced to ensure this occurs without a degradation of service levels as measured by [service quality indicators]." [498]

[498] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 133.

The BCUC also determined that service quality indicators must be balanced and fully reflect the obligations legislated under the *Utilities Commission Act* to provide "reasonable, safe, adequate and fair service."[499]

BC Hydro's Service Plan has 12 performance metrics which correspond to four goals around safety, reliability, affordability and clean energy. These performance metrics are developed in consultation with the Government of B.C. and approved by BC Hydro's Board of Directors.

In its Decision on FortisBC's 2014 to 2018 PBR Application, the BCUC set out 10 Approved Service Quality Indicators for the electric utility in Table 2.26.[500] Of these 10 indicators, five identical or similar metrics are already contained within BC Hydro's Service Plan (All Injury Frequency Rate, Customer Satisfaction Index, System Average Interruption Duration Index, System Average Interruption Frequency Index and Key Generating Facility Forced Outage Factor). The remaining five metrics are focused on emergency response and customer service.

Additional key performance indicators focused on customer service and emergency response may be appropriate for BC Hydro. With regards to customer service metrics, BC Hydro internally tracks both First Contact Resolution and Telephone Service Factor. However, Billing Index and Meter Reading Accuracy would not be appropriate key performance indicators as the installation of smart meters means that BC Hydro is at nearly 100 per cent on both of these metrics. A more appropriate metric may be per cent of bills issued on actual reads, which is already reported to the BCUC on a quarterly basis through our Summary Report of Customer Complaints and Consecutive Estimates.

BC Hydro's Service Plan contains additional metrics compared to those approved for FortisBC. We believe that the Progressive Aboriginal Relations Designation, Project

[499] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), pages 142 to 143.

[500] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 147.

Budget to Actual Cost, Zero Fatality and Serious Injury and Timely Completion of Corrective Actions metrics would also be appropriate to evaluate progress during the PBR term.

The Affordable Bills, Clean Energy and Energy Conservation Portfolio metrics would likely not be appropriate for evaluating progress during the PBR term. With regards to the Affordable Bills metric, a PBR plan would already provide incentives to discover efficiencies to achieve competitive rates and as explained above, key performance indicators are meant to counterbalance these incentives, not reinforce them. With regards to the Clean Energy and Energy Conservation Portfolio metrics, the *Clean Energy Act* already contains legislative requirements with regards to energy generation and conservation. A key performance indicator would not provide any additional incentive to meet these objectives relative to the existing legislative requirements.

11.6.2 Annual Review Processes

In its Decision on FortisBC's 2014 to 2018 PBR Application, the BCUC set out an Annual Review process that would include:[501]

- An evaluation of the PBR Plan and identification of deficiencies and concerns with recommendations to address;
- A review of current year projections and upcoming year forecasts;
- Identification of efficiency initiatives that require a payback period extending beyond the PBR plan and whether these initiatives should be captured through an Efficiency Carry-Over Mechanism;[502]
- A review of unforeseen events that should be put to the BCUC for decision on exclusion (through the "Z" factor); and

501 BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 179-180.

502 Refer to related discussion in section 11.3.2 of this report.

- A review of performance on key performance indicators and identification of any key performance indicators that should be reviewed.

We believe that the above scope is appropriate and that a similar Annual Review process would be suitable for BC Hydro.

11.7 Implementing a PBR Plan

The BCUC has asked BC Hydro to consider an implementation timetable for a PBR plan including a proposed schedule of consultation with representatives of key customer groups and BCUC staff.

Dr. Schmidt cites Edison Electric Institute's *Performance-Based Regulation: Design and Implementation Strategies* to provide the following guidance regarding the implementation of a PBR plan:

> "Do not expect the PBR process to be quick or routine. The process of change is not simple or easy. Utilities have found that their first PBR case involved a tremendous amount of regulatory work. The initial PBR case can look very much like a full-blown general rate case with a full cast of intervenors."[503]

11.7.1 Potential Implementation Timetable

BC Hydro has filed a cost of service Revenue Requirements Application for fiscal 2020 and fiscal 2021. BC Hydro suggests that the BCUC provide its decision on the adoption of PBR for BC Hydro in its decision on this Revenue Requirements Application.

As discussed further in section 11.8 below, we believe that BC Hydro should continue to be regulated through cost of service regulation at this time.

However, if the BCUC decides to adopt PBR for BC Hydro, following this Revenue Requirements Application proceeding, BC Hydro could file a proposed PBR plan, using fiscal 2021 as the base year, by February 2021. This timeline would provide

[503] Schmidt, page 105.

approximately one year, following the BCUC's decision on BC Hydro's Revenue Requirements Application, to develop a PBR plan and conduct consultation with customer groups and BCUC staff.

11.7.2 Proposed Consultation Approach

There are many significant and complex issues that will inform whether PBR is adopted for BC Hydro and how a PBR plan is designed. Given the nature and importance of these issues, we believe that extensive consultation with customer groups and BCUC staff would be required to identify concerns, opportunities and potential solutions.

A potential approach would be to adopt a consultation process similar to the one used to inform our 2015 Rate Design Application. BC Hydro could conduct topic-specific workshops, including information presentations and a question and answer session. The following topics may be appropriate for dedicated workshops:

- PBR Principles – to establish common objectives that all parties hope to achieve from the transition from cost of service regulation to PBR;
- PBR Framework – including whether BC Hydro's PBR plan should be a price cap or a revenue cap, if a hybrid approach is appropriate, the criteria for uncontrollable (Y) and unforeseen (Z) factors, potential key performance indicators to monitor progress and the appropriate Annual Review process;
- Creating and Sharing Benefits Under PBR – including the length of the PBR term and the appropriate application of efficiency carry-over mechanisms, stretch factors, an earnings sharing mechanisim and off-ramps and re-openers; and
- Managing Capital and Other Costs Under PBR – including how capital spending and other cost components should be managed under the PBR plan and the appropriate trade-offs between the incentives provided, the degree of

regulatory oversight and the level of certainty that funding will be sufficient to support the required investment.

In addition to the workshops, BC Hydro could use the following process to obtain and consider feedback. Based on previous experience, two to three months would be required to complete the full cycle for each workshop topic:

- Materials, including the presentation and any background or supporting information, would be circulated in advance of each workshop;
- Workshop summary notes, including stakeholder questions and BC Hydro initial responses, would be posted in draft to an external website for access by participants;
- Stakeholders would provide written comments for consideration by BC Hydro and all participants; and
- BC Hydro would prepare consideration memos for each workshop to summarize feedback received and how that feedback was considered and used to develop or narrow alternatives.

Some interveners have previously expressed reservations about the adoption of PBR in British Columbia and for BC Hydro.[504] In its Decision on FortisBC's 2014 to 2018 PBR Application, the BCUC stated:

> "Regardless of the method chosen, to be successful over the longer term, the parties need to feel that their concerns are heard and where reasonable, acted upon." [505]

BC Hydro believes that a negotiated settlement process to identify areas of common agreement prior to BC Hydro's submission of a proposed PBR plan may help to secure intervener and stakeholder support for elements of a proposed PBR plan.

[504] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 10-15 and BC Hydro Review of the Regulatory Oversight of Capital Expenditures and Projects Workshop Transcript (May 23, 2018), pages 69 to 72.

[505] BCUC Decision, FortisBC Inc. Multi-Year Performance Based Ratemaking Plan 2014-2018 (September 15, 2014), page 15.

Negotiated settlements have been successful in British Columbia in the past.[506] In addition, in their summary paper titled *Negotiated Settlements: The development of legal and economic thinking*, Dr. Joseph Doucet and Dr. Stephen Littlechild[507] identify a number of advantages to this approach.

For example, as explained in *Nonunanimous settlement of public utility rate cases: a response*, a negotiated settlement process may identify better solutions than a traditional regulatory process:

> "…the settlement process permits solutions that the regulatory agency itself, constrained by statute, may *not* be able to pursue… the flexibility inherent in the settlement process may be by far the most telling ground for its encouragement…"[508]

Further, as explained in *Democracy and Regulation: How the Public can Govern Essential Services*, a negotiated settlement may produce a more acceptable outcome:

> "[W]hen the regulator makes the decisions, everyone loses something, and the parties have no control over what they lose. In the negotiation process, each party chooses which among the many points it is willing to lose in order to gain something else. Although this may sound like a distinction without a difference, in fact, the trade-offs arrived at voluntarily are much more stable and effective. Negotiated settlements are actually more democratic because all parties participate in the decision. As a result the terms are more likely to be implemented with enthusiasm and effectiveness than if they had been imposed from above by a regulator. Furthermore, in an atmosphere of

[506] BCUC Decision, BC Hydro Fiscal 2011 Revenue Requirements Application, Appendix FF, Order No. G-180-1, pages 4 and 7 and BCUC Decision, FortisBC Energy Utilities 2012-2013 Revenue Requirements and Rates Application, pages 21 to 22.

[507] Dr. Littlechild is widely regarded as the pioneer of performance based regulation in the United Kingdom. In 1983, he authored a report to the Secretary of State for Industry entitled "Regulation of British Telecommunications' Profitability" which is often referred to as "The Littlechild Report."

[508] Buchmann, A.P., Tongren, R.S., 1996. Nonunanimous settlement of public utility rate cases: a response. Yale Journal of Regulation 13, page 343.

> trust and negotiation, more information is freely shared, with the result that more comprehensive solutions can be developed."[509]

Lastly, as Dr. Doucet and Dr. Littlechild observe, a negotiated settlement process may foster trust and collaboration:

> "Settlements have also provided a new forum of collaboration and increased value creation between pipelines and their customers. Observers and participants are in no doubt that this could not have occurred under the traditional litigated approach to utility regulation."[510]

11.8 BC Hydro Should Continue to be Regulated Through Cost of Service Regulation

In sections 11.3 to 11.7 above, BC Hydro has provided its initial conclusions in response to the issues raised by the BCUC. This provides a framework for a PBR plan, should the BCUC decide to adopt PBR for BC Hydro. However, for the following four reasons, we believe that BC Hydro should continue to be regulated through cost of service regulation at this time.

11.8.1 Cost of Service Regulation Should Be Given Time to Work

First, after years of significant limitations on the BCUC's jurisdiction over BC Hydro, cost of service regulation should now be given the opportunity to work.

As shown in Table 11-4 below, through various directions, the Government of B.C. has historically limited the BCUC's oversight of BC Hydro. Government directions have, for all practical purposes, determined rates in recent years.

509 Palast, G., Oppenheim, J., MacGregor, T., 2003. Democracy and Regulation: How the Public can Govern Essentla Services, page 96.

510 Doucet, Joseph and Littlechild, Stephen. Negotiated settlements: The development of legal and economic thinking. Utilities Policy 14 (2006), page 274.

Table 11-4 BC Hydro Revenue Requirement Proceedings and Government Directions

Revenue Requirement Proceeding	Government Direction	Outcome
Fiscal 2005 to Fiscal 2006		BCUC Decision (Order No. G-94-06)
Fiscal 2007 to Fiscal 2008		Negotiated Settlement Agreement (Order No. G-143-06)
Fiscal 2009 to Fiscal 2010		BCUC Decision (Order No. G-16-09)
Fiscal 2011		Negotiated Settlement Agreement (Order No. G-180-10)
Fiscal 2012 to Fiscal 2014	Direction 3	Rates set by Direction 3 (Order No. G-77-12A)
Fiscal 2015 to Fiscal 2016	Direction 6	Rates set by Direction 6 (Order No. G-48-14)
Fiscal 2017 to Fiscal 2019	Direction 7	BCUC Decision within rate caps set by Direction 7 (Order No. G-47-18)

It has been nine years since the BCUC made an unconstrained rate decision under cost of service regulation.[511]

The Fiscal 2017 to Fiscal 2019 Revenue Requirements Application provided the opportunity for a detailed examination of BC Hydro's operations and forecast costs. However, due to the rate caps and various other directives prescribed by Direction No. 7, the BCUC's oversight was more limited than it would have been in a traditional cost of service proceeding.

In its Decision on the Fiscal 2017 to Fiscal 2019 Revenue Requirements Application, the BCUC stated:

> "We acknowledge BC Hydro's cost cutting measures and also the upcoming comprehensive government review of BC Hydro's expenditures and we are hopeful that further efficiencies can be found. Our concern lies in the apparent decoupling of revenues and expenditures within the test period. Expenditures have risen

[511] BCUC Order No. G-180-10 authorizing the Fiscal 2011 Negotiated Settelement Agreement was issued on February 19, 2010. As part of the Fiscal 2009 to Fiscal 2010 Revenue Requirements Application proceeding, an Oral Hearing was held from October 6, 2008 to October 29, 2008.

> faster than revenues. A company with expenditures that exceed its revenues is not sustainable. Accordingly we are of the view that a rate setting mechanism that could help BC Hydro to accomplish its cost control objectives is of value."[512]

In June 2018, the Government of B.C. initiated a Comprehensive Review of BC Hydro. Phase One of the Comprehensive Review resulted in two significant changes:

- First, the Government of B.C. rescinded Direction Nos. 3, 6, and 7, enhancing the BCUC's oversight of BC Hydro.
- Second, BC Hydro ceased using the Rate Smoothing Regulatory Account at the end of the third quarter of fiscal 2019. The Rate Smoothing Regulatory Account, in combination with the rate caps prescribed by Direction No. 7, had allowed BC Hydro to defer portions of the approved revenue requirement in a particular fiscal year for recovery in future fiscal years. In this application, BC Hydro is not proposing to smooth rates during the fiscal 2020 to fiscal 2021 test period and is requesting BCUC approval to close the Rate Smoothing Regulatory Account.

With enhanced oversight of BC Hydro and the closure of the Rate Smoothing Regulatory Account, the BCUC now has the ability to examine BC Hydro's forecast revenues and expenditures and to set rates based on cost of service principles. BC Hydro believes that unconstrained cost of service proceedings would address the issues raised by the BCUC in its Decision and that cost of service regulation should be given the opportunity to work, before the adoption of PBR is seriously considered.

[512] BCUC Decision and Order No. G-47-18, BC Hydro Fiscal 2017 to Fiscal 2019 Revenue Requirements Application (March 1, 2018), page 33.

11.8.2 Conferring the Necessary Autonomy on BC Hydro Under PBR May Be Less Palatable Given the Return to Enhanced Regulation is So Recent

Second, the fact that BC Hydro is only now returning to enhanced regulation is likely to make it more challenging to secure stakeholder support for the principles of PBR.

As Dr. Weisman explains in his report, there may be little practical difference between PBR and cost of service regulation, in the absence of a strong regulatory commitment to the principles of PBR. A key principle of PBR is that the utility should be provided with the autonomy to manage its expenditures within the PBR framework without a detailed regulatory review that would second guess the decisions made. In exchange for this increased autonomy, the utility assumes both the risk that the PBR formula may not sufficiently fund certain costs as well as the opportunity to retain additional savings, if new efficiencies are discovered, over and above what is required to meet the formula.

A strong regulatory commitment to this principle requires stakeholder support for the adoption of PBR over cost of service regulation. In the absence of stakeholder support, it may be difficult to avoid detailed regulatory reviews that would lead to second guessing.

BC Hydro believes that it may be challenging to secure stakeholder support for the adoption of PBR at this time:

- Intervener comments during a workshop in the BCUC's Review of the Regulatory Oversight of Capital Expenditures and Projects proceeding indicate that many interveners may have concerns about the increased autonomy from detailed regulatory review that some of BC Hydro's cost components would receive under PBR.[513]

[513] BC Hydro Review of the Regulatory Oversight of Capital Expenditures and Projects Workshop Transcript (May 23, 2018), pages 69 to 72.

- Greater autonomy from detailed regulatory review is likey the opposite of what interveners are expecting, following a prolonged period where the BCUC's oversight of BC Hydro has been limited.
- In its Decision, the BCUC stated that it did not have a high degree of comfort in BC Hydro's starting operating costs, given its limited involvement in the approval of recent revenue requirements.

If PBR is adopted for BC Hydro, the regulatory framework for BC Hydro would have shifted from cost of service regulation with rate caps, to cost of service regulation without rate caps, to PBR, in a very short period of time. BC Hydro believes that it would be difficult to secure stakeholder support and regulatory commitment to the principles of PBR, so soon after BC Hydro's return to enhanced regulation. In addition, cycling through various regulatory regimes, in such a short time frame, is likely to create instability and uncertainty that can undermine confidence in the regulatory process.

In addition, it would be particularly important to establish familiarity and comfort with BC Hydro's costs, prior to locking them in as base costs, for a prolonged period of time, under a PBR plan. BC Hydro believes that the most effective way to build a strong foundation of familiarity and comfort is through successive cost of service proceedings that would provide the BCUC and interveners with the opportunity to become fully conversant with BC Hydro's operations.

11.8.3 Cost of Service Regulation is Intuitive While PBR is Esoteric

Third, cost of service regulation is more transparent and accessible while PBR is more esoteric, relying on specialized expertise.

The process under cost of service regulation is fairly intuitive: BC Hydro provides information, the BCUC and interveners ask questions and the BCUC sets rates to recover only those costs that it determines to be prudently incurred plus a reasonable rate of return.

Under PBR, once base costs are established, the amount of revenue recovered through rates would be largely independent of BC Hydro's costs. This separation is achieved by adjusting rates for the effects of inflation and productivity improvements for a specified period of time. This shifts the focus of the proceeding from determining the prudent level of spending to identifying total factor productivity growth for the electricity industry, determining what costs can be accommodated by a formula or should be treated as flow through items, guarding against service deterioration, and determining how benefits and risks should be allocated.

These issues introduce an alphabet of factors (e.g., i, x, k, y, z) into the regulatory process. The design of PBR, the inter-relationship among various PBR elements, and determination of these factors is highly specialized and is primarily the domain of experts. The complexity of these issues makes PBR inherently less accessible to customers and the public generally. While interveners are eligible for Participant Assistance Cost Award funding, which can help fund experts and other support, participants and customers may feel more disconnected from these types of proceedings than a traditional cost of service review.

11.8.4 PBR is Premised on a Profit Incentive, but BC Hydro Does Not Have a Mandate to Maximize Profits

Fourth, BC Hydro does not have a mandate to maximize profits, which can dull the additional "carrot" incentive that PBR attempts to provide.

When the amount of revenue recovered through rates is de-linked from a utility's costs, rather than dependent on them, this creates both "carrot" and "stick" incentives for efficient performance.

In the conclusion to his report, Dr. Weisman discusses the adoption of PBR for Crown Corporations like BC Hydro, stating:

> "Policymakers should recognize that the expected gains from adopting PBR may be subject to greater uncertainty in the case of crown corporations. In many respects, these public enterprises are de facto subject to two different

> regulatory authorities—the regulatory commission of jurisdiction and its government owners." [514]

As a Crown Corporation, under cost of service regulation, BC Hydro already has significant "stick" incentives to operate efficiently:

- As BC Hydro's shareholder, the Government of B.C. has required BC Hydro to manage within a very efficient framework. For example, the 2013 10 Year Rates Plan set rate targets for fiscal 2020 to fiscal 2024 and BC Hydro was required to find new efficiencies to maintain those rate targets as a declining rate of load growth created new cost pressures. In addition, through the Comprehensive Review, the Government of B.C. and BC Hydro worked together to identify additional opportunities to reduce costs, to support the government's affordability mandate.
- As BC Hydro's revenue requirements applications are submitted on a forecast basis and cover multiple years, rates are set independently of BC Hydro's actual costs over the test period. This means that unexpected cost pressures that arise during the test period must be managed and fully absorbed by BC Hydro within its existing approved revenue requirement, unless there is a regulatory mechanism in place to defer the impact.

By allowing a utility or its shareholder to retain all or a portion of the savings over and above what is required to meet the formula, PBR aims to use financial incentives to motivate a process through which new savings - that were not previously identified under cost of service regulation - are discovered. This process is intended to emulate what would happen in a competitive market where, in an effort to increase their market share, rival producers would continually discover new ways to reduce their costs, achieving "dynamic" efficiencies.

Accordingly, the incremental benefit of adopting PBR would be to provide "carrot" incentives on top of the "stick" incentives that are already in place.

[514] Appendix FF, page 63

The challenge with applying this approach to BC Hydro is that it assumes BC Hydro is motivated by the prospect of higher earnings. This is not the case. Rather, the Government of B.C. expects BC Hydro to achieve its allowed net income target, not to exceed it. This does not mean that BC Hydro will not seek out or find additional efficiencies in future years. Rather, it means that the incentive to find these efficiencies would come, as it does today, from the obligation and commitment on the part of management to deliver on its mandate and not from the opportunity to increase earnings.

11.8.5 Cost of Service Regulation is More Appropriate for BC Hydro than PBR

In sections 11.3 to 11.7 above, BC Hydro has provided its initial conclusions in response to the issues raised by the BCUC. This provides a framework for a PBR plan, should the BCUC decide to adopt PBR for BC Hydro. However, for the reasons set out above, we believe that BC Hydro should continue to be regulated through cost of service regulation at this time. BC Hydro respectfully recommends that the BCUC use this Revenue Requirements Application proceeding to engage interveners to canvass their views.

List of Appendices

BC Hydro

Fiscal 2020 to Fiscal 2021
Revenue Requirements Application

Appendix A

Financial Schedules

Table of Contents

1 Overview

Appendix A contains the detailed financial schedules of the revenue requirements model, and is intended to provide, in a single location, the details of the elements which make up the revenue requirements for the Test Period and prior years. The working revenue requirements model that produces the schedules is provided in electronic form as part of this filing.

The overall purpose, general structure and model mechanics of Appendix A remains unchanged from the Previous Application. Appendix A is provided in this Application in two forms: the printed form and the electronic form. The printed form includes information for the fiscal 2020 and fiscal 2021 Test Period, as well as the Previous Application information from fiscal 2017 to fiscal 2019. The electronic form of Appendix A includes information for the fiscal 2020 and fiscal 2021 Test Period, as well as historical RRA and Actual or Forecast information over the five year period from fiscal 2015 to fiscal 2019.

Of the 42 total schedules in Appendix A, 23 are used for the purpose of providing information on BC Hydro's total revenue requirements, while 19 are used for the purpose of determining the Transmission Revenue Requirement. The Table of Contents in Appendix A includes a column indicating the primary purpose of each schedule in Appendix A.

Where possible, BC Hydro has made a number of modifications to Appendix A to simplify schedules. In addition, BC Hydro has added new schedules to enable the allocation of operating costs to Transmission, Distribution, Generation and Customer Care functions in order to determine the Transmission Revenue Requirement (which is presented in Chapter 9). These changes, and others, are described below.

2 Simplification - Elimination of Rows

In all schedules throughout Appendix A, rows which relate to items from applications prior to fiscal 2015 and which are no longer required, have been removed.

3 New Schedules - Cost Allocation

BC Hydro's re-organization results in a centralized organizational structure which aligns with the work functions that we perform – planning, building, operating and supporting. As part of preparing the Transmission Revenue Requirement, and in order to continue the methodology of allocating operating costs to the Generation, Transmission, Distribution, and Customer Care functions, BC Hydro has added eight new schedules, Schedules 3.6 to 3.13, for the purposes of allocating Operating Costs and Provisions to these functions.

The Current Operating Costs and Provisions for each Business Group are shown on Schedules 3.7 to 3.13, and are allocated within these schedules to the Generation, Transmission, Distribution, Customer Care, and Business Support functions. Schedule 3.6 summarizes these allocations. The allocation of historical Current Operating Costs and Provisions under the current Business Groups has been included in these schedules for presentation purposes only. RRA and Actual allocations from previous approved Revenue Requirement Applications are still used in calculating the final allocations in fiscal 2015 to fiscal 2019.

No additional schedules were required for other components of BC Hydro's revenue requirements (i.e., Cost of Energy, Amortization, Finance Charges, Taxes etc.) as the allocation of costs to specific functions have not been impacted by changes in BC Hydro's organization structure.

4 Categorization of Cost of Energy

As discussed in Chapter 4, section 4.2, the repeal of the Heritage Contract means that BC Hydro now has the flexibility to categorize its costs of energy differently in Appendix A. In Schedule 4.0, which sets out BC Hydro's costs of energy, BC Hydro has created a new category called Market Energy and categorized its energy costs into Heritage Energy, Non-Heritage Energy and Market Energy. We believe that this categorization will make it easier to understand BC Hydro's energy costs.

5 Presentation of Waneta 2017 Revenues

Pursuant to Order No. G-130-18, the revenue from the Waneta 2017 transaction must be shown as a line item separate from revenue from rate regulated activities in BC Hydro's revenue requirement applications. BC Hydro has shown revenue related to the Waneta 2017 transaction in lines 20 to 23, 33 and 34 on Schedule 15.0.

6 Revised Schedules - Operating Costs

Schedules 5.1 to 5.7 present BC Hydro's operating costs by Business Group. These schedules replace Schedules 5.1 to 5.5 from the Appendix A in the Previous Application, which showed operating costs according to the previous Business Groups. Operating costs, both RRA and Actual, from fiscal 2015 to fiscal 2019 have been restated according to the new Business Groups.

Additionally, to address BCUC's concern relating to the various terminologies used to describe BC Hydro's operating costs, a table has been provided at the bottom of Schedule 5.0 in Appendix A to illustrate the continuity of the various operating cost views. These operating cost views are further explained in Chapter 5, section 5.5.1.

IN THE MATTER OF
the *Utilities Commission Act*, RSBC 1996, Chapter 473

and

British Columbia Hydro and Power Authority (BC Hydro)
Fiscal 2020 to Fiscal 2021 Revenue Requirements Application

BEFORE:
Commissioner
Commissioner
Commissioner

on Date

ORDER

WHEREAS:

A. On February 25, 2019, British Columbia Hydro and Power Authority (BC Hydro) filed its Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (Application) with the British Columbia Utilities Commission (BCUC) pursuant to sections 44.2, 58 to 61 and 99 of the *Utilities Commission Act* (Act) requesting, among other things,

   (i) effective April 1, 2019, a reduction of the Deferral Account Rate Rider (DARR) from 5 percent to 0 percent and an increase in rates by 6.85 percent, resulting in an average net bill increase of 1.76 percent;

   (ii) effective April 1, 2020, an increase in rates by 0.72 percent; and

   (iii) approval of the fiscal 2020 and fiscal 2021 OATT rates in Table 9-8 of the Application effective April 1, 2019 and April 1, 2020, respectively.

B. BC Hydro requested these changes be made effective on an interim basis, pending a final BCUC decision on the Application.

C. The BCUC has considered the Application and determines that approval of interim rates is warranted.

NOW THEREFORE pursuant to sections 58 to 61, 89 and 90 of the *Utilities Commission Act*, and for the reasons outlined in the decision issued concurrently with this order, the BCUC orders as follows:

1. The requested reduction of the DARR from 5 percent to 0 percent is approved on an interim basis, effective April 1, 2019.

.../2

2. The requested rate increases of 6.85 percent and 0.72 percent, to be applied as set out in Appendix EE of the Application, are approved on an interim basis effective April 1, 2019 and April 1, 2020, respectively.

3. The requested OATT rates for fiscal 2020 and fiscal 2021 as set out in Table 9-8 of the Application are approved on an interim basis effective April 1, 2019 and April 1, 2020, respectively.

4. The rate schedules set out in Appendix EE are accepted for filing.

5. The rates and OATT rates approved by this order will remain interim and subject to refund with interest at BC Hydro's weighted average cost of debt until further order of the BCUC.

6. BC Hydro must provide customers with notification of the interim rate increase as soon as is practicable.

DATED at the City of Vancouver, in the Province of British Columbia, this (XX) day of (Month Year).

ORDER

WHEREAS:

A. On February 25, 2019, British Columbia Hydro and Power Authority (BC Hydro) filed its Fiscal 2020 to Fiscal 2021 Revenue Requirements Application (Application) with the British Columbia Utilities Commission (BCUC) pursuant to sections 44.2, 58 to 61 and 99 of the *Utilities Commission Act* (Act) requesting, among other things,

   (i) effective April 1, 2019, a reduction of the Deferral Account Rate Rider (DARR) from 5 percent to 0 percent and an increase in rates by 6.85 percent, resulting in an average net bill increase of 1.76 percent;

   (ii) effective April 1, 2020, an increase in rates by 0.72 percent;

   (iii) approval of the fiscal 2020 and fiscal 2021 OATT rates in Table 9-8 of the Application effective April 1, 2019 and April 1, 2020, respectively; and

   (iv) acceptance of a demand-side management expenditure schedule of $207.1 million in fiscal 2020 and fiscal 2021 as set out in Table 10-1 of the Application.

B. On March XX, 2019, the BCUC issued Order No. G-XX-19 approving BC Hydro's request that the changes to the DARR and rates sought in the Application be approved on an interim basis effective April 1, 2019, pending a final BCUC decision on the Application.

C. On XX, 2019, the BCUC issued Order No. G-XX-19 establishing a regulatory timetable for the review of the Application.

D. [Other recitals as required.]

.../2

E. The BCUC has considered the Application and the evidence and submissions filed in the proceeding and makes the following determinations.

NOW THEREFORE pursuant to sections 44.2, 58 to 61 and 99 of the *Utilities Commission Act*, and for the reasons outlined in the decision issued concurrently with this order, the BCUC orders as follows:

1. The requested final reduction of the DARR from 5 percent to 0 percent is approved effective April 1, 2019.

2. The requested final rate increases of 6.85 percent and 0.72 percent, to be applied as set out in Appendix EE of the Application, are approved effective April 1, 2019 and April 1, 2020, respectively.

3. The following requested changes to deferral and regulatory accounts and the associated financial treatment are approved:
    a. Amortize into rates, over the fiscal 2020 to fiscal 2021 test period, the forecast fiscal 2019 net closing balance and the forecast fiscal 2020 and fiscal 2021 net additions and net interest applied to the Cost of Energy Variance Accounts;
    b. Defer any variances related to the accounting for EPAs determined to be leases under International Financial Reporting Standard (IFRS) 16, which are not eligible for deferral treatment under existing orders, to the Non-Heritage Deferral Account;
    c. Defer any variances between forecast and actual amounts related to the Biomass Energy Program, which are not eligible for deferral treatment under existing orders, to the Non-Heritage Deferral Account;
