# Introduction

## Introduction

Appendix B contains the catalogue of thermal performance data sheets for all the details available for this guide. The thermal performance information includes U-values, transmittance values and condensation indices. Appendix B consists of a catalogue with full thermal information for each detail.

Catalogue Index
1. Window Wall
2. Conventional Curtain Wall
3. Unitized Curtain Wall
4. High Performance Curtain Wall
5. Steel-Framed Construction
6. Metal Buildings
7. Concrete and Mass Masonry Construction
8. Wood-Frame and Timber Construction
9. Balconies and Doors
10. Roofs

Each thermal data sheet, along with its matching material data sheet, is meant to be standalone. For instance, Detail 5.2.5 is a balcony slab detail for a steel stud assembly. That data sheet contains the material information for both the slab detail, and the clear field steel stud assembly above and below it. The clear field steel stud assembly material data sheet 5.1.14 is not additionally required to analyze the slab detail. Additionally, some assemblies contain more than one interface detail, so while they are arranged by major detail type (slab, then parapet etc.), there may be other interface details contained within it. Each thermal data sheet contains the thermal performance values for all interface details contained within that assembly detail. Note that some clear field assemblies do not have their own individual thermal data sheet and may be included within other thermal data sheets. For instance, there is no separate clear field data sheet for an interior insulated concrete wall, however there is clear field data available for that wall within the slab interface detail 7.2.2.

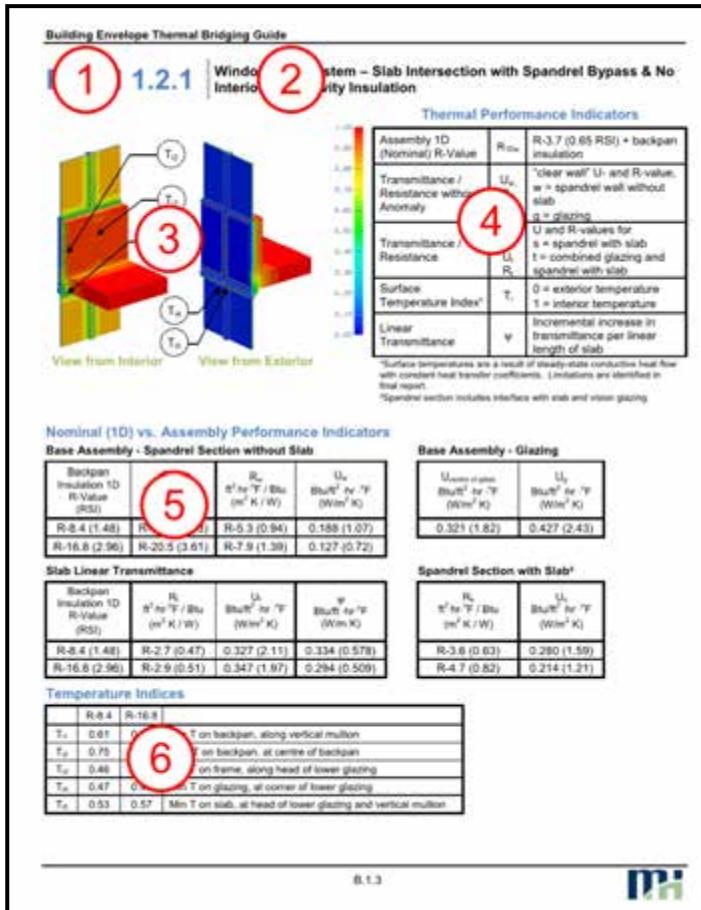

## Modelling Assumptions

- Exterior surfaces and air spaces include convection, conduction and radiation heat exchange.
- The models were evaluated at non-dimensionalized temperatures, where 0 is the exterior temperature and 1 is the interior. This was done to allow the results to be applicable to any temperature difference. See condensation indices below for more information.
- The model was analyzed at steady state, so thermal mass is not taken into account within assembly U-values.
- Air leakage was not taken into account. It was assumed materials were well fit together
- Contact resistances between materials were used

Additional modeling parameters and assumptions can be found in Section 5 of ASHRAE 1365-RP.

## Thermal Data Sheets

Each thermal data sheet contains several pieces of information. An example thermal data sheet is shown below with a description for each section following.

### 4) Thermal Performance Legend

A thermal performance legend is provided denoting terms and subscripts for the thermal values that follow.

### 5) Thermal Values

The thermal data sheets contain several types of thermal performance indicators. If one or more assemblies are present on a detail, there will typically be multiple tables present, one for each assembly and one for the averaged values for all the assemblies combined. For clear field thermal data sheets, they typically have all the information contained within one table, however for curtain wall and window wall assembly clear field thermal data sheets; they also include the glazing data. In these instances, the spandrel clear field value and glazing values are in two separate tables, along with a combined assembly that is an average of the glazing and spandrel combined.

For interface detail thermal data sheets, each type of interface detail present in a single assembly has their own table, along with a separate table for the clear field values. There may be multiple ways the clear field values are presented. If there is only one clear field assembly, all values for the detail are given in a single table and the clear field values are presented as U<sub>a</sub> and R<sub>a</sub>. If there are multiple clear field assemblies or multiple interface transmittances in a single detail, the clear field values for each clear field assembly will be presented in a "Base Assembly" table. This is usually the case when there are glazing assemblies involved.

### 1) Detail Name

Each detail is named based on position within the catalogue index. The first number 1.x.x indicates the construction type according to the main index (ie 1 is Window-Wall, 5 is Steel Framed, 8 is Wood Framed etc). The second number x.1.x indicates detail group (ie. 1 is clear field values, 2 may be all slabs and 3 may be all parapets). The last number x.x.1. is simply the order in which the detail appears within that grouping (ie slab detail 1, slab detail 2 etc).

### 2) Detail Description

A basic description is included that denotes the construction system or type, along with additional detail identifiers such as limited dimension information, transmittance type and insulation locations

### 3) Thermal Image

An isometric thermal image from the interior and from the exterior is provided, along with a non-dimensionalized temperature scale and key locations for temperature indices, see condensation indices below. While temperatures could be read off these images, they are meant to give a general look at where the areas of high heat flow are.

The thermal values provided in these tables are as follows:

- Insulation 1D R-value is the value of insulation if it is varied within the model. This is typically the exterior insulation or backpan insulation amount.
- $R_{1D}$  is the combined thermal resistance of all the materials in a clear field assembly. This is the value of the assembly if there were absolutely no thermal bridging.
- $R_o$  and  $U_o$  is the clear field thermal resistance and transmittance when there is only one base clear field assembly.
- $R_x$  and  $U_x$  is the thermal resistance and transmittance for base assembly "X" when there are multiple clear field assemblies. Be aware of the subscripts given in the Thermal Performance legend. The subscript may not always represent a clear field assembly value.
- $U_{center\ of\ glass}$  and  $U_g$  are the thermal transmittances through the 1D center of glass and the overall glazing assembly respectively.
- $R$  and  $U$  are modelled assembly thermal resistance and transmittance that include the effects of interface details for the specific size of the modeled assembly. There may be additional subscripts if the assembly contains multiple interface details, please be aware of the subscript labels given in the Thermal Performance Legend. This is important for details with glazing, such as window wall and curtain wall. The thermal values for the combined assembly with spandrel and glazing may be wanted, however as glazing can be dealt with separately, most designers will only want the information on the spandrel, therefore the spandrel only values with the slab are given separately.
- $\Psi$  is the linear transmittance value. There may be additional subscripts if there are multiple interface details within one assembly
- $X$  is the point transmittance value. There may be additional subscripts if there are multiple interface details within one assembly
- $T_{ix}$  is the condensation indice for location x

## 6) Condensation Indices

The thermal data sheets also provide surface temperatures of assembly components that could be exposed to interior air to help locate potential areas of risk for condensation. In order to be applicable for any climate (varying indoor and outdoor temperatures), the temperatures are non-dimensionalized into a temperature index,  $T_i$ , as shown below

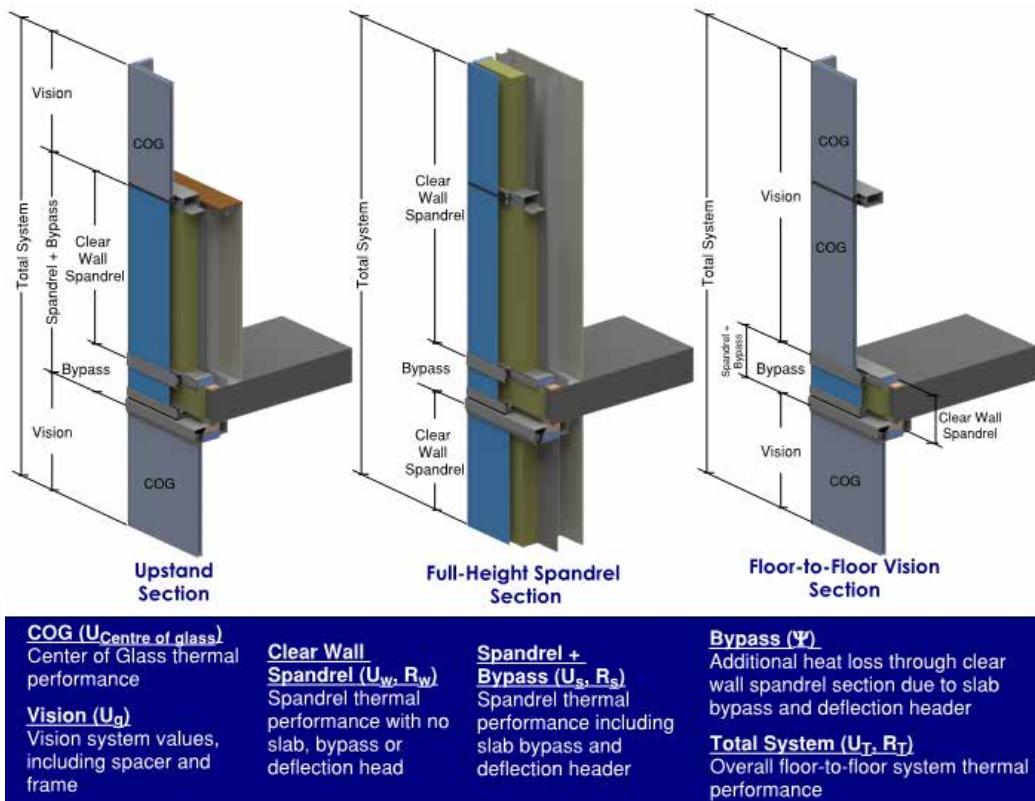

$$T_i = \frac{T_{surface} - T_{outside}}{T_{inside} - T_{outside}}$$

The index is the ratio of the surface temperature relative to the interior and exterior temperatures. The temperature index has a value between 0 and 1, where 0 is the exterior temperature and 1 is the interior temperature. If  $T_i$  is known, the above equation can be rearranged for  $T_{surface}$ . Note that these not meant as absolute temperatures and are only given as guidance on potential regions of condensation. There are many factors that can affect the formation of condensation that are not included in the modeling. For more discussion, see section 5.3 of ASHRAE 1365-RP.

## 7) Window-Wall Systems

Window-wall systems integrate vision glazing, opaque spandrels, and intermediate floor bypasses into their systems, making it difficult to differentiate the thermal performance of these sections. Below is a figure to help clarify how different sections are identified in the thermal bridging details.

For the floor-to-floor vision section scenario the bypass linear transmittance  $\Psi$  is compared to a spandrel clear wall section of the same dimension but with regular mullions in place of the deflection header and without the impact of the slab.

## 8) At-Ground Transitions

Some details contain at-grade transitions. The  $\Psi$ -value can be used like any other linear transmittance and it represents the incremental heat flow between the wall and foundation assembly. While heat flow through the wall assembly is based on heat flow per area (U-value), heat flow at foundation assemblies (slab on grade or below grade) is calculated by L-value based on ISO 10211: 2007. The L-value is simply the overall heat flow of the slab on grade per unit length of the slab perimeter. It is based on the assumption that the overall steady state heat flow through slab on grade is dominated by the perimeter, similar to F-factors referenced in ASHRAE 90.1.

Wall and floor junctions with slab on grade are still characterized by linear transmittance  $\Psi$ . The linear transmittance at wall to floor junctions are calculated by subtracting the L-value of the overall assembly by the L-value of the slab and thermal transmittance of the clear wall per unit width as shown by the equation below:

$$\Psi = L_{2Dt} - L_{2Df} - U_{ow} * H_w$$

**Where:**

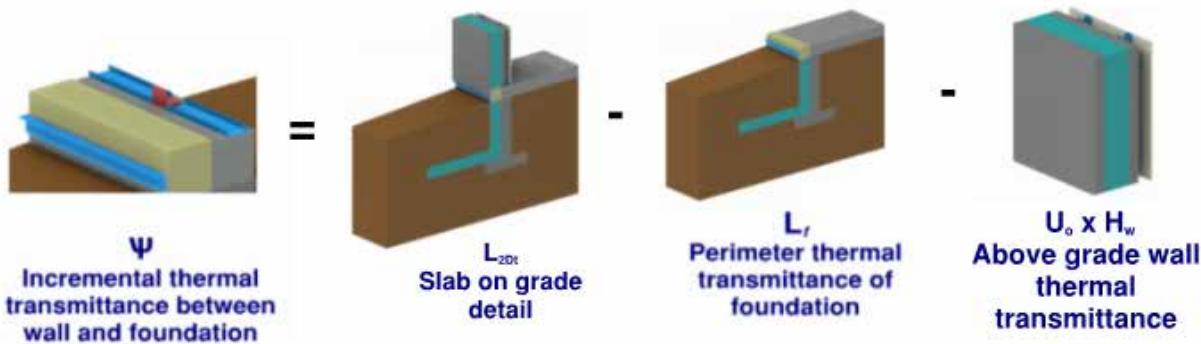

$\Psi$  = Linear transmittance of wall/ slab on grade transition

$L_{2Dt}$  = Heat flow of overall assembly per unit length of slab perimeter

$L_{2Df}$  = Heat flow of slab edge per unit length of slab perimeter

$U_{ow}$  = U-value of the clear wall

$H_w$  = Height of the clear wall in the overall modelled assembly

### 9) PDF Version

With the PDF version of the catalogue, each entry in the catalogue index is linked to each construction section. Within each section, there is an additional index for the details, which are also linked directly to each detail thermal sheet. To return to the index, simply click on the Building Envelope Thermal Bridging Guide header.

## Detail 10.4.2

### Exterior Insulated Low Sloped Roof with Fully Adhered Roof Membrane and Mineral Wool and Polyisocyanurate Insulation - Flange-Style Drain Penetration

#### Thermal Performance Indicators

Assembly 1D (Nominal) R-Value	$R_{1D}$	R-3.5 (0.62 RSI) + Insulation
Transmittance / Resistance without Anomaly	$U_o, R_o$	"clear field" U- and R-value, without roof drain
Transmittance / Resistance	$U, R$	U- and R-values for the overall assembly
Surface Temperature Index <sup>1</sup>	$T_i$	0 = exterior temperature 1 = interior temperature
Point Transmittance	$\chi$	Incremental increase in transmittance for drain

<sup>1</sup>Surface temperatures are a result of steady-state conductive heat flow with constant heat transfer coefficients. Limitations are identified in final report.
